PSITTACI (Lat., parrots). The order or suborder of birds to which belong the parrots, parakeets, love-birds, lorikeets, etc. (q.v.). The Psittaci are easily recognized by the powerful hooked bill, cored at the base, the fleshy tongue, and the zygodactyl feet. The wings and tail are variable. The furculum is weak, defective, or wanting; the lower larynx is peculiarly constructed with three pairs of muscles; after-shafts are present on the feathers; and the pterylosis is remarkably falconiform. Cæcum, gall-bladder, and sometimes the oil-gland are wanting. The greatest diversity is shown in the arrangement of the carotid arteries and ambiens muscle. The classification of the Psittaci has proved a puzzle, but there are probably at least two well-marked families, Psittacidae and Trichoglossidae, with perhaps seven sub-families.

PSKOV, pskóf. A government of Russia, bounded by the governments of Saint Petersburg and Novgorod on the north, Tver and Smolensk on the east, Vitebsk on the south and southwest, and Livonia on the west (Map: Russia, C 3). Area, 17,070 square miles. The southern part is somewhat hilly and undulating; the northern is low, marshy, and thickly wooded. The chief rivers are the Lovat, which flows into Lake Ilmen; the Velikaya, a tributary of Lake Pskov; and the Düna, which drains the southeastern part of the government. Pskov has a large number of lakes, of which Lake Pskov is the largest. The average annual temperature is about 41° F. Although the soil is mostly sandy and far from fertile, agriculture is the chief industry, and rye and oats are the principal crops. On the larger estates, as well as on the farms owned by colonists from the Baltic Provinces, modern agricultural methods are employed, and cereals are raised for export. Stock-raising is neglected. Flax is grown on a large scale and exported. Next to agriculture, lumbering is the most important industry.

The principal manufacturing industries are distilling, milling, and the production of lumber. The annual value of manufactures is over \$5,000,000. Population, in 1897, 1,136,540. The bulk of the population is composed of Great Russians. Capital, Pskov.

PSKOV. The capital of the government of the same name and one of the most ancient cities of Russia, situated on the rivers Velikaya and Pskova, 171 miles southwest of Saint Petersburg (Map: Russia, C 3). It is divided into two parts, the Great City with the Kremlin on the right bank of the Velikaya, and Zavelitchie on the opposite bank. The town is still partly surrounded by its ancient walls, and has retained some remains of the fortress. In the old cathedral in the Kremlin dating from the twelfth century are the tombs of the princes of Pskov, and the church in the Spaso-Mirozhski Monastery (twelfth century) contains well-preserved frescoes and mural paintings, and a treasury with many valuable antiquities. Noteworthy are also the Cathedral of Saints Peter and Paul with its ancient icons, the churches of the Old Ascension Convent, and the old palaces of the wealthy merchants. The modern town is uninteresting. The educational institutions of

Pskov comprise two gymnasia, a Realschule, a corps of cadets, a seminary for teachers, and one for priests. There is a considerable trade and some manufacturing. Population, in 1897, 30,400.

Pskov, ancient Pleskov, was in existence at the time of the coming of the Varangians to Russia. Threatened by the Lithuanians and the Germans, Pskov became a dependency of Novgorod, but, unlike other dependencies of that republic, it enjoyed more or less autonomy, and its inhabitants took part in the *vyetche* of Novgorod (q.v.). With the growth of its commerce Pskov became more and more independent, and finally began to elect its own princes, who, however, were still considered as representatives of Novgorod the Great. By the Treaty of Bolstov in 1348 Pskov attained complete independence.

As a republic Pskov did not differ essentially in its internal organization from Novgorod. Commercially it was of the utmost importance, lying on the way between Riga and Novgorod. In the fourteenth century it became a member of the Hanseatic League. The aggressive policy of the Princes of Moscow, however, soon put an end to the little republic. Pskov committed the fatal blunder of appealing to the Princes of Moscow in its struggles with Novgorod in the beginning of the fifteenth century, thereby giving them an opportunity to interfere in its internal affairs. The internal conflicts between the masses and the upper classes afforded Moscow an additional pretext for interference, and Pskov was soon compelled to accept princes appointed by Moscow. The position of Pskov was further weakened by the fall of Novgorod, and the republic was finally abolished in 1510 by Prince Vasili, its *vyetche* suppressed, its leading merchants exiled to Moscow, and replaced by settlers from that city. Since then the city has declined, and the only important event in its history is its long siege by the Poles under Stephen Báthory in 1581-82. Consult Nikitsty, *Umriss der innern Geschichte Pskors* (Petersburg, 1873).

PSKOV, LAKE. A lake in Russia. See PEIPUS.

PSORALEA, só-rá-lé-á (Neo-Lat., from Gk. *ψωραλεος*, *psóraleos*, scabby, from *ψώρα* *psóra*, itch, from *ψᾶν*, *psan*, to rub; so called from the dots sprinkled over the surface). A genus of plants of the natural order Leguminosæ, mostly natives of warm countries, with blue, purple, or white flowers, and generally abruptly pinnate leaves. *Psoralea esculenta*, the bread-root of North America, and prairie apple, *pomme blanche* and *pomme de prairie* of the Canadian boatmen, is a perennial herb about a foot high, with a carrot-like root, rich in starch and used as food, both boiled and raw. It abounds on the high plains from the Saskatchewan to Texas. *Psoralea hypogæa* and *Psoralea cuspidata* of the same region also have tuberous roots.

PSORIASIS, só-rí-á-sis (Neo-Lat., from Gk. *ψωρασις*, itch, from *ψωριᾶν*, *psóriān*, to have the itch, from *ψώρα*, *psóra*, itch), LEPRA, ALPHOS. A chronic skin disease characterized by inflammatory dry, red, roundish patches with adherent silvery scales. Between the patches the skin cracks and bleeds. It is distributed principally over the extensor sides of the extremities, especially about the elbows and knees and the scalp, as also the trunk, and finally the flexor sides of the limbs.

No part of the body is exempt but the mucous membranes. The disease frequently accompanies rheumatism. Its cause is still obscure. The treatment consists of the internal use of arsenic, iodide of potassium, thyroid extract, salicylates, quinine, and citrate of potash, together with the local use of alkaline baths, subacetate of lead, zinc oxide, mercurial ointments, thymol, betanaphthol, chrysarobin, etc. The waters at several spas, as Leviso, Bourboule, Royat, which contain arsenic, have a vogue in the treatment of psoriasis.

PSOVIE, or BIRZON. See GREYHOUND.

PSYCHE, sí'kè (Lat., from Gk. ψυχή, breath, life, soul, butterfly, from ψύχειν, *psychein*, to breathe). As a mythological character Psyche is a creation of the later Greek speculation, and in literature is scarcely known before the story in Apuleius (q.v.). Here Psyche appears as the youngest and most beautiful of three daughters of a king. She aroused the jealousy of Venus, who sent Cupid to inspire her with passion for the meanest of men. The god, however, loved her, and caused her removal to a fairy palace of delight, where he visited her in darkness, strictly forbidding her to see his face. Her jealous sisters persuaded her to disobey this injunction, but when she approached the sleeping god with a lighted lamp, his unexpected beauty caused her to start, a drop of oil fell on the god, who woke, and after rebuking her curiosity disappeared. Vainly Psyche sought him throughout the earth and finally came to the palace of Venus, who treated her as a slave, and laid upon her impossible tasks, which, however, the unseen aid of her lover enabled her to accomplish. Finally even Venus's wrath was appeased, Jove gave her immortality, and she was united to Cupid. In this form a common folk-tale has been adapted to the philosophy which taught the preëxistence of the soul in happiness, its hard service in the body, and final immortality in bliss. Though there is no other literary testimony to this myth, the works of art show that as early as the second century B.C. the love of Eros and Psyche had engaged the Greek artists. One aspect of this story is only found on works of art of the Roman Imperial period—the torture of Psyche by Eros. Sometimes we see him holding the butterfly over a torch; at other times he binds and scourges the maiden Psyche, or with a torch sings the butterfly's wings which spring from her shoulders; again, Psyche lies prostrate before him in entreaty. The earlier groups show the lovers embracing. In the Pompeian wall-paintings or on gems we also find Psyche or Psyche with Eros engaged in various human occupations or amusements. On the Roman sarcophagi of the second and third centuries of our era, the myth of Psyche is used with obvious reference to the life of the soul, and naturally the representations pass over into the early Christian symbolism. Consult: John's edition of Apuleius (Leipzig, 1856); an English version in Walter Pater's *Marius the Epicurean*; Conze, *De Psyche Imaginibus Quibusdam* (Berlin, 1855); Collignon, *Essai sur les monuments relatifs au mythes de Psyche* (Paris, 1877).

PSYCHIATRY (from Gk. ψυχή, *psychē*, breath, life, soul + *laipela*, *iatreia*, healing, from *laipéōv*, *iatreuein*, to heal, from *laipós*, *iatros*, physician). The science which treats of the

pathology, clinical conditions, progress, cause, and treatment of diseases affecting the mind. Whether diseases are within the domain of neurology or that of psychiatry is determined by a study of the symptoms and physical signs. Many diseases affecting the mind present marked physical changes, such as tremors, alteration in tendon reflexes, pupillary anomalies, etc., as well as perversions of conduct or of action, such as exaltation, prodigality, suspicion, abulia, etc. A physician who devotes himself to the study of psychiatry is termed a psychiatrist or alienist. See INSANITY.

PSYCHICAL RESEARCH (from *psychic*, from Gk. ψυχικός, *psychikos*, relating to the soul or mind, from ψυχή, *psychē*, breath, life, soul). The term 'psychical research' takes its meaning from the activities of the Society for Psychical Research (q.v.), founded in England in 1882. The original programme of the society proposed a systematic investigation of "that large group of debatable phenomena designated by such terms as mesmeric, psychical, and spiritualistic." The work of investigation of these 'residual phenomena' was intrusted to six committees, who were to inquire severally into "the nature and extent of any influence which may be exerted by one mind upon another apart from any generally recognized mode of perception;" into hypnotism, the so-called mesmeric trance, clairvoyance, and other allied phenomena; to undertake a revision of Reichenbach's researches with reference to discovering whether his 'sensitives' possessed "any power of perception beyond a highly exalted sensibility of the recognized sensory organs;" to investigate the reports of apparitions at the moment of death, and of houses reputed to be haunted; to inquire into the causes and general laws of the phenomena of spiritualism; and to collect material relative to the history of these subjects. It becomes apparent that the group of inquiries thus circumscribed does not constitute a subdivision of an established body of knowledge, but contemplates an extension or revised interpretation of physical and psychical modes of action.

The most extensive investigations of 'psychical research' have been concentrated upon the effort to establish or detect evidence for the transference of thought apart from the recognized channels of sense. The experimental evidence has been accumulated by arranging that one person, called the 'agent,' shall think intently of a definite mental (usually a visual) impression and attempt to transfer the impression to the mind of the 'percipient,' who is supposed to be endowed with peculiar powers of this type and who in turn tries to read and record the impression thus 'transferred.' Numbers, words, drawings of simple geometrical forms, sketches of familiar objects, colors, actions, simple calculations, or even sounds, tastes, and odors have been 'transferred' in this way. The process of 'transference' seems to be more effective when the percipient is in an hypnotic or trance-like condition. In such a state there is an increased sensitiveness to slight indications of sense (hyperæsthesia), which in turn suggests the functioning of an unusual degree of sensibility of the ordinary kind in cases of successful percipiency. The data needed to justify the assumption of a non-sensory mode of thought transference are most difficult to collect; first, because the ex-

treme delicacy of sensibility in a sensitive nervous system is itself responsible for much that passes for thought-transference; secondly, because the precautions necessary to eliminate such possibilities have not as a rule been taken in the seemingly successful experiments, and proper conditions frequently are difficult to secure; thirdly, because the usual methods of performing such experiments leave the way open for unconscious exaggeration and misinterpretation, as well as for the unconscious indication of hints to the percipient. The experimenters have taken into account all of these difficulties. Yet, in the opinion of many whose judgment is entitled to great weight, the accumulated evidence does not justify, even provisionally, the entertainment of a 'telepathic' hypothesis.

The telepathic hypothesis does not rest its case upon experimental evidence alone, however. It presents an enormously extensive body of witnesses to the telepathic sending of hallucinations or presentiments, many of them having direct personal significance to those concerned, and an unusual number of them being connected with the moment of death or danger to one of the persons involved in the hallucination. The proportion of the recorded cases that contain a verifiable coincidence of event and presentiment is, on the whole, small. An elaborate census of hallucinations has been gathered by the society, and sets forth the relatively large occurrence of such hallucinations among normal persons in apparent good health. The elimination of coincidence is a vital point. The doubtfulness of erities is increased by the consideration that an intense interest in presentiments may induce the habit of noticing and recording them, thus increasing their relative frequency and the opportunity for apparently unexplainable coincidence; further by the dominant tendency to note and be impressed by favorable instances and not to notice the vastly larger number of unfavorable ones. Other investigations of students in psychical research relate to the asserted manifestation of the spirits of the departed in the affairs of this earth, mainly through individuals known as 'mediums.' Here again the evidence falls into an experimental and an observational group. The experimental evidence is that of the physical phenomena of spiritualism, the moving of tables, appearance of forms, release of the medium from knots and bonds, reading of sealed messages, and so on. In this field so much fraud or sleight-of-hand has been discovered that the students in psychical research have as a rule recognized the weakness of such evidence. Yet some of the most eminent among them have been unwilling to consider the hypotheses of deception—conscious or unconscious—in certain cases, because of their personal faith in the honesty of the medium; and in such cases as that of Mrs. Piper, in which the subject in a trance state reveals to sitters knowledge of their private affairs apparently quite beyond the usual channels of information, the alternative is presented by the investigators that the information thus revealed is obtained by the cooperation of departed spirits, or is suggestive of the action of some such unknown force as telepathy.

In many respects the field of psychical research and of psychology is the same, though the methods and purpose of the investigators may be distinct. Hypnotism, subconscious activity,

alterations of personality, hysteria, mental automatism, and related topics find recognition in the records of both. A type of such inquiry is 'crystal-gazing,' that is, the alleged power to see in a crystal or other reflecting surface a visual projection of shifting scenes and images, which upon examination can be referred to experiences subconsciously assimilated. As illustrations of the exercise of the subconscious imagination, the record of such instances possesses a distinct value for psychology. In the minds of some observers of such phenomena they, like other experiences, suggest the working of supernormal mental processes, and cannot in many cases be interpreted upon the psychological principles just indicated. Equally deserving of mention are certain studies, pursued by persons interested in psychical research, that contribute to the psychology of deception. Such studies have shown how readily the reports of performances purporting to give evidence of supernormal powers are vitiated by the effects of observation, by prejudice, by lack of technical knowledge, by lapses of memory and the like.

To the credit of psychical research must be placed a revival of interest in many worthy problems of psychology; the rescue from oblivion of important illustrative material; the contribution of illuminating aids to the comprehension of the culture history of the human race; and the social service of setting forth the pernicious and illusory character of certain systems of belief that threatened at various times the mental health of communities. To its disadvantage must be recorded the fostering of what is to some persons an unwholesome interest in the occult.

BIBLIOGRAPHY. The most important publications are those of the English Society for Psychical Research, of which up to 1903 seventeen volumes have appeared. In 1884 there was formed an American Society for Psychical Research which published four volumes before it merged its existence with that of the parent society. The best single volume surveying the field is Podmore's *Studies in Psychical Research* (London, 1897). Podmore's work on *Modern Spiritualism* (2 vols., New York, 1902) gives much information upon that as well as kindred topics. Other works worthy of mention in an outline bibliography are Andrew Lang, *Cock-Lane and Common Sense* (London, 1894); Podmore, *Apparitions and Thought Transference* (ib., 1894); Gurney, Myers, and Podmore, *Phantasms of the Living* (ib., 1886); Mason, *Telepathy and the Subliminal Self* (ib., 1897). In Jastrow, *Faet and Fable in Psychology* (1900), will be found a critical survey of certain of the problems and positions of 'psychical research.'

PSYCHICAL RESEARCH, SOCIETY FOR. An association formed in London, England, early in 1882 (as the result of a conference convoked by Professor W. F. Barrett), for the purpose of making "an organized and systematic attempt to investigate that large group of debatable phenomena designated by such terms as mesmeric, psychical, and spiritualistic." Through the agency of committees the society has gathered and published a vast amount of material on the subjects involved, with many discussions thereon. (For a discussion of the results attained by the committees, see PSYCHICAL RESEARCH.) Among the

most notable investigations of the society have been those conducted by Richard Hodgson, J. H. Hyslop, and others on the 'trance medium,' Mrs. Leonora Piper, of Boston, Massachusetts. The society's most conspicuous work was the census of hallucinations, which it carried on from April, 1889, to May, 1892. The following question was asked: "Have you ever, when believing yourself to be completely awake, had a vivid impression of seeing or being touched by a living being or inanimate object, or of hearing a voice; which impression, so far as you could discover, was not due to any external physical cause?" To this question exactly 17,000 answers were received, and a report thereon of about 400 pages was issued, embracing tabulated results and explanatory and discussional matter. (*Proceedings*, vol. x.). Of the 17,000 answers 1684, or 9.9 per cent., were affirmative; of the 8372 answers of men 655, or 7.8 per cent., were affirmative; of the 8628 answers of women 1029, or 12 per cent., were affirmative. The committee announced that it could make from this report one important deduction: that between the death of a person and the simultaneous apparition of that person to another person, at a distant spot, there is some connection.

The society is governed by a council of 24 members, who elect the officers and the new members. Meetings are held about once a month and are reported in the *Proceedings*, published monthly. The first president was Henry Sidgwick, who served 1882-84 and also 1888-92. The first vice-presidents were Arthur James Balfour, W. F. Barrett, John R. Holland, Richard H. Hutton, Rev. W. Stainton Moses, Roden Noel, Balfour Stewart, and Hensleigh Wedgewood. Other presidents have been: Balfour Stewart, 1885-87; Arthur James Balfour, 1893; William James, 1894-95; Sir William Crookes, 1896-99; Frederic W. H. Myers, 1900; Sir Oliver J. Lodge, 1901-02. Other prominent members have been Edmund Gurney, Lord Rayleigh, Frank Podmore, and J. J. Thomson. An American branch, established in 1895, includes in its membership Josiah Royce, William Romaine Newbold, Richard Hodgson, and J. H. Hyslop. In 1902 the English society had about 900 members, and the American branch about 500.

PSYCHOLOGICAL APPARATUS. The apparatus employed in a well-equipped psychological laboratory falls into the following main divisions: (1) Physiological models of the sense organs and the brain; (2) demonstration apparatus, for use in the lecture room before a large audience; (3) drill apparatus, for class work with students in the laboratory; and (4) research apparatus for the investigation of new problems, generally built, in part at least, within the laboratory. To these four classes may be added (5) certain anthropometrical instruments (see ANTHROPOMETRY), such as those which measure the diameter of the pupil, or the force and steadiness of muscular action; (6) apparatus for the observation of the habits and faculties of the lower animals, such as a microscope, with special attachments for work on the protozoa; mazes of wire or wood, to test the formation of habits in reptiles or small mammals; aquaria; cages, whose fastenings are designed to test the intelligence of their occupants; and (7) simple instruments for use with chil-

dren or defective persons, designed to test sensation, perception, feeling, action, attention.

Psychological instruments proper, i.e. the pieces included in classes (3) and (4), may be divided again into two great groups, as qualitative and quantitative. The object of a qualitative instrument is to demonstrate a fact. Suppose, e.g. that we have a black box, with ground-glass front, containing a gas-lamp, and that there are two sets of grooves behind the glass, the front set for the insertion of a black wooden shutter, and the rear set for the insertion of a second glass, colored. We light the lamp, pull up the shutter, and let the observer stare at the colored glass, which he sees through the ground-glass front. After thirty seconds we drop the shutter, and the observer sees, on the dark gray of the ground glass, a 'negative after-image' of the original color. If the colored glass was green, he now sees a colored patch of deep purple. We have performed a qualitative experiment upon the visual after-image; we have demonstrated its existence, but we have not measured its duration, or its intensity and extent as compared with the intensity and extent of the green stimulus. Had our apparatus been so constructed that we could take these measurements, the experiment would have been quantitative.

The instruments designed for quantitative work are of two kinds: those which furnish a direct scale-reading, and those which show the course of a bodily or mental process, with all its variations, as a function of time elapsed. Instruments of the former type are familiar to every one. The mercury thermometer, e.g. is a physical instrument, which allows one to determine the temperature of a room by noting the point on the scale of degrees that has been reached by the head of the column of mercury. Instances from psychology would be the æsthesiometer, which tells us how many millimeters apart two points must be set down upon the skin, with a given intensity, if they are to be perceived separately as two, and not run together in a single blurred perception; the chronoscope, from the dials of which we can read off our reaction time in units of a thousandth of a second; and the protractor of the color wheel or color mixer, which tells us the number of degrees or half-degrees by which we have varied the composition of a parti-colored rotating disk. In all these cases we have a scale of conventional units, from which we can read our results. Instruments of the second type are those employed by the 'graphic method.' The essential feature of this method is that it furnishes a curve the abscissa of which are time units (seconds, or fifths or tenths of seconds), while the varying heights of the ordinates show the variations of the process under observation. The process may be bodily, as when we trace the curve of breathing, in order to see how it changes with change in our mental state; or it may be mental, as when we have recourse to the graphic method to record the fluctuations of attention (q.v.).

PSYCHOLOGICAL ACOUSTICS. The least noticeable intensity of auditory sensation is measured by some form of *acoumeter*. The stimulus is given by the dropping of a tiny hammer upon a steel bar, by the fall of a cork or pith ball upon a glass plate, etc. Either the sound is kept constant, and the observer notes the distance at

which it can be heard; or the distance is kept constant and the height of fall varied until a sound can just be sensed. Our discrimination of sound intensities is measured by the *sound pendulum*, or the *fall phonometer*. The principle of both instruments is the same—two sounds, of slightly different intensities, are produced by the dropping of a ball or pendulum-bob against a hard-wood block, and the observer is required to say at what point the difference becomes noticeable. The highest audible tone is determined either by means of a series of tiny tuning forks, or steel cylinders, or by means of *Galton's whistle*, a piston whistle of small bore actuated by a rubber bulb, whose length can be varied from that required for a shrill tone to a length that gives a sharp hissing noise, with no trace of tonal quality. The lowest audible tone is determined by a very large tuning fork, giving tones between the limits 16 and 25 vibrations in the second; by tuning forks of wire, loaded at the tips of the prongs; by a steel tongue, *Appunn's lamella*, which can be set in vibration between the limits 4 and 24 in the second; or by the production of deep difference tones. (See AUDITORY SENSATION.) Discrimination of tonal pitch and the phenomena of clang-tint and tonal fusion are studied by the aid of delicately graduated tuning forks; reeds, with their appropriate bellows tables; organ pipes; blown bottles; siren; sonometer; etc. For the study of rhythm, the ticks of a metronome are employed, or the puffs of tone from a tuning fork placed behind a rotating disk of cardboard, pierced at regular intervals. For the study of localization of sound, i.e. of the apparent distance and direction of a given source of sound, the *sound cage* is used. This consists of two graduated semicircles of wire, the one turning about a horizontal and the other about a vertical axis. The observer sits with his head at the centre of the semicircles, and attempts to localize the click of a telephone receiver, which is placed by the experimenter at some point upon the circumference of the sound sphere.

PSYCHOLOGICAL OPTICS. Psychology borrows from the oculists their various tests of the acuity of vision, and from the physicists their manifold photometrical devices. The phenomena of color mixture are studied by means of the *spectrophotometer*, or (more usually) by the rotated disks of the *color-mixer*. This consists essentially of an axle, vertical or horizontal, which is turned with extreme rapidity by hand, by clockwork, or by an electric motor. Disks of cardboard or paper, slit along one radius so that they may be fitted together to form a single compound disk, are clamped upon the near end of the axle, and the colors of the disks cancel or blend, according to their quality and saturation. Color-mixers may also be employed for experiments on our sensible discrimination of brightnesses (grays) and colors. The phenomena of indirect vision are brought out by the *perimeter* or *campimeter*. The former consists of a hollow hemisphere, upon the centre of which the eye to be examined is fixated. Wafers of various colors are brought into the hemispherical field, along the different meridians, and the observer reports what he thus (indirectly) sees. When the whole field has been explored, a map can be made of the three zones of retinal sensitivity. The campimeter does the same work as the perimeter, except that the field is plane and not

hemispherical. Of tests of color-blindness the simplest is, perhaps, the worsted test of Holmgren. Some hundred skeins of differently colored wools are brought together, and the subject is required to match, from the heap, certain skeins that are handed him by the experimenter. For the study of perception of space in the third dimension, the *stereoscope* and *psuedoscope* are indispensable. The latter is a converting stereoscope, i.e. a stereoscope whose lenses or prisms give us an illusion of inverted tridimensionality, hollows appearing in relief, and *vice versa*. This department of psychological inquiry is rich in research instruments, which expose threads, lines, or edges at different (and, of course, unknown) distances from the observing eye. There are also special instruments for the sudden brief exposure, on a dark field, of words or figures, which are to serve as the starting-point of a train of association; others for the serial exposure of words or colors, which are to be memorized; and yet others for the test and control of the visual imagination.

HAPTICS AND ORGANIC SENSATION. The first requirement in the field of cutaneous sensation is a set of *pressure, temperature, and pain points*. These are of wood, metal, or hair. Various means have been devised for regulating the intensity of pressure, the temperature of the applied point, etc. One instrument for this purpose is the *kinesimeter* of Hall and Donaldson, which passes pressure or temperature points over a selected area of the skin, at a constant rate and intensity. The least noticeable pressure is determined by a series of small and accurately graded *touch weights*, or by a series of hair points, the area and bending weight of which are known. Discrimination for pressure is measured by weights, laid upon the resting skin; discrimination for lifted weights (in which pressure co-operates with the articular and tendinous sensations), by cylindrical weights of hard rubber, filled with shot, which are lifted successively in pairs, and thus compared. Sensitivity to temperature and pain is determined by the application of *temperature cylinders* and of the *algometer* to a chosen portion of the skin. The algometer is a rod, usually covered at the exposed end with cloth or chamois leather, which works against a spiral spring; the amount of pressure which evokes pain is read from a scale laid along the spring. The *asthesiometer*, in simplest form, is a pair of ordinary drawing compasses, tipped at the ends with hard rubber. The object of the instrument is to show us how far apart two cutaneous pressures must lie, if we are to perceive them as separate; and, again, what separation of the compass points at one part of the skin gives a separation, in perception, equal to that of a given separation of the points at another part of the skin. The least amount of movement that can arouse an articular sensation is given by the *arm board*, a hinged board upon which the observer lays his hand and arm (bringing the elbow over the hinge), and which is then, very gradually, raised or lowered by the experimenter. Discrimination of kinesthetic sensations is tested by the finger-movement and the arm-movement apparatus of Cattell and Münsterberg. In both of these the finger is inserted in a car, which travels for a prescribed distance along a track; the observer then tries to reproduce the movement by memory. The static sense (sensation of dizziness) is studied by the *rota-*

tion table, a flat bed or table upon which the observer is stretched, and which can be twirled round, in the horizontal plane, at constant rates. Perception of the movement and position of the whole body is investigated both by the rotation table, and by the *tilt-board*, a similar instrument, in which the table can be swung through approximately 180° in the vertical plane. The observer, strapped upon the table, estimates the extent and direction of movement, the true values of which can be read from a scale.

TASTE AND SMELL. For the study of gustatory sensation, we need very simple appliances: a magnifying glass or concave (enlarging) mirror, for bringing out clearly the separate papillae of the tongue; fine camel's-hair brushes, for the application of stimulus; and sets of solutions, of varying strength—sweet (sugar), salt, sour (tartaric acid), and bitter (hydrochlorate of quinine). For the study of olfactory sensation, on the other hand, we need a special (and in some of its forms highly complicated) instrument, the *olfactometer* of Zwaardemaker. In principle, the olfactometer consists of a glass tube, bent up at right angles to enter the observer's nostril, and passing through an odorless screen of wood or metal, which prevents the access of any foreign odor to the nose. Over the portion of the tube that projects behind the screen is slipped an 'olfactory cylinder'—a glass eased tube of some odorous matter, such as rose-wood or asafetida. When the cylinder is pushed hard against the screen, its outer edge is flush with the end of the glass inhaling tube, so that nothing of its substance can be smelled. If, however, it be pulled out, say for 1 centimeter, then the current of air which reaches the observer's nostril must pass over this 1 centimeter of exposed odorous surface before it enters the inhaling tube. If the cylinder be pulled out still farther, then the incoming air current must pass over a still greater odorous surface. We have, in this way, a means of quantitatively regulating the stimulus that we are applying to the sense organ.

AFFECTIVE PROCESSES. Under this heading, we must give a brief general account of the *graphic method*. The essentials of the method are three in number. We must have (1) a *recording surface*, on which the curve is to be traced. This generally takes the form of a brass drum, rotated by weight or motor or clockwork, and covered with a sheet of smoked white paper. It is called a *kymograph*. We must have (2) a *time line*, i.e. a tracing marked off into divisions which represent known time units. We may, e.g. attach a little strip of parchment to one of the prongs of an electrically driven tuning fork, and lay the tip of this strip tangentially against the revolving drum. As the drum moves and the fork vibrates, the movement of the strip will be drawn out into a sinuous curve, each wave of which represents the time unit of the vibrating prong. The curve shows white upon the drum surface, since the moving strip knocks off the soot at the point of contact. Finally, (3) we must have special apparatus which shall write upon the drum, above the time line, the course of the process under investigation. Such apparatus are actuated, for the most part, either by electricity or by air transmission. For example, in registering the course of breathing, we employ air transmission. We connect the stems of two

stretch a sheet of thin rubber over their two heads. If we press the elastic covering of either head, the covering of the other will, evidently, bulge outward. Let us, then, apply the first head to the observer's chest and hinge a light lever (which we apply to the drum surface) to the other. As the chest rises and falls in respiration, the lever on the second funnel-head will rise and fall correspondingly, and we have our curve traced upon the kymograph. The funnels are known as *Marcy's tambours*. In the *sphygmograph*, or pulse recorder, the free tambour is laid over the radial artery of the wrist, and the pulsations of the artery are reproduced upon the drum. In the *pneumograph*, or breathing recorder, this tambour is replaced by an elastic girdle, passed round the thorax: this opens into the connecting rubber tube, and the curve is traced as before. In the *plethysmograph*, or volume recorder, the tambour is replaced by a glass vessel containing air or water. The hand or arm is inserted in the vessel, which is then hermetically closed, save for the tube connection to the writing tambour. As the inclosed member changes in volume, the writing point rises and falls upon the kymograph surface. Lastly, in the *dynamograph*, or strength recorder, the free tambour is replaced by a heavy steel spring, which is gripped by the hand; as the pressure increases or relaxes, puffs of air are sent along the connecting tube to the writing lever, and the fluctuations of muscular strength are correctly registered. It is also necessary to record the involuntary movements of arm and hand. For this purpose we use the *automatograph*, a scientific modification of the once popular planchette. The course of fatigue may be followed by means of the *ergograph*, which records the work done in a continuous pull against a spring, or in the successive lifting of a constant weight.

ACTION. The simplest instrument for the performance of reaction experiments (see REACTION) is Sanford's *vernier chronoscope*. This consists of two pendulums, of slightly different lengths. The one is started by the opening of a key, simultaneously with the giving of the stimulus (the signal for movement); the other, by the opening of a second key, pressure upon the button of which constitutes the movement of reaction. The two pendulums swing together on the principle of the vernier; and the number of swings made, before coincidence is reached, gives the reaction time in fiftieths of a second. A more elaborate arrangement is that of the *Hipp chronoscope*. This is an electric clock, with a unit of a thousandth of a second. The clock is started by the giving of the reaction stimulus, and arrested by the reaction movement. The stimulus may be given by the swing of a pendulum, which sends a ray of light or exposes a patch of color to the observer's eye; by the fall of a hammer upon a metal block; by a pressure upon the skin. In every case, the instrument employed is in electrical connection with the chronoscope. The movement of reaction may be made by hand or foot, by voice, by lips, or eyelid. Whatever the form of 'reaction key' employed, it, too, is always in electric connection with the chronoscope. Once more, the time of reaction may be recorded directly, by time-markers, upon the surface of the chronograph, a kind of kymograph, provided with tuning-fork controls that give an exceedingly accurate time line.

ATTENTION. The fluctuations of attention are measured by very faint auditory or visual stimuli; e.g. by the ticking of a distant watch, the continuous fall of a little stream of sand, or the light gray rings on white ground produced by rotation on the color-mixer of a disk of white cardboard, on which is drawn a broken black radius. Distribution or distraction of attention is studied by the *complication pendulum*—an instrument which presents to the observer, at one and the same moment, impressions of sight, of sound, and of touch. The range of attention, i.e. the number of objects simultaneously apprehensible by a single attentive observation, is determined visually by the *tachistoscope*, and auditorily by the metronome. The tachistoscope consists, in essentials, of a screen carrying words, figures, or letters, which can be displayed for a fraction of a second by a shutter, like the instantaneous shutter of a photographic camera.

OTHER INSTRUMENTS. Apparatus employed in the study of the more complicated mental processes have, as a rule, the special form given them by individual investigators. There are several forms of *memory apparatus*, the essential feature of which is the serial exposure of words, letters, etc., to be memorized by the observer. In work upon recognition, it is usual to adopt some one of the pieces given under the headings *Psychological Acoustics* and *Psychological Optics*. Something has been done, in the study of imagination, by aid of the symmetrical figures formed by folding upon itself a piece of paper upon which an ink-blot has been made; recourse is also had to the suggestions aroused by printed sentences or paragraphs. Individual psychology has its own materials, of specially prepared proof-sheets or pages of printer's pi, letter-patterns upon ruled cards, etc., etc. Finally, it may be said that the apparatus described in the body of the article above are, in general, the simplest of their kind; many more elaborate instruments have been devised, as e.g. for the study of rhythm.

Every laboratory must possess a good stock of *general supplies*, for use with the above-mentioned special apparatus. We may refer, in particular, to chemical and photographic materials; electrical appliances—motors, cells, storage batteries, switches, keys, wires; mechanical supplies—tools, balances, materials for the construction and repair of simple instruments, standards, arms, clamps, etc., for the building up of complex apparatus; projection lantern, and wall charts.

In the light of the above discussion, the figures of the plates will be largely self-explanatory. The sound pendulum was first invented by Fechner; it is figured in the form given it by Wundt. The combined color-mixer and campimeter was devised by Hering. Figs. 2, 3, 4, 6, 7, 8 of this Plate are taken from Titchener's *Experimental Psychology*. The Appunn tonometer is a box containing reeds, differing by 4 complete vibrations; it is used for investigations of sensible discrimination, etc. The figure of Zwaardemaker's olfactometer shows the appliances used for the simultaneous record of the observer's breathing curve. The Deprez signal is a time-marker, replacing the tuning fork referred to in the text. Masson's disk is employed in experiments on the fluctuation of visual attention. Figs. 2, 4, 5, 9, 10 of this Plate are taken from Titchener's

Experimental Psychology; Fig. 7 is from Sanford's *Laboratory Course*.

Consult the authorities referred to under **LABORATORY**, and especially the catalogues of instrument-makers listed in Titchener, *Experimental Psychology* (New York, 1901). See **DURATION**; **ILLUSION**.

PSYCHOLOGICAL ASSOCIATION, AMERICAN. A learned society organized in New York, July 8, 1892, and having its headquarters at Columbia University. Its object is the advancement of psychology as a science, and it has a membership of one hundred and twenty-five. The society publishes an annual volume of *Proceedings*.

PSYCHOLOGY (from Gk. $\psi\upsilon\chi\eta$, *psychē*, breath, life, soul + $-\lambda\omicron\gamma\iota\alpha$, *-logia*, account, from $\lambda\acute{\epsilon}\gamma\omega$, *legein*, to say). Psychology may be defined as the science of mind. More exactly, it is the science of mind considered for the sake of mental facts and processes alone, and apart from their values or consequences. It is thus distinguished from the other mental sciences: from logic, which is concerned with the truth or error of reasoning processes; from epistemology, which is concerned with the validity of perception; from metaphysics, which deals with the consistency and reference of fundamental conceptions; and from ethics, which is concerned with ideas in relation to their influence upon conduct. Psychology is distinguished from all these, while at the same time it necessarily encroaches upon their territory in considering the mental facts with which they also deal, what distinguishes psychological science from the others being its point of view, which is primarily the observation and analysis of the immediate psychical phenomenon whatever its nature.

The most important works which appeared before the advent of modern philosophy, works which the modern psychologist cannot afford to neglect, are Aristotle's treatise *De Anima* with its appendices, the *Parva Naturalia*, and the *Summa Theologiae* of the scholastic philosopher Thomas Aquinas. For Aristotle's psychology, consult the works of Wallace (Cambridge, 1882) and Hammond (London, 1901). Carus, *Geschichte der Psychologie* (Leipzig, 1808), and Harms, *Geschichte der Psychologie* (Berlin, 1878), have written general histories of psychology, but both are very incomplete. The two volumes of Siebeck, *Geschichte der Psychologie* (Gotha, 1880, 1884), extend only to Thomas Aquinas. Dessoir has recently published the first part of a *Geschichte der neueren deutschen Psychologie* (2d ed., Berlin, 1897).

The principal stages in the development of modern psychology may be characterized as the speculative or deductive, the empirical or associationist, and the scientific or experimental. The first and third are preponderantly German, the second English. The first may be said to culminate in Hegel (consult Wallace, *Hegel's Philosophy of Mind*, Oxford, 1894), though it has continued in the 'purely introspective' works of the Herbartian school. The second contains the great names of English philosophy, from Thomas Hobbes down to John Stuart Mill and Alexander Bain. The cardinal defect of this psychology is its confusion of the logical or epistemological standpoint with the standpoint of psychology proper. It conceives of perception, e.g. as a sum or aggregate of least bits of knowledge, which it

terms sensations; and it is fond of appealing to the naïve consciousness for confirmation of its analysis. The associationist position has been largely transcended, though the epistemological reference still remains prominent, in the later English and American works of J. Ward, W. James, and G. F. Stout. In spite of all deficiencies, the psychologies of the associationist school retain a high value on the level of descriptive analysis. The third or experimental stage of psychology was inaugurated in Germany by the work of R. H. Lotze, *Medizinische Psychologie* (Leipzig, 1852); G. T. Fechner, *Elemente der Psychophysik* (ib., 1860); and W. M. Wundt, *Grundzüge der physiologischen Psychologie* (ib., 1874). It should be added that France has made important contributions to modern psychology from the side of abnormal psychology (Pierre Janet, H. Bernheim, Th. Ribot, A. Binet); and that the work of the English nineteenth-century writers upon ethnopsychology (E. B. Tylor, J. Lubbock, H. Spencer) can hardly be overestimated. The influences that determined the course of psychological thought in America were, down to about 1880, almost entirely theological and educational; and the principal works upon mental philosophy (N. Porter, J. McCosh) belong to the Scotch school of natural realism. In recent years America has made very great advances in experimental psychology, in which she stands to-day second only to Germany. In the field of child psychology (G. S. Hall, J. M. Baldwin) America has left Germany (W. Preyer) far behind.

The special departments of psychology are very numerous, and their interrelations not always obvious. We have experimental and physiological psychology, race or folk or anthropological or ethnic psychology, comparative and genetic, animal and child psychology, social or collective psychology, individual or differential psychology, introspective psychology, abnormal psychology or mental pathology, philosophical and educational or applied psychology. Can we find any guiding principle that shall bring order into this chaos, and exhibit all the psychologies as parts or phases of a unitary whole?

We may rule out, first of all, those psychologies which are differentiated from the rest, not by diversity of subject-matter or of problem, but by emphasis of method. Experimental psychology, e.g. is merely psychology treated by the experimental method; and since there is, in principle, no mental process or complex of processes that is inaccessible to experiment, experimental psychology may be regarded, in principle, as coextensive with psychology. In other words, it is simply an historical accident, the result of the youthfulness of psychological experimentation and of the very natural concernment of the experimentalist with the processes that yield themselves most easily to experimental control, that there are some chapters of psychology, as psychology is written to-day, in which experiment is prominent, and others in which it plays little or no part. So, again, all psychology is introspective: either directly introspective (normal human psychology) or analogically introspective (infant and animal psychology); there is no special or peculiar introspective psychology. The phrase is sometimes used to designate a school of thinkers who will hear nothing of the dependence of mind upon the nervous system, but seek to elaborate a 'pure' psychology out of

nothing but the psyche itself—and are thereby compelled to have recourse to 'unconscious' mental processes, which are very far from being given in introspection. This use is, however, misleading: it is better to name the founder of the school, and to speak, e.g. of the Neo-Herbertians.

We may rule out, in the second place, those psychologies that transcend the sphere of mind, whether on the side of science or on that of philosophy. Physiological psychology, e.g. includes portions of physiology. The problem of physiological psychology is, "first, to examine those vital processes which lie midway between external and internal experience, and which therefore demand the application, at one and the same time, of the two methods of observation, the external and the internal; and, secondly, from the point of view which it has gained in its investigation of these processes, to survey the whole realm of vital phenomena, and thus mediate, so far as possible, a comprehensive theory of human existence" (Wundt, *Physiologische Psychologie*, i., 2). Philosophical psychology, or the philosophy of mind, deals with such questions as that of the nature of mind (whether there is a mind-substance, or whether the mental processes, as given, constitute mental reality: 'substantiality' vs. 'actuality'); of the ultimate elements of mental experience (intellectualism vs. voluntarism); and of the relation of mind to body, of psychical to physical (parallelism vs. interaction). We may mention: Rehnke, *Lehrbuch der allgemeinen Psychologie* (Hamburg and Leipzig, 1894); Ladd, *Philosophy of Mind* (New York, 1895); and Münsterberg, *Grundzüge der Psychologie*, i. (Leipzig, 1900). Lastly, applied psychology is called upon to furnish regulative principles to the art of education. Genetic psychology shows how the normal individual develops; applied psychology has to deduce from the genetic data an ideal plan or scheme of the evolution of personality, and then to show how this ideal may be most nearly attained in practice. In the discharge of both offices, it leaves the ground of scientific psychology.

There still remain the various subdivisions of psychology proper. We shall realize their interconnection and mutual relation most easily by taking an analogy. Mind, like the living body, is an organism: in this sense, psychology is the correlate of biology. Now biology falls into several part-sciences. The individual living organism is, under different aspects, the subject-matter of morphology, of physiology, and of embryology. Morphology treats of the structure of the organism, of its composition from cells and from cell-aggregates or tissues. Physiology treats of the organism as a group of functions—respiration, secretion, digestion. Embryology treats of the growth of the organism, structural and functional alike, following the changes of tissue and of function that mark the rise and fall of the vital processes. Further, biology deals with groups of organisms, with species. Over against morphology stands taxonomy, in which cells and tissues are replaced by organisms and their classes (species, genera, orders, etc.). Over against physiology stands bionomics, in which the function of organs within an individual organism is replaced by the function of species in the economy of their natural environment. And over against embryology stands paleontology, the science of the development of species. Once more: biology, as pathology, treats of the diseased or

defective organism, and so has its 'abnormal' side.

Let us apply this classification to psychology. We have, in the ordinary text-book of psychology, a morphology and a physiology of mind. Some authors lay more stress upon the analysis of structure (Külpe, Titchener), others upon the analysis of function (James, Stout, Ward): this is mainly a matter of the psychologist's training, of the direction (scientific or philosophical) from which he approaches the psychological problem. The important thing is to keep the two lines of inquiry distinct, not to hypostatize function, to invent separate structures that shall carry its separate phases, as is done, e.g. by a psychology that speaks of 'memories' and 'memory ideas' as qualitatively unique processes; and not to translate structure directly into function, as is done, e.g. by a psychology that makes sensation the primary source of knowledge. We have, again, in infant and child psychology, a mental embryology. Spinoza's classification of the emotions and Wundt's classification of the forms of association—to bring together instances from different periods of time—are essays in mental taxonomy. Social psychology and ethnopsychology, so far as they have gone, fall for the most part under the head of mental bionomics. Animal psychology, and such comparative psychological systems as those of Spencer and Romanes, are the counterparts of paleontology. We may bracket together the study of the child and animal minds, of the growth of the individual and racial mind, as genetic psychology. Mental pathology, the psychology of the abnormal, deals with such topics as the space ideas of the blind (study of defect or lack), dreaming and hypnosis (temporary mental derangement), and insanity (permanent mental derangement). Finally, individual psychology investigates the variations of normal mental function. The inquiry may be pursued in the interests of genetic psychology (Galton) or of mental physiology (Stern). The present quasi-independence of individual psychology is due to the fact that it has but recently attracted any widespread attention; psychologists have been concerned to discover mental uniformities rather than to examine mental differences. There can be no doubt that, in course of time, it will be absorbed into general psychology.

If now, in the light of the above classification, we attempt to lay out a complete psychological programme, we shall arrive at some such result as the following. The psychologist will prepare himself for his work by a study of the nervous system at its various developmental levels. Entering upon psychology proper, he will seek to determine, on the structural side of mind, the number and nature of the mental elements, the patterns upon which they are arranged in the complex processes, and the gradual growth in intricacy of these patterns as mental development proceeds; on the functional side, the nature of the root-functions of mentation, the mode of coöperation of these functions in the developed mind, and their gradual growth in complexity from the infant to the man. In his study of function, he will be keen to note differences, individual variations, as well as uniformities. He will, further, give some attention to the questions of classification and arrangement of the typical mental formations, keeping the genetic principle

well in view. He will endeavor to extend his knowledge of mental function beyond civilized humanity to the animals and the lower races of man, and to trace the psychological laws underlying the great products of the collective mind—language, custom, and myth. Here, too, his work will be informed by the genetic spirit. During his occupation with normal phenomena, he will not neglect the observation of the abnormal. Finally, he may attack the questions that lie on the border line between science and philosophy, the questions of the appearance of mind in the evolution of the universe, of the criterion of mentality in the lowest animals, of the ultimate nature of mind, of the relation of mind to body; or he may turn the results of his scientific inquiries to immediate practical account, embodying them in some psychologically grounded system of education. The programme is too large for any one man to cover; and the interests which it demands—philosophical, scientific, practical—would hardly appeal, in any case, to a single personality. But we can see, assisted by our biological analogy, that it is unitary and self-consistent.

BIBLIOGRAPHY. Special references will be found under the headings ANIMAL PSYCHOLOGY; CHILD PSYCHOLOGY; ETHNIC PSYCHOLOGY; EXPERIMENTAL PSYCHOLOGY; GENETIC PSYCHOLOGY; INDIVIDUAL PSYCHOLOGY; MENTAL PATHOLOGY; PSYCHOPHYSICS; SOCIAL PSYCHOLOGY. General introductions to psychology are: Baldwin, *Story of the Mind* (New York, 1898); Buell, *Essentials of Psychology* (Boston, 1898); Ladd, *Primer* (New York, 1894); and Titchener, *Primer* (New York, 1900). Useful works of text-book size are Baldwin, *Elements* (New York, 1893); Dewey, *Psychology* (New York, 1898); Höffding, *Outlines* (London, 1891); James, *Text-book* (New York, 1892); Ladd, *Outlines of Descriptive Psychology* (New York, 1898); Maher, *Psychology* (London, 1900); Mercier, *Sanity and Insanity* (London, 1890); Moll, *Hypnotism* (London, 1891); Morgan, *Introduction to Comparative Psychology* (London, 1894); Murray, *Handbook* (Boston, 1890); Ribot, *Psychology of the Emotions* (London, 1897), and other works; Scripture, *The New Psychology* (London, 1897); Külpe, *Outlines* (London, 1895); Ladd, *Elements* (London, 1889); Titchener, *Outline* (New York, 1899); Wundt, *Human and Animal Psychology* (trans., London, 1896); id., *Outlines* (trans., Leipzig, 1898); Ziehen, *Introduction to Physiological Psychology* (London, 1895). Larger treatises are Bain, *Senses and Intellect* (London, 1868); id., *Emotions and Will* (London, 1880); Baldwin, *Handbook* (New York, 1890-91); id., *Mental Development* (New York, 1895-97); Cornelius, *Psychologie* (Leipzig, 1897); Höfler, *Psychologie* (Vienna, 1897); James, *Principles* (New York, 1890); Jodl, *Lehrbuch* (Stuttgart, 1896); Ladd, *Elements of Physiological Psychology* (New York, 1889); id., *Psychology, Descriptive and Explanatory* (New York, 1894); Lipps, *Grundthat-sachen des Seelenlebens* (Bonn, 1883); Marshall, *Instinct and Reason* (New York, 1898); Morgan, *Animal Life and Intelligence* (London, 1891); id., *Habit and Instinct* (London, 1896); Romanes, *Mental Evolution* (London, 1888); Stout, *Analytic Psychology* (London, 1896); Sully, *Human Mind* (London, 1892); Volkmann, *Lehrbuch* (Köthen, 1884); Wundt, *Physiologische Psychologie* (Leipzig, 1893). It must be understood

that this list is merely selective, even for the quite recent period which it covers.

PSYCHOLOGY, ETHNIC, OR ETHNOPSCHOLOGY. A department of psychology as yet hardly susceptible of exact definition. We may describe it, provisionally, as the individual psychology of races, tribes, or peoples. While it seeks to analyze and depict the mental peculiarities of societies of communities, still it is not concerned, as is social psychology (q.v.), with the mental products of the common life of man; it seeks rather, by methods of statistical comparison and averaging, to construct the typical individual of the tribe or people under consideration, and thus to make clear his resemblances to and difference from the typical individual of the text-books of descriptive and experimental psychology. Ethnopsychology thus attempts the same problem in the sphere of racial types that ethology (in Mill's sense of the science of character) attempts in the sphere of the individual variations of human tendency and endowment (Wundt). It stands to the physical and physiological parts of ethnology (ethnogeography, anthropometry, etc.) as psychophysics stands to physiology. Ethnopsychology, as thus defined, forms, together with the histories of language, myth, and custom, the necessary propædæutic to social psychology. Under its province would fall, e.g. an investigation of the keenness of perception (sight, smell), or the æsthetic tastes, or the superstitious beliefs of the savage; a study of the relative parts played by reason and emotion in the Anglo-Saxon and the Latin minds; a comparison of the minds of the Oriental and of the Occidental: inquiries varying in scope from the cleanly formulated questions of normal psychology to the widest generalizations of which the science of mind is capable, but all aiming at a single end—the individual characterization of the mentality of a racial group. It must, however, be repeated that the term ethnopsychology has not hitherto found general acceptance, and that many authors discuss topics like those just mentioned under the headings of anthropology, ethnology, and sociology (qq.v.).

BIBLIOGRAPHY. For definition, Wundt, *Völkerpsychologie* (Leipzig, 1901); for comparison of hunter, nomad, and agriculturist, Wundt, *Ethics* (London, 1897); for a comparison of the Anglo-Saxon and French minds, Le Bon, *The Psychology of Peoples* (Eng. trans., London, 1898); for analysis of the love consciousness at different levels of mental development, Finck, *Primitive Love and Love Stories* (New York, 1899). Consult also: Tylor, *Anthropology* (New York, 1885); Spencer, *Sociology* (ib., 1885); id., *Essays* (ib., 1891).

PSYCHOLOGY, EXPERIMENTAL. A comprehensive term for those phases of mental science which are variously called 'the new psychology,' 'psychophysiology,' 'physiological psychology,' and 'psychophysics.' It may be defined as the exact science of mind (see **PSYCHOLOGY**), and as such is not a department of psychology, coordinate with other departments, but rather a psychology dominated by a certain method. Kant said, in his *Metaphysische Anfangsgründe der Naturwissenschaft*, that psychology could never be a science: (1) Because mental process has but one dimension (time), and where you have but one dimension you cannot apply mathematics to your subject-matter, i.e. cannot handle it

scientifically; (2) because no sane person would submit himself to your psychological experiments, even if you devised them; and (3) because the employment of psychological method, or introspection (q.v.), changes the objects upon which it is directed, and so precludes the possibility of uniform results. Kant was, however, blinded by his *a priori* assumptions; he shared with the great German philosophers since Leibnitz (q.v.) a hearty contempt for the 'lower faculty of knowledge' or sense-perception (see **FACULTY**); and he was unduly impressed by the worthlessness for science of the 'empirical' psychologies of his own day. Hence he could not see, as we do, that wherever in the past there had been scientific discussion of the facts and laws of perception, and of the physics and physiology of voluntary action, important contributions had been made to a future science of experimental psychology. Indeed, it is only in the latter half of the nineteenth century that the three Kantian objections have been finally answered, and that psychology has taken rank as a science among the sciences.

The argument that mathematics is inapplicable to mental processes was brilliantly met by Herbart (q.v.), who pointed out that our inner experience shows differences not only of duration, but also of intensity, and expressed the course of ideation, as a function of these two variables, in a series of mathematical formulæ. Herbart's 'mathematical psychology' is now out of date; the method that he, as a pioneer, followed has not stood the test of time. But his service to the cause of mental science is none the less real and enduring. The second and third objections have been overcome by the work of Fechner and Wundt (qq.v.), whose *Elemente der Psychophysik* (Leipzig, 1860) and *Grundzüge der physiologischen Psychologie* (4th ed., Leipzig, 1893) mark epochs in the development of the new psychology. No one could urge, after the publication of the *Psychophysik*, that psychological experimentation with human subjects was impossible. Fechner experimented, systematically and successfully, with himself and with others, upon a long list of special problems, and the methods which he prescribed are those employed to-day in psychophysical investigations. Wundt put the matter beyond the reach of controversy by his foundation of the first psychological laboratory (q.v.) at Leipzig in 1879. Wundt appears, further, to have been the first to use the phrase 'experimental psychology,' which occurs in his *Beiträge zur Theorie der Sinneswahrnehmung* (1862). His services both to psychology proper and to psychophysics can hardly be overestimated. We have to note here, in particular, his insistence that the psychological experiment consists simply in a carefully guided and rigidly controlled introspection, i.e. his refutation of Kant's third objection. A single instance must suffice. "The sensation," says Wundt, "contains in it no reference to the organs by whose external or internal stimulation it has been aroused; it tells us nothing of the character of its stimuli; it comes to us as a simple quality, giving no hint of any means whereby we might define that quality more nearly." In other words, the sensation is its bare qualitative self, devoid of all objective reference. When we remember that the sensation of the faculty psychology, as of the English empirical psychologists, has always been a

bit of sense-knowledge, a mental state of process that informs us of something in the outside world, we see what an advance in insight and scientific method is implied in Wundt's formulation.

The sources from which experimental psychology has drawn are manifold. It is especially indebted, for fact and for inspiration, to physics, astronomy, and the physiology of the organs of sense. The photometric investigations of Bouguer, Arago, and Masson contained hints of the constancy of the relative sensible discrimination for light intensities. The observed relation between the intensity of a star, as photometrically determined, and its apparent brightness or 'magnitude' was similarly significant. The 'error of observation' in physical measurements indicates, by its very name, the close connection of physics and psychology, and the need of the former to be supplemented by the latter. The 'personal equation' noticed by astronomers, as an inevitable source of error in their observations of stellar transits, formed the starting-point for the later elaborate researches into simple and compound reaction-times. On the other hand, a large number of professedly 'physiological' inquiries, inquiries carried out by physiologists with physiological interest, have been taken over bodily by experimental psychology. Physiology cannot deal, in strictness, with the doctrine of sensation and perception, but only with the mode of function of the sense-organs regarded as living structures. Where, however, psychological knowledge and method are in advance of physiological, the physiologist naturally seeks to fill out the gaps in his own science by making an excursion into the other. This custom has led, at times, to the mistaken belief that psychology is only a department of physiology; but, on the whole, the countervailing gain has been well worth a little misunderstanding. The inquiries of E. H. Weber into the cutaneous and muscular senses, and the spatial functions of eye and skin, have proved of fundamental importance to the science. (See WEBER'S LAW.) The studies of A. W. Volkmann on visual space perception, of H. von Helmholtz on vision and audition, of E. Hering on vision, and of S. Exner on the duration of mental processes, form some of the early links of a chain of physiological research which is still worthily continued; in the work, e.g. of H. Zwaardemaker on smell, and of A. Goldscheider on the cutaneous and muscular sensibilities. Until psychology has laboratories upon the scale of those devoted to physics and physiology, it must be in large measure dependent for exact investigations upon the representatives of these older disciplines; while, in any case, the labors of men trained in general scientific method cannot fail to be of high value in this particular field.

What, now, we may ask, are the provinces of mind which the new psychology has made peculiarly its own? In principle, there is no psychological problem that cannot be experimentally attacked. In actual fact, owing to the youth of the science, its lack of material means and of trained workers, and the extreme difficulty of its subject-matter, there are very many problems that still await the experimenter. If we are to attempt a catalogue of what has been accomplished, we must begin (1) with the fields of sensation and of sense-perception. The literature of these subjects: of vision, audition, and

the rest of the sense-qualities, of spatial and temporal perception (see DURATION; EXTENSION), and of qualitative perception (see FUSION), has already attained very considerable proportions. When Helmholtz published, in 1867, his great work on physiological optics, it seemed that he had exhausted the subject, that its difficulties were resolved, once and for all. But what was judged to be the end has proved to be only the beginning; the work of many men has accumulated and is still accumulating, bringing new facts and new questions. And as here, so elsewhere: experiment is taking us toward an exact doctrine of sensation and perception, whose complexity had, before its advent, been not so much as guessed at. (2) The psychology of attention (q.v.) may almost be termed a positive creation of the experimental method. It is strange and instructive to turn from a modern system of psychology, in which the doctrine of attention looms so large and important, to a German eighteenth-century work, or a volume of English associationism, where (except for a few scattered hints) we find no mention of it whatsoever. (3) The same thing may be said of the psychology of action. When F. C. Donders, in 1866, proposed to use the method of reaction for the measurement of mental acts like choice, discrimination, and judgment, he was building better than he knew; for the laboratory reaction, the exact type of a voluntary action, has been the chief aid toward a final analysis of the active consciousness. (4) H. Ebbinghaus's *Das Gedächtniss* (1884) brought the function of memory under experimental control, and has been followed by many monographs upon recognition and the various conditions of the reproductory consciousness. (5) Finally, the feelings are gradually submitting themselves to experimental treatment. Fechner himself laid the foundations of an exact science of experimental aesthetics (q.v.); and Mosso's researches into the bodily symptoms of affective processes have borne rich fruit. If we cannot say that experiment has given us a settled psychology of feeling, we can at least assert that the issues are more clearly marked and the problems more definitely formulated than ever before; and this means that it is only a matter of time until our questions are adequately answered.

There has been some dispute as to whether certain results of animal psychology (q.v.), of physiological experimentation on the brain cortex, of the treatment of brain disease, and of tests made upon hypnotized subjects (see HYPNOTISM) should be included under the phrase 'experimental psychology.' Such inclusion depends partly upon our definition of the word 'experiment;' experiments on animals and on hypnotic subjects are of a different order from those described above; and partly on the extensibility of the word 'psychology,' upon the point, i.e., whether all that furthers or contributes to a science is necessarily itself a part of the science. However, it is more important to note that psychology has gained or may gain from all these four sources than to find a single name for them. Consult: Titchener, *Experimental Psychology* (New York, 1901); Sanford, *Course in Experimental Psychology* (Boston, 1898).

PSYCHOMETRY (from Gk. *ψυχή*, *psychē*, breath, life, soul + *μέτρον*, *metron*, measure). A term used (1) for a supposed power, possessed

by certain 'sensitive' persons, of reading character from handwriting, or passing the fingers over the head of the subject, etc., etc. More recently, it has been used (2) as the equivalent of mental chronometry, to cover all experimental investigations into the temporal course of mental processes; but the usage is lapsing.

PSYCHOPATHOLOGY (from Gk. *ψυχή*, *psychē*, breath, life, soul + *πάθος*, *pathos*, disease + *-λογία*, *-logia*, account, from *λέγειν*, *legein*, to say). A synonym for mental pathology. The term is wider than psychiatry (q.v.), since it covers all study of the mental symptoms of disease, without special reference to therapeutics. It is narrower than abnormal psychology, since (at least in current usage) it deals only with serious mental derangement, and not with such comparatively normal abnormalities as dreaming and hypnosis.

PSYCHOPHYSICS (from Gk. *ψυχή*, *psychē*, breath, life, soul + *φυσικός*, *physikos*, physical, from *φύσις*, *physis*, nature, from *φύειν*, *phyein*, to produce; connected with Lat. *fui*, I was, Skt. *dhā*, to become, and ultimately with Eng. *be*). The science of the inter-relations of mind and body. The term was coined by Fechner to designate an exact science of the relations of dependence between the physical and psychical worlds. He discriminated an internal and an external psychophysics; in the former, sensation is considered in its direct relation to the brain and nervous system; in the latter, sensation is indirectly studied in its dependence upon external physical stimuli. No definition could be more general. We have to ascertain the facts and laws of mind, and the physiological facts and laws (of brain or of sense-organs) with which they are connected; we have to parallel the two series of events, noting how variation in the one is related to variation in the other; we have to express the functional interdependences exactly, i.e. in terms of measurement, of mathematical formulæ; and from our whole inquiry we shall attain a 'philosophical' standpoint, a theory of the general relation between the physical and psychical worlds.

Fechner is concerned, primarily, with the problem of mental measurement. And when we turn to the special portion of his *Elemente der Psychophysik*, we find that he is occupied, for the most part, with the relation between stimulus and sensation that is formulated in Weber's law (q.v.). In the quantitative expression of this relation he sees the one universal psychophysical uniformity. A regrettable result of this generalization is that the term psychophysics has been narrowed in meaning. Thus Münsterberg, finding his justification in historical usage, identifies it with the "question of the relation between stimulus and sensation;" and the *Century Dictionary* defines it as "the science of the relations between stimuli and the sensations which they evoke." Some writers go further still, and—in view of the fact that Weber's law has proved to be a law of sensation intensities—restrict psychophysics to the intensive relations between stimulus and sensation. Thus Baldwin states that "investigations in intensity constitute psychophysics." In the light of modern developments, however, we have a full right to hold to the general definition laid down by Fechner.

A word must be said in detail of the psycho-

physical measurement methods, the elaboration of which owes much to Fechner, and the understanding of which is an integral part of training in psychophysics. We cannot measure a mental process, sensation or other, as we can measure physical magnitudes; but we can measure function, sensitivity, and sensible discrimination; and we can measure the differences or distances that separate term from term within a sensation scale. There are two groups of methods by aid of which such measurements can be made. The first includes the *gradation* methods, the second the *error* methods. In the former, we approach the object of measurement by slow degrees, in order to arrive at a single accurate result; in the latter, we approach the object to a certain distance over and over again, and submit the whole number of results to mathematical treatment, in order to arrive at the required determination. The gradation methods imply, in general, a 'procedure with knowledge'; the observer knows the nature and the direction (increasing or decreasing) of the differences submitted to him for estimation; the error methods imply the 'procedure without knowledge'—the observer is left in ignorance of the conditions of the experiment. Typical of the latter class of methods is Vierordt's method of right and wrong cases. Two slightly different stimuli are laid before the observer, in a long series of experiments; and he must say, in each case, whether the sensation aroused by the second stimulus is greater (louder, brighter, longer) than, equal to, or less than the sensation aroused by the first. He does not know either the amount of difference or the order of presentation of the two impressions in the separate tests. From the distribution of the 'right,' 'wrong,' and 'equal' cases (right and wrong being determined by the objective relations of the stimuli), that stimulus difference is calculated which is able to evoke a just noticeable difference of sensation. Typical of the former class is Wundt's method of minimal changes. Two subjectively equal stimuli are taken, and the one gradually increased until it is just noticeably different from the standard. This point determined, the stronger stimulus is gradually decreased, until the point of subjective equality is reached. The differences from the standard found in these two determinations are averaged. The procedure is then repeated in the reverse direction; the one stimulus is decreased, to the point at which it is just noticeably less than the standard, and then increased again to subjective equality. The two differences are averaged as before. From the average of the two averages (the upper and lower difference limens), we obtain the value of the difference limen.

PSYCHRÓMETER. See HYGROMETER.

PTAH, ptii. An Egyptian deity. See MEMPHIS.

PTARMIGAN (with inorganic initial *p*, from Gael. *tarmachan*, Ir. *tarmochan*, *tarmonach*, *ptarmigan*). A kind of grouse, differing from true grouse (q.v.) chiefly in having the tarsi and toes thickly clothed with short feathers. The species are natives of northern or greatly elevated regions. They are not polygamous like the true grouse, nor do the males strut with erected and expanded tail. Most of the species change color on the approach of winter, assuming at the fall molt a white or nearly white plumage, in place of the mottled reddish brown of summer. At this season also the shanks and feet acquire longer

SEASONAL CHANGE IN PTARMIGAN'S CLAWS.

s, summer condition: foot of willow ptarmigan, drawn June 10, just before the change to the short, summer claw; *w*, winter condition: the same, drawn October 18, showing full-feathered preparation for winter.

and denser feathering, and the short summer claws are shed and replaced by a growth of longer stronger claws of service in scratching away the snow to get at buried food, and the diversities of color have caused much confusion and difficulty concerning them. All are highly esteemed as food, and are valued as game-birds. Less often seen in Great Britain, but widespread, and numerous in Scandinavia and Northern Russia, whence great numbers are sent to market in winter, is a grayer species (*Lagopus mutus*). Two closely allied species, the 'rock' and the 'willow' ptarmigans, range throughout Arctic America, but do not extend southward to the United States. Along the summits of the Rocky Mountains is to be found another species (*Lagopus leucurus*) in which the tail remains white all the year round, and it is therefore called the white-tailed ptarmigan, or 'mountain quail.' All make their nests on the ground among the heather or thickets in which they pass their lives and find their food (buds, berries, leaves, and insects), and lay brown eggs very heavily blotched with brownish black. For bibliography, see GROUSE. See Plate of GROUSE, ETC.; and of EGGS of WATER AND GAME BIRDS.

PTERANODON, tēr-ān'ō-dēn (Neo-Lat., from Gk. πτερόν, *pteron*, feather, wing + ἀνόδους, *anodous*, toothless, from ἀν-, *an-*, negative prefix + ὀδούς, *odous*, tooth). A large fossil flying lizard, in fact the greatest known flying creature; found in the Cretaceous rocks of Kansas. See PTERODACTYL.

PTERASPIS, tēr-ās'pīs (Neo-Lat., from Gk. πτερόν, *pteron*, feather, wing + ἀσπίς, *aspis*, shield). One of the most primitive fossil fishes of the subclass Ostracodermi, found in the Silurian and Devonian rocks. The front part of the body was covered by dorsal and ventral shields which were made up of several heavy bony plates united by fusion of their joints. The orbits are small and are placed well forward at the very margin of the head shield. The general form of the body was shark-like, its length about four or five inches; the posterior portion was covered by small polygonal scales. See OSTRACODERMI.

PTERICHTHYS, tēr-ik'thīs (Neo-Lat., from Gk. πτερόν, *pteron*, feather, wing + ἰχθύς, *ichthys*,

fish). A genus of primitive fossil fishes of the subclass Ostracodermi, found in Devonian rocks in Great Britain and Germany. The body was from four to eight inches long, broad and high in front, with flattened ventral surface and short tapering tail. The anterior portion is inclosed in large turberculated bony plates which are firmly united to each other, those of the head shield being articulated by a hinge with those of the body shield. The orbits are placed near together on the forward slope of the head and are separated by a small plate which has on its under surface a pit for the pineal body. A cleft between the lower margin of the head shield and the front margin of the ventral body shield represents the mouth, and there have been found indistinct traces of bones that are supposed to represent the jaws. At the sides of the front of the body shield are attached two paddle-shaped jointed appendages made up of small closely fitted plates, which resemble the pectoral fins of the fishes. The tail portion, which is shorter than the armored portion of the trunk, is covered by small rounded or hexagonal scales, and has a small triangular dorsal fin and an upturned tip on the ventral side of which is a small caudal fin. A close ally of *Pterichthys* is *Bothriolepis*, found in the Upper Devonian of North America and Europe. See OSTRACODERMI.

PTERIDOPHYTES, tēr'id-ō-fīts (Neo-Lat. nom. pl., from Gk. πτερίς, *pteris*, fern + φυτόν, *phyton*, plant). The fern-plants, one of the four great divisions of the plant kingdom, next in order of rank to the highest group, the flowering or seed plants (spermatophytes). There are three great divisions of pteridophytes: (1) ferns (Filicales), (2) horsetails (Equisetales), and (3) club-mosses (Lycopodiales). The pteridophytes have a well-developed vascular system, which is entirely absent in the bryophytes, the next group

below them. This system of conducting and strengthening tissues is correlated with the attainment of much greater size and larger foliage display by the fern plants than by the moss plants. It associates them with the seed plants (spermatophytes). Since plants below the seed

plants are often called cryptogams, pteridophytes are often called vascular cryptogams. There is also a well-marked alternation of generations (q.v.), which may be illustrated by the life-history of a common fern. When a fern spore germinates it produces a green, flat, usually heart-shaped body (prothallium), so small that it escapes ordinary observation. This body bears the sex-organs (antheridia and archegonia, Figs. 1, 2, 3). It is therefore the sexual plant or gametophyte and is entirely independent. The egg produced and fertilized upon this prothallium (gametophyte) germinates and produces the conspicuous but sexless fern plant or sporophyte (Fig. 1), upon the under surface of the leaves of which

about 500 species and were formerly much more abundant and conspicuous, are characterized by their slender, trailing, branched stems, thickly covered by small foliage leaves, and by a strobilus consisting of sporophylls, each bearing a

FIG. 2. STRUCTURE OF EUISETUM.

1, prothallium; 2, longitudinal section of an archegonium; 3, section of an antheridium; 4, a sporophyll with 5 sporangia visible; 5, a spore, showing elaters; 6, a sperm.

asexual spores are produced (Figs. 1, 5). When these fall to the ground and germinate they produce prothallia, and thus complete the cycle. Pteridophytes differ from bryophytes (q.v.) especially in that their gametophytes are leafless and inconspicuous, and the sporophytes are prominent, leafy, and nutritively independent of the gametophyte. Further, the sperms of pteridophytes are very large, spirally coiled, and bear numerous cilia for swimming (Figs. 1, 4).

The terms (Filicales) are the most prominent pteridophytes in the present flora, numbering about 4500 species, chiefly tropical. In habit they are mainly terrestrial, but some tropical forms are epiphytic (perching) and one aberrant group, the 'water ferns' float or are rooted in water. The peculiar characters are the horizontal subterranean stem, which sends to the surface comparatively few large leaves (fronds), dichotomously veined, usually compound, which bear on the under surface very numerous spore-cases (sporangia), and uncoil from the bud (circinate). The horsetails (Equisetales), which were formerly very abundant and included large trees, now comprise only about twenty-five small or straggling forms, well marked by their jointed and fluted stems, the absence of foliage leaves, and the terminal conical structure ('strobilus'), consisting of spore-bearing leaves (sporophylls, q.v.), each of which bears five to ten spore-cases (sporangia) on its lower surface (Fig. 2). The club-mosses (Lycopodiales), which comprise

FIG. 3. SELAGINELLA.

1, archegonium with egg; 2, antheridium with sperms; 3, upper part of female gametophyte, with heavy megaspore wall.

single sporangium upon the upper side (Figs. 3 and 4). The most important feature of the group is that Selaginella, the largest genus, is heterosporous. See HETEROSPORY.

Probably the greatest interest to the botanist in connection with the pteridophytes lies in the hypothesis that seed-plants have been derived from them, to prove which has been the purpose of much inconclusive investigation. There is general consent that seed-plants have not come from

FIG. 4. SELAGINELLA.

a, megaspore; b, prothallium; c, rhizoids; d, embryo sporophyte.

the horsetails, but opinion is divided between the ferns and club-mosses as probable ancestral forms with the burden of testimony apparently in favor of the former, at least in some cases. For fuller details, see FERNS; EUISETUM; LYCOPODIALES.

Consult books cited under MORPHOLOGY, all of which treat more or less fully of this group. Also: Campbell, *Mosses and Ferns* (New York,

1895): Atkinson, *The Biology of Ferns* (New York, 1894). For works on classification, see under TAXONOMY.

PTERODACTYL, tēr'ō-dāk'til (Neo-Lat., from Gk. πτερόν, *pteron*, feather, wing + δάκτυλος, *daktylos*, finger). The common name for any one of the flying lizards, remains of which are found in the Mesozoic rocks. There are about twenty different genera of pterodactyls, all included in the order Pterosauria (wing-lizards),

1, *Dimorphodon macronyx*; 2, pteranodon, the toothless, bird-like type of jaws.

also called Ornithosauria (bird-lizards). All the members of this order show a remarkable adaptation of the lizard body to bird-like habits, though in structure they remain essentially reptilian. They cannot be considered as ancestral to the birds, for they constitute a wholly independent line of descent, probably derived from common dinosaurian ancestors, and they present

PTERODACTYLUS SPECTABILIS.

an instructive example of parallelism of evolution due to adoption by two separate races of similar modes of life. The pterodactyls have skeletons of light but firm construction with hollow bones. The earlier forms had strong, spreading teeth which gradually disappeared in successively later members of the group, and the loss of the teeth was accompanied by a corresponding increase in length and sharpness of the jaws until in the latest genera (*Pteranodon*, etc.) the jaws are dagger-like. The large eyes, surrounded by a ring of sclerotic plates, are placed well back and on the sides of the skull. The body

RHAMPHORHYNCHUS GEMMINGI (lithographic stone of Bavaria).

was short and rather stout, the limbs long and slender, and in the earlier forms there was a long slender tail. The wings resembled in general those of the bats rather than those of birds, for they consisted of thin but strong membranes

stretched along the sides of the body and supported by the fore and hind limbs and the tail. The structure of the fore limb is quite different, however, from that seen in bats and birds, and presents equally interesting modifications of the parts of the arm in the adaptation of the latter from a walking leg to a wing-like organ. The long bones are considerably lengthened, the first finger is sometimes represented by a sort of dew-claw, the second, third, and fourth fingers are small and slender and furnished with sharp-hooked claws, and the fifth, or 'little finger,' is greatly elongated and strengthened to form the framework along which the anterior edge of the wing membrane is attached. Impressions of these

PTERODACTYL OF THE GENUS RHAMPHORHYNCHUS (restored).

wing membranes have in several cases been found so well preserved that the courses of the arteries are easily traceable. The hind limbs are of decidedly reptilian structure and from well-developed organs of locomotion in the earlier members of the group, they degenerated to weak clawed organs of prehension by which the later, more highly specialized, pterodactyls probably suspended themselves from points of rocks or from the limbs of trees after the manner of the modern bats.

The various genera range in size from less than 12 inches to about 20 feet in spread of wings. Some of them were evidently able to do little more than sail on leaping through the air, as does the flying squirrel, by means of the stretched membranes; while others were among the most powerful flying creatures that have ever lived. The principal genera are *Dimorphodon*, *Rhamphorhynchus*, *Pterodactylus*, and *Pteranodon*, or *Ornithostoma*.

(Berlin, 1882); Williston, "Winged Reptiles," *Popular Science Monthly*, vol. lx. (New York, 1902); Lucas, "The Greatest Flying Creature, the Great Pterodactyl, *Ornithostoma*," *Annual Report of the Smithsonian Institution* for 1901 (Washington, 1902).

PTEROPODA (Neo-Lat. nom. pl., from Gk. πτερόπους, *pteropous*, wing-footed, from πτερόν, *pteron*, feather, wing + πούς, *pous*, foot). An order of gastropod mollusks, agreeing in most of their features with the tectibranch forms like *Bulla*, etc. The head, eyes, and tentacles are usually wanting or vestigial, while on each side of the mouth are wing-like appendages, apparently a pair of greatly developed parapodia, giving the peculiar 'butterfly' appearance to these beautiful pelagic mollusks. The shell is conical or helix-like. The species are herma-

phroditic. *Limacina arctica* is of the size of, and looks like, a sweet-pea blossom, moving up and down in the water. It is common from Labrador to the polar regions. The largest form on the eastern coast of North America is the beautiful

FORMS OF PTEROPODS.

Clione papilionacea, which has a head and lingual ribbon. It is an inch long, the body fleshy, with no shell, the wings being rather small. It is likely to occur in vast numbers and forms the food of whales and other large surface-feeders. (See OOZE.) The larvæ of the pteropods pass through a trochosphere stage, spherical with a ciliated crown, and afterwards assume a veliger form. (See MOLLUSCA.) The pteropods are, in some degree, a generalized type. They have a wide geographical distribution and a high antiquity. Consult authorities cited under GASTROPODA; and Von Zittel and Eastman, *Text-Book of Palæontology* (New York, 1900).

PTEROSAURIA, tēr'ō-sq'ri-á (Neo-Lat. nom. pl., from Gk. πτερόν, *pteron*, feather, wing + σαῦρος, *sauros*, lizard). An order of extinct bird-like reptiles, with hollow bones, well-formed joints, and with the fore limbs modified for use as wings. See PTERODACTYL.

PTERYLO'SIS (Neo-Lat., from *pteryla*, feather-tract, from Gk. πτερόν, *pteron*, feather, wing + ἕλη, *hylē*, wood). The method of growth of feathers in birds. The bodies of most birds

PTERYLOSIS.

Dorsal and ventral views of the body of a quail, showing feather tracts.

are not uniformly covered with feathers, such a condition being found only among the Ratitæ and the penguins. In all other birds the feathers are grouped in clearly defined areas or tracts

(pteryle) with bare spaces (apteria) between them. To this condition, which has high taxonomic value, Nitsch (Pterylographie Arum, Halle, 1840), gave the name 'pterylosis,' and to the aspect of the tracts 'pterylography.' These tracts are different in the various groups, both in extent and position; but in general it may be said that feather-growth is fairly continuous over the head and throat; along the sides of the neck; on the shoulders, wings, tail, and lower part of the thighs, occasionally extending to the toes; in a band of varying breadth and shape down the centre of the back; and in two bands down the lower side of the body, where the central line from the throat to the vent is invariably free. It is believed that pterylosis was not present in ancient birds, which primitively were feathered all over, but is an acquired trait conceived to be advantageous in economy of energy, and in making the feathers fit more snugly and lie better with reference to wind and rain. Consult a translation of Nitsch's work, edited by Sclater and published by the Ray Society, London, in 1867; also Gadov's article "Pterylosis" in Newton, *Dictionary of Birds* (New York, 1893-96).

PTINIDÆ. A family of small beetles. See DEATH-WATCH.

PTOLEMAIC (tōl'ē-mā'ik) **SYSTEM**. In astronomy, a planetary theory expounded by Ptolemy (q.v.). It was an attempt to reduce to a scientific form common and primitive notions concerning the motions of the heavenly bodies. The primary and fundamental doctrines of this system are that the earth is the centre of the universe, and that the heavenly bodies revolve round it in circles, and at a uniform rate. These notions, which are naturally suggested by the first general aspect of things, having, previous to any accurate observation, established themselves as unquestionable axioms, phenomena which were found, on closer examination, to be inconsistent with them, were explained by the introduction of additional hypotheses. In the Ptolemaic system, the earth, the most stable of the 'elements,' held the lowest place, and supported water, the second in order; above water was placed air, and then fire, ether being supposed to extend indefinitely above the others. In or beyond the ether element were certain zones or heavens, each heaven containing an immense crystalline spherical shell, the smallest inclosing the earth and its superincumbent elements, and the larger spheres inclosing the smaller. To each of those spheres was attached a heavenly body, which, by the revolution of the crystalline, was made to move round the earth. The first or innermost sphere was that of the moon, and after it in order came those of Mercury, Venus, the sun, Mars, Jupiter, Saturn, and the fixed stars, eight in all. To this system later astronomers added a ninth sphere, the motion of which should produce the precession (q.v.) of the equinoxes, and a tenth, to cause the alternation of day and night. This tenth sphere, or *primum mobile*, was supposed to revolve from east to west in 24 hours, and to carry the others along with it in its motion; but the Ptolemaic astronomers did not venture to explain how this was done, although since the axis of motion of the *primum mobile* was that of the equator, its extremities being the poles of the heavens, while that of the ninth sphere was the axis of the ecliptic, some explanation was certainly neces-

sary. As observations of the heavens increased in accuracy it was found that the heavenly motions were apparently not uniform, and this was explained as follows: The acceleration of the sun on one side, and retardation on the other side of his orbit, is only apparent, and results from the earth not being in the centre of his sphere, C (see Fig.), but at E, and consequently his mo-

PTOLEMAIC SYSTEM.

tion appears to be slowest at P, and quickest at R. The alternate progression and regression of the planets was accounted for by supposing them to move, not directly with their crystallines, but in a small circle, whose centre was a fixed point in the crystalline, and which revolved on its axis as it was carried round with the latter; thus (Fig.) the planet was carried round the small circle ABD, as that circle was carried round PQR (now supposed to represent the planetary crystalline). The planet while in the outer portion of its small circle would thus have a forward, and in the inner portion a backward motion. The larger circle was called an *eccentric*, and the smaller an *epicycle* (q.v.). This theory of eccentrics and epicycles satisfied the early astronomers; but further investigation showed its incompleteness, and in later times it was found necessary to explain newly discovered discrepancies by heaping epicycle upon epicycle, till such a complication of the system had been produced as drew from Alfonso X. of Castile, to whom the Ptolemaic system was being explained, the remark that "if the Deity were now to reconstruct the world, he (Alfonso) could give him a few useful hints." As soon as astronomers came to understand and test the *Copernican system* the Ptolemaic system was discarded. See *COPERNICAN SYSTEM*; *GALILEO*.

PTOLEMAÏS, tōl'ē-mā'is. The Roman name of a seaport of Syria, now known as Acre (q.v.).

PTOLEMY, tōl'ē-mī (Lat. *Ptolemæus*, from Gk. Πτολεμαῖος, *Ptolemaios*). The name of sixteen kings of Egypt forming the Thirty-first or Macedonian Dynasty, which ruled from B.C. 323 to 30.

PTOLEMY I. (c.367-283 B.C.), surnamed *SOTER* ('the Preserver'), was a Macedonian, the reputed son of Lagus. He displayed marked ability as a soldier and was one of Alexander the Great's favorite generals in his Eastern campaigns. On the death of Alexander (B.C. 323) and the division of his possessions, Egypt and Libya fell to the share of Ptolemy and, while nominally only satrap of these provinces, he was from the first virtually an independent ruler. In B.C. 306 he became King in name as well as in fact. Under his able rule Egypt became a power of the first rank, Palestine and Southern Phœnicia, Cyprus, Libya, and Cyrene were included in her possessions, and Egyptian influence was paramount in the Mediterranean. The new capital, Alexandria,

soon became the foremost city of the world, both in commerce and in culture. The famous museum and library founded by Ptolemy I., and fostered by his successors, exerted a profound influence and attracted to Alexandria men of letters and of science from all parts of the Hellenistic world. The King himself was the author of a history of Alexander the Great, a work of which Arrian (about A.D. 134) made free use in the composition of his *Anabasis*. Ptolemy was a wise administrator and skillfully reconciled the opposing interests of his Greek and Egyptian subjects. In B.C. 285, after a most successful reign, he abdicated in favor of his son, Ptolemy II.

PTOLEMY II. (B.C. 308-247), surnamed *PHILADELPHUS*, the son of Ptolemy I. by Berenice, the grandniece of Antipater, was born on the island of Cos. He reigned from B.C. 285 to 247. He first married Arsinoë, the daughter of Lysimachus, King of Thrace, but eventually banished her, and, in compliance with ancient Egyptian custom, married his own sister, Arsinoë. Philadelphus undertook no great wars, and under his peaceful reign Egypt prospered greatly. The security afforded by her maritime supremacy, supported by a powerful fleet, stimulated her Mediterranean commerce to a lively activity, and a great trade developed on the Red Sea with Arabia and the Somali coast. This trade was encouraged by the establishment of new ports, by reopening the old route through the Wadi Hammamât to the Red Sea, and by planting a colony, called Ptolemais Epitheras, on the African coast near the site of the modern Suakin. A canal was also opened from the upper end of the Red Sea to the Nile. An important work, undertaken in the reign of Philadelphus, was the famous lighthouse erected on the island of Pharos, at the mouth of the harbor of Alexandria, by Sostratus the Cnidian. The Egyptian history of Manetho is reported to have been compiled at the suggestion of Philadelphus, and tradition alleges that the King caused the Hebrew scriptures to be translated into Greek by seventy (or seventy-two) elders sent from Jerusalem for the purpose. See *SEPTUAGINT*.

PTOLEMY III. (c.282-222 B.C.), surnamed *EUERGETÈS* ('the Benefactor'), was the son of Ptolemy II. by his first wife, Arsinoë, daughter of Lysimachus of Thrace. He succeeded his father in B.C. 247, and reigned until B.C. 222. He married Berenice, daughter of Magas, the stepson of Ptolemy I., who brought Cyrene as her dowry. In the beginning of his reign he made war upon Syria to avenge the murder of his sister Berenice, widow of Antiochus Theos. Ptolemy overran the Seleucid dominions as far as Babylon and Susa, but, after an absence of three years, he was called home by the news of domestic disturbances. He brought with him an immense booty, which included the images of the Egyptian gods carried away by Cambyses. It was the restoration of these images to their proper temples that gained for the King his title *Euergetes*, and furnished the motive for the decree passed in his honor by the Egyptian priesthood in B.C. 238. (See *DECREE OF CANOPUS*.) The result of the war placed Ptolemy in possession of all Cœle-Syria, together with Damascus and the port of Antioch, and gave him the control of the sea up to the Hellespont and the coasts of Thrace. He wisely made no attempt to hold the more distant Asiatic possessions of the Seleucid

Empire. Euergetes was a liberal patron of the arts and of literature, and added considerably to the collections of the Alexandrian Library. The splendid Temple of Edfu (q.v.) was planned and begun by him, and he also built at Karnak, Philæ, Esne, Canopus, and other places. In his reign Egypt reached the highest point of military glory, prosperity, and wealth.

PTOLEMY IV. (c.244-205 B.C.), surnamed **PHILOPATOR**, the son of Ptolemy III. by his wife Berenice, reigned from B.C. 222 to 205. He married his sister Arsinoë about B.C. 212. Philopator, who is said by Polybius to have been addicted to drunkenness and debauchery, was throughout his reign under the influence of unscrupulous favorites. The murder of his mother, Berenice, and of his brother Magas, shortly after his accession, was due to the machinations of his minister Sosibius, and later he fell under the influence of his mistress Agathoclea and her brother Agathocles, who caused the murder of his wife Arsinoë. In the early part of Philopator's reign Antiochus III. seized many of the Egyptian possessions in Syria, and in B.C. 218 defeated an Egyptian army sent against him. The following year Ptolemy took the field in person, and signally defeated Antiochus at Raphia. Although he allowed his defeated antagonist easy terms, he secured the quiet possession of the Syrian provinces for the rest of his life. Philopator, like most of his family, had strong literary tastes. He wrote a tragedy called *Adonis*, and built a temple to Homer at the King of poets. The beautiful Temple of Deir-el-Medneh is his work, and he also built at Assuan, Edfu, and other places.

PTOLEMY V. (B.C. 210-181), surnamed **EPHAPHANES** ('the Illustrious'), who reigned from B.C. 205 to 181, was only five years old when he succeeded his father, Philopator. Antiochus the Great of Syria and Philip V. of Macedonia took advantage of his minority to seize upon the foreign possessions of Egypt, and Antiochus actually made himself master of Cœle-Syria and Palestine, and threatened Egypt itself. Through the intervention of Rome, however, the war was stopped, and Antiochus betrothed his daughter Cleopatra to the young Ptolemy (B.C. 198). Epiphanes was declared of age in B.C. 196, and his coronation was celebrated with unusual splendor. It was on this occasion that the Egyptian priesthood published the decree which forms the inscription on the famous Rosetta Stone (q.v.). In 193 Epiphanes married Cleopatra, and the revenues of Cœle-Syria and Palestine were given as her dowry, but her father garrisoned these provinces with his own troops and they were practically lost to Egypt. In B.C. 181 Epiphanes was poisoned by some of his followers while he was making preparations for a war against Seleucus IV., the son and successor of Antiochus the Great, in order to recover Cœle-Syria.

PTOLEMY VI. (c.191-181 B.C.), surnamed **EUPATOR**, the eldest son of Epiphanes, seems to have reigned for a few months, at most, after his father's death, but nothing is known in regard to him.

PTOLEMY VII. (c.188-146 B.C.), surnamed **PHILOMETOR**, was the son of Epiphanes and his Syrian wife, Cleopatra, and reigned from B.C. 181 to 146. He was a mere child at the time of his accession, and his mother, a woman of remarkable ability, ruled the country during his mi-

nority. She died in B.C. 173, the year of her son's coronation, and a quarrel arose about her dowry. In the war which ensued, Antiochus IV. invaded Egypt, defeated the Egyptian forces near Pelusium, and had himself proclaimed King at Memphis. The young King was made prisoner, but his brother, afterwards Ptolemy IX., gathered an army, assumed the royal title, and successfully defended Alexandria. Antiochus retired to Syria, but soon invaded Egypt again, and would probably have made himself master of the country had not the Roman envoy, M. Popilius Lænas, ordered him back to his kingdom. The two Ptolemies ruled together until B.C. 163, when they quarrelled and Philometor was obliged to flee to Rome for protection. By arrangement, the government of Egypt proper was restored to him, and his brother was made King of Cyrene. In B.C. 146 Philometor was killed in battle against the Syrian usurper Alexander Balas.

PTOLEMY VIII. (c.148-146 B.C.), surnamed **EUPATOR II.** or **NEOS PHILOPATOR**, was the son of Ptolemy VII., and, although a child at his father's death, was proclaimed King by his mother. The claim was resisted by his uncle Ptolemy IX., who marched upon Alexandria with an army, but the dispute was settled by agreement. Ptolemy IX. obtained the throne and married his brother's widow, and the young King was murdered after a nominal reign of a few months.

PTOLEMY IX. (c.184-117 B.C.), surnamed **EUERGETES II.**, and nicknamed **Physcon** ('fat-paunch') is reported by Greek writers to have been a monster of cruelty and licentiousness, but the charges against him seem to have been exaggerated. His reign (B.C. 146-117) was, on the whole, able. His marriage with his brother's widow, Cleopatra, was a political necessity, and not long afterwards he married his niece, also named Cleopatra, daughter of Ptolemy VII. In B.C. 130 he was expelled from Egypt by a revolution headed by his wife, the elder Cleopatra, but two years later he returned to Alexandria and resumed the rule of the country. He exhibited great activity in repairing and restoring the temples of Egypt, and maintained the great Library of Alexandria in a worthy manner. He possessed some literary ability, and wrote a collection of memoirs in 24 books.

PTOLEMY X. (?-B.C. 81), surnamed **SOTER II.** or **LATHYRUS**, was the son of Ptolemy IX. He ruled jointly with his mother, Cleopatra, from B.C. 117 to 106, when he was driven from Egypt by a revolution and took up his abode in Cyprus. Cleopatra, to whose influence his expulsion was due, summoned her younger son, Ptolemy XI., to Egypt and appointed him co-regent. In the meantime Ptolemy X. made himself master of Cyprus and ruled there until recalled to Egypt in the year 88. The latter part of his reign was marked by a serious rebellion at Thebes which lasted for nearly three years and was put down with great difficulty. He died in B.C. 81. Soter II., before his accession to the throne, had married his sister, Cleopatra, but was forced by his mother to put her away and marry his younger sister, Selene.

PTOLEMY XI. (?-B.C. 88), surnamed **ALEXANDER I.**, was the brother of Ptolemy X., and was placed on the throne by his mother, Cleopatra, in B.C. 106, after the expulsion of her elder son. In B.C. 101, fearing that his mother was planning his death, he caused her to be murdered. In B.C. 88

he was driven from Egypt by a revolution, and was killed in an unsuccessful attack on Cyprus.

PTOLEMY XII. (c.105-80 B.C.), surnamed ALEXANDER II., was the son of Ptolemy XI. by an unknown mother. He was living at Rome at the time of the death of his uncle, Ptolemy X. The latter's daughter, Cleopatra-Berenice, widow of her uncle, Ptolemy XI., and stepmother of Alexander II., succeeded to her father's throne, and Sulla advised Alexander II. to marry his stepmother and thus make himself King of Egypt. The marriage was arranged, but when the King and his wife had reigned together for nineteen days, the Queen was murdered by her husband. This cruel deed so enraged the army that they rose against Alexander II. and put him to death. With him the legitimate line of the Ptolemies came to an end.

PTOLEMY XIII. (c.95-51 B.C.), surnamed NEOS DIONYSUS or AULETES ('the Piper'), was a natural son of Ptolemy X., Soter II., and after the death of Ptolemy XII. possessed himself of the throne without opposition. He reigned from B.C. 80 to 51. He was addicted to every kind of vice and debauchery. He was a skilled performer on the lute, and frequently competed for the prize in musical contests with professionals. He maintained friendly relations with Rome; when he died he left his kingdom to his daughter, Cleopatra, and his elder son, Ptolemy XIV., who was to marry his sister, and appointed the Roman people his executors.

PTOLEMY XIV. (c.61-47 B.C.), surnamed DIONYSUS, married his sister, the famous Cleopatra (q.v.), and ruled jointly with her from B.C. 51 to 48, when a dispute arose and the Queen was obliged to leave Egypt. In B.C. 47 Caesar sent troops to support her cause and Ptolemy was defeated. He was accidentally drowned while trying to escape.

PTOLEMY XV. (c.58-45 B.C.), the younger son of Auletes, became the nominal husband of his sister Cleopatra in B.C. 47, and was co-regent with her for two years, when she murdered him to make room for her son Cæsarion.

PTOLEMY XVI. (B.C. 47-30), called CÆSARION, was the son of Cleopatra by Julius Cæsar and was nominally co-regent with his mother from B.C. 45 until her death. After the battle of Actium Cleopatra endeavored to secure his safety by sending him out of the country, but he was betrayed to Octavius, who caused him to be put to death.

Consult: Strack, *Die Dynastie der Ptolemäer* (Berlin, 1897); Mahaffy, *The Empire of the Ptolemies* (London, 1895); *A History of Egypt Under the Ptolemaic Dynasty* (New York, 1899); Meyer, *Das Heerwesen der Ptolemäer und Römer in Ägypten* (Leipzig, 1900); Budge, *A History of Egypt* (New York, 1902). The last-named work contains a full bibliography of the subject. See also the section on *Ancient History* under EGYPT.

PTOLEMY (CLAUDIUS PTOLEMÆUS). An ancient astronomer and geographer. He was a native of Egypt, though it is uncertain whether he was born at Pelusium or at Ptolemais in the Thebaid. Nothing is known of his personal history, except that he flourished in Alexandria in A.D. 139 and there is probable evidence of his having been alive in A.D. 161. Ptolemy, both as an astronomer and geographer,

held supreme sway over the minds of almost all the scientific men from his own time down to the close of the Middle Ages; but, and in astronomy especially, he seems to have been not so much an independent investigator as a corrector and improver of the work of his predecessors. In astronomy he had the labors of Hipparchus to guide him; and, indeed, he scrupulously distinguishes between Hipparchus's labors and his own. To Ptolemy belongs the invention of a planetary theory, the discovery of the moon's evection (q.v.), and the singular distinction of being the sole existing authority on the subject of ancient astronomy. From this last-mentioned fact, the system of astronomy which he sets forth in the *Μεγάλη Σύνταξις τῆς Ἀστρονομίας* commonly known by the mediæval title *Almagest* (q.v.) received his name, and, as the *Ptolemaic system* (q.v.), obtained the homage of succeeding generations till the time of Copernicus.

The *Almagest* is divided into thirteen books, and the trigonometry of the Greeks is known almost entirely through this work of the second century. It shows that the Greeks were then confined to the sexagesimal system and used tables of whose chords instead of half-chords. Book i. contains all that can be regarded as pure theory. It contains a method for calculating chords; the fundamental theorem in rectilinear trigonometry, that the rectangle of the diagonals of an inscribed quadrilateral equals the sum of the rectangles of the pairs of opposite sides; and the principles of spherical geometry and trigonometry sufficient to construct a table of the sun's declination to each degree of longitude. The further mathematical work of the *Almagest* consists of applications of the geometry and trigonometry of Book i.

As a geographer, Ptolemy appears as the corrector and improver of the works of a predecessor, Marinus of Tyre, about whom, except from Ptolemy's writings, little is known. His *Γεωγραφικὴ Ἐπιπέγησις*, is divided into eight books, all of which, with the exception of the first, eighth, and a portion of the seventh, are nothing more than a catalogue of places, with their latitude and longitude (to 12ths of a degree), with a brief general description prefixed to each continent and country or tribe, and interspersed here and there with remarks of a miscellaneous character on any point of interest. The rest of the work contains details regarding his mode of noting the positions of places, by latitude (*μῆκος*) and longitude (*πλάτος*) with the calculation of the size of the sphere of the earth, and of the extent of surface then known. He also describes the mode adopted by him of projecting the surface of a hemisphere on a flat surface, and shows its superiority over the projections of Eratosthenes, Hipparchus, and Marinus. He constructed a series of twenty-six maps, together with a general map of the world, in illustration of his work.

The chief of his writings, besides those already mentioned, are: *Τετραβιβλος Σύνταξις*, with which is combined another work, called *Κάρπος* or *Centiloquium*, from its containing a hundred aphorisms, both works treating of astrological subjects, and held by some on this account to be of doubtful genuineness; *Φάσεις ἀπλανῶν ἀστέρων καὶ συναγωγὴ ἐπισημασειῶν*, a treatise on the phenomena of the fixed stars, or a species of almanac. The rest of his works are of inferior im-

portance, and consist of descriptions of various kinds of projections (q.v.), the theory of the musical scale, chronological and metaphysical treatises, and a summary of the hypotheses employed in his great work, the *Almagest*. Others of Ptolemy's works have been lost, and it is still a moot point whether or not they contained a treatise on optics, as a Latin version of what is said to have been an Arabic translation of Ptolemy's original treatise on that subject is still in existence.

The *Almagest* and the *Geography* were the standard text-books to succeeding ages, the first till the time of Copernicus, the second till the great maritime discoveries of the fifteenth century showed its deficiencies. They have passed through numerous editions, the best of which are, for the *Almagest* and most of Ptolemy's minor works, that by Hialma (Paris, 1813-16-19-20); and for the *Geography*, the Latin versions of 1482 and 1490, published at Rome, the *editio princeps* of the Greek text by Erasmus (Basel, 1533), and the Elzevir edition (Leyden, 1619). The catalogue of stars has been frequently reprinted separately, the last and best edition being that of Francis Baily, vol. xiii. of the *Memoirs of the Royal Astronomical Society* (London, 1843).

PTOMAINES, τῳμᾶνζ (from Gk. πτώμα, *ptōma*, corpse, from πίπτειν, *piptein*, to fall; connected with πέτεσθαι, *petesthai*, to fly, Lat. *petere*, to attack, seek, Skt. *pat*, to fly, fall). A name applied to a class of poisonous organic substances of animal origin, extremely similar in their chemical and physical properties and physiological action to the vegetable alkaloids. The similarity of the ptomaines and the alkaloids is important inasmuch as it throws doubt on the results of post-mortem analyses for the detection of vegetable poisons administered during life. Ptomaines are among the characteristic products of the putrefactive changes taking place in the body after death. It seems, however, that these poisons cannot be detected before the expiration of about two days after death. If therefore analysis should reveal the existence of poisonous matter before that time, the conclusion would be that it had been administered during life; but if the analytical tests should be applied after the lapse of two days, the results would be subject to serious doubt. The effects that often follow from using bad fish or canned meat are probably due to the action of ptomaines. There is also increasing evidence that the symptoms of many diseases are caused, not by the specific micro-organisms themselves, but by the ptomaines produced by them. Chemically the ptomaines are amines; that is to say, they contain one or more NH_2 groups attached to hydrocarbon radicles. Following are a few of the more important ptomaines known:

the products of the pancreatic putrefaction of gelatin, was isolated by Nencki in 1876.

Cadaverine, penta-methylene-diamine, $\text{NH}_2(\text{CH}_2)_5\text{NH}_2$, is found in corpses during the earlier stages of putrefactive decomposition; it is a liquid solidifying to a crystalline mass at low temperatures and forming crystalline compounds with acids and with certain salts.

Putrescine, tetra-methylene-diamine, NH_2

$(\text{CH}_2)_4\text{NH}_2$, is found in considerable quantities in putrid herrings and in corpses during the latter stages of putrefactive decomposition; it is, like cadaverin, a liquid crystallizing in the cold and combining with acids and certain salts to form crystalline compounds.

Choline, trimethyl-oxyethyl-ammonium hydroxide, $(\text{CH}_3)_3\text{N}(\text{OH})\text{CH}_2\text{CH}_2\text{OH}$, is found among the products of decomposition of pig's or ox bile; it is a thick, colorless liquid readily decomposing if mixed with water and heated; it acts as a strong base, forming deliquescent salts with acid, and also crystalline compounds with certain salts. It may be prepared from the yolk of eggs by decomposing the lecithin of the latter as follows: the yolk is carefully extracted with alcohol and ether, and the residue is boiled with caustic baryta; on precipitating the barium with carbonic acid and filtering, the solution is evaporated and the residue extracted with absolute alcohol, from which the choline is precipitated in the form of its platinum-chloride salt and the latter is decomposed with sulphureted hydrogen. Wurtz succeeded in preparing choline synthetically.

Neurine, trimethyl-vinyl-ammonium-hydroxide, $(\text{CH}_3)_3\text{N}(\text{OH})\text{CH}=\text{CH}_2$, is chemically similar to choline, from which it may be prepared; it is a highly poisonous liquid ptomaine, forming crystalline compounds with acids and with certain salts; it is a common product of the putrefaction of meat.

PTOSIS (Neo-Lat., from Gk. πτώσις, fall, from πίπτειν, *piptein*, to fall). A falling; a prolapse. Ptoxis is the term commonly used of a falling of the eyelid. (See EYE, DISEASES OF). Enterptosis is a prolapse of the intestines into a lower plane than normal, owing to laxity of the abdominal walls. Gastroptosis is a falling of the stomach, which occurs in cases of retention of food in that organ, whereby it is weighted heavily, and also in cases in which the walls of the viscus are weak.

PUBERTY (Lat. *pubertas*, from *puber*, *pubes*, mature). The period of life at which the generative organs of the male or female become capable of exercising the function of reproduction. The term is also applied to the changes in the special organs and the general system that accompany the onset of this period. Sexual maturity is reached earlier in warm climates. The age at which puberty commences in temperate zones is, in males, between sixteen and eighteen; in females, between fourteen and sixteen; but it cannot be reckoned by age alone, and is influenced by national or hereditary peculiarities and by some diseases. The changes noted in the male at puberty are a development of the larynx with the 'breaking' and deepening of the voice, a growth of hair about the face, pubes, and other parts of the body; the fuller development of the sexual apparatus, with secretion of the seminal and accessory fluids; and finally the appearance of sexual instincts and inclinations. In the female, physical and functional maturity are almost contemporaneous, and functional womanhood ceases suddenly at the menopause or climacteric. The change most characteristic of puberty in the female is the appearance of the menses, but besides this there are development of the breasts, ovaries, uterus, and external genital organs, and changes in the bony pelvis. In

both sexes there is a rapid increase in size and weight. This period is critical in the life of the individual. Hereditary diseases are apt to declare themselves at this time, and many mental and nervous disturbances take place.

PUBLICANI (Lat., tax-gatherers). In ancient Rome, the farmers of the public revenues (*rectigalia*). These revenues were put up to auction by the censors and were sold for a period of five years. They were derived chiefly from tolls, tithes, harbor-duties, *scriptura* (the tax paid for the use of public pasture-lands), mining and salt duties. As the State required the publicani to give security for the sum at which they had purchased the collecting of the taxes, and as this sum was usually much greater than the wealth of any single individual, companies were formed, the members of which were enabled to carry on conjointly undertakings far beyond the capabilities of the separate shareholders. Their contract with the Roman Government was made in the name of a single person, who was called *maniceps*, and who was held responsible for his *socii* to the State. Only Roman citizens were eligible as publicani. As in France before the Revolution, the farming of revenues resulted in great injustice and peculation, especially in outlying provinces; and the publicans were a bitterly hated class, as appears in numerous passages of the New Testament.

PUBLIC BATHS. See BATH-HOUSES, MUNICIPAL.

PUBLIC CALLINGS. Any trade or calling carried on by a private individual or private corporation which, because of its quasi public character, has certain privileges as well as legal obligations which do not attach to an ordinary private trade or calling. The business of common carriers and that of innkeepers are examples of public callings. The essential characteristics of public callings are that those engaged in them hold themselves out as engaged in the business of serving the public indiscriminately.

From the earliest time the common law held that the classes of business carried on by common carriers, innkeepers, truckmen, ferrymen, bakers, millers, and wharfingers were, or under proper conditions might be, public callings. And in later times the courts have held that the businesses of telegraph and telephone companies, elevator companies, and warehousemen were public callings. In general it may be said that all who engage in public callings must serve the public without discrimination for reasonable compensation, and with a high degree of care for the persons and property of those who engage their services. This rule, however, is subject to the limitation that the person claiming the public service must be a proper person to receive it. Those engaged in public callings in return for their obligation to serve all persons properly entitled to service have the compensating advantage that they either have a lien for their services or may claim payment or compensation in advance. They also have the right to make and enforce reasonable regulations governing the conduct of their business.

When a business is affected with a public interest, and thus becomes a public calling, it ceases to be *juris privati* only, and is subject, within reasonable limits, to the right of the State

to regulate it. See CARRIER, COMMON; INN-KEEPER; CONSTITUTIONAL LAW.

PUBLIC COMFORT STATIONS. These conveniences, often including lavatories and water-closets, are numerous in most of the larger European cities, but are entirely lacking, except in parks, in all but a very few American cities. In Europe a slight charge is usually made for their use, though in many cases they are absolutely free. Boston, New York, and San Francisco have entered upon the work of establishing public comfort stations. In Boston in 1902 the bath department had charge of twelve public water-closets in various parts of the city. The underground structure on the Common had an average daily attendance of 6000. In San Francisco a commodious public convenience was built in 1903, by the Merchants' Association and given to the city. In New York a committee previously appointed by the Mayor issued, in January, 1897, an exhaustive report on public baths and public comfort stations. The report recommended that public comfort stations should be built, and several have been established.

Consult chapter on "Public Baths and Water-Closets" in Baker, *Municipal Engineering and Sanitation* (New York, 1902). See also the report on *Public Baths and Public Comfort Stations* (New York, 1897), referred to in the text.

PUBLIC DOMAIN OF THE UNITED STATES. For a discussion of the surveys made upon the national domain, see SURVEYING. See also LANDS, PUBLIC.

PUBLIC FUND. The money in the hands of an officer of a government to be employed for governmental purposes. Public funds are raised by taxation in various forms, and the accumulation of public revenues from any source. A State treasurer may have the public money credited to different 'funds,' as the 'school fund,' etc., and usually has no authority to transfer money from a fund raised for a certain purpose to another fund to be employed for an entirely different purpose. See TAXATION; and the authorities there referred to.

PUBLIC LAW. That branch of the law which defines and protects the rights which subsist between State and subject, as distinguished from that which affects the rights that subsist between subject and subject. In public law the State, which defines and protects the right, is a party interested in or affected by the right, and may, therefore, uphold or extinguish it. The conception of public law, as opposed to private law, is due to the Roman law, in which the law of crime was included under the same head; and the civil law of the Continent of Europe retains the same classification.

The field of public law may be divided in accordance with the same distinctions which apply in the subdivision of private law; and the same distinctions may be made between substantive and adjective law, rights *in rem* and rights *in personam*, rights antecedent and remedial, and rights normal and abnormal. The connection and reciprocal relations of these parts of the public law to each other have not yet become well settled; and among modern civil law jurists they have been very differently and rather loosely treated.

The topics under which public law is most commonly treated are constitutional law, or that which defines the form of government; adminis-

trative law, or that branch which prescribes the manner in which the various political powers of the State shall be exercised within the Constitution; criminal law, or that branch which contains the rules affecting injuries to itself and disobedience to the rules laid down for the common welfare, and the penalties to be inflicted for violations of the same; and criminal procedure, also called adjective criminal law, or those rules of law affecting the bringing of criminals to justice. Besides these usual subdivisions of public law two other important divisions have been made comprising the quasi rights and quasi duties of the State as a juristic or artificial person against or in favor of natural persons, and the procedure relating to the State in this capacity, or the body of law prescribing the mode in which the State may sue and be sued. These rights of the State are irrespective of, and in addition to, those which belong to the right of eminent domain, and are those which govern it, as, for instance, a landed proprietor, the owner of personal property used in or about public buildings or of manufacturing establishments, a contractor in engineering operation, a banker issuing promissory notes, a legatee under a will, etc. Its rights and liabilities under many of these heads are different from those of individuals or other artificial persons, especially with reference to liabilities for injuries done by its servants, and as to the barring of its rights by prescription. The procedure provided for when the State is a party is not essentially the same for both the parties, as in private law; but is relatively abnormal, and takes different forms according to whether the suit is against the subject by the State, or vice versa.

For a discussion of the details of the various branches of public law see the titles CONSTITUTIONAL LAW; ADMINISTRATIVE LAW; LAW, CRIMINAL; PROCEDURE; PLEADING; COURTS; etc., and consult the authorities referred to under those titles.

PUBLICOLA, PUBLIUS VALERIUS (?-B.C. 503). A Roman consul, described by Livy and Plutarch as a magnanimous patriot. He bore a chief part in expelling the Tarquins. After the death of his colleague, Junius Brutus, having heard of the suspicions of the people that he was aiming at despotic power, he demolished in the night a palatial edifice which he had reared, and ordered that the fasces which were carried before him as the emblem of power should be lowered when he came before the people. By his efforts, stringent laws were enacted to protect the liberties of the citizens. It was decreed that persons convicted of crime should have the right of appeal from the consuls to the people, and that whoever attempted to be king might be slain by any man at any time. The surname of *Publicola* (or, in its older form, *Poplicola*), 'friend of the people,' was conferred upon him and his descendants. He was thrice elected consul.

PUBLIC POLICY. That principle of the law which holds that no person can lawfully do that which has a tendency to be injurious to the public or against the public good. The earliest trace of this principle in English law reports is found in a case decided in the second year of the reign of Henry V. (1414). A dyer had contracted not to use his art within a certain town for six months. He did exercise his art there within the time limit, and was sued for breach

of his contract. When the case came before the court, Mr. Justice Hull is reported to have been uncommonly angry at the plaintiff, and to have declared with an oath that had the plaintiff been present he should have gone to prison for daring to restrain the liberty of the defendant. He went upon the maxim that it was not good for the realm—that it was against public policy—for men to bind themselves not to exercise their trade. Two hundred years later Mr. Justice Anderson cited this decision in holding a similar contract void; declaring such a contract to be "against the law, against the liberty of the freeman, and against the commonwealth;" adding that defendant might as well bind himself not to go to church. About the same time, a contract by a land-owner that he would not sow his land for a certain period was adjudged void as "tending to the inconvenience and prejudice of the State." The principle announced in these early cases has never since been repudiated, although its application to particular contracts in *restraint of trade* (q.v.) has varied with changing business conditions and public opinion.

The wisdom of the principle has been doubted by eminent judges. One has said that "public policy is a very unruly horse, and when once you get astride it you never know where it will carry you." Another has said that "public policy does not admit of definition and is not easily explained." Still another has declared that public policy, which he defines to mean "the prevailing opinion from time to time of wise men," is "an excellent principle, no doubt, for legislators to adopt, but a most dangerous one for judges." A fourth has denounced the term as "vague, unsatisfactory, and calculated to lead to uncertainty and error when applied to the decision of legal rights. It is the province of the statesman and not the lawyer to discuss, and of the legislature to determine, what is best for the public good, and to provide for it by proper enactments. It is the province of the judge to expound the law only, not to speculate upon what is the best, in his opinion, for the advantage of the community." Notwithstanding these criticisms, the principle continues to hold an important place, especially in the law of contract (q.v.). It has not the broad sweep given to it by Lord Hardwicke and his contemporaries, a century and a half ago, when he remarked: "Political arguments, in the fullest sense of the word as they concern the government of the nation, must have great weight in the consideration of this court, and though there may be no bad faith in contracts as to other persons, yet if the rest of mankind are concerned as well as the parties, it may properly be said that it regards the public utility." The present view of the subject is well expressed in a modern English decision, as follows: "You have this paramount public policy to consider, that you are not lightly to interfere with the freedom of contract."

As already remarked, the earliest application of the principle was to contracts in restraint of trade. It was next applied in cases of champerty (q.v.) and to maintenance (q.v.). It is rarely invoked in the latter cases at present.

Another class of contracts to which the principle was early applied was that of wagers. Indeed, Sir Frederick Pollock has expressed the opinion that the doctrine of public policy, so far as regards its assertion in a general form in

modern times, arose from wagers being allowed actionable at common law. The validity of such contracts having been admitted, courts set to work to discourage them as much as possible by holding many of them to be against public policy.

Contracts promotive of immorality have always been deemed subversive of public utility and hence void. Agreements in restraint of marriage, wagers that one will not marry, and marriage brokerage contracts, or agreements to bring about the marriage of a particular person, have been held void because against sound public policy. This principle has been applied, also, in avoiding agreements for the sale of offices and for the assignment of officers' salaries, as tending to injure the public service; in avoiding agreements with an alien enemy as well as those which are hostile to a friendly country, such contracts having a tendency either to harm our country directly or to embroil us with other nations. Most frequently of all, perhaps, it is applied in avoiding contracts for the stiling of criminal prosecutions, or the perversion of justice in civil suits, or for services in lobbying with legislators, or improperly influencing administrative officers. Combinations between business houses or corporations entered into for the purpose of preventing honest competition, or the creation of monopolies, are void as against public policy. (See TRUST.) Consult: Pollock, *Principles of Contracts* (London, 1902); Anson, *Principles of the English Law of Contracts* (London, 1901); Greenwood, *Doctrine of Public Policy in the Law of Contracts* (Chicago, 1886).

PUBLIC SCHOOLS. A term usually applied in the United States to the institutions maintained at public expense for the formal education of children. The idea of organizing schools where rich and poor might obtain efficient free instruction did not take firm root in the minds of the people of the several States until the early part of the nineteenth century, although even the earliest settlers of the colonies were not unmindful of their duty with respect to the education of the young. In 1647 a law was passed in Massachusetts requiring every town of fifty householders to maintain a master to teach reading and writing, and every town of one hundred householders to maintain a grammar school, the wages of such master to be paid by parents whose children took advantage of the instruction. A somewhat similar law was passed in Connecticut in 1650. In most of the New England colonies education was considered a public responsibility. New York, on the contrary, owing to the wrangling between the Dutch and English, was rather late in recognizing the necessity for a public school system; comparatively little attention, in fact, having been paid to the subject before the close of the Revolution. The same is true of Pennsylvania, which depended mostly on private benefactions for the establishment of schools. New Jersey, on the other hand, passed a law in 1693 looking to the establishment of schools. In the South there were no school systems previous to the Revolution. What was done in the way of education was chiefly the result of private enterprise. The four decades following the Revolution form the transitional period. Local autonomy gradually gave way to centralization and State supervision, this process varying, of course, with local condi-

tions. The Federal Government was from the very beginning doing much by means of land grants and other aid to encourage the several States in the establishment of school systems, setting aside in 1785 and 1787 one thirty-sixth of all the public land in the several States for school purposes. In 1795, at the instance of Governor Clinton, a law was enacted in New York providing for local school supervision, and in 1812 the office of State superintendent of common schools was created, Gideon Hawley holding it until 1821, when the office was unfortunately abolished and the Secretary of State was nominally left to carry out the duties of superintending schools. It was not until 1854 that the office was revived. In Massachusetts the Board of Education was organized in 1837, and the various school organizations were united and correlated, the moving spirit in this work being Horace Mann (q.v.). The other States followed the example of New York and Massachusetts. Connecticut and Rhode Island found a leader in Henry Barnard. In this successful movement for public schools no little credit is to be assigned to the efforts of the various educational associations, particularly the National Educational Association.

The three main types of public schools in the United States are: (1) the city elementary and high schools; (2) the town union school, which includes a high school department; (3) the district school, so called from its usually being established in certain rural districts, and offering elementary instruction. As a rule, little attention is paid in these district schools to grading. The general tendency is growing now toward the establishment of public institutions for dependent children, truants, and incorrigibles, where, in connection with industrial training, the elementary branches are taught. In 1900 the attendance of the elementary schools was about 15,900,000, about 1,300,000 attending private schools. The term public schools is anomalously used in England to denote the several famous preparatory schools, as Eton, Harrow, and Rugby. For details of the various systems of public instruction in the United States and the principal European countries, see SCHOOLS; COMMON SCHOOLS; GRAMMAR SCHOOLS; EVENING SCHOOLS; EDUCATION; PRIMARY EDUCATION; NATIONAL EDUCATION, SYSTEMS OF.

PUBLIC WASH-HOUSES. See WASH-HOUSES, PUBLIC.

PUBLILIUS SYRUS. A Roman writer of mimes. He was a native of Syria. He was brought to Rome when a boy as a slave; but his master was kind, educated him, and finally gave him his freedom. He excelled in writing mimes, which were in great vogue at Rome in the latter times of the Republic. Julius Cæsar gave him the preference over all other mimographers. His works are lost, but some of his moral apothegms, which have been preserved by Seneca and other ancient writers, are remarkable for their laconic precision and justness of sense. These have been gathered under the title *Publili Syri Mimi Sententiæ*, and were published by Meyer (Leipzig, 1880) and Friedrich (Berlin, 1880).

PUBLIUS. The signature used by Hamilton, Jay, and Madison in their papers contributed to the *Federalist*. Papers 2-5 and 64 were written

by Jay; 10, 14, 18-20, 37-63 by Madison; and the remainder by Hamilton.

PUCCINIA, pük-sin't-á (Neo-Lat., named in honor of *Puccini*, an Italian anatomist). A genus of fungi, the best known species of which is probably *Puccinia graminis*, wheat rust, which passes part of its life upon the barberry (q.v.). See RUST.

PUCCOON' (from the North American Indian name). An American name for various plants or their colored juices. In the South it is applied to *Sanguinaria* (q.v.); in the Southwest to *Lithospermum hirtum* (hairy puceoon) and *Lithospermum canescens* (hoary puceoon or alkamet). Yellow puceoon (*Hyarastis Canadensis*) is also called Indian dye or turmeric, yellow or orange root, and golden seal.

PUCHTA, pook'tá, GEORG FRIEDRICH (1798-1846). A great German jurist who systematized the theories of the historical school of law. He was born at Kadolzburg, was educated at Erlangen, taught there (1820-28), was professor at Munich until 1835, then in Marburg, in Leipzig (1837-42), and for the last three years of his life in Berlin as successor of Savigny. A follower of Schelling in philosophy, and an intimate friend of that master, whom he had known in Munich, Puchta was a profound thinker and clear stylist. His more important works are: *Civilistische Abhandlungen* (1823); *Lehrbuch der Pandekten* (1838; 12th ed. 1877); *Einleitung in das Recht der Kirche* (1840); *Kursus der Institutionen* (1847-47; 9th ed. 1881); *Vorlesungen über das heutige römische Recht* (1847-48, edited by Rudorff; 6th ed. 1873-74).

PUCK. An elf who plays an important part in Shakespeare's *Midsummer Night's Dream*, and who is identified with Robin Goodfellow (q.v.).

PUCKLE, JAMES (1667?-1724). An English writer. He was born at Norwich and later settled in London as a notary public. He is remembered for *The Club, or a Dialogue Between Father and Son, in Vino Veritas* (1711). In 1723 a revised and enlarged version appeared under the title *The Club, or a Grey Cap for a Greenhead, in a Dialogue Between Father and Son*. It is a series of character sketches connected by the fiction of a club, called *The Noah's Ark*. The son describes the types met at the club, and his father comments upon them. The edition of 1723 was reprinted with illustrations by John Thurston (1817), with a preface added by S. W. Singer (1834); again at Glasgow in 1890; and with an introduction by Austin Dobson (London, 1900; New York, 1901).

PÜCKLER-MUSKAU, pük'lér-mus'kou, HERMANN LUDWIG HEINRICH, Prince (1785-1871). A German author, born in Muskau, Lusatia, and educated at Halle and Leipzig. He entered the army in 1803, served with much distinction, and in 1822, after his retirement, was made prince by the King of Prussia. He traveled much in England, where he developed his love for landscape gardening. Gardens on his own estate at Muskau and in Weimar were laid out after the plans described in his *Landschaftsgärtnerei* (1834). His books of travel, especially *The Travels of a German Prince in England* (tr. by Sarah Austin, 1832), *Tutti Frutti* (tr. by Spencer, 1834), and *Mehemet Ali and Egypt* (1848), made a strong impression on account of their brilliant style. His first work,

Briefe eines Verstorbenen (1830), a diary descriptive of manners and customs of the aristocracy of many lands, is still read.

PUCRAS (East Indian name), or KOKLASS. A pheasant of the Himalayan genus *Pucrasia*, recognizable by the long crests and still longer ear-tufts of the cocks. Their flight is swift and they are favorites with sportsmen.

PUDDLING. See IRON AND STEEL.

PUDICITIA, pü'di-sish't-á (Lat., modesty). The goddess of chastity and modesty, at first worshiped only by patrician Roman matrons, but later by plebeians as well. She corresponds to the Greek goddess *Aidos*.

PUDSEY, püd'zi. A woolen-manufacturing town in the West Riding of Yorkshire, England, three miles east of Bradford (Map: England, E 3). It was incorporated in 1899, and has shown much municipal activity and improvement. Population, in 1891, 13,400; in 1901, 14,900.

PUDU, pöö'döö (South American name). A very small white-tailed, stout-limbed deer of the Chilean Andes (*Puduha humilis*), which has antlers in the form of minute simple spikes, and has no upper canine teeth. It is restricted to the high mountains of Chile, where it is an object of sport. See Plate of FALLOW DEER, MUSK, ETC.

PUEBLA, pwá'blá. An inland State of Mexico, bounded by the State of Vera Cruz on the north and east, Oaxaca and Guerrero on the south, and by Morelos, Mexico, and Hidalgo on the west (Map: Mexico, K 8). Area, 12,204 square miles. The State includes one of the most elevated portions of Mexico. On the western frontier rise the volcanic peaks of Popocatepetl and Iztaccihuatl, and on the eastern boundary the great cone of Orizaba. The northern part is traversed by the Sierra Madre, and the extreme north slopes toward the low coast region. The central portion belongs to the Plateau of Anahuac (q.v.), while in the south deep valleys are the most prominent features. The chief river is the Apoyac, or upper course of the Mescala, which traverses the southern portion. The climate varies considerably according to the elevation, and the soil is generally fertile in the valleys, where sugar and cotton are cultivated. The more elevated regions are devoted chiefly to the raising of cereals. Grazing is carried on extensively in some parts of the State. The mineral deposits are believed to be considerable, but mining is as yet in a backward state, though some marble is quarried. The State is crossed by several railroad lines. Population, in 1895, 973,876; in 1900, 1,024,446, including a large number of civilized Indians. Capital, Puebla.

PUEBLA, or PUEBLA DE ZARAGOZA, formerly PUEBLA DE LOS ANGELES. The capital of the State of Puebla, Mexico, and the largest city of the Republic next to the national capital. It is situated on the Atoyac River, 60 miles southeast of Mexico City, at an elevation of 7200 feet above the sea, and between the bases of Mounts Malinche and Popocatepetl (Map: Mexico, K 8). It is a very pleasant and well-built city, regularly laid out with broad streets and spacious squares. The uniform slope of the ground gives it a good natural drainage, which is further reinforced by a good artificial system, so that it is a very healthful city. Among its many handsome buildings the most prominent is the cathedral, which rivals that of Mexico, and whose two fine towers

dominate the view of the city. Other notable buildings and institutions are the Palace of Justice, the Alhóndiga, a large and handsome building occupied by the State Legislature, the State College with a large library, the School of Medicine, the Palafoxiana Library containing over 100,000 volumes, the Academy of Fine Arts, and several theatres and hospitals. The city is an important commercial and industrial centre. It has several cotton and woolen mills, foundries, and glass factories, and is connected by rail with Mexico, Vera Cruz, Orizaba, and Oaxaca. Population, in 1895, of the city proper, 88,684.

Puebla was founded as a mission station in 1530 by Toribio de Benavente. In 1847, during the war with the United States, it was occupied for some time by the American forces. In 1862 it was attacked by the French army, which was repulsed by General Zaragoza, in whose honor the city received its present name. The French, however, captured it in the following year. Consult: Romero, *Geographical and Statistical Notes on Mexico* (London, 1898); Ramirez, *Informe sobre la captoración hecha en los terrenos de Tultic* (Mexico, 1883).

PUEBLO, pwéb'ló (Sp., village). A name first used by the Spaniards, and later adopted by the Americans, to designate the semi-civilized agricultural and sedentary Indians dwelling in adobe or stone-built communal houses in the arid region of the Southwestern United States, chiefly along the Rio Grande and its tributaries. The term 'village Indians' was used in distinction from the ruder wandering tribes, without reference to political or linguistic affiliations. The existing pueblos, or settlements, now number 27, besides the Mexicanized colonies of Isleta in Texas and Seneñ in Mexico, together with several sub-pueblos, representing in all four distinct stocks, with about twice as many languages and several additional dialects. With the exception of Zuñi, the seven Moki villages in Arizona and the two Pueblo colonies below El Paso, all the existing pueblos are within a limited area of north central New Mexico, but the hundreds of ruins, together with traditional and historical evidence, prove that the area of Pueblo culture formerly comprised the whole region from the Pecos to the middle Gila, and from central Colorado and Utah southward into Mexico. This does not mean that all of the ruins were occupied at the same time, but that at one time or another every part of the region in question was within the sphere of Pueblo culture. There seems to have been a gradual withdrawal from the northern and other more exposed sections and a concentration upon central points, due to the invasion of the savage Apache and Navaho. Some Pueblo tribes have distinct traditions of their former occupancy of particular ruins, frequently remote from their existing villages.

The recorded history of the Pueblos begins with their discovery by Father Marcos de Niza in 1539, followed up by the expedition of Coronado (q.v.) the following year. Later on the occupation and conquest of the country was begun in earnest. Within the next century missions were established in nearly every pueblo, and the whole country was mapped out into districts, held under close subjection by Spanish garrisons. The exactions of the commanders, the outrages of the soldiers, and the interference of the mis-

sionaries with the old-time pleasures and ceremonies of the Indians, bred discontent, and in 1680, under the leadership of Popé, a medicine man of the Tewa, there was a simultaneous rising of the Pueblos from the Pecos to the Hopi villages so sudden and complete in its surprise that priests, soldiers, and civilians were everywhere butchered, and the survivors after holding out for a time under Governor Otermin at Santa Fé fled to El Paso, leaving not a single Spaniard in New Mexico. A few of the Piro and Tigua tribes who adhered to the Spaniards followed them in their retreat, and were afterwards colonized respectively at Seneñ and Isleta, below El Paso. The people of Awátobi, one of the Hopi towns, who had refused to dismiss or butcher their missionaries, were massacred by their kindred of the other Hopi villages, and their town was destroyed. Taking care to make their preparation complete, the Spaniards gathered their forces together for another invasion of the country, and this time with such success that by 1692 the reconquest of the Pueblos was complete. The missions, however, were not reestablished, and most of the tribes relapsed into their primitive religion and ceremonial. Their history from that period until the Mexican War brought them under American jurisdiction is of little outside importance. By the treaty with Mexico they were declared American citizens on the same terms as their Mexican neighbors, but the new territorial administration refused to admit them to equal rights, and they continue to be treated as Indians under Government control according to the regular agency system. They are entirely self-supporting, however, and ask and receive little beyond schools and recognition of certain village and farming reservations.

Physically the Pueblo Indians are small in stature, but very strong, being able to walk or even run long distances, or climb steep or difficult mountain trails, under burdens that would tax the strongest white man. They are darker than the Plains Indians, with mild and friendly countenances, indicative of their disposition. They are not aggressive warriors, fighting usually only in self-defense, and preferring rather to avoid trouble with the wild Apache and Navaho by building their settlements upon the tops of high cliffs, to be ascended only by narrow and easily defended trails. Hence the name 'Cliff Dwellers' frequently applied to them and more particularly to the extinct inhabitants of the northern cañon ruins. Since the Government has interfered to restrain the predatory tribes, most of the Pueblos have come down upon the plain, but the Hopi of Arizona still have their villages upon mesas several hundred feet above the surrounding level. Their houses are solidly built communal structures of adobe or stone set in clay mortar, with square rooms and flat roofs, through which trap-doors with ladders give access to the interior, the outer walls being frequently without door or window as a precaution against attack. Rooms are added to the original structure as needed, and a whole village frequently forms one compact building, with stories in terrace style, one above another. An important feature of each pueblo is the *kiva* or underground chamber for the use of the various ceremonial societies.

Their dress is of buckskin or of cotton or woolen fabrics of their native weaving. In some

PUEBLO OF ZUNI INDIANS

1. ZUNI PUEBLO FROM THE SOUTH

2. VIEW IN THE PUEBLO

tribes, as the Hopi, the unmarried women are distinguished by a peculiar arrangement of the hair. They are all basket-makers, each pueblo having its own method or design. In variety of pattern and beauty of decoration they have developed the pottery art to a higher stage than was found anywhere else in the United States. Their men are also skillful wood-carvers, particularly in the shaping of ceremonial figurines. Their main dependence is agriculture, each pueblo cultivating its fields in common, usually by aid of irrigation from an adjoining stream, and producing corn and beans in many native varieties, with melons, squashes, and other vegetables, ehile, tobacco, as well as peaches, introduced by the early Franciscan missionaries. The grinding of the meal upon stone metates and the baking of the bread upon heated slabs of stone occupies a large share of the woman's indoor time, while pottery and the field occupy her attention outside. The men, besides their field work, do the weaving and carving, besides procuring the wood, which must generally be brought from long distances on the backs of burros. The intervals between crop seasons is given to a succession of elaborate and spectacular ceremonials, one of which, the snake dance (q.v.) of the Hopi, has achieved a national reputation. Most of these ceremonials are of a sacred character, being either invocations or thanksgiving for the rain and the crops, and each is in the keeping of a special secret society.

Family life is based upon the clan system, the number of clans being very large in proportion to the population, and the woman is the ruler of the household. The marriage ceremonial is elaborate, including feasting, processions, and dances, and only one wife is allowed. The government is by villages rather than by tribes, each pueblo having a peace chief or governor, assisted by councilors, together with a war chief.

The present number of the Pueblos is about 10,000. Excluding the seven Hopi (Moki) villages in Arizona, with 1840 souls, and the two Mexicanized pueblos of Isleta and Senecú below El Paso, the existing inhabited pueblos number 18, all in New Mexico, as follows: Acoma, 650; Cochiti, 300; Isleta, 1120; Jemez, 450; Laguna, with sub-pueblos of Pahuate, Paraje, Casa Blanca, and others, 1080; Nambe, 100; Picuris, 125; Sandia, 75; San Felipe, 550; San Ildefonso, 250; San Juan, 425; Santa Ana, 230; Santa Clara, 325; Santo Domingo, 1000; Sia, 125; Taos, 425; Tesuque, 100; Zuñi, 1540. They are classified by linguistic stocks as follows: Shoshonean: Mashongnivi, Shmopovi, Shupaulovi, Sichumovi, Oraibi, Walpi. Tahoan: Isleta (New Mexico), Isleta (Texas), Jemez, Nambe, Pecos (extinct), Picuris, Pojoaque (extinct), Sandia, San Ildefonso, San Juan, Santa Clara, Senecú (Chihuahua, Mexico), Taos, Tesuque, Tewa or Hano (with Hopi, Arizona). These are grouped under five cognate languages, viz.: *Tano* or *Tigua* (Isleta, New Mexico; Isleta, Texas; Sandia); *Taos* (Taos, Picuris); *Jemez* (Jemez, Pecos); *Tewa* or *Tegua* (Nambe, Pojoaque, San Juan, San Ildefonso, Santa Clara, Tesuque, Tewa or Hano); *Piro* (Senecú); *Keresan* (Acoma, Cochiti, Laguna, San Felipe, Santa Ana, Santo Domingo, Sia); *Zuñian* (Zuñi). See colored Plate of AMERICAN INDIANS, under INDIANS; also the accompanying plate showing a Zuñi Pueblo.

PUEBLO. The second largest city of Colorado, the county-seat of Pueblo County, and an important commercial and industrial centre, 120 miles south by east of Denver (Map: Colorado, E 2). Situated in a small basin near the eastern foot-hills of the Rocky Mountains and on both sides of the Arkansas River, at the junction of the Fontaine qui Bouille, Pueblo enjoys a natural location for a great railway and business centre. Its transportation facilities comprise the Denver and Rio Grande, the Atchison, Topeka and Santa Fe, the Missouri Pacific, the Chicago, Rock Island and Pacific, and the Colorado and Southern. The vicinity to the east is interested to a very large extent in stock-raising, and to a somewhat important degree in agriculture. Near the city are deposits of coal, limestone, and oil, and the tributary region includes very highly productive mineral districts. Pueblo is the great distributing and receiving point for this section of vast natural wealth. It has become known as the 'Pittsburg of the West,' being famous for its iron and steel, and smelting industries. There are in the city several smelters producing lead, silver, and gold, zinc, and copper; the immense plant of the Colorado Fuel and Iron Company, which manufactures various iron and steel products; foundries and machine shops, including railroad car shops; manufactories of fire-brick, glass, woollens, furniture, etc.; and large stock yards. According to the census of 1900, an aggregate capital of \$12,374,000 was invested in these industries, which had a production valued at \$30,795,000, the output of the lead smelting and refining works alone amounting to nearly \$20,000,000.

Pueblo has the McClellan Public Library, with more than 12,000 volumes; law libraries; the State Insane Asylum and several other charitable institutions; and the State Mineral Palace and Park. In the building last mentioned is a complete collection of the minerals of Colorado. The government, under a charter of 1887, is vested in a mayor, elected biennially, and a unicameral council, and in administrative officers. Fire department officials, the police judge, and city physician are elected by the council, which also confirms the mayor's nominations of police officials. The engineer, auditor, treasurer, and clerk are chosen by popular election. There are two systems of water-works, one of which is owned by the municipality. A few Mormons settled temporarily on the site of Pueblo in 1846, and about 1850 a trading post was established here, the inhabitants of which, however, were massacred by the Ute Indians in 1854. The present city was laid out in 1859 and was chartered in 1873. In 1887 Pueblo, South Pueblo, and Central Pueblo were consolidated. Population, in 1890, 24,558; in 1900, 28,157.

PUELICHE, pōō-ā'chā (eastern people). A people of Araucan stock roving over the pampas region of the Rio Negro, Southern Argentina. They are so called in distinction from the cognate Moluche, or 'western people,' in and west of the Andes. Those living in the foothills of the Andes are frequently also distinguished as Pehuenehe, 'pine forest people.' In language and general characteristics they differ but slightly from the others of the same stock, but are rather wilder than those of Chile, spending much of their time on horseback and seldom staying long in one place. They carry on a considerable

trade in cattle, salt, and tobacco with the tribes west of the mountains. They have large herds of cattle and horses, are expert with the bolas, and fond of gambling and music. They wear their hair flowing or gathered behind into a queue decked with silver beads, with a bright turban about the head, and a blanket wrapped about the waist and held in place by a belt. Physically they are of medium stature, broad-chested, and inclined to corpulency. They pluck out the beard and eyebrows, and the women paint their faces in red and black.

PUENTE DE CALDERON, pwān'tá dá kál'dá-rōn' (Sp., bridge of Calderon). A bridge over the Rio Grande de Santiago, about 30 miles from the city of Guadalajara, Mexico, noted as the scene of the defeat of the revolutionary forces under Hidalgo, about 80,000 poorly armed, by Calleja with 6000 well-equipped troops, January 17, 1811.

PUENTE GENIL, nā-nēl'. A town of Southern Spain in the Province of Cordova, situated 32 miles south of Cordova on the river Genil, which is here crossed by a stone bridge, and on the railroad to Malaga. It has a secondary college and a public library; it is surrounded by olive orchards, and its principal industry is the manufacture of olive oil. Population, in 1900, 12,959.

PUENTES (pwān'tás) **DAM**, FAILURE OF. See DAMS, paragraph *Failure of Dams*.

PUERPERAL FEVER (from Lat. *puerpera*, parturient woman, from *puer*, child + *parere*, to bear), **PUERPERAL SEPSIS**, **CHILDBED FEVER**. A fever appearing in puerperal women within a week after labor—usually from the third to the fifth day—attended with septic infection of the blood and acute inflammation of one or more of the reproductive organs or the loose cellular tissues connected with them, and often characterized by severe and widespread complications. This fever was long considered specific, and under the names childbed fever, lying-in fever, etc., was a fatal and frequent complication of the puerperium, particularly in lying-in hospitals. It is now known that the disease is due to infection from some microorganism introduced into the genital tract by contact with unclean hands, instruments, dressings, clothing, or bedding. The credit of pointing out the true origin of this disease is due to Dr. Oliver Wendell Holmes, who in 1843 promulgated the doctrine of extragenital infection. In 1847 Semmelweis proclaimed the same teachings in Europe. Since modern antiseptic midwifery has caused the hands, instruments, and the materials used in the lying-in room to be sterilized, puerperal fever has become a comparatively rare occurrence, while a better knowledge of its pathology and prompt treatment of its earliest symptoms make it a much less fatal and severe sequel of labor.

The complications that may arise in puerperal fever are both grave and numerous. Pericarditis, pleurisy, endocarditis, pneumonia, and inflammation of the joints may occur, and the liver, kidneys, bladder, or spleen may be secondarily infected. The disease is usually ushered in with violent and prolonged chills, followed by an irregular fever, uneasiness, nausea, extreme general depression, with a rapid, feeble pulse, and shallow respiration. The expression is anxious, the tongue heavily coated, and the urine scanty

and albuminous. Severe cases run a rapid course and often terminate fatally within a week.

The prevention of puerperal infection by the exercise of rigid cleanliness in every labor case, and particularly when instrumental interference is demanded, is now one of the most important duties of the obstetrician. (See ANTISEPTICS.) When, however, infection has taken place, on the appearance of the initial symptoms the genital tract should be irrigated at frequent intervals with from three to four quarts of some warm antiseptic solution. Mercuric chloride, creolin, carbolic acid, or plain normal salt solutions are those usually employed for this purpose. If this measure does not prove efficient in abating the fever in a short time, it is necessary to explore the uterine cavity and remove by means of the wire curette the decomposing material which is almost certain to be found there. Frequent douching with one of the solutions named above is continued until convalescence sets in. The general treatment is stimulating and supportive. An abundance of easily digestible liquid food, such as milk, beef tea, broths, and animal juices, must be given. Alcoholic stimulants may have to be given in large amounts with strychnine and other cardiac tonics. Fever is reduced preferably by cold sponging, and abdominal pain and swelling relieved by the application of the hot-water coil or hot-turpentine stupe. Complications must be met as they arise.

PUERPERAL INSANITY. A term applied to mental derangement occurring during the first six weeks of the puerperal state. During the great changes comprised in the onset of labor and the beginning of uterine involution, with the nerve drain, the rapid metabolism of tissue and the necessity for sudden adjustment to a new order of life, the risks of every woman are great; and the mother who is predisposed to mental derangement is in especial danger. The onset of an attack of puerperal insanity is frequently sudden, but more frequently preceded by nerve fag, insomnia, restlessness and garrulity, fickle fancy, unreasonable likes or dislikes, and perverted affection. Suspicion and obstinacy, violent hatred of husband or infant follow. Delusions and hallucinations of a terrifying kind occur, and there is constant excitement, perpetual talking in an incoherent way, impulsive action, often obscenity in speech and conduct, and often homicidal or suicidal impulse.

Puerperal insanity takes the form of mania in about one-half of the cases, of melancholia in about one-half. Moral shock has often a strong influence in the production of this insanity, for over 25 per cent. of the cases occur in mothers of illegitimate children. It is frequent in primiparæ. About one-half are violent or homicidal, about one-quarter of the cases are suicidal. Eighty per cent. of the cases recover.

The treatment must be directed toward the genital apparatus, the digestive tract, the capacity for sleep, and the necessity for hydrotherapy. Custodial care is, in the vast majority of the cases, necessary; for removal from familiar home surroundings is valuable. Consult Bevan Lewis, *Text-book of Mental Diseases* (London, 1889).

PUERTA DEL SOL, pwār'tá dēl sōl (Sp., Gate of the Sun). The chief square of Madrid, on the site of the former eastern gate of the

city. It is now in the centre of Madrid, the focus of the most important streets, and the favorite meeting-place of the populace.

PUERTO CABALLOS, pwār'tō kā-bā'yōs. A town of Honduras. See **PUERTO CORTÉS**.

PUERTO CABELLO, kā-nā'yō. A seaport of Venezuela, situated on the Golfo Triste, 55 miles west of Carácas, with which it is connected by rail (Map: Venezuela, D 1). It has a hot and unhealthy climate, but an excellent harbor protected by a chain of islands and fortified. It is the third in importance among the ports of the Republic. The shipping in 1900 amounted to 218,788 tons. The principal export is coffee, of which nearly 26,000,000 pounds were exported in 1900. Other exports are cacao, hides, and lumber. Population, about 15,000. In the eighteenth century Puerto Cabello was one of the most important towns of Venezuela, and a great trade centre. In 1743 it repulsed the attack of an English squadron. It was an important point during the English-German blockade of 1903.

PUERTO CORTÉS, kōr-tās', or **PUERTO CABALLOS**. A port of Honduras, situated on a bay of the Gulf of Honduras (Map: Central America, C 3). It is the best harbor on the north coast of the Republic, and is the terminus of a railroad connecting with the interior. It exports mahogany, cedar, vanilla, and hides. Population, 2000.

PUERTO DE SANTA MARIA, dā sän'tā má-rē'á, commonly known as **EL PUERTO**. A town of Spain, in the Province of Cadiz, situated on the Bay of Cadiz, at the mouth of the Guadalete, five miles northeast of Cadiz (Map: Spain, B 4). The town lies amid pleasant surroundings, and is well built, with a fine, large main street containing the houses of the rich wine-merchants. Many of the houses are lighted by electricity from a central power plant. There are several old convents, a well-equipped Jesuit college, a modern theatre, and a large bull ring. A characteristic feature of the town is the *bodegas*, or wine stores—large buildings with thick walls and narrow windows. El Puerto is the principal port for the exportation of sherry wines, since it is the nearest port to Jerez de la Frontera (q.v.), with which it is directly connected by rail. Other industries include the manufacture of brandies, starch, flour, soap, and glass. There are fisheries and exports of fish. Population, in 1887, 20,590; in 1900, 19,373.

PUERTO LA MAR, lá mār. A seaport of Chile. See **CONIJA**.

PUERTO MONTT, mōnt. The capital of the Province of Llanquihue (q.v.), Chile.

PUERTO PLATA, plä'tá. A port of the Republic of Santo Domingo, situated on the north coast of the island of Haiti (Map: West Indies, M 5). The town has a well-protected harbor and considerable export trade, chiefly in tobacco. It has steamship communication with the United States and Europe. Population, about 4000.

PUERTO PRINCESA, prēn-thá'sá. The capital of the Province of Moro Palawan, Philippine Islands, situated on the east coast of the island of Palawan, 80 miles southwest of Taytay (Map: Philippine Islands, C 10). It was formerly a Spanish penal colony, and has a capacious, land-

locked harbor with a lighthouse. Population, about 1500.

PUERTO PRÍNCIPE, prēn'thé-pá. A province of Cuba, occupying the east central portion of the island, and bounded on the north by the Atlantic Ocean, on the east by Santiago de Cuba, on the south by the Caribbean Sea, and on the west by Santa Clara (Map: Cuba, H 5). Its area is 10,500 square miles. It is the largest province of the Republic next to Santiago. The north coast is lined with a chain of large islands, and innumerable islets lie off the southern coast. The surface is an undulating plain with some detached groups of hills in the northern part. The most extensive forests of the island are found in this province, and lumbering, copper-mining, and cattle-raising are the chief industries. Agriculture is here less developed than in the other provinces, and sugar and tobacco plantations are chiefly confined to the district around the capital, Puerto Príncipe (q.v.). The province is by far the most thinly populated in the island, the population in 1899 having been only 88,234. Consult Torres Lasqueti, *Colección de datos históricos-geográficos y estadísticos de Puerto del Príncipe* (Havana, 1888).

PUERTO PRÍNCIPE. Capital of the Province of Puerto Príncipe, Cuba. It is situated in a broad, sandy, and elevated savanna region, 25 miles from the north and 45 miles from the south coast of the island (Map: Cuba, G 5). It is very antiquated in appearance, with narrow, winding streets and old houses built of brick and stone. The chief industries are connected with cattle-raising, for which the surrounding country is well adapted, and cattle products are the chief exports, though some sugar is also produced. The city is connected by rail with its port, Nuevitas, on the north coast, and it is a station on the Cuban main trunk railroad, completed in 1902, which connects it with Havana and Santiago. Population, in 1899, 25,102; of the municipal district, 53,140. Puerto Príncipe was an important military post during the Spanish régime, and was surrounded by an extensive system of trenches, stockades, and small forts. The surrounding country was the centre of insurgent operations during the revolution, and only 16 miles north of the city lies Cubitas, the capital of the revolutionary government from 1896 to 1898.

PUERTO REAL, rá-íl'. A town of Southwestern Spain, in the Province of Cadiz, situated at the head of the Bay of Cadiz, 5 miles east of the city of that name. It is a well-built modern town, founded in 1488 on the site of the old Roman *Portus Gaditanus*. It has a harbor with a steamship pier and a dry dock, and manufactures textiles, cements, and salt. Population, in 1900, 9683.

PUERTO RICO, rē'kō. See **PORTO RICO**.

PUFENDORF, pu'f'en-dōrf, SAMUEL, Baron (1632-94). A celebrated German publicist, born at Chemnitz, in Saxony. He began the study of theology at Leipzig, but speedily turned to the subject of public law, which he pursued at Jena till 1657. In 1658 he became tutor in the family of Coyet, Swedish Minister at Copenhagen, and in 1660 went with his patron to The Hague, where he published his *Elementa Jurisprudentiæ Universalis* (1660). This led to his being sum-

moned to the University of Heidelberg, where the chair of the law of nature and of nations was created for him. In 1667 he published, under the pseudonym of Severinus de Mozambano, *De Statu Imperii Germanici*, a merciless analysis of the anachronisms and absurdities of the Imperial Constitution. This work aroused great attention and brought the author much fame and many enemies. In 1670 Pufendorf followed a call to the Swedish University of Lund. There he wrote *De Jure Naturæ et Gentium* (1672) and *De Officio Hominis et Civis* (1673). In the former of these he makes an elaborate study of the origin of law, finding its threefold source in reason, the civil law, and revelation. He also did much to free the study of jurisprudence from the fantastic speculations of the theologians, and as a result was precipitated into bitter controversies with the representatives of the old order. In 1677 he became Councilor of State and royal historiographer to the King of Sweden. There followed a number of important works, *Einleitung zur Historie der vornehmsten Reiche und Staaten* (1682), *De Rebus Suecicis* (1686), and *De Rebus a Carolo Gustavo Gestis* (1688). In *De Habitu Christianæ Religionis ad Vitam Civilem* (1687) he upheld the right of the State as against the Church. He went to Berlin in 1686, summoned by the Great Elector, and after the latter's death in 1688 was made by his successor Privy Councilor. He died in Berlin October 26, 1694. The *De Rebus Gestis Friderici Wilhelmi Magni* and *De Rebus Gestis Friderici III.* appeared the year after his death. Consult: Treitschke, "Samuel von Pufendorf," in the *Pruussische Jahrbücher* (Berlin, 1875); Droysen, "Zur Kritik Pufendorfs," in *Abhandlungen zur neuen Geschichte* (Berlin, 1876).

PUFF. A bold and impudent literary humbug in Sheridan's farce *The Critic*, the author of *The Spanish Tragedy* rehearsed in the play, and "a professor of the art of puffing."

PUFF-ADDER. An African viper (*Bitis* or *Clotho arictans*), which takes its name from its habit of lifting its head when approached, and menacing the enemy by hissing loudly with a puffing sound. It is a typical viper, but has an unusually broad, triangular head, due to the excessive size of its poison sacs, and its bite is very dangerous. This shape, the large upturned nostrils, and cruel eyes give it an especially ugly appearance. It attains a length of four to five feet, and is often as thick as a man's arm. Its color is yellowish brown, checkered with reddish brown and white, making it very difficult to see as it lies on the ground. Its movements are generally slow, and its habits are those of vipers generally. This serpent is found all over Africa, except along the Mediterranean coast. Consult Hopley, *Snakes* (London, 1882). See Colored Plate of FOREIGN VENOMOUS SERPENTS.

PUFFBALLS. Globular fungi occurring on the surface of the ground, and producing internally innumerable minute spores, which usually escape through a definite opening at the top. See BASIDIOMYCETES; MUSHROOM.

PUFF-BIRD. A barbet, especially of the family Bucconidæ. These take their name from their habit of sitting motionless on a perch for hours at a time, with their feathers raised until the bird looks like a puffball. At the first alarm,

the feathers flatten instantly. See BARBET and Plate of TROGON, HOOPOE, ETC.

PUFFER. See GLOBEFISH, and Plate of PLECOGONATH FISHES.

PUFFIN (so called from its puffed-out beak). An auk of the genus *Fratercula*, characterized by the high, compressed form of the beak. The best known is the common one (*Fratercula arctica*) of the Arctic and north temperate regions generally, which migrates southward in winter as far as Spain and Long Island. It is a little larger than a pigeon; the forehead, crown, back of the head, a collar round the neck, the back, wings, and tail are black, the other parts of the plumage white. The puffin lays only a single egg in a burrow or some natural hole in a cliff-face, where great numbers congregate and behave like auks and guillemots (qq.v.). The eggs and young birds are sought after by fowlers for food. Other species are found in the Arctic and North Pacific oceans, coming to California in winter. Among the most notable are the crested puffin (*Lunda*

BEAK OF PUFFIN (*Fratercula Arctica*).

The left-hand figure shows the appearance of the beak of the male in the breeding season, at the close of which all the parts lettered are separately molted. The appearance of the beak in the non-breeding season (winter) is shown in the right-hand figure.

cirrhata), which has a long tuft of feathers on each side of the head, and the tufted puffin (*Fratercula corniculata*). This might more suitably be called 'horned' puffin, as each of its upper eyelids bears a slender, upright, acute horn (See Plate of AUKS, ALBATROSS, ETC.), which, however, is only an appendage of the male in the breeding season, and drops off at its close, just as the special coatings and appendages of the beak and eyes in some other puffins are acquired in the spring and molted in the fall.

PUG (variant of *puck*, from Ir. *puca*, Welsh *puca*, *pucci*, goblin, sprite). A small, smooth, short-nosed house-dog, introduced into England probably from Holland, to which country it seems to have come, according to general testimony, from the East Indies. The breed was well established in England by the year 1700, and continued so from the reign of William II. to George II. By the first quarter of the nineteenth century pugs had nearly or quite disappeared from Great Britain. The fawn variety was reintroduced from Holland, and now there are two recognized strains—the Fawn and the Black (the latter brought from China about 1875 by Lady Brassey). An inferior quality has long been bred in Italy and in France, where they were called 'carlins,' after a celebrated Harlequin. The pug is essentially a house-dog, and a very good one, and for that purpose a smaller dog than the standard allowed in competition (13 to 17 pounds) is the better. The general appearance is that of a large-headed, smooth-coated, black-faced, pug-nosed, bright little dog,

compact in form, with well-knit proportions and well-developed muscles. In color he is (in the ordinary variety) fawn all over, except on the muzzle or 'mask,' the ears, the moles on his cheeks, the 'thumb-mark' or 'diamond' on his forehead, and his back trace, which should all be as black as possible. His face is deeply wrinkled, and he carries his tail curled as tightly as possible over his hips. His coat must be short, smooth, soft, and glossy, neither hard nor woolly.

The 'black pug' differs only in color; he is entirely black.

PUG. A demon in human form in Ben Jonson's comedy *The Devil's an Ass*, a mischievous creature resembling Shakespeare's Puck.

PUGATCHEFF, по́уга-чѣф, YEMELYAN IVANOVITCH (c.1726-75). A leader of a great popular uprising in Russia, known as *Pugatchefshchikina*. He was a Cossack of the Don, and fought against the Prussians in the Seven Years' War, and in the campaign against Turkey in 1769. On his return he was arrested for helping his brother-in-law to escape across the Don. Fearing punishment, he ran away to the Cossacks of the Terek, where he heard persistent rumors that Peter III. was still alive. Strikingly resembling the murdered Czar in personal appearance, he pretended to be that sovereign, and declared his purpose of reasserting his right to the crown and of dethroning Catharine II. He issued a proclamation in the name of Peter III. in 1773, and in the same year the rebellion began. He attached to his cause the Raskolniks, whose religion he embraced, and won over several Finnish and Tatar tribes, and a large number of the peasantry. After the capture of many fortresses on the Ural and the Don, Orenburg among them, he marched against Moscow, but was sold by some of his companions for 100,000 rubles. After trial he was executed in Moscow. His insurrection is said to have cost 100,000 lives.

PUGET, пу'зһá', PIERRE (1622-94). A French sculptor, painter, and architect; born probably near Marseilles. At the age of fourteen he was apprenticed to a wood-carver named Roman, employed in the decoration of ships, and at about eighteen he went to Florence and soon after to Rome. His great natural ability attracted the attention of Pietro da Cortona, the famous painter and decorator, whose assistant he became. Bernini and Algardi were then in full career, and Puget was thus from the first subjected to the powerful influence of the Italian Decadence. Beginning with 1650, he appears to have devoted himself almost exclusively to painting pictures for the churches of Marseilles and other cities of Southern France. He was a painter of considerable ability. In style, of course, he followed the decadent Italian school, but he also was influenced by the work of Van Dyck. There is record of fifty-six pictures by him, nineteen of which are still in existence, including three portraits of himself.

His first important works in stone are the famous pair of male caryatids (1657) on the portal of the façade of the Hôtel de Ville at Toulon. In this work a familiar Italian motive is treated with supreme originality and power. In 1659 he went to Paris and made three fine figures for the Château of Vaudreuil, in Normandy. He attracted the attention of Fouquet, who en-

gaged him to assist in the decoration of his new château at Vaux-le-Vicomte. In 1660 he went to Genoa and made for Fouquet his celebrated statue of "L'Hercule gaulois," now in the Louvre. The next seven years in Genoa were the most successful of his entire career. For Francesco Sauli he made statues of Saint Ambrose and Saint Sebastian in the Church of Santa Maria di Carignano, the former being especially fine. He made also a statue of the "Conception" in the Albergo de' Poveri (1664), the great altar of the Church of the Theatines (finished 1670), and probably assisted J. B. Carlone in painting the dome of this church. After 1668 Puget seems to have divided his time between Marseilles, Toulon, and Genoa. He was continually employed by the French Government in the decoration of ships until the example of the English navy brought about the abandonment of such work. In Marseilles Puget played a large rôle in the projected reconstruction of the old city. Several important streets were laid out by him, and he is credited with a large number of buildings which show the influence of Genoese architecture. The reputation of Puget rests chiefly upon two powerful works which were executed during this period—the statue of Milo of Crotona and the great bas-relief of Alexander and Diogenes, both in the Louvre.

Consult: Léon Lagrange, *Pierre Puget, peinture, sculpteur, architecte*, the leading biography (Paris, 1868); Emeric-David, *Histoire de la sculpture française* (ib., 1872); Rioux-Maillon, "Pierre Puget décorateur," in *Revue des arts décoratifs*, vol. ii.

PUGET (pu'jět) SOUND. A large, irregular, and many-branched inlet, extending over 100 miles into the northwestern part of the State of Washington (Map: Washington, C 1). From the junction of the Straits of Georgia and Juan de Fuca, which separate Vancouver Island from the mainland, Puget Sound proper extends southward, and divides into two main branches, Hood's Canal in the west and the Admiralty Inlet in the east. The latter ends in a maze of branching fiords, on one of which stands Olympia, the State capital. The shores were originally covered with forests, but have been largely denuded by extensive lumbering. Still the mountains in the background make it one of the most picturesque bodies of water in the United States. The temperature of the Sound water is cool, coming as it does from melting snow, especially through the Fraser River. As a result the summer heat of the surrounding country is very much tempered. The depth ranges from 180 to 925 feet. The absence of shoals, the abundance of harbors, and the deep penetration into the country, peculiarly adapt it to commerce. Port Townsend, Seattle, and Tacoma are situated on its shores.

PUGHE, pū, WILLIAM OWEN (1759-1835). A Welsh antiquary. He was born in Wales, but at the age of seventeen went to London, where he studied Welsh literature. After assisting Owen Jones in editing Welsh poems, he was associated (1801-07) with him and with Edward Williams in publishing the *Myrryrian Archaeology of Wales*. Between 1793 and 1803 he published *The Welsh and English Dictionary*, containing 100,000 words (re'dited 1806, 1832, and 1857), which, though not trustworthy in matters of etymology, is very complete and has excellent

definitions. In addition, he edited the *Cambrian Register* and the Welsh magazine *Y Greal*, and translated into Welsh Milton's *Paradise Lost*, Bishop Heber's *Palestine*, and other English poems. His works had a considerable influence in awakening interest in Welsh literature.

PUGILISM (from Lat. *pugil*, boxer, from *pugnus*, fist; connected with Gk. *πύγμα*, *pygmē*, fist, OHG. *fūst*, Ger. *Faust*, AS. *fyst*, Eng. *fist*). Prize fighting. The practice of fighting for a prize with the fists has from earliest times been peculiarly an Anglo-Saxon sport, but in its professional aspect it is comparatively modern. Tom Figg, who was the champion of England in 1719, is said to have introduced professional pugilism into England. He was the owner of a theatre in London where contests with and without gloves were regularly held. During his lifetime the sport was so popular as to be under the direct patronage of royalty. After his death, however, there was a lull in the public interest until about 1735, when George Taylor declared himself the champion of England. From this time on prize fighting grew in popularity and was indulged in and patronized by all classes of society. The fights were conducted under the rules of the London prize ring, but gradually became so disreputable by their invariable brutality that national laws were enacted prohibiting prize fighting throughout the United Kingdom. With the founding of the Amateur Athletic Club in 1866, scientific boxing again came into vogue, and at the same time the Marquis of Queensberry's rules were recognized as the code under which boxing contests should be conducted. These rules, although known by the name of the Marquis of Queensberry, were really formulated by one of the founders of the Amateur Athletic Club, J. G. Chambers. The fashion of the period, however, which demanded the patronage of some prominent member of the nobility, led him to secure the use of that nobleman's name, because of his known interest in the sport. The underlying motive of the rules was to mark a distinction between professional and amateur, and thus to create an interest in glove fighting. Originally they provided for a series of contests for gentlemen amateurs, the prizes being challenge cups. There were to be three classes of contestants: 'heavy,' weighing more than 158 pounds; 'middle,' less than 158 pounds; and 'light-weights,' of 140 pounds and under. There were three judges, and each bout was to consist of three rounds, each one of which might be up to five minutes in duration, with one minute rest between the rounds, the contestants not responding to the call of time to be declared the loser. The ring was fixed at 24 feet. In the original rules there is no mention of a ten-second time limit, but, on the other hand, the idea seems to have been to permit the contestants to fight the full three rounds, permitting the one who had been knocked down any reasonable time to recover. The modern Queensberry rules contain the following clause under which all present-day glove contests are fought:

"Contest for Endurance.—To be a fair stand-up boxing match in a 24-foot ring, or as near that size as practicable; no wrestling or hugging allowed; the round to be of three minutes' duration and one minute time; if either man fall through weakness or otherwise he must get up unassisted; ten seconds to be allowed him to do

so; the other man meanwhile to retire to his corner, and when the fallen man is on his legs the round is to be resumed and continued until the three minutes have expired, and if one man fails to come to the scratch in the ten seconds allowed it shall be in the power of the referee to give his award in favor of the other man; a man hanging on the ropes in a helpless state with his toes off the ground shall be considered down; no seconds or any other person to be allowed in the ring during the rounds; should the contest be stopped by any unavoidable interference, the referee to name time and place for finishing the contest as soon as possible, so that the match must be won or lost, unless the backers of both men agree to draw the stakes. The gloves to be fair-sized boxing gloves of the best quality, and new; should a glove burst or come off it must be replaced to the referees' satisfaction. A man on one knee is considered down, and if struck is entitled to the stakes. No shoes or boots with spriggs allowed."

Modern prize fights and boxing contests are divided into six classes, the weights for which are as follows: Heavy, more than 158 pounds; middle, under 158 pounds; welter, under 142 pounds; light-weight, under 133 pounds; feather-weight, under 122 pounds; bantam-weight, under 115 pounds.

PUGIN, pū'jin, AUGUSTUS (1762-1832). An English architect and writer on architecture. He was born in Normandy, but during the French Revolution went to London, where he was educated at the Royal Academy. He is chiefly known by his works on mediæval architecture, and published (1821-23) *Specimens of Gothic Architecture*. In 1825, in conjunction with John Britton, he published *Architectural Illustrations of the Buildings of London*; and afterwards (1831) *Examples of Gothic Architecture, and Gothic Ornaments*; and, with Le Keux, in 1827, *Specimens of the Architectural Antiquities of Normandy*. In this, his best work, as also in his *Gothic Ornaments*, he was assisted by his son, A. N. W. Pugin.

PUGIN, AUGUSTUS NORTHMORE WELBY (1812-52). An English architect and designer. He was born in London, March 1, 1812, and was a pupil of his father, Augustus Pugin. Becoming a convert to Roman Catholicism, he designed a large number of churches for that denomination in England, including the Roman Catholic Cathedral in London. He is probably the most important of the architects connected with the revival of Gothic architecture in England during the nineteenth century, which he promoted as much by his books as by his buildings. Among his works are the following: *Contrasts, a Parallel Between the Noble Edifices of the Fourteenth and Fifteenth Centuries and the Present Day* (1836); *The Present State of Ecclesiastical Architecture in England* (1843); *True Principles of Pointed or Christian Architecture* (1841). His son, EDWIN WELBY PUGIN (1834-75), completed a number of his father's designs and buildings, besides others of his own.

PUGLIA, pōō'lyá, LA. The modern Italian form of the name of Apulia (q.v.), Italy.

PUG MILL. See CLAY.

PUGNO, pu'nyó', RAUL (1852—). A French pianist, born at Montrouge, near Paris. He received the rudiments of his musical education

from his father, a music teacher. At the age of six Raoul competed with a large class of boys for entrance into the Paris Conservatory and headed the list of successful competitors. He graduated, taking the first prize, and also first prize in harmony, in the counterpoint and fugue class of Ambroise Thomas. In 1896 he was appointed professor of piano at the Conservatory, and in 1897-98 he toured the United States with Ysaye, the famous violinist. He made a second concert tour in 1902. His compositions include an oratorio, *La résurrection de Lazare* (1879); the comic operas *Ninetta* (1882) and *Le Sosie* (1887); *Le retour d'Ulisse* (1889); operetta, *La petite Poucette* (1891); and many pianoforte pieces, vocal music, and chamber music.

PUGREE, or **PUGAREE** (Hind. *pagri*, turban). A long, light-weight, silk or muslin cloth wound round the head gear, or helmet, in tropical countries. As its origin indicates, it was first used by British soldiers serving in India, but is now part of the clothing equipment of all British soldiers serving abroad, and likewise of soldiers of all other nationalities serving in tropical climates.

PUISSET, pwê-zâ', or **PUDSEY**, HUGH DE (c.1125-95). An English Bishop of Durham and Earl of Northumberland, born in France, a nephew of King Stephen. He came to England in his teens, became archdeacon to his uncle, Henry of Blois, and in 1143, being appointed Treasurer of York, entered his long career in the ecclesiastical politics of the North. In it he was greatly assisted by Adelaide de Percy, long his mistress. In 1153, after a bitter struggle, Hugh became Bishop of Durham; but in temporal politics he took little part until 1174, when he attempted to join the rebellion against Henry II. With Richard's accession he came into new prominence because of his opposition to the King's nomination of Geoffrey for the Archiepiscopate of York, and because of his purchase of the Earldom of Northumberland. With Longchamps he had a long quarrel as to who should be chief justiciar and was finally worsted. Gradually he fell out with Richard also, and in 1194 found it good policy to surrender his earldom. His hope of repurchasing it was long baffled by his old enemy, Geoffrey, and by Hugh Bardulf, who received the earldom. PUISSET died on his way to negotiate with the King for his lost offices. He was a man of unusual ambition and ability. Durham and Northumberland made him one of the greatest princes of England. He built many castles and churches; he was a patron of Reginald of Durham, of Alan de Insulis, of Peter of Blois, and possibly of Roger of Hoveden; and it was under his orders that the *Boldon Buke* or 'Durham Domesday Book,' edited by Greenwell (1832), was drawn up.

PUISNE (pû'nê) **JUDGES** (OF. *puisne*, Fr. *puîné*, junior, from ML. *postnatus*, later-born, from Lat. *post*, after + *natus*, born, p.p. of *nasci*, to be born). Associate judges of the King's Bench Division of the High Court of Justice of England, and other divisions of the High Court in Great Britain, and associate judges in India and other British colonies. The term *puisne* was first employed, on the permanent establishment of the Court of Common Pleas at Westminster, to designate the associate judges as distinguished from the Chief Justice, who presided over the

court. Later the term was applied to the associate justices of the other courts, as the 'puisne judges of Queen's Bench Division' and 'puisne Barons of Exchequer.' At present in England the Lord Chief Justice presides over the King's Bench Division, and serving with him are fourteen puisne judges. In India puisne judges preside in the courts of various cities and districts. The term is not employed in the United States, the word 'associate' being applied to the various justices of a court to distinguish them from the Chief Justice. See COURT.

PUJOL, pu'zhôl', ALEXANDRE DENIS. See ABEL DE PUJOL.

PUKET, pōō'kêt', or TONKA. A Siamese port on Salang or Junk-seylon Island, off the west coast of the Malay Peninsula. It is noted principally for its tin mines, the annual production being estimated at more than 2000 tons. Population, about 20,000.

PULANGUI, pu-lân'gê, or RIO GRANDE DE MINDANAO. The largest river of the Philippine Archipelago. It rises near the north coast of Mindanao and flows southward through a beautiful, fertile, and populous valley as far as Lake Liguasan, whence it turns northwest, and empties into the Bay of Ilana, at Cotabato (Map: Philippine Islands, J 12). It is over 200 miles long, navigable 70 miles for vessels drawing 3½ feet.

PULASKI, pōō-lîs'kê (Pol. *Pulawski*, pōō-lîv'skê), CASIMIR (1748-79). A Polish soldier in the American Revolution. He was born in Podolia, Poland, the son of Count Joseph Pulawski, who had a leading share in the organization of the Confederation of Bar in 1768. Casimir, who had had some military experience with the Duke of Courland, joined enthusiastically in the movement to liberate his country, and fought heroically in the unequal struggle against the Russians. He was accused, unjustly it appears, of complicity in the plot to abduct King Stanislas Poniatowski from Warsaw (1771), and in consequence was outlawed and deprived of his estates. Escaping to Turkey, he passed thence to France, where he was induced by Franklin and the French Ministry to assist the Americans against England. He arrived in Philadelphia in 1777, served first as a volunteer, and then, for his gallantry at the battle of Brandywine, was appointed Chief of Dragoons with the rank of brigadier-general. In 1778, with the sanction of Congress, he organized an independent corps of cavalry and light infantry. With this body, called Pulaski's Legion, he was ordered to South Carolina. He reached Charleston on May 9, 1779, and soon afterwards led an unsuccessful sortie against the British, under Prevost, before the city. Later in the same year he commanded the French and American cavalry at the siege of Savannah, and during the attack of October 9th was mortally wounded, dying two days later on board the United States brig *Wasp*. Consult Sparks, "Life of Count Pulaski," in *Sparks's American Biography*.

PULCHERIA, pûl-kê'rî-â (c.399-453). A Byzantine empress and saint of the Greek Church. She was the oldest daughter of the Emperor Arcadius, and from early youth was noted for ability and piety. In 414 she became co-ruler with her brother, Theodosius, who was

content to leave the management of affairs in her hands. She governed wisely, was active in condemning the Nestorian and Eutychian heresies, and promoted virtue and piety. About 446 she withdrew from the Court, but after the death of Theodosius (450) she resumed the direction of the government. Early in life she took a vow of virginity, but now, having been absolved from her vow, for State reasons, she married the general Marcian. She corresponded with Cyril of Alexandria, Pope Leo the Great, and many bishops and priests, who all speak in the highest terms of her wisdom and devotion to the Church.

PULCI, pul'chè, LUCA (1431-70). An Italian poet, elder brother of Luigi Pulci. He wrote the *Pistole*, love letters in tercets; the *Driadeo d'Amore*, a mythological poem in octaves; and the *Ciriffo Calvaneo*, a chivalrous poem in octaves, which was continued by Luigi. There is some question as to whether Luca composed any part of the poem called the *Giostra*. (See **PULCI**, LUIGI.) Consult the *Pistole* in the edition of Florence, 1481; the *Driadeo* in Torraca's *Poemetti mitologici* (Leghorn, 1888); the *Ciriffo* in the edition of Florence, 1834.

PULCI, LUIGI (1432-84). An Italian poet, born at Florence of a family once wealthy and noted in the fifteenth century for its literary attainments. Both Cosimo and Piero de' Medici were his patrons and friends, and he was on terms of intimacy with Lorenzo the Magnificent. Pulci's chief work is the romantic, chivalrous poem called by him the *Morgante* when he published 23 cantos of it at Venice in 1482, and known as the *Morgante maggiore* since the appearance of the second and complete edition of it at Florence in 1483. The great value of the *Morgante* consists in the fact that it was the first artistic treatment in Italian of the chivalrous stories of Charlemagne and his peers so long before imported from France. It marks the first important step in the direction of the chivalric poem of Ariosto. There is little unity of action in Pulci's work. It takes its name from the giant Morgante, who is converted to Christianity and accompanies Orlando (Roland) on some of his expeditions, but Morgante is by no means the chief personage of the poem. Although the *Morgante* is in no sense a mock-heroic poem, it must be admitted that in its tone it often mingles the serious with the humorous, the heroic with the vulgar, the grave with the grotesque, and piety with irreverence, and all these were characteristic qualities of the Florentine democracy of Pulci's time. The first canto of his poem was translated into English octaves by Byron. Pulci's other poetical works comprise the *Confessions*, which has somewhat the air of a parody on the Scriptures; the *Beca di Dicomano*, a burlesque imitation of the *Nencia da Barberino* of Lorenzo the Magnificent; his revision of the *Ciriffo Calvaneo* of his brother Luca, and his continuation of the octaves on the *Giostra* of Lorenzo de' Medici ascribed to Luca; some *Strambotti*, some satirical and jocose sonnets, and other shorter lyrics. In prose he wrote the *Lettere a Lorenzo il Magnifico* (Lucca, 1886) and a novel. There are several editions of the *Morgante*: the *Confessione*, the *Beca*, and the sonnets may be found in the editions of Lucca, 1759.

Consult Volpi, "Luigi Pulci, studio biografico," in the *Giornale storico della letteratura italiana*, xxii., and the *Life* prefacing Bonghi's edition of the *Lettere*.

PULILAN, pul'è-làn. A town of Luzon, Philippines, in the Province of Bulacán, situated 5 miles north of Malolos (Map: Luzon, E 7). Population, in 1896, 10,058.

PULITZER, JOSEPH (1847—). An American journalist, born at Budapest, Hungary. He was privately educated, and emigrated to the United States in 1864. He served in 1864-65 in a Federal cavalry regiment, after hardships arrived in Saint Louis, was a reporter there for Carl Schurz's *Westliche Post*, a Republican journal, and later became managing editor of the paper, in which he also obtained a proprietary interest. In addition to his activity in journalism, he studied law, and, having been admitted to practice in Missouri, became somewhat prominent in local politics, and in 1869 was elected to the State Legislature. He was also a member of the Missouri constitutional convention of 1874. In 1876-77 he was Washington correspondent of the *New York Sun*, and in 1878 purchased the *Saint Louis Dispatch*, which, combined by him with the *Evening Post* (Saint Louis) as the *Post-Dispatch*, became an important journal of the West. The *New York World*, which he acquired in 1883 and with which his name became chiefly identified, attained under his direction a very large circulation. In 1884 he was elected to the Federal House of Representatives as a Democrat from the Ninth New York District, but not very long afterwards resigned to give his undivided attention to business affairs. He made several donations to educational and charitable causes, and in 1903 provided an endowment fund for a school of journalism at Columbia University.

PULKOVA, pul'kò-vá. A village in the Government of Saint Petersburg, Russia, situated on a high ridge, about 10 miles southwest of the capital (Map: Russia, D 3). It is noted as the site of the principal observatory of Russia.

PULKOVA OBSERVATORY. A Russian astronomical observatory, in latitude 59° 46' north and longitude 30° 20' east, founded by Emperor Nicholas I. for the special cultivation of sidereal astronomy. Its construction was begun in 1835 and completed in 1839 under the supervision of W. Struve (q.v.), who then became its director. Its chief instrument was a refractor of fifteen inches aperture, which was without a rival till 1870, when a twenty-four inch refractor was mounted at the Newall Observatory in Newcastle, England. This was followed by a twenty-six-inch refractor for the Naval Observatory (q.v.) in Washington. In September, 1879, a contract was made with the firm Alvan Clark & Sons of Cambridgeport, Mass., for the construction of a refractor of thirty inches aperture for the Pulkova Observatory. The instrument was delivered in 1884, but first used for observations in 1885. This instrument is now excelled by the refractors of Lick and Yerkes Observatories. The Pulkova Observatory has also a well-equipped astro-physical laboratory. Consult: *Zum 50-jährigen Bestehen der Nicolai-Hauptsternwarte* (Saint Petersburg, 1889); *Description de l'observatoire astrono-*

mique central de Poulkova (Saint Petersburg, 1845); *Publications de l'observatoire central Nicolas* (Saint Petersburg, 1893-1901).

PULLAN, RICHARD POPPLEWELL (1825-88). An English architect and archaeologist, born in Knaresborough, Yorkshire, and educated at Christ's Hospital. He studied architecture under Richard Lane in Manchester, early devoted himself to polychromy, and with Wyatt had charge of the decoration of the Byzantine and Gothic halls of the Crystal Palace (1851). In 1857 he was sent by the architectural department of the Foreign Office to examine the Halicarnassus mausoleum and to make excavations in Cnidus (q.v.); this work is described in *A History of the Discoveries at Halicarnassus, etc.* (London, 1862-63). Pullan was employed in 1862 in excavating the Temple of Bacchus at Teos, and that of Apollo Smintheus in the Troad; and in 1869 on the Temple of Athene Polias at Priene. He built several churches in Italy, and wrote *Byzantine Architecture* (1864), *Principal Ruins of Asia Minor* (1865), *Eastern Cities and Italian Towns* (1879), and *Lectures on Christian Architecture* (1879).

PULLET. One of the many provincial names for the British edible clam (*Mya truncata*). See CLAM, and accompanying Colored Plate.

PULLET, AUNT. A leading character in George Eliot's *Mill on the Floss*, the sister of Mrs. Tulliver, a selfish invalid, who domineers over her husband.

PULLEY (OF., Fr. *poulie*, probably from LGer. *pulen*, AS. *pullian*, Eng. *pull*). A circular wheel turning on a smooth axle through its centre, and with a grooved cut in its rim so that a cord can run around it. A 'fixed' pulley is one whose axle is fixed to some support; while a free pulley is not stationary, but is carried in the bight of the cord passing over it. A fixed pulley simply changes the direction of the force

cally upward; therefore if there is equilibrium $2F_1 \cos \theta = F_2$; and the mechanical advantage, $\frac{F_2}{F_1}$ is $2 \cos \theta$. In particular, if, as is usually the case, the two branches of the cord are parallel and vertical, $\theta = 0$, and $2F_1 = F_2$.

This same formula may be deduced by considering the system displaced slightly from equilibrium, using the principle of the conservation of energy.

Fixed and free pulleys may be combined in many ways, but the principle is evident. If a continuous cord passes over a free compound pulley—made up of several independent wheels—in such a manner that there are n supporting branches of the cord, the mechanical advantage is n .

Pulleys are also made in which two toothed wheels of different radii are clamped together, so that as one turns the other must also; and the cord is replaced by a chain whose links fit into the teeth. Such a pulley is called a 'differential' one. If one wheel has in its rim N teeth, and the other $N-1$ the 'mechanical advantage' is $2N$.

The principle of the action of pulleys was first given by Stevinus. See BLOCK; TACKLE.

PULLMAN. An industrial town now forming a part of the southernmost ward of Chicago. It was founded in 1880 by George M. Pullman, who established here the extensive shops of the Pullman Palace Car Company. The town was laid out along artistic and scientific lines, with handsome brick houses, wide streets, flower gardens, a fine school building, library, hotel, and theatre, and was under the sole control of the company. The idea of the promoter was to secure for his employees all the advantages which might accrue from congenial surroundings. The high rates charged for rent, water, and gas, however, caused dissatisfaction among the residents, and in 1889 they voted in favor of annexation to Chicago. Population, at that time, about 12,000. Consult Doty, *The Town of Pullman* (Pullman, 1893).

PULLMAN, GEORGE MORTIMER (1831-97). An American inventor, born in Chautauqua County, N. Y. He worked for a time as a cabinet-maker with an elder brother in Albion, N. Y., and in 1853 took a contract for moving buildings that obstructed the widening of the Erie Canal. Six years later he removed to Chicago, where he did business as a building contractor. In the same year that he reached Chicago he remodeled two old coaches into sleeping cars. Four years later he built the first new sleeping car, 'Pioneer,' upon lines of the now famous 'Pullman' cars. In 1867 he organized the Pullman Palace Car Company, and was its president until his death. In 1880 he founded for his employees the model town of Pullman (q.v.) and attempted to make the place an ideal home for his men. In 1887 he invented and put into execution the idea of vestibule trains. He was also connected with various other industrial undertakings, and was president of the company which put into operation the Manhattan Elevated Railroad of New York City.

PULMONATA (Neo-Lat. nom. pl., from Lat. *pulmo*, lung). An order of air-breathing gastropod mollusks having no gills, but the mantle-cavity modified into a respiratory sac or 'lung,'

FIG. 1.

FIG. 2.

which the cord exerts. If in Fig. 1 F_1 and F_2 are two forces acting on a cord passing over a pulley, they will be equal if the system is in equilibrium.

If a free pulley carrying a weight is supported by a cord, as shown in Fig. 2, there are three forces acting on the pulley, a force F_2 vertically down equal to the weight of the pulley and the weight it carries, and two forces obliquely upward each equal to F_1 due to the two branches of the cord which passes over the pulley. If the branches of the cord make an angle θ with the vertical, $2F_1 \cos \theta$ is the total force acting verti-

with a contractile opening under the margin of the mantle. Those forms which live in the water are obliged to obtain their air supply at the surface. The heart has only one auricle and that usually lies in front of the ventricle. The nerve cords connecting pleural and visceral ganglia are not crossed. The Pulmonata are either land or fresh-water forms, except *Onchidium*. They are all hermaphroditic. The number of known species runs up into the thousands, and though they are found in all temperate regions, they abound especially in certain tropical islands, as Jamaica and the Hawaiian Islands. In America the order is represented by many species of land-snails, slugs, and pond-snails. Few species reach a large size, and most have rather plainly colored shells. See SNAIL.

PULPIT (from Lat. *pulpitum*, platform, rostrum). A piece of church furniture used for the delivery of sermons. In the first Christian ages, when the bishops were practically the only preachers, they delivered their addresses from the episcopal throne at the end of the apse; hence a pulpit is called *chaire* in French to this day. Then the ambo (q.v.) was sometimes used for this purpose, and later the jube or rood-loft between the choir and nave. By the eleventh or twelfth century small movable pulpits had been introduced, which could be brought out at the time of the sermon; and by degrees the modern pulpit, generally on one side of the nave, was evolved. There are some excellent mediæval examples in Italy, especially that by Benedetto da Majano in Santa Croce at Florence, two very fine ones by Nicola Pisano at Pisa and Siena, and another by his son Giovanni at Pistoja. The most ancient pulpits extant in France are supposed to be not earlier than the fifteenth century. Admirable examples of wood-carving are those of Saint Etienne du Mont and Saint Germain l'Auxerrois in Paris, and Sainte Gudule in Brussels. Another notable one was made for the Cathedral of Strassburg by Johann Hammerer at the end of the fifteenth century.

PULQUE, pul'kã (Sp., from Aztec *octli*). A favorite beverage of the Mexicans and of the inhabitants of Central America and some parts of South America. It is made from the juice of different species of agave (q.v.).

PULSATILLA. See ANEMONE; PASQUE FLOWER.

PULSE (Lat. *pulsus*, a beating, from *pellere*, to drive). The rhythmical expansion of the arteries due to the blood-waves caused by successive contractions of the heart. The arteries are elastic tubes and there is injected into them at each contraction of the heart ventricles from two to four ounces of blood. As a consequence, an already full but contracted artery becomes distended, lengthened, and uplifted, giving rise to the sensation in the examining finger which is called the pulse. The pulse-wave due to any given beat of the heart is not perceptible at the same moment in all the arteries of the body. The difference in time is proportioned to the distance of the arteries from the heart, and rarely amounts to more than $\frac{1}{4}$ or 1-6 of a second. The pulse is usually felt at the radial or thumb side of the wrist, the artery being near the surface at this point and easily compressed against the bone. It may, however, be perceived in many other situations, notably at the point where the

facial artery crosses the lower jaw, in the temporal artery above the ear, the carotid in the neck, the brachial in the arm, and the femoral just below the fold of the thigh.

The pulse rate varies greatly in health according to age, sex, temperament, exercise or rest, emotional states, temperature, time of day, posture, atmospheric pressure, and personal idiosyncrasy. Before birth the average number of pulsations per minute is 150; in the newly born, from 140 to 130; during the first year of life, 130 to 115; during the second year, 115 to 100; about the seventh year, 90 to 85; about the 14th year 85 to 80; in adult life, 80 to 70; in old age, 70 to 60; in decrepitude, 75 to 65. In the female and in persons of a sanguine temperament the pulse rate is more rapid by several beats in the minute than in males and individuals of a phlegmatic type. The rate is also higher after a meal and during exercise. The pulse is most frequent in the morning and becomes gradually slower as the day advances; it is more rapid in the standing than in the sitting or recumbent posture; high temperatures also accelerate it. During sleep the pulse is usually slower than in the waking state. Forty is not an uncommon rate, and instances have been known in which the pulsations were only 30 or more rarely 20 to the minute.

In disease the pulse presents wide variations in rate, regularity, volume, and tension, and is a valuable guide in diagnosis and in estimating the physical condition of the patient, and disturbances of its relation to respiration and temperature are always significant. Excessive slowness of the pulse (bradycardia) occurs in some diseases of the heart, in conditions of collapse, in meningitis, in cerebral tumors, and in jaundice. It is also observed in convalescence from acute fevers and is probably an expression of exhaustion. As a physiological phenomenon bradycardia occurs in the puerperal state, and in hunger. As a general rule in disease the pulse is more apt to be abnormally fast (tachycardia) than slow. Nearly every disturbance of health tends to quicken the pulse; rapid heart action is the constant accompaniment of acute inflammation, of fever in all forms, and of most heart diseases. When the intervals between successive beats of the heart are not of uniform length, the pulse is said to be irregular. A pulse *intermits* when a beat is dropped out of every four or more pulsations. Another form of irregularity is known as the *pulsus bigeminus* or *allarythmia*. In this the beats occur in successive pairs with an abnormally long interval between them. *Pulsus paradoxus* consists in the diminution or total disappearance of the pulse during inspiration and is a very rare occurrence.

The pulse is said to be *full* when the volume of the pulsation is greater than usual, and it is called *small* or *contracted* under the opposite condition. Fullness may depend on general plethora and on prolonged and forcible contractions of the left ventricle of the heart; a small pulse results from general deficiency of blood, from feeble action of the heart, congestion of the venous system, or exposure to cold. When very small it is termed thread-like.

The *tension* or *hardness* of the pulse is the property by which it resists compression. A hard pulse can scarcely be stopped by any degree of

pressure by the finger. Hardness is favored by a powerfully acting heart, a normal amount of blood, and contraction of the peripheral blood vessels, as for instance by cold. Softness of the pulse is favored by a feeble heart, by valvular imperfections interfering with the supply of blood to the arterial system, and by a free flow through the capillary area. A hard pulse is generally indicative of inflammation, and a soft or compressible pulse of general weakness.

The blood from the veins returns to the heart under normal conditions in a steady stream, the pulse being lost in the capillary area. Some pulsation, however, can often be seen in the larger veins near the heart, the jugular veins, for example, in many persons with a healthy circulation. The expansion of the vein is synchronous with dilatation of the ventricles, and collapse with contraction. Another kind of pulsation, in which this relation is reversed, takes place when the tricuspid valves guarding the veins become insufficient through disease. A wave of blood is sent back into the venous trunks, producing a visible pulsation. This phenomenon may also be produced by hypertrophy of the right auricle and aneurism of the aorta.

An instrument has been devised by which the variations of the pulse can be indicated upon paper attached to a revolving cylinder. See SPHYGMOGRAPHY; HEART, DISEASES OF THE; ARTERIES, paragraph *Diseases*.

PULSOMETER. See PUMPS AND PUMPING MACHINERY.

PULSZKY, pul'skê, FRANZ AUREL (1814-97). An Hungarian politician and author, born in Eperies. He studied law, and visited England, where he wrote in German and Hungarian *Aus dem Tagebuche eines in Grossbritannien reisenden Ungarn* (1837). In 1839, he entered the Diet as member from Sáros. In 1848 he became Under-Secretary of State in the Hungarian Ministry of Finance, and subsequently Minister of Commerce. After Kossuth went to England, Pulszky remained with him, and accompanied him on his journey through America, described in *White, Red, and Black* (1852) in English. He was condemned to death in *contumaciam* by the Austrian Government in 1852. After 1860 Pulszky resided in Italy. He fought under Garibaldi. In 1866 he was pardoned. After his return to Hungary he was elected to the Diet and became director of the National Museum at Pesth. His publications include: *Die Jakobiner in Ungarn* (1851), a romance; *Eletem és Korom* (1882), an autobiography; and *Die Kupferzeit in Ungarn* (1884).

PULTENEY, pult'nê, WILLIAM, Earl of Bath (1684-1764). An English political leader, born in London. He was educated at Westminster School and Christ Church, Oxford, and after traveling on the Continent, entered Parliament as a Whig in 1705. On the prosecution of Walpole in 1712, he defended him with great eloquence, and from 1714 to 1717 was his Secretary of War. In 1725, however, he joined the opposition, and became the bitter antagonist of his former friend, succeeding by the brilliancy of his speeches in depriving him of his place. Shortly after Walpole's fall in 1742 Pulteney was created Earl of Bath. On the resignation of the Pelham Ministry in 1746 he was made Premier, but, unable to form a Cabinet, he held

the office for only two days and then practically retired from public life. As a speaker, Pulteney was full of spirit and fire and showed much of the searching keenness of satire, the inexhaustible resources of ridicule and persiflage, which distinguished him as a writer. He joined Bolingbroke in establishing *The Craftsman* (1726), a political periodical, and he wrote many political pamphlets and verses, including the popular song *The Honest Jury, or Caleb Triumphant*.

PULTOWA, pul-tô'vá. A government and a city of Russia. See POLTAVA.

PULTUSK, pul'tusk. A town of Russian Poland, in the Government of Warsaw, situated on the Narev about 34 miles north of Warsaw (Map: Russia, B 4). It is a well-built town with an old castle, the former residence of the bishops of Plotzk. It is noted as the scene of an engagement between the Russians and the French in 1806. Population, in 1897, 15,900.

PUMA (Peruvian name), COUGAR, or MOUNTAIN LION. A large American cat (*Felis concolor*) originally native from the watershed of Hudson Bay to the Straits of Magellan, and still present except in the most civilized parts of the country. It is of slender build, with a rather small head and long limbs, and usually measures about 40 inches from the snout to the root of the tail, which usually is about 26 inches in length, and of nearly the same thickness throughout. Unlike the other great American cat, the jaguar (q.v.), which is densely spotted, the adult puma has no spots, except that the lips and the outer rim of the ear are black, there is a patch of white on each side of the muzzle, and the tip of the tail usually is blackish. The upper parts are uniform dull fox-red, appearing gray in certain lights, owing to the fact that each hair is fawn-gray, red only at the tip; the throat, belly, and inside of the legs are reddish-white. This unspotted, tawny coat led the earliest explorers on the Atlantic coast to regard the animal as a lion, and the name survives in the West. The early settlers in the States called it a panther (usually pronounced 'painter'). 'Congar' is derived from a Brazilian language, but involves an error. (See COUGAR.) 'Puma' was its native name in Peru. Considering that the species is distributed over so great a range of territory, its variations in form and color are surprisingly small.

In the Eastern United States it has been greatly dreaded as a fierce and treacherous beast, particularly dangerous because of its alleged habit of springing upon travelers from branches of trees or rocky ledges. When attacked it was courageous in resistance, and the killing of one was justly considered evidence of skill and courage. In the West, on the other hand, the mountain lion, although more numerous in the Rocky Mountains than the panther ever appears to have been in the East, has always been regarded as a shy and cowardly beast, little to be feared, except when cornered. The truth seems to be that this animal has less ferocity than any other of the great cats, and under ordinary circumstances is inclined to avoid rather than to attack men, and often seems to seek their company in a friendly way. This timidity and confidence aided the easy extinction of these animals throughout the eastern part of the country, but they are still

abundant in the Rocky Mountains, and westward, where the ranching industries supply them with abundant food in the young cattle and horses. The principal food of the puma in North America was deer, but it seized any smaller prey which came in its way. The mode of hunting was by lying in wait for or creeping within leaping distance of the victim and then springing upon it. In the case of sheep, to which in the South-western United States it is especially destructive, the puma rarely contents itself with taking a single one, which would satisfy its hunger, but, having once entered a fold or flock, it kills right and left, so that in many cases a hundred sheep have been killed out of a flock in one night by a single puma. Their silence when hunting or when attacked is a notable characteristic; yet on rare occasions, in winter nights, they make the woods resound with terrifying screams. The young are born in the early spring, and are usually two or three in number; and it is believed that under natural conditions most pairs breed only once in two years. The kittens at first are covered with black spots and stripes, and their tails are ringed. These markings disappear at the end of about six months, after which they become of the uniform color of their parents. Full size is not attained before the end of the second year, and during all this time they associate with the mother, while the father of the family seems to lead a solitary existence. Like other cats, their hunting is entirely at night.

BIBLIOGRAPHY. True, "The Puma," an illustrated monograph with full bibliography, in *Annual Report Smithsonian Institution* (Washington, 1889); Merriam, *Vertebrates of the Adirondacks* (New York, 1893); Porter, *Wild Beasts* (New York, 1894); Baillie-Grohman, *Fifteen Years . . . in the Hunting Grounds of Western America* (London, 1900); Alston, *Biologia Centrali-Americana* (London, 1879-82); Hudson, *The Naturalist in La Plata* (London, 1892). See Colored Plate of CAT FAMILY, accompanying article LION.

PUMBLECHOOK, pūm'b'l-ehōōk, Mr. Uncle to Joe Gargery in Dickens's *Great Expectations*, a fishy-eyed, pompous man, who bullied Pip when he was poor, but was most servile when he came into his money.

PUMELO. See GRAPEFRUIT.

PUMICE (from Lat. *pumex*; probably connected with *spuma*, foam). An effusive igneous rock, having a spongy or frothy texture, and composed largely or entirely of glass. It is frequently made up of parallel fibres or threads with intervening spaces to form a delicate structure. It is produced by the expansion of the occluded moisture of lavas when they reach the surface of the earth, and is most abundantly developed in lavas of rhyolitic composition (see RHYOLITE), since these are usually very viscous. It may, however, be exceptionally produced in connection with any effusive rock, and is hence classified in respect to its chemical composition into rhyolite pumice, trachyte pumice, and the like. Pumice is extensively used in the manufacture of tooth powder and other abrasive materials. Most of the commercial product is derived from the Lipari Islands.

PUMP. See PUMPS AND PUMPING MACHINERY.

PUMPHELLY, RAPHAEL (1837—). An American geologist, born in Owego, N. Y., and

educated in Hanover, Germany, and in the mining schools of Paris and Freiberg, from 1854 to 1860. After explorations in Corsica and in Arizona, he received in 1861 a commission from the Japanese Government to explore the mineral wealth of the island of Yesso. In February, 1863, under pressure of the anti-foreign party, the Shogun dismissed the foreign employees who were "spying out the land." Pumpelly then went to China, and, having been commissioned by the Chinese Government to report on the coal supply of the Empire, he made journeys through the central and northern provinces and into the Desert of Gobi. Upon the completion of this work in 1864, he spent a short time in Nagasaki, and then returned to Europe by way of Siberia. The Smithsonian Institution published a volume recording his geological researches in China, Mongolia, and Japan, and this was supplemented by a popular narrative of his travels and adventures entitled *Across America and Asia* (1870). Upon his return to the United States Pumpelly was appointed professor of mining in Harvard University, an office which he held from 1866 to 1873. During a short period he was the State geologist of Michigan and then of Missouri, and in 1879 he entered the service of the United States Geological Survey. In 1879-80, he conducted at Newport, R. I., an investigation for the National Board of Health on the filtering ability of various soils. In 1881 he organized an important trans-continental survey through the northwestern territories of the United States. In 1884 he again entered the United States Geological Survey. In 1903 he left this country for the purpose of making observations in the Trans-Caspian country under the auspices of the Carnegie Institution of Washington. His publications include: *Geological Researches in China, Mongolia, and Japan*, published by the Smithsonian Institution (1866); *Across America and Asia* (1870); *Geology of the Copper District of Michigan* (1875); *Iron Ores and Coal Fields in Missouri* (1873); "The Mining Industries of the United States," in vol. xv. of the *United States Census Report* (1886); and *Geology of the Green Mountains* (1894).

PUMPKIN (variant of *pumpion*, from OF. *pompom*, variant of *pepon*, from Lat. *pepo*, from Gk. *πέπων*, *pepōn*, kind of melon, ripe; connected with Skt. *pakva*, ripe, from *pac*, to cook; influenced by popular etymology with the Eng. diminutive termination *-kin*). The common name of several annual, vine-like, tendril-bearing herbs of the genus *Cucurbita*, family Cucurbitaceæ, natives of warm countries, cultivated for their fruits. The common field pumpkin (*Cucurbita Pepo*) is a coarse running, rough-leaved vine, often exceeding 20 feet in length. The fruit is gourd-like, oblong with flattened ends, yellow when ripe, and normally weighing from 15 to 40 pounds. The edible portion consists of a fleshy layer an inch or more thick beneath the rind. In America the pumpkin is extensively planted in corn-fields in occasional hills of corn. In its raw state the fruit is used as a cattle food, and, after having its hard outer rind and seeds removed, for making pies. The method of cultivation are the same as for squash (q.v.). See Plate of CUCUMBER ALLIES.

PUMPKIN INSECTS. See SQUASH INSECTS.

PUMPKINSEED. See SUNFISH.

PUMPS AND PUMPING MACHINERY

(Of., Fr. *pompe*, Ger. *Pumpe*, *Plumpe*, *Plumpfc*; possibly, though very doubtfully, connected with Lat. *plumbum*, lead). Devices used to move liquids and gases. The various kinds of pumps, without regard to their motive power, may be broadly classified as follows: (1) Bucket lifts, or water elevators, by means of which a balanced pole, or sweep, a windlass, or a wheel, lowers, raises, and empties one or more buckets or other receptacles. (2) Displacement pumps, acting on the principle that two bodies cannot occupy the same space at the same time. (3) Impellers, which by their own continuous motion in the water to be moved impart some of their velocity to water with which they come in contact. (4) Impulse pumps, which employ the force of a suddenly arrested large column of water to lift a smaller column to a greater elevation than the original source. See HYDRAULIC RAM.

BUCKET LIFTS, or WATER ELEVATORS. These are the simplest of the four classes of pumps named. They have been used from the remotest historical times and are still employed in varying forms the world over. The well sweep, or bucket and balanced pole, still frequently seen in certain rural sections of America, is much the same as the shadoof of Egypt and the paecottah of India. The single bucket or, in Oriental countries, the earthen pot, attached to a rope, wound around a windlass, is another very common water lift. A series of buckets mounted on an endless rope or chain, dipping into the water below, and running over and driven by a wheel above, is an improvement over either of the foregoing, giving a continuous stream of water. Primitive multiple bucket or pot lifts of this general character, driven by animal power acting through a rude combination of wheels and horizontal sweeps, are sometimes known as *Persian wheels*. Modern refinements of this device are called *chain pumps*. Sometimes the wheel carrying the buckets is placed in and driven by a running stream. Another form of water lift is the scoop wheel, composed of a series of curved blades, terminating in a hollow axle, into which they discharge the water scooped up by the revolution of the wheel. Where similarly arranged curved tubes take the place of the blades the device is called a *tympanum*. Of the various water lifts described the bucket and chain pumps are most extensively used, particularly where manual labor is costly.

DISPLACEMENT PUMPS. In their most common form they employ a piston to push water ahead of them in a cylinder which the piston tightly fits, or else a plunger which does not wholly fill the cylinder, instead of forcing all the water in the cylinder ahead of it, merely displaces a volume equal to that of the plunger itself. Instead of a piston, steam or air may be used to effect the displacement. Valves are an essential feature of displacement pumps, and may also be used on the outlet end of impeller or centrifugal and jet pumps, to prevent back pressure when the pumps are not running. In the simplest form, as in the ordinary suction lift pump, described below, valves are nothing more than pieces of leather or rubber, cut to the desired shape, and hinged at one edge or side. They lift for the passage of the water upward and close on the reverse stroke of the piston in order to prevent a reverse flow. In most large pumps

many small valves are employed, instead of one of sufficient size to accommodate the whole flow of water. This reduces the shock and jar due to the sudden opening and closing of the valves. The majority of such valves consist of an inlet, valve seat, disk, or valve proper, stem, cover plate, and spring, although the spring may be omitted. The disks are commonly made of vulcanized india-rubber, and the other parts of bronze. Ball and cone valves are also used, particularly on deep

PUMPING MACHINERY—TYPES OF PUMPS.

well pumps. The Reidler valve, a German device used on some of the highest grades of American and foreign pumps, employs only one valve on each inlet or outlet, which is closed mechanically, instead of by the force of the liquid being pumped, and therefore has a positive and comparatively gentle motion, combined with a single large waterway of ample capacity. Valve stems control the lift of the valves and prevent displacement from their seats, while the springs are designed to take up slacks. When the only function of a valve is to prevent back pressure, or flow, a single check or flap valve may be used.

Displacement pumps are subdivided into many classes, of which the following are the most important: *Reciprocating pumps* have either pistons or plungers which move alternately back and forth or up and down, always in a straight line. Such pumps are single or double acting, according to whether the water is displaced on one or both parts of the stroke. They are also known as *direct-acting* when the motive power is applied in a direct line with the movement of the piston or plunger, and as of the *crank-and-fly-wheel* type, or the beam type, when either of these devices is employed to transmit the motion. The beam is similar to the walking-beam of some steamboats and is an essential feature of the old Cornish beam engine. (See STEAM ENGINES.) Pumps are known as *simple*, *duplex*, *triple*, etc., according as one, two, or more pistons or plungers are driven by a motive power unit. Beam pumps are rapidly diminishing in relative numbers. Crank-and-fly-wheel pumps are quite extensively used, particularly for high duties and for power pumps. Direct-acting pumps are very common. While large numbers of simple pumps are in use, duplex and triple, but more particularly du-

plex, are the rule, except for small sizes and special purposes. *Rotary pumps* have revolving instead of reciprocating pistons. Two pistons revolve on parallel axes. Their longitudinal surfaces are formed into a series of curves, so they mesh closely on the inside as they revolve, while their outer parts fit tightly against a curved pump chamber. *Screw pumps* displace water when revolved in a chamber with proper inlets and outlets. *Chain piston pumps* are a simple type, consisting of a series of pistons mounted on an endless chain. Both pistons and chain pass upward through a vertical cylinder, forcing water ahead of them, then descending again to repeat the process. The *Pulsometer* is a more elaborate apparatus, in which the pump and motive power are combined. The displacement is effected by means of steam, acting in two connecting chambers. On admitting steam into one of these the water is forced out gradually, but with the increasing wall area to which the steam is exposed with the expulsion of the water the steam is condensed, a vacuum is created, more water rushes in, and the steam is automatically turned into the other chamber, whereupon the process is repeated. Such pumps are very largely used by contractors and others for pumping dirty water, or even water containing mud and small stones, on account of their comparatively simple construction and great durability.

The work done by a pump, when the pump is placed above the level of the water to be raised, and at the same time below its final elevation, is frequently classified as suction-lift for the first part, and force-lift for raising the water above the pump level. Pumps may perform either suction or force lift alone, or the two combined, according to their location.

The accompanying diagram represents the ordinary suction pump. A is a cylinder, which is called the barrel; with it is connected at the bottom a pipe, B, which communicates with the water to be raised; and at its top is another pipe, C, which receives the water raised. In the barrel are placed two valves, D and E. D opens upward and is fixed in position at the bottom of the barrel; E also opens upward and is attached to and forms part of the piston F, which moves up and down the barrel when motive power is applied to the rod G. When the valve E is opened, water or air can pass through it to the upper side of the piston; but when shut, none can pass from one side of the piston to the other. The other valve, D, is similar to it in all respects. On moving the piston up the barrel, the valve E closes, owing to the atmosphere pressure above it; no air can pass from above it into the part of the barrel from which it is moving. The air contained in the lower part of the barrel becomes rarefied, by having to occupy a greater space, and exerts less pressure on the valve D at the bottom of the barrel than the air in suction pipe B below it. This valve is thus opened, and the air from the suction pipe enters the barrel; so that when the piston has arrived at the top, a volume of air equal to the contents of the barrel has passed from the suction pipe into the barrel. When the piston descends, it compresses the air in the barrel, which shuts the valve D; and when the density of the compressed air becomes greater than that of the atmosphere, the valve E in the piston is forced open, and the air in the barrel passes to the upper side of the piston. The next upward

stroke of the piston again draws a like quantity of air from the suction pipe into the barrel; and, as none of this air again enters the pipe, but is passed to the upper side of the piston by its downward stroke, the suction pipe is by degrees emptied of the air it contained. During this process, however, motion has taken place in the water at the foot of the suction pipe. The surface of the water at H is pressed upon by the weight of the atmosphere with a pressure of about 15 pounds on every square inch; and, by the laws of fluid pressure, if an equal pressure is not exerted on the surface of the water in the suction pipe, the water will rise in it, until the pressure on the surface, plus the weight of its fluid column, balances the pressure of the atmosphere on the surface H outside; so that, as the air in the suction pipe is rarefied, the water rises in it, until, when all the air is extracted from it, the water stands at the level of the valve D. By the next upward stroke of the piston, the barrel being emptied of air, the water follows the piston, and fills the barrel as it filled the suction pipe.

SINGLE SUCTION PUMP.

The pressure produced by the downward stroke shuts the valve D, and forces the water in the barrel through the valve E. The succeeding upward stroke carries this water into the pipe above, and again fills the barrel from the suction pipe. In like manner, every successive upward stroke discharges a body of water equal to the content of the barrel into the pipe above it, and the pump will draw water as long as the action of the piston is continued.

The ordinary forms of lift and force pumps are very similar to the suction-lift pump before described, with this exception, that the valve represented by E, instead of being fixed on the piston, is placed in the discharge pipe, the piston itself being solid. The water is drawn up into the barrel by suction in the manner just described in the suction pipe, and then the pressure of the piston in its downward stroke forces it through the outlet valve to any height that may be required.

In these pumps it will be observed that the water is forced into the ascending pipe or column only on the downward stroke; it will thus be discharged in a series of rushes or jerks. As it is a great object to procure a continuous discharge, both for its convenience, and for the saving of

the power wasted by the continual acceleration and retardation of the ascending column, various methods have been used for that purpose. The most common is the air chamber, which is an airtight receptacle fixed vertically on the discharge pipe; the water forced into the pipe by the down stroke compresses this air, which, acting as a spring, returns this force to the ascending column during the period of the up stroke, and so, by taking the blow of the entering water, and returning it gradually, equalizes the pressure, and renders the discharge uniform.

If in place of a piston, which fits the pump cylinder tightly, a plunger rod smaller than the cylinder be used, working in a water-tight packing or stuffing box and discharging through an outward opening valve at the other end, we have a simple force pump, which may at the same time be made very powerful. It will be understood that the pistons or plungers may work in either a horizontal or vertical direction, giving rise to the terms horizontal and vertical pumps, and that, as already mentioned under valves, most of the large displacement pumps have a number of small inlet and outlet valves, instead of one large one.

IMPELLER PUMPS include the centrifugal and the jet types. *Centrifugal pumps*, in their simplest form, consist of a series of vanes, or blades, mounted radially on an axis, and inclosed in a chamber. The centrifugal action of the revolving blades throws the water through the outlet pipe. The present accepted curved vanes tend to convert the machine into a screw pump, with displacement due to pressure. Centrifugal pumps are generally confined to raising water to comparatively small elevations, but they may be employed for higher lifts, although not so economically as some form of displacement pump. *Jet pumps* make use of a jet of steam or water, which, being delivered at high velocity through a small throat imparts some of its velocity to the water to be moved. The *air lift* has been classed by some as a displacement, and by others as a jet pump. It seems more correct to say that its action depends upon the formation of a column of water and air, which, because of its lesser specific gravity or weight, is overbalanced, or raised, by a column of water. Two tubes are employed, the smaller of which is centered within the larger. The small inner pipe conveys compressed air down into the volume of water to be lifted. The air and water together rise up through the outer and larger tube. This device is used oftentimes as a substitute for deep-well reciprocating piston pumps, which require the placing of a pump deep in the well and

connecting it by means of a long piston, or pump rods with some sort of motive power at the surface. Air-lift pumps are cheap in first construction, simple in operation, and have no wearing parts, but their fuel economy is low.

As steam lifts thousands of times more water than any other artificial agent, the term pumping engine, and even the word pump alone, is often employed to denote the combination of a pump and a steam engine in one machine; while when a pump is driven by detached motive power, even if that power be steam itself, the pump is termed a power pump—that is, one operated by independent power. There is a tendency to confine the term 'pumping engine' to more or less elaborate machines of large capacity, and to confine the use of the term 'steam pumps' to those of smaller capacity and simpler design, but there is no hard and fast line between the two. Other motive powers for pumps are electricity, gas, gasoline, and oil engines. With the exception of the steam pumping engine, the various motors employed to drive pumps will not be described further in this article, and most of the principles involved in the steam end of pumping engine will be explained under STEAM ENGINE.

SECTION THROUGH SMITH-VAILE STEAM PUMP.

STEAM PUMPING ENGINES. The simplest of these machines consists of a single steam and a single water cylinder, with a common piston, but this type did not come into use until ponderous beam engines had been employed for scores of years. All steam pumping engines have pumps of the displacement type. The steam end of the pump may use the steam at its initial pressure through the whole length of the stroke, when it falls in the simple, high-pressure type. If now the steam, after having done all possible work in the first cylinder, is admitted to a second one, still further service may be secured and the machine becomes compound. A third, or even a fourth cylinder may be used, in which case the terms triple and quadruple expansion are employed. If it is desirable to obtain still higher degrees of expansion, cut-offs are employed, so the steam is shut off when the stroke of the pis-

ton is but partially completed. The balance of the stroke is due to the expansion of the steam in the cylinder and is a gradually decreasing pressure. (See STEAM ENGINE.) In the direct-acting pumps the piston speed is maintained through the whole stroke by means of a compensating device. One of the best known of these, the Worthington high-duty attachment, employs an accumulator for this purpose, consisting of an oscillating piston. During the first part of the stroke the forward end of the pump piston forces the oscillating piston against water pressure. When the steam is cut off this pressure is automatically released, and, through proper mechanism, is utilized during the completion of the stroke, while the steam is expanding. In place of this device another manufacturer employs a portion of the high pressure of one side of a duplex engine to aid the expanding steam on the other side. Where a fly-wheel is employed it

following figures from Turneure's *Water Supply*, based on the duty per 1000 pounds of steam: High duty, 168-100 millions; ordinary pumping engines, 100-75 millions; steam pumps, 40-10 millions; direct-acting deep-well pumps, 6-2 millions; vacuum pumps, 8-2 millions; jet-pumps, 4-1 million foot-pounds. Power pumps, with direct connecting engines, the pumps alone having an efficiency of 75 per cent., are ranked at 114 to 37 millions according to the type of engines. The air-lift pumps, with a pump efficiency of 25 per cent., are figured to give duties of 31,000,000 to 6,000,000 foot-pounds per 1000 pounds of steam, with various styles of air compressors. The theoretical efficiencies of the above three classes of pumping apparatus (i.e. pump and motive power combined) range from 20.6 per cent. for the high duty engines to 0.13 per cent. for the jet pumps, 14.7 per cent. for the triple-expansion condensing engines and power pumps, 4.8 per cent. for simple high-speed condensing engines and power pumps, and 4 to 0.77 per cent. for air-lift pumps.

HISTORICAL SKETCH. The earliest authentic record of a displacement pump, or of any improvement over the water lifts, seems to be a description of the force pump of Ctesibius of Alexandria, in Hero's *Spiritualia*. Two single-acting vertical pumps were operated alternately by a common beam, or brake, and the two discharge pipes were connected with an air chamber and the stream was then thrown from a movable nozzle. Hero also described another device for raising water, in which the expansive power of steam, acting in a closed vessel, was made to displace or lift water. In the fifteenth century there is evidence of the frequent use of hand pumps in wells, and, in fact, it seems that they may have been well known over a thousand years earlier, for a German translation of *Vegetius* (Erfurt, 1511) contains an illustration of a suction-lift pump, with a rectangular barrel. The original of this work was dedicated to Valentinian II. (A.D. 375-392). The substitution of a plunger for a piston, in the ordinary force pump, is credited to Sir Samuel Moreland, who obtained an English patent on the device in 1675. His plunger passed through a stuffing box on the upper end of the vertical pump cylinder, while a double-acting force pump, differing somewhat in principle from the one just suggested, was described by La Hire in 1716, in the *Memoirs of the French Academy*. The rotary piston pump dates from the sixteenth century, or earlier. Servièrre (born at Lyons in 1593) describes a number of rotary pumps, including a double interlocking piston pump. The rotary displacement pump has been but little used, and when now employed it is generally for such service as fire protection, where economy of operation is a comparatively minor consideration. See FIRE-ENGINE.

The invention of the centrifugal pump is ascribed to Lemour, who, in 1732, sent to the French Academy a description of a very elementary hand pump of this type. An inclined tube was joined to the lower end of the axle and the whole was revolved by a crank at the upper end of the axle. One of the earliest centrifugal pumps to come into practical use was constructed in Massachusetts, in 1818, and was known as the Massachusetts pump. It was like a fan blower, with four right-angled blades. From this

WORTHINGTON PLUNGER AND RING PATTERN PUMP.

affords all necessary compensation, exactly as in the steam engine. The Holly-Gaskill is the best-known type of a horizontal fly-wheel pumping engine and the Leavitt and Allis engines illustrate the vertical type. The object of these various devices is to secure greater economy in the use of fuel, to which end an increased first cost of construction, or capital outlay, is undergone. Such engines are classed as high duty.

The duty of a pumping engine was formerly expressed in millions of pounds of water lifted one foot high by the consumption of 100 pounds of coal. Since coal is variable in quality, there was substituted for it as a basis the work done by 1000 pounds of dry steam; and as a further refinement, the work done by 1,000,000 British thermal units (B.T.U.). The two last give results that are fairly comparable for ordinary conditions, but, whereas 1000 pounds of dry steam, in a high-grade pumping engine, have yielded about 150,000,000 foot-pounds, the duty of the same engine, based on 100 pounds of coal, was about 168,000,000 foot-pounds. On the coal basis the duty of pumping engines has increased, in round numbers, from 6,000,000 foot-pounds for the Newcomen atmospheric pumping engine of 1769 to 178,000,000 foot-pounds for the best crank-and-fly-wheel triple-expansion pump of the present day. The wide range of efficiency of various types of pumps now used is shown by the

(Each Caselet of each section, 17,500,000 gallons.)

time to the middle of the century centrifugal pumps were brought out from time to time, including the Gwynn, Andrews, and Appold. The last was exhibited in England in 1851. It was a great improvement over all others up to that date and has been a basis for many of the most successful centrifugal pumps built since that time.

A crude form of water pressure pump was described by Fludd in 1618. A column of water was raised by means of a vertical piston, driven by the weight or pressure of a second and higher column. Valves were provided in the delivery tube, much as in the ordinary suction and force lift pump. An automatic three-way cock cut off and wasted the pressure water, whereupon the piston fell by its own weight. About 1739 Belidor introduced in some French mines what might be termed a single direct-acting horizontal water pressure engine, much like the simplest form of steam pump of the present day. When the pressure water, which in this case was also the water being pumped, had forced the corresponding piston to the end of the stroke, the water was automatically diverted beneath both pistons to the air chamber with which the pump was provided, and also to the other end of the pump. This reversed the stroke of both pistons, whereupon the operation was repeated.

The use of compressed air to raise water, the air itself also being compressed by a column of falling water, is described by Hero in his *Spiritualia*; this, while showing a knowledge of the principle, was merely a toy. In 1695 Denis Papin of Blois, France, utilized a waterfall to compress air and attempted to transmit the air about a mile to a mine and there drive a piston pump. The leakage and friction were so great that the attempt failed. Papin did not try to apply the air pressure directly to the water to be lifted, as described by Hero, but such an application was effected at a mine in Schemnitz, Hungary, in 1755, and continued in use for many years. In this case water was lifted from a shaft 104 feet beneath the surface by water from a spring 140 feet above the mouth of the shaft. The spring water compressed air in a strong copper cylinder at the mouth of the shaft, which, being piped to a second cylinder at the base of the shaft, forced the water up and out through another pipe. The valves connected with this apparatus were operated by hand. A number of patents for raising liquids by ejectors were granted in the United States between 1860 and 1870. At present, where compressed air is used to raise water the compression is effected by air compressors (q.v.). The air is applied in one of three ways: (1) Simple displacement; (2) as a substitute for steam in pumping engines; (3) in the air-lift pump. In all these three cases air is thus used because of its greater mechanical convenience under special conditions, or because of the readiness with which it may be conveyed through pipes at remote and inaccessible points. One of the principal examples of air displacement apparatus now in use is the *Shone ejector*. It was invented by I. Shone, of Wrexham, England, who brought it before the public in 1878. Although available for other purposes, it is chiefly used to lift sewage from relatively small isolated districts. The sewage is received in an air-tight chamber, provided with valves on both the inlet and outlet pipes. Compressed air from a central

station rushes in and displaces the sewage in the chamber. The falling sewage, when the chamber is empty, automatically shuts off the air supply. The Liernur system of removing house wastes, developed about the same time as the Shone, makes use of a vacuum instead of compressed air. By this means the wastes are, from time to time, sucked into central chambers, and from there to a single central station, where the air-exhausting pumps are located. (See SEWERAGE.) The vacuum principle, as used in vacuum pumps, is used for other purposes, but the efficiency of these machines is low and their general scope of application is otherwise limited.

The air-lift pump was suggested by Freiburg, in a pamphlet published in 1797; described in an English translation (1876) of lectures on mining by Callon; patented by Jos. P. Frizzell, of Boston, in 1880; and used in Berlin, Germany, about 1885. About the latter date, Professor Elmo G. Harris, of Rolla, Mo., developed an air lift. But the introduction of the device to practical use was largely due to Julius G. Pohle. This man, with a Mr. Hill, made various applications of air to raising water, beginning in 1886. In 1888 Pohle exhibited an air-lift pump at Alameda, Cal., and in 1892 he secured patents on it. In the following ten years the Pohle and various other air-lift pumps were adopted for raising water from deep wells at many municipal and private water-supply plants.

The development of the steam pumping engine was foreshadowed by the steam fountain of Hero; the improved steam fountain of the Italian Porta, described by him in 1601, in which a separate boiler was used; and the inventions of the Marquis of Worcester, who is supposed to have been the first to put this device in practical operation for raising water intermittently. He also used a separate boiler and displaced water intermittently from a closed vessel by steam pressure. In 1663 Worcester secured patents on an improvement of this device. A separate boiler supplied steam alternately to two vessels placed over the water to be lifted and connected thereto by means of pipes. The condensation of steam in the vessel created a vacuum, whereupon atmospheric pressure filled this chamber with water from below. Meanwhile steam displaced the water in the other vessel. This was a forerunner of the pulsometer pump, described above.

Next in order of importance among those to whom we are indebted for the pumping engine comes Thos. Savery, who in 1698 patented the first pumping engine used to drain the mines of Cornwall. In 1702 he published a pamphlet, *The Miners' Friend*, in which he described his device and its advantages. The water-raising features of this machine were essentially the same as those of Worcester, but Savery added a surface condenser and a second or feed-water boiler. In 1690 Denis Papin suggested steam as a substitute for gunpowder to move a piston. In 1705 Thomas Newcomen, John Calley, and Savery patented a pumping machine which combined a steam piston, outside condenser, balanced beam, pump rods, and a bucket piston pump. On applying the condensing jet a vacuum was created beneath the piston, whereupon atmospheric pressure forced the piston down and with its fall the steam end of the beam also fell, while the water end, with the pump rods and pump, was lifted. When steam was admitted beneath the piston, the

atmospheric pressure was balanced and the pump rods fell. It is claimed that Newcomen and Calley were under no obligations to Savery, but gave him an interest in this patent to avoid threatened legal complications. However this may be, the numerous engines of the sort subsequently built were known as Newcomen atmospheric engines. Smeaton made great improvements in the Newcomen engine, but it was James Watt who, during the second half of the eighteenth century, transformed the atmospheric into the steam engine. (See STEAM ENGINE.) Watt left the pump end of the mechanical device much as he found it. Toward the close of the eighteenth century the use of the steam engine had been confined almost wholly to the raising of water, and the most notable steam pumping engines thus far developed had been erected in the mines of Cornwall. From 1800 to 1840 various improvements in these machines were made and the term Cornish engine came into use. The pump end changed from the bucket piston lift to the plunger force pump. The ponderous beam still remained, and though in ordinary municipal water-supply practice the long and heavy pump rods were not required, the Cornish beam pumping engine was, at best, a cumbersome device.

In 1840 Henry R. Worthington, of New York, while experimenting on the application of steam to canal navigation, invented the direct-acting steam pump to feed his boilers. In 1841 this new type, the first practical application of steam in this way, was patented. In 1845 the manufacture of such pumps was begun in South Brooklyn, and in 1850 Mr. Worthington submitted a number of small low-lift valves for the single high-lift valve previously employed. In 1855 the first direct-acting Worthington pump for water-works service was put in use at Savannah, Ga. In 1857 an unsuccessful attempt was made to secure the adoption at Brooklyn of a new departure in pumping engines, namely, the duplex pump; but it was not till 1863 that the first duplex Worthington pump was erected. This was at Charlestown, Mass., and it had a capacity of 5,000,000 gallons a day. In 1884 the Worthington high-duty pump attachment, already described, was perfected by C. C. Worthington of the firm of H. R. Worthington. The original device was invented by J. D. Davis in 1879 and subsequently bought by the firm just named. The Worthington pumps are of the horizontal type, and the illustration shows a Worthington pumping machine installed at the Baltimore water-works high-service pumping station and delivering 17,500,000 gallons of water daily.

A high-duty pumping engine, designed by I. P. Morris of Philadelphia, was installed at Lowell, Mass., in 1873. It was a vertical compound, having the two steam cylinders under one end of the beam and the pump and fly-wheel under the other end. It had a daily capacity of 5,000,000 gallons and gave a duty of 93,000,000 foot-pounds per 100 pounds of coal. In the same year (1873) another type of high-duty pumping engine, after designs by E. D. Leavitt, Jr., of Cambridgeport, Mass., was tested at Lynn, Mass. It showed a duty of 104,000,000 foot-pounds per 100 pounds of coal. This was the first of a series of high-duty fly-wheel engines designed by Leavitt, which changed, later on, from the compound, or double, to the triple expansion type. One of these pumping engines, built for the Calu-

met and Hecla Mining Company, in Michigan, has a daily capacity of 60,000,000 gallons. For a high-lift and high-duty pump this is believed to be unsurpassed in size.

Another name connected with the development of pumping engines is that of George H. Corliss, of Providence, R. I. He erected a compound engine, with double-acting pump plungers, at Pawtucket, R. I., in 1878, which gave a duty of 127,000,000 foot-pounds per 100 pounds of coal. The pump end had annular bronze valve disks only 1-32 inch thick. The diameters of the valves are $2\frac{1}{4}$ inches, and the lift 1 inch. The aggregate area of the valves is equal to the area of the plungers. A type of fly-wheel pumping engine which has been very widely used in the United States is the Holly-Gaskill, invented by H. F. Gaskill, of Lockport, N. Y. The first of these was erected at Saratoga Springs, N. Y., in 1882. It had a capacity of 4,000,000 gallons a day and showed test duties ranging from 102,000,000 to 113,000,000 foot-pounds per 100 pounds of coal. It was a compound, horizontal, crank-and-fly-wheel engine with double-acting plunger pumps.

Another class of high-duty pumping engines is commonly known as the Allis, from the makers, and is frequently named from the chief engineer of the builders, Edwin Reynolds. The first pump of this type was built in 1886 for the city of Milwaukee, Wis. The three pumps and single-acting plunger, the engines are triple-expansion, and the cranks are placed on the axle at the angles of 120° with each other, in order to so vary the time of the stroke of each pump as to give a continuous flow of water. This pumping engine gave a test of 129,000,000 foot-pounds per 100 pounds of coal, which has been greatly exceeded by later Allis machines, one of which is shown on the accompanying plate.

MUNICIPAL PUMPING PLANTS. In 1582 a Dutchman named Peter Maurice erected a large pumping plant at London Bridge for the water supply of London. A current wheel drove 16 force pumps, each 17 inches in diameter and 30 inches long. By this means 216 gallons of water per minute, or 311,000 gallons a day, were raised to a cistern at an elevation of 120 feet, from which buildings near by were supplied through lead pipes.

The earliest pumping plant in America, or at least the earliest one on record as supplying water for municipal purposes, was built at Bethlehem, Pa., some time between 1754 and 1761. It is described as a five-inch lignum vitæ pump, and lifted water to a height of 70 feet, through bored hemlock logs. In 1761 three single-acting iron force pumps, of 4-inch bore and 18-inch stroke, driven by an undershot water-wheel, were substituted. Of other early American pumping plants, the Center Square and the Fairmouth works at Philadelphia, started in 1801 and 1815, respectively, are perhaps the most notable. It is stated that about 1760 a Newcomen atmospheric pumping engine was imported from England for use at copper mines near Belleville, N. J. What appears to have been the first steam pumping engine to be built in the United States was erected by the city of Philadelphia in 1800 and put in operation on January 27, 1801, at the Center Square Works. One of the pumps lifted water from the river level to a second

PUMPING MACHINERY

ST. LOUIS WATER WORKS

pump about 50 feet higher, which in turn raised it another 50 feet. Both pumps were double-acting force pumps and the engines had wooden lever beams and fly-wheels. The pumps had a daily capacity of 3,000,000 gallons. The iron steam cylinder of at least one of these engines was cut in halves, united by copper, and secured externally by an iron band 18 inches wide. This cylinder was 36 inches in diameter.

A screw wheel pump of immense size and capacity, but of very low lift, was put in operation at Milwaukee, Wis., in 1889. It is used to force water through a brick-lined tunnel, 12 feet in diameter and 2500 feet long, to flush the Milwaukee River, which is badly polluted with sewage. The screw wheel is 13 feet in diameter. At 60 revolutions per minute it delivers 525,000,000 gallons a day against a head or lift of 4 feet. On a run of a number of months it gave a duty of 69,000,000 foot-pounds per 100 pounds of coal.

C., 1898); also chapters on pumps in general reference books cited under articles on IRRIGATION and WATER-WORKS. See AIR COMPRESSORS; ARCHIMEDES' SCREWS; DRAINAGE; HYDRAULIC RAM; and STEAM ENGINE.

PUÑACA, pōo-nyä'ká. A small goby or guavina (*Dormitator maculatus*), dark brown, with lighter bluish spots, and from one to two feet in length. It presents a great variety of forms. This and a number of closely allied fishes (see GUAVINA) are called 'sleepers' because

PUNACA.

of their burying themselves in the mud in order to pass unfavorable seasons in dormancy.

PUNCH (abbreviation of *Punchinello*, from Fr. *Polichinelle*, from It. *polcicello*, clown, buffoon, puppet, diminutive of *polcino*, *puleino*, child, young chicken, from *pullus*, young chicken, young of any animal). The chief personage in the popular comic drama of *Punch and Judy*, performed by means of puppets. See PUPPET.

The history of the play in which Punch figures is hardly less obscure than that of its designation. The invention of the piece is ascribed to an Italian comedian, Silvio Fiorello, about 1600, but it was later modified by Andrea Calcese, and very likely it is in substance much older. The personality of Punch has even been

traced back to the simpleton Maccus of the ancient Atellan farces, though with little other proof than its resemblance to a small bronze figure of the latter, discovered near Naples in 1727. The form of the play, as we know it, seems to be largely of French development, since our Punch is in several respects quite different from the character as he has survived in the vicinity of Naples. Having found its way to England in the seventeenth century, the exhibition became very popular there. Its popularity seems to have reached its height in the time of Queen Anne, and Addison has given in the *Spectator* a criticism of one of the performances. The scenes, as now given by strolling *Punch and Judy* shows, are much shortened from those originally performed, in which allusions to public events of the time were sometimes interpolated. The minor variations of the acted version are infinite. Jeremy Collier called Punch the Don Juan of the people. A similar character is said to exist in the puppet shows of India and elsewhere in the Orient. In Paris Punch, who is a great favorite of the children on afternoons in the Champs Elysées, is called *Guignol* (q.v.). This name properly belongs to a puppet character of Lyons, invented about the end of the eighteenth century, quite local and figuring in several mimic comedies. When brought to Paris, the title was applied to the original *Polichinelle*. Consult works cited under PUPPET; also Collier, *Punch and Judy*, with *Punch's Real History* (3d ed., London, 1844), illustrated by Cruikshank.

PUNCH. An important English weekly paper, devoted to humorous and satirical commentary on current events. It is doubtful if the whole story of its origin will ever be known, but the consensus of opinion seems to be in favor of crediting the original idea to Ebenezer Landells, a London wood engraver and draughtsman, and Henry Mayhew, a well-known wit and writer. The original idea was to reproduce in London the success of Philipon's *Charivari*, which already had an established position in Paris. Mayhew secured Mark Lemon as editor and a staff of writers, and the first issue was published on July 17, 1841. According to Lemon's manifesto, published in the first number, it was destined to fight for the abolition of the Fleet and Marshalsea prisons and of capital punishment, and to uphold the standard of national integrity and virtue. It succeeded with the first part of its programme, and while it has ceased its crusade against capital punishment, it has consistently attacked abuses of all kinds, as well as every form of sham gentility, vulgar ostentation, crazes and fads, foolish extremes of costume, and silly affectations of fashion whether in language or in habits. Throughout the world it is regarded as an exponent of English opinion scarcely inferior to the *London Times* itself. While it draws its materials as freely from the happenings of foreign politics as from the occurrences of English national life, it has nevertheless always judged external events from the English point of view, and home affairs from the highest moral standard.

At the time of its inception it was practically the only periodical which could be said truthfully to represent the attitude of the great mass of the British nation, absolutely free from party or governmental bias. Its humor, like its policy,

has been typically English—so much so that it has been frequently misunderstood by foreign critical opinion, with the result that its insularity has lost for it the best work of non-English contributors. An exception to this rule was the engagement of 'Artemus Ward.' The renowned French caricaturist Caran d'Ache has also drawn for it. A list of the Englishmen who have met weekly about the table on which most of them have carved their initials would include many of the best-known writers and artists. Among the former may be mentioned Douglas Jerrold, Thomas Hood, and Thackeray, who wrote for it until 1854; among the latter, Keene, Sambourne, Leech, Tenniel, Briton Rivière, du Maurier, Harry Furniss, and Phil May. Lemon was editor from the beginning until 1870; the later editors have been Shirley Brooks, 1870-74; Tom Taylor, 1874-80; and Sir F. C. Burnand, 1880—. Consult: Spielmann, *The History of Punch* (London, 1895); Mayhew, *A Jorum of Punch* (ib., 1895).

PUNCH (from ML. *punctuare, punctare*, to pierce, from Lat. *punctum, punctus*, point, from *pungere*, to pierce). A tool for cutting circular or other shaped pieces out of metal, wood, or other materials. The simplest form of this instrument consists of a piece of steel formed at one end into a hollow cylinder, the end of which is ground to a very sharp cutting edge. The other end of the punch is made strong and thick, to receive blows from a hammer, and to serve as a handle. When the instrument is in use, the cutting edge is applied to the surface which is to be perforated, and a blow sufficiently hard is struck on the end of the handle, when a circular piece of the material is cut out and left in the hollow part, which can be removed at the upper end of the cylinder. Punches are also made where a die or punch fits accurately into a corresponding hole through which the material is forced. See DIES AND DIE SINKING. For punching machines, see METAL-WORKING MACHINERY.

PUNCTUATION (ML. *punctuatio*, from *punctuare, punctare*, to pierce). In writing or printing, the use of certain marks called points, to separate sentences and parts of sentences. Its most important office is that of preventing ambiguity or obscurity. More inclusively, its object is to indicate correct grouping of the words, as an aid to quick perception of their relationships, and so of their meaning.

In Greek inscriptions and manuscripts generally, there is no attempt to separate the words, and in early times no system of punctuation was employed. It is true that in some archaic inscriptions columns of dots are occasionally found separating words, but they have no reference to the pauses, and cannot properly be called punctuation. However, even by the end of the fourth century B.C., readers found it convenient to indicate pauses by arbitrary signs, though the published copies of books seem to have known no division of words or use of diacritical signs. The development of an organized system of punctuation seems to have occurred at Alexandria. To judge from the papyri, the earliest mark is used to indicate a new paragraph. Here a slight space is left in the line (later a large initial is sometimes found), while below the line in which the pause occurs is drawn a short horizontal line (the so-called *παράγραφος, paragraphos*) which sometimes takes the form of a wedge. This

sign is used in the plays to indicate a change of speaker, and in the papyrus of Bacchylides to mark in the odes the strophe, antistrophe, and epode. Another method was the employment of a dot or small circle, and we are told that Aristarchus of Byzantium systematized this use, so that the point high above the line indicated a full stop, that low on the line a lesser pause, like a semicolon, and the point in the middle a comma. This system, however, though accepted by the grammarians, does not appear in the papyri, where the point is usually placed high, whatever its value.

In general it may be said that these and other diacritical signs seem to have been used chiefly in editions of the poets, whose dialectic and archaic forms presented greater difficulties to the ordinary reader. Other systems, some of great complexity, were employed by later grammarians and editors, but did not come into general use. The Greek manuscripts of later date show a system more like that now employed. About the ninth century the comma appears to denote the slight pause, while the high dot (·) indicates a colon or semicolon, and the full stop is denoted by a larger dot or double dot and a space. A little later the interrogation point (;) appears, though not very frequently. The Latin grammarians adopted the punctuation by dots from the Greeks, but seemingly modified the system slightly so as to give the middle dot the middle value, and the lower the smallest. The oldest manuscripts, however, show no punctuation at all, and the later uncials show great variety, and no recognized system. In the seventh century we find the equivalent to a comma, the semicolon with its modern value, and a full stop expressed by a more complex sign. In the Carolingian and later manuscripts the system is somewhat altered, and approaches more closely that in common use, as the comma is introduced, and an inverted semicolon to indicate a pause between comma and semicolon, while a sign of interrogation also appears. Quotation marks in various forms are found early in both Greek and Latin manuscripts.

All modern languages agree practically in the use of the same points, applied according to principles laid down by Aldus Manutius (1450-1515), but since his time, of course, extensively developed. Differences in detail between languages rest mainly on different methods of thought and construction, though some peculiarities are arbitrary. In Spanish a question or an exclamation has its especial mark at the beginning as well as at the end. French has a peculiar set of quotation marks, and German uses commas in normal position at the beginning and inverted commas at the close of a quotation. But the leading principles are universal. Punctuation in English is legitimately subject in many respects to personal choice, since many sentences, when not very long and of simple construction, are equally clear whether points are or are not freely used. Liberal insertion of points is called close punctuation, and omission of all but those absolutely necessary is known as open punctuation. The latter practice probably prevails at present in the best English usage, although the only statement that may be made with certainty in this respect is that usage is not uniform.

Differing methods of pointing have been called

rhetorical punctuation and *grammatical* punctuation, with the supposition that in the former case, for guidance in reading, each place of natural pause should be indicated by a distinctive point. It was probably this rhetorical or elocutionary consideration that led to the assignment of time values to the marks. The comma was said to indicate a pause long enough to count one, the semicolon two, the colon three, and the period four. But good reading or speaking does not justify this notion of counting, pauses being made where even a rhetorical punctuator would not indicate them, and the time of the pause being often shortened or lengthened in a way that cannot be recognized without the addition of other distinctive marks not yet invented. In any case the reader's individuality may ignore punctuation. Consequently, punctuation governed by purely grammatical circumstance seems likely to prevail increasingly, although it has not yet entirely superseded the other method. Another classification has been made, including, besides rhetorical and grammatical, *etymological* and *reference* punctuation; but, although the marks for the last two purposes are used in positions similar to those of real punctuation, their nature more nearly approaches that of diacritics.

The comma is used to mark the slightest actual turn or jointure in grammatical construction, and thus occurs much more frequently than any other point. Very often it is placed after a long nominative without an actual break in sense, but no one has ever prescribed an exact or even approximate length of the subject after which the comma is to be used.

The semicolon is used after a clause when the turn in sense is too distinct to use merely a comma, and not sufficient for a period; most frequently between clauses all or some of which contain commas. Often a semicolon is placed between what might be made separate sentences; this is done, as it is in this instance, because of a closer connection of sense than where the sentence form is used. Discriminative use of the semicolon is often considered a test of punctuation.

The colon is now generally confined to an introductory function, being comparatively seldom used as a mark of ordinary grammatical punctuation.

The period is used at the end of every sentence that is not a question or an exclamation, an interrogatory or exclamatory sentence being properly ended with its own appropriate mark.

The dash is used to denote a sudden change in the construction, a suspension of sense, an unexpected transition in the sentiment, a sudden interruption, or hesitation.

Marks of parenthesis are used to inclose a word, phrase, clause, or sentence inserted independently, as for explanation or any similar purpose. Square brackets inclose an insertion not merely disconnected, but having no effect on the meaning of the context, an editorial explanatory word or phrase, or an independent direction, as in dramatic composition. An apostrophe is the sign or part of a sign of the possessive; it takes the place of letters omitted in contracting a word; and it is used to mark the end of a quotation whose beginning is marked by inverted commas. The use of various other marks is commonly explained in treatises on punctuation, including

marks of reference, elision, emphasis, connection, and diacritics.

Some difference in punctuation is generally considered necessary according to differences in composition. Thus, a succession of short sentences may need very little pointing within any sentence, while even the same thoughts might be expressed by the use of one long, complex sentence that demands, for unmistakable division into parts not liable to confusion in reading, correspondingly complex punctuation. Accordingly, authors must determine this matter without strict reference to any formulated set of rules, as occasional demands for special pointing cannot all be comprehended in any system. As a rule, for instance, the frequent use of dashes has been stigmatized as a mark of ignorance; but, notwithstanding, it may be—but not often—truly artistic. Again, while it has been said that the colon has practically gone out of use as a purely grammatical point, it also may be used freely by a master hand with so good effect as to be beyond criticism. Among the fullest and most noted of the older treatises are: Brown, *Grammar of English Grammars* (1851 and many later editions); Wilson, *Treatise on Punctuation* (1850 and many later editions). Recent special works are: Bigelow, *Handbook of Punctuation* (Boston, 1885); Teall, *Punctuation* (New York, 1897).

PUN'DIT (from Skt. *paṇḍita*, learned). The name given to a Brahman who is versed in the Sanskrit language, and in the science, laws, and religion of the Hindus.

PUNICA FIDES, *pū'nī-kā fī'dēz* (Lat., Punic faith). A term used by the Romans to express treachery, in allusion to the popular conception of the Carthaginians.

PUNIC WARS. The name commonly given to the three great wars waged between Rome and Carthage; the first (B.C. 264-241) ended with the cession of the Carthaginian part of Sicily to Rome; the second (B.C. 218-201) resulted in the loss of Spain to Carthage, and the third (B.C. 149-146) in the destruction of Carthage. The Latin word *punicus*, or *panicus*, was the name given by the Romans to the Carthaginians, in allusion to their Phœnician descent. See **CARTHAGE**; **HAMILCAR**; **HANNIBAL**; **ROME**; **SCIPIO**.

PUNISHMENT (from *punish*, from OF. Fr. *punir*, from Lat. *punire*, *pœnire*, to punish, from *pœna*, punishment, expiation, pain, from Gk. *ποινή*, *poinë*, punishment; connected with Gk. *ἔλκεν*, *elkein*, Skt. *ci*, to avenge). Pain or suffering inflicted because of some misdeed. In criminal law the word punishment is used to designate the penalty inflicted by the State upon a person for committing a criminal offence. The earliest forms of punishment were those which carried with them the idea of vengeance and were inflicted with the desire to do harm to him who had previously done harm. More recently, however, the idea of retribution has made way for the theories of prevention and reformation. The former of these theories insists that the State shall inflict upon a criminal only such punishment as will keep him from further wrong-doing and deter others from criminal acts. The latter theory regards the reformation of the criminal as the only legitimate design of punishment and maintains that when this is accomplished further punishment should cease. None of these three theories—of retribution, preven-

tion, or reformation—holds absolute sway in our criminal codes. Generally there are traces of all three, although the tendency of recent development has been in the direction of reforming the criminal.

In the early history of society the infliction of punishment for crime was left in the hands of the person wronged, or his kin, clan, or tribe. The punishments inflicted were usually characterized by cruelty and were out of proportion to the offense committed. Indignities were frequently inflicted upon the body of a criminal after death. When, moreover, certain standards concerning the degree of offense came generally to be accepted, the punishment for the same offense varied according to the social rank of the injured party. In the course of time a system of fines was substituted for physical punishment. By the payment of a fine to the injured person or to his family, the offender was made free from liability to further punishment.

With the increasing complexity of society and the development of the idea of the State, the right to punish was taken away from the offended party and vested in the State. Crimes came to be considered as offenses against the State, the social order, and punishment is now regarded as an act of social defense calculated to establish the inviolability of the law and to deter those who may be criminally inclined from overstepping the limits of legally permissible conduct.

Punishment, in criminal law, possesses four characteristics. First, it represents, objectively, some pain or damage inflicted upon an offender. Whether the person punished conceives the punishment as a pain or damage does not matter. Secondly, punishment is imposed by government as the representative of legal order in society. Thirdly, it is determined and carried out as a consequence of judicial procedure and decision. Fourthly, it aims at some definite purpose, whether this purpose be the maintenance of order, retribution, or reformation. Punishments are of varying nature; they may involve encroachment upon the life or physical integrity, on the personal liberty, on the property, or on the rights and privileges of an offender. To the first of these classes belong capital punishment and such generally obsolete punishments as the cutting off of tongue or hands. In the second class we find deportation, imprisonment, and compulsory labor. The third class includes fines and the confiscation or destruction, by the State, of an offender's property. As punishments of the fourth class, the criminal is often deprived of political or civil rights belonging to citizenship, such as the electoral franchise, capacity to testify in courts of justice, or to hold office. Forms of punishment formerly in vogue, but now discarded among civilized nations generally, are mentioned under TORTURE.

Some of the qualities which 'ideal' punishments should possess, to correspond to modern ethical standards, are the following: (a) Morality. Punishments should not stunt or destroy the moral sense of the culprit or of those witnessing the punishment. (b) Equality. Punishments should represent a damage or pain of equal importance or intensity to different offenders committing the same crime. This condition is difficult to fulfill, for the imposition of different punishments for one and the same crime seems to be a violation of democratic principles, while

a fixed fine of say \$100 for a specific offense represents a much severer punishment for a poor man than for a man of wealth. (c) Personality. The evil effects of punishment should be confined to the offender alone, and not extend to innocent persons. (d) Elasticity. The punishment should be such that it can be varied to suit the various degrees of guilt. (e) Commensurability. The diverse punishments of the criminal code must be of such a kind that they may be compared with one another, and thus permit the judge to choose among several penalties that which corresponds in severity to the gravity of the offense. (f) Reparability. It should be possible in case of judicial error to repair the injury done to a person unjustly condemned.

Sometimes the laws prescribe a definite penalty for a specific offense, and the judge then has no choice. Usually, however, he is permitted to elect among several penalties which the law permits for a given misdemeanor; he may choose, for example, between "a fine of from \$1 to \$100 or imprisonment for a period not less than three days or more than three months." Theoretically the nature and method of punishment might be left entirely to the discretion of the judge; but this system is unknown in practice.

PUNJAB, pūn-jāb', or **PANJAB** (Hind., five rivers: the Jhelam, Chenab, Ravi, Sutlej, Beas). A northwestern province of British India (q.v.), bounded on the north by the Northwest Frontier Province and Kashmir, on the east by Tibet and the United Provinces of Agra, on the south by Rajputana and Sindh, and on the west by the Northwest Frontier Province (Map: India B 2). The last was in great part included in the Punjab until 1901, when it was constituted a separate province, thereby reducing the area of the Punjab to 133,741 square miles. Of this area 97,209 square miles are directly under British administration, the remaining 36,532 square miles being occupied by a number of feudatory native States, of which the largest is Bahawalpur. The extreme northern part of the province lies among the foothills and projecting spurs of the Himalayas, but the greater portion consists of an almost perfectly level plain sloping gently from an elevation of 1600 feet at the base of the mountains to less than 200 feet in the extreme southwest. This plain is traversed by the Indus (which flows on or near the western boundary), and its great tributaries, the Jhelam, Chenab, Ravi, and Ghara, or Sutlej (the chief affluent of which is the Beas), which all unite into the Panjnad before they enter the main stream near the southwestern boundary. The climate of the plains is excessively hot and dry in summer, the temperature sometimes rising to 120°. The winters are cool, with occasional frosts at night. The rainfall ranges from 36 inches in the north to only 4 inches in the south, being in the greater portion insufficient for the needs of agriculture. Healthy vegetation is accordingly confined to narrow lands along the river courses, and the great interfluvial tracts, known as *doabs*, are covered only with a scanty jungle of scrub, here and there affording pasturage.

As in all parts of India, most of the inhab-

itants are engaged in agriculture. The soil as a rule is highly fertile and only lacks an adequate water supply. In the south there is practically a barren desert. In the extreme north good crops are usually raised and without irrigation. There is a larger irrigated area in this province—9,375,000 acres—than in any of the other governmental divisions. This area has been greatly extended in recent years, owing to the large irrigating enterprises of the British Government, the Government canals supplying an area of 4,243,000 acres. An area almost equal to this amount is watered from wells, but reservoirs or 'tanks' are almost wholly wanting. In the south the canal system of irrigation prevails and the irrigated areas fringe the river courses. In the northern half of the country wells are common, and the cultivated area is not limited to the proximity of the rivers. The Punjab has become noted for its wheat crops. It produces more wheat than any other province. The wheat-growing area, however, has not increased for some time. Rice, on the contrary, receives much less attention than in most of the sections of the country, less than 500,000 acres being devoted to it. Large quantities of pulse, millet, and other food grains are grown, and sugar-cane, cotton, and oil seeds are also important products. The general desert conditions are of course a serious disadvantage to pastoral pursuits, yet this industry receives considerable attention, and the cattle for 1900 were estimated at 8,197,000 head, the buffaloes at 2,495,000, and sheep and goats at 9,901,000. The horses, mules, and donkeys together numbered less than 1,000,000. In the drier portions of the country camels are the most serviceable animals, and the province contains twice as many of them—271,000—as any British Indian Province. See INDIA.

Some manufacturing is engaged in, the Oriental domestic methods being most common. In 1899 there were 106 factories, employing 12,054 hands. Among the chief products are muslins and other cotton goods, manufactures of camel's hair, and glazed tiles and pottery. The potter's art especially has degenerated under foreign influence. The province now has railroad connection with the three principal trade centres of India—Calcutta, Bombay, and Karachi. The Indus River affords water transportation, but railway competition has reduced this to a minimum. The imports into the Punjab from other parts of India average about \$35,640,000 annually, the largest items being cotton goods (mostly European), sugar, rice, and iron. The exports average about \$29,160,000 annually, the principal articles being wheat, raw cotton, hides, grain and pulse, rape and mustard seed. Over 90 per cent. of the wheat passes through the port of Karachi.

The chief executive officer of the province is the Lieutenant-Governor, who is appointed by the Governor-General of India with the approval of the Crown. Since 1897 the province has had a legislative council of nine nominated members. There are 148 municipalities, in two-thirds of which the municipal committees are elected by the rate-payers. District boards have oversight of the rural regions, and most of the districts are divided into smaller divisions with local boards.

The population, in 1901, numbered 22,455,819 (of which, however, 2,125,480 have since been deducted as belonging to the Northwest Frontier Province). Between 1890 and 1900 there was

an increase of 7.13 per cent., as against an increase of 10.74 per cent. in the preceding decade. There were 202 inhabitants to the square mile, or considerably less than half the density of the Ganges Valley region. Since the Punjab lies at the northwest gateway of India, the numerous migrations and military expeditions from the west have passed through it, making it the scene of numerous conflicts. The result has been that in many respects it is different from the other portions of India. The Caucasian blood is more pronounced, as is also the military spirit. The Jats constitute a large part of the population. The Pathans have scattered settlements throughout the province, and the Beluchis have settlements on the Lower Indus. Over one-half of the people are Mohammedans—a larger per cent. than is found in other parts of India. The Pathans and the Beluchis nearly all hold to that faith. A large number of Jats are Hindus. The Sikhs (q.v.) are an offshoot from the Hindu Jats. The Christians numbered in 1901 only 53,587, of whom 30,839 are Europeans. The caste system, as adopted by the Indus Valley Jats, differs materially from the original system. The Sikhs have endeavored without success to abolish caste. As in other parts of India, most of the population lives in rural villages. Delhi, the largest city, had a population in 1901 of 208,300. Lahore, the capital, ranks second with 120,000, having decreased from 176,800 since 1891. In 1897 there were 8507 schools of all grades, with 265,922 pupils. The cost of maintaining these was divided between the provincial and the local units of government supplemented from fees and other sources. For the history of the Punjab, see SIKHS; and for the language, see PANJABI LANGUAGE AND LITERATURE.

(London, 1882); Medlicott, *Sketch of the Geology of the Punjab* (Calcutta, 1888); Gore, *Lights and Shades of Hill Life in the Afghan and Hindu Highlands of the Punjab* (London, 1895); Latif, *History of the Punjab from the Earliest Antiquity to the Present Time* (ib., 1896).

PUNKIE (of uncertain etymology). One of the biting midgets of the family Chironomidae and genus Ceratopogon. These flies are very minute, and one species (*Ceratopogon nocivum*) is the cause of considerable distress to hunters in the Maine woods, where it is called 'no-see-um.' Other species are found in both North and South America. The larvæ feed on decaying animal or vegetable matter.

PUNNAH, pūn'ā. A native State of India. See PANNA.

PUNO, pūn'ō. The southeasternmost department of Peru, bounded on the north by Cuzco, on the east and south by Bolivia, and on the west by Moquegua and Arequipa (Map: Peru, C 6). Area, about 40,000 square miles. The northern part of the department is occupied by the Carabaya Range of the eastern cordillera of the Andes, whose forest-covered slopes belong to the region of the Montaña, and give rise to the River Madre de Dios. The southern half belongs to the basin of Lake Titicaca, whose waters form the southeastern boundary of the department. The

greater part of the inhabitants, chiefly Aymara Indians, live in the lofty Titicaca basin, where the climate is cold and but little agriculture can be carried on. The chief occupation is cattle-raising, and very little is produced for export. Population, in 1896, 537,345. The capital is Puno (q.v.).

PUNO. The capital of the Department of Puno, Peru, 100 miles east of Arequipa, on the western shore of Lake Titicaca, and on a branch of the Mollendo-Cuzco Railway (Map: Peru, D 7). It is the centre of trade between Bolivia and the Peruvian coast. Population, about 5000.

PUN'SHON, WILLIAM MORLEY (1824-81). An English Wesleyan Methodist minister. He was born at Doncaster, Yorkshire, became a local preacher in the Methodist Church, entered the ministry in 1844, and was sent for a few months to the theological institution at Richmond. His first regular parish was Whitehaven (1845), and he held pastorates in Newcastle-on-Tyne, Sheffield, Leeds, London, and Bristol. In 1868 he was sent to Canada, where he was president of the Conference for five successive years, and was instrumental in building churches, strengthening Victoria University, and the enlargement of the denomination. In 1873 he returned to England. In 1875 he became secretary of the Wesleyan Methodist Missionary Society. His eloquence and power as a preacher placed him among the foremost clergymen of his day. He published volumes of addresses, lectures, and sermons and one volume of poems. Consult his *Life* by Macdonald (chapters xi.-xv. by Professor Reynar; London, 3d ed., 1888).

PUNT, pōont (Egyptian *Puēnt*). A country on the Red Sea, often mentioned in the hieroglyphic inscriptions, whence the Egyptians obtained incense, gold, ebony, ivory, leopard skins, ostrich feathers, and other commodities. The earliest recorded voyage to Punt was under King Assa of Dynasty 5, and King Se'ankh-ka-rē of Dynasty 11 sent an expedition which, crossing the desert from Koptos to the Red Sea, built a ship and sailed down the coast to Punt. Expeditions were also sent thither by Amenemhat II., Thothmes III., Rameses III., and other monarchs. Queen Hatshepsut (Hatasu), who sent a whole fleet to Punt, caused the details of the voyage to be depicted upon the walls of the Temple of Deir el-Bahri, with interesting representations of the inhabitants of the land and of their dwellings. The question as to whether Punt is to be sought on the Asiatic or the African side of the Red Sea has given rise to much discussion, but from the evidence of the Egyptian monuments it seems clear that it corresponded with the modern Abyssinian and Somali Coast. Consult: Dümichen, *Die Flotte einer ägyptischen Königin* (Leipzig, 1868); Müller, *Asien und Europa* (ib., 1893); Erman, *Life in Ancient Egypt* (London, 1894); Naville, *Deir el-Bahri*, Memoirs XII., XIII., XIV., and XIX. of the Egypt Exploration Fund (London, 1894 et seq.).

PUNT, pünt (AS. *punt*, from Lat. *ponto*, *punt*, *pontoon*, from *pons*, bridge). A heavy, oblong, flat-bottomed boat, propelled by a pole thrust against the bottom of a river or lake, and useful where stability and not speed is needed. It is a primitive form of boat, found in many countries, notably from ancient times on the waterways of Mexico. Punting has,

however, become a popular sport, especially in England, where the conditions of climate and the nature of the rivers are particularly favorable to it. The Thames Punting Club was revived in 1890, and holds championship and other races. This club differentiates punts from other partly similar boats by defining a punt as "a flat-bottomed craft without stem, keel, or stern-post, and with the width at each end at least one-half of the width of the widest part." Amateur punting championships have been held in England annually since 1886, and professional races since 1876. See *BOAT*.

PUNTA ARENAS, pōon'tá á-rá'nás. A port of Chile situated on the northwest shore of the Strait of Magellan (Map: Chile, C 14). The town has grown rapidly, and has broad streets, several fine buildings, and electric lighting. It is an indispensable port of call and coaling station for all steamers passing through the Strait, and has a growing trade in wool, skins, beef, and other cattle products. Population, in 1895, 3227; in 1900 (estimated), 6419.

PUNTARENAS, or PUNTA ARENAS. The principal seaport on the Pacific coast of Costa Rica, situated on the Gulf of Nicoya, 44 miles west of San José (Map: Central America, E 5). Its harbor is provided with an iron breakwater, but large vessels anchor outside. It is the western terminus of the transatlantic railroad from Port Limón. It has steamship communication with the United States. It exports coffee, rubber, tortoise-shell, and silver. Population, about 5000.

PUPA (Lat., doll, puppet). That stage in the life of an insect having perfect metamorphoses which intervenes between the larva and the adult. See *INSECT*; *METAMORPHOSIS*.

PUPIE'NUS (M. Clodius Pupienus Maximus). Joint Emperor of Rome with Balbinus for a few months in 238. They were elected by the Senate when the news came that the two Gordians had died in Africa, and both were before long assassinated by the soldiery.

PUP'IN, MICHAEL IDVORSKY (1858-). An American physicist and inventor, born at Idvor, Southern Hungary, of Serbian ancestry. He was educated at the village school of his native town and at a military school at Prague, and came to America in 1874. He entered Columbia College in 1879 and graduated in 1883. He then studied mathematics and physics at Cambridge University, England, and also at the University of Berlin, where in 1889 he received the degree of doctor of philosophy, holding while abroad the John Tyndall Fellowship of Columbia. Upon his return to America he was appointed instructor in mathematical physics at Columbia University, and in 1892 adjunct professor of mechanics. In 1901 he became professor of electro-mechanics. Professor Pupin's most important researches were in electrical resonance, electrical wave propagation, and theoretical and experimental consideration of the magnetization of iron. He became well known for his work on the propagation of electrical waves, as he was able to apply his researches in this field to long-distance telephony and multiplex telegraphy. By his use of non-uniform conductors in which wire coils possessing a certain amount of self-induction were placed at stated intervals along the conductor, he

was able to prevent the attenuation of the electrical waves so that a far greater amount of the original current could be received at the terminal of the telephone conductor or cable. This invention greatly extended the limits of long-distance telephony and made possible the use of the telephone with cables of considerable length. The rights were acquired by the Bell Telephone Company, in 1901, a year after the research had been described before the American Institute of Electrical Engineers, and was also bought by German telephone interests and given an extensive and successful trial.

PUPIP'ARA (Neo-Lat., from Lat. *pupa*, doll, puppet, *pupa* + *parere*, to bring forth). A so-called series of flies including those forms in which the female gives birth to full-grown larvæ which immediately transform to pupæ. The term is really erroneous and the group is not a natural one, the points of resemblance, as Müggenberg suggests, being probably the results of convergence. The series comprises four families, the Hippoboscidæ or bird-ticks (see TICK; FOREST-FLY), the Braulidæ or bee-lice, the Streblidæ, and the Nycteribiidæ or bat-ticks. (See TICK.) The flies of this group have very abnormal habits and live by sucking the blood of mammals, birds, and bees; in some cases they are wingless parasites. The family Braulidæ consists only of single species, *Braula cæca*, a minute insect which lives on bees. The adult is said to deposit a pupa in the cell of a bee by the side of a young bee larva. The queen bee is said to be especially affected by the adult Braulas. The series Pupipara corresponds with the group Eproboscidæ, which is ranked as a suborder of the Diptera.

PUPPER, pup'pēr, JOHANN. The correct name of the German Augustinian monk called Johannes von Goch (q.v.).

PUPPET (OF. *poupette*, doll, from Lat. *pupa*, doll, puppet). A small jointed figure, commonly of wood or cardboard, representing a character on the stage of a puppet theatre, and moved with strings, or iron rods, or otherwise by a concealed agent. For the dialogue in this mimic drama, the invisible operator varies his voice as he takes the different rôles. The more elaborately installed puppets are now commonly called marionettes, from the French term, *marionnettes*, a diminutive, perhaps through the form *mariolettes*, of Marie, and denoting originally little figures of the Virgin Mary. Of the simpler form of puppets, the familiar representatives are Punch and Judy. See PUNCH.

The origin of this form of entertainment is lost in antiquity. It was known to both Greeks and Romans. Figures with movable limbs have been found even in the tombs of ancient Egypt and of Etruria, though many of these were probably only dolls for children and afford little evidence of a puppet drama. Of this perhaps the earliest development was in India. It is significant that the Sanskrit equivalent for stage-manager, *sūtradhāra*, literally means thread-holder. In China puppet-shows are likewise known, and also an adaptation of them in which the movable figures cast their shadows upon a curtain, whence the name, *ombres chinoises*. See SHADOW-PLAY.

Puppet-shows have received perhaps their highest development among the Javanese, who may have derived the idea from India. The Javanese puppets are ordinarily about two feet high, and

of elaborate, usually grotesque formation. They are used for shadow-plays as well as for direct representation, and the dramas in which they are employed are of great elaboration—often of religious and ceremonial significance. In Java, also, women sometimes dress as puppets and act in shadow-plays, imitating the stiff posturing of their models. Although choruses may be given them, the dialogue remains with a separate speaker. This affords a living analogy to a similar stage in the development of Oriental drama, tradition of which is preserved in China. Among the Turks, too, and in Mohammedan countries generally, the puppet-show is a popular entertainment, in which, it is asserted, the marionette actors exhibit a style of immorality even more atrocious than does our own Punch. Puppet-shows were used in the Middle Ages by the Christian Church, among other dramatic means, such as miracle-plays. In England these religious puppet-plays were called *motions*. The earliest exhibitions of this kind consisted of representations of stories taken from the Old and New Testaments, or from the lives and legends of saints. Several men gained reputation in the eighteenth century as puppet exhibitors, among them Powell, Pinkethman, Yates, and Flockton. In Germany puppets are said to have been known as early as the twelfth century. Lessing and Goethe in their day thought the subject not unworthy of their serious artistic attention. A favorite piece in the German puppet theatres early in the nineteenth century was *Doktor Johannes Faust*, which was published at Frankfurt in 1846. In France the introduction of regular marionettes is commonly credited to Pierre Brioché, who had a puppet-show on the Pont Neuf at Paris, in the reign of Louis XIV., but there is reason to believe that they were really known there much earlier. They have been especially popular at Lyons, where the character of *Guignol* was invented, but naturally they are a familiar adjunct to fairs and other periodic festivities generally.

Of the marionette drama of Western Europe the real home, however, seems to be among the Italians. Puppet theatres have been known for centuries at Naples, Milan, and elsewhere, and in America the best-maintained marionette shows are among Italian immigrants. The dialogue in these mimic theatres is in its detail largely extemporized. The favorite themes are legends of the Court of Charlemagne. There is, moreover, a considerable literature for the marionette stage. Thus, besides what has already been mentioned, may be cited such German collections as Engel, *Deutsche Puppenkomödien* (Oldenburg, 1874-92), Kollmann, *Deutsche Puppenspiele* (Leipzig, 1891), and Mahlmann, *Marionettentheater* (Leipzig, 1806), and also some of the best-known pieces of Maeterlinck, to say nothing of his imitators. A distinction might, however, properly be drawn between plays actually for marionette performance and the so-called 'plays for marionettes,' which merely form a modern literary type subtly defined through the associations of the name. On the puppet theatre there are observations in *The Spectator* and *The Tatler*, and Addison wrote a Latin poem entitled *Machinæ Gesticulantes* (Anglice, *A Puppet-Show*). Consult on the history of the subject: Magnin, *Histoire des marionnettes* (2d ed., Paris, 1862); Pischel, *Die Heimat des Puppenspiels* (Halle, 1900); Maindron, *Marionnettes et guignols* (Paris, 1900).

PUQUINA, pōō-kē'nā. A people of very low grade of culture and intelligence formerly living upon certain islands in Lake Titicaca and the adjacent shores in Southern Peru. Their language constitutes a distinct stock, and is said to have been at one time one of the three general languages of Peru.

PURACÉ, pōō-rā-sā'. A volcano rising from the Central Cordillera in Colombia, 220 miles southwest of Bogotá and immediately east of the town of Popayán (Map: Colombia, B 3). Its present height is about 15,500 feet, but previous to 1849, when its top was blown off by an explosion, it was considerably higher. The crater is still active, emitting continuously large quantities of hot vapor.

PURĀṆA, pōō-rā'nā (Skt., ancient lore). The name of a class of late poetic Hindu works of mixed cosmogonic, epic, and didactic character. The word *purāna* occurs frequently in the prose texts of the Veda as a designation of the Veda's own cosmogonic and legendary lore; the name is also given to the great epic, the *Mahābhārata* (q.v.). But in its most distinctive sense the word refers to a class of writings which certainly do not date before the sixth century A.D., and some of which may be as late as A.D. 1500. The existing Puranas seem to be sectarian religious manuals for the people, written in the interest of either the worshippers of Vishnu (q.v.) or Siva (q.v.). Though the fundamental Hindu Triad, Brahma, Vishnu, and Siva, is recognized the Vishnuite Kurma-Purana does not hesitate to say: "Vishnu is the divinity of the gods, Siva of the devils;" to Brahma all alike refer only in a perfunctory fashion. According to ancient tradition, the ideal Purana is divided into five parts: (1) Primary creation, or cosmogony; (2) secondary creation, or the destruction and rebuilding of worlds; (3) genealogy of gods and patriarchs; (4) *Manvantaras*, the periods of reigns of Manu; (5) the history of the dynasties of kings. Though no extant Purana is so divided, yet the subject matter roughly follows that order. The entire type of composition is of secondary importance; it borrows its themes very largely from the epic literature, and represents religion, practices, and legends in an exaggerated, fantastic, often distorted fashion. The actual light which the Puranas shed upon the antiquity they profess to illumine is very small. The number of Puranas is said to be eighteen, in the following order: Brahma, Padma, Vishnu, Siva, Bhagavata, Naradiya, Markandeya, Agni, Bhavishya, Brahmavaivarta, Linga, Varaha, Skanda, Vamana, Kurma, Matsya, Garuda, Brahmanda. Some lists omit the Agni and replace it by the Vayu-Purana. Of these the second, third, fifth, sixth, tenth, seventeenth, and probably the first are Puranas of the Vishnu sect; the fourth, eighth, thirteenth, fifteenth, and sixteenth belong to the Siva sect. The others are not so well defined. A great many of the Puranas have been edited and published, or are in course of publication, especially in the collection of texts published in Calcutta under the name of *Bibliotheca Indica*. Of translations there are few; the most accessible specimen in English is the translation in five volumes of the Vishnu-Purana by Wilson, edited by Fitzedward Hall (London, 1864-70). The first nine books of the Bhagavata-Purana were translated into French by Burnouf (Paris, 1840-44).

PURBECK BEDS. The name given in England to a group of strata forming the upper member of the Oolite group of the Upper Jurassic, well developed in the Isle of Purbeck, south of Poole estuary, in Dorsetshire.

PURCELL, HENRY (c.1658-95). One of the most eminent of English musicians. He was born at Westminster, and was the son of Henry Purcell, one of the gentlemen of the chapel royal appointed at the Restoration. He lost his father at the age of six, and was indebted for his musical training to Cook, Humphreys, and the famous English church organist and composer, Dr. Blow. His compositions at a very early age showed evidence of talent. In 1680 he was chosen to succeed Dr. Christopher Gibbons as organist of Westminster Abbey, and in 1681 he was made organist of the chapel royal. He wrote numerous anthems and other compositions for the Church, which were eagerly sought after for the use of the various cathedrals, most of which have retained their place and popularity to the present day. Purcell's dramatic and chamber compositions are even more remarkable. Among the former may be mentioned his music to *The Tempest*, his songs in Dryden's *King Arthur*, his music to Howard's and Dryden's *Indian Queen*, to Urfe's *Don Quixote*, and his *Fairy Queen*, the manuscript of which, long lost, was found in 1901. A great many of his cantatas, odes, glees, catches, and rounds are yet in demand throughout England. In 1683 he composed 12 sonatas for two violins and a bass. Purcell studied the Italian masters deeply, and often made reference to his obligations to them. In originality and vigor, as well as harmony and variety of expression, he far surpassed both his predecessors and his contemporaries. His church music was collected and edited from the original manuscript by Vicent Novello, in a folio work which appeared in 1826-36, with a portrait and essay on his life and works. He was regarded as the father of what has since come to be recognized as English melody. He died of consumption in London, and was buried in Westminster Abbey.

PURCELL, JOHN BAPTIST (1800-83). A Roman Catholic clergyman. He was born at Mallow, Ireland, and came to the United States at the age of eighteen. He studied at Asbury College, Baltimore, at Mount Saint Mary's College, Emmitsburg, Md., at Paris and Issy, and was ordained at Paris in 1826. Returning to the United States, he became professor of moral philosophy at Mount Saint Mary's College, and eventually was elevated to the presidency. In 1833 he became Bishop of Cincinnati, in 1839 assistant at the Pontifical throne, and in 1850 Archbishop of Cincinnati. During his long pre-eminence he extended the effectiveness of the Church in his diocese and gained great personal popularity both within and without his own Church. Misfortune overtook his later years through unfortunate investments or the inadequate business management of funds intrusted to the keeping of his brother, the Rev. Edward Purcell. The Archbishop assumed responsibility for the failure, making an assignment of his personal and diocesan property for the benefit of the creditors.

PURCHAS, SAMUEL (c.1575-1626). An English clergyman and author. He was born at Thaxted, in Essex. Taking orders after his graduation from Saint John's College, Cambridge,

he became curate of Purleigh, in Essex, afterwards minister at Estwood, in Essex, and with an interim when he served George Abbot, Archbishop of Canterbury, as chaplain, finally became parson of Saint Martin's, near Ludgate. He is notable, after Hakluyt, as the writer and compiler of books of voyages; and having inherited many unpublished narratives, upon the death of the former, he resigned his living to engage in their publication. His works are: *Purchas, His Pilgrimage, or Relations of the World and the Religions Observed in All Ages* (1613), a work which assembles all accessible information gathered from the various voyagers concerning the inhabitants of the world and their religions; the writer's industry, as he declares in his dedicatory epistle, led him to consult 1200 authors; *Purchas, His Pilgrim. Microcosmus, or the History of Man. Relating the Wonders of His Generation, Vanities in His Degeneration, Necessity of His Regeneration* (1619); *Hakluytus Posthumus, or Purchas His Pilgrimes, Contayning a History of the World in Sea Voyages and Land-Travells by Englishmen, and Others* (4 vols., 1625). This work contains the matter left by Hakluyt, is now exceedingly rare, and much sought after. Its accuracy is not above criticism.

PURCHASE. A mechanical contrivance of pulleys and ropes for gaining power. See **BLOCK**; **TACKLE**.

PURCHASE. In its technical legal sense, the act by which a person acquires an estate in land in any way other than by inheritance, where the heir is substituted in place of his ancestor by operation of law. Consult the authorities referred to under **REAL PROPERTY**.

In a popular sense the word purchase denotes the act of buying any kind of property, the purchaser being called the *vendee* and the seller the *vendor*. See **SALES**.

PURCHASE SYSTEM. A former system of obtaining commissions in the British Army, abolished by royal warrant in July, 1871. The system did not exist in the Royal Artillery, Engineers, Marines, Nineteenth to Twenty-first regiments of cavalry, and the 101st to 109th regiments of foot. Regulations fixed the value of the different grades as follows:

Lieutenant-colonel.....	£4,500
Major.....	3,500
Captain.....	1,800
Lieutenant.....	700
Cornet or Ensign.....	450

In practice, much higher prices would often be paid, particularly in the Guards regiments. No rank above lieutenant-colonel could be purchased. In defense of the system it was argued that it tended to secure for the army men of wealth and high station, which had a corresponding effect on the standing and morale of the army. On the other hand, it was held that it barred out many desirable men, and confined army commissions to a privileged few.

PURCHAS JUDGMENT. A celebrated ecclesiastical judgment rendered by the judicial committee of the Privy Council in *Herbert vs. Purchas*, an appeal from the Canterbury Court of Arches brought in 1871. The defendant or respondent was charged with Popish practices in connection with public services conducted by him at Saint James's Chapel, Brighton, England. The principal offenses charged were the use of the

mixed chalice, of a cap or beretta, of 'holy water,' and of wafer-bread in the Eucharist, the wearing of certain vestments, and the turning of his back to the people at certain stages of the service. The decision of the court was adverse to Mr. Purchas on all points except that relating to the beretta. The judgment was rendered on an *ex parte* hearing, as the respondent was provided with funds to procure counsel only after the decision was pronounced; his petition for a rehearing of the case was refused, and the course of the court in so doing was the subject of much unfavorable comment. Mr. Purchas was compelled to pay the costs and admonished to discontinue the prohibited practices. He refused to comply, and in 1872 was suspended, and his property sequestered to pay the costs. He died in October, 1872.

PURDUE' UNIVERSITY. A coeducational State institution of higher learning at Lafayette, Ind., established in 1869, and named for John Purdue, an early benefactor. Its income is derived chiefly from the land grant of 1862 and from the Morrill and Hatch acts, and amounted in 1903 to \$219,611. The university is the Indiana Institute of Technology, designed to afford a good theoretical and practical education in mathematics, science, literature, and art. It embraces six schools: Mechanical Engineering, Civil Engineering, Electrical Engineering, Agriculture, Science, and Pharmacy. Students in each of the schools are required to spend an average of three hours a day in laboratory, shop, or field. It confers the degrees of bachelor of science and graduate in pharmacy in course, and the following degrees for advanced work: Master of science, mechanical, electrical, and civil engineer, and analytical chemist. The requirement for admission is an examination or a certificate from a commissioned school. In 1903 there were 1339 students and 99 instructors. The university has 90 acres of land in its campus and farm. Its endowment was \$340,000, its grounds and buildings were valued at \$558,000, and the total value of the college property was estimated at \$760,000. The library contained 11,611 volumes.

PURGATION. See **COMPURGATION**.

PURGATIVES (Lat. *purgativus*, cathartic, from *purgare*, to cleanse, from *purus*, pure + *agere*, to drive, to do). Medicines which, within a comparatively short time after administration, produce a more or less fluid evacuation of the bowels. These drugs act partly by stimulating the peristaltic motion (q.v.) of the intestine, whereby the contents of the bowel are hurried in their passage to the rectum, and partly by determining the passage of a large amount of fluid into the intestine from the blood vessels. Purgatives may be classified as follows: (1) *Laxatives* (q.v.). (2) *Simple purgatives*, including aloes, rhubarb, cascara sagrada, senna, and ox-gall. (3) *Drastic purgatives*, such as jalap, scammony, gamboge, croton oil, colocynth, elaterium, and calomel. Small doses of the drastic purgatives act as mild cathartics; when taken in large doses, they act as irritant poisons, and are employed when milder purgatives have proved inefficient, or when it is necessary to remove a large quantity of fluid from the system, as in dropsical affections. Certain of these drugs, as jalap, elaterium, and scammony, are called *hydragogue* cathartics, because of the large amount

of secretion they excite. (4) *Saline purgatives*. These also increase the secretion of intestinal fluid and hinder its reabsorption, so that a large amount of it accumulates in the bowel and excites gentle peristalsis and a free evacuation. The salines are largely used as habitual purgatives. They form the essential ingredient of most purgative mineral waters (q.v.). In this class are sulphate of magnesia, sulphate of soda, phosphate of soda, and the potassio-tartrate of soda either in simple solution or in the form of Seidlitz powder (q.v.). (5) *Cholagogic purgatives* are those which have a stimulating effect either on the secretion or flow of the bile, and produce green-colored or 'bilious' stools. Several of the drugs already mentioned possess this property. Among the cholagogues most frequently employed are podophyllin, calomel, mercury, and the phosphate and sulphate of soda. Consult Potter, *Materia Medica, Pharmacy, and Therapeutics* (New York, 1903).

PURGATORIO, *pōōr'gā-tō'rē-ō* (It., Purgatory). The second part of Dante's *Divina Commedia*. After leaving the Inferno, Dante, guided by Vergil, reaches the Mount of Purgatory in the Western Ocean. They ascend the steep approach to the gate of Purgatory, where Dante's forehead is marked by an angel with seven P's (standing for *Peccatum*—'sin'), one of which he loses on each of the seven terraces where the seven deadly sins are punished. When they reach the river bounding Purgatory, Vergil leaves Dante, and Beatrice approaches to lead him onward to Paradise.

PURGATORY (ML, *purgatorium*, from Lat. *purgatorius*, cleansing, from *purgare*, to cleanse). The name given, in the Roman Catholic and Oriental churches, to a place of purgation, in which, according to their doctrine, souls after death either are purified from venial sins or undergo the temporal punishment which, after the guilt of mortal sin has been remitted, still remains to be endured by the sinner. The ultimate eternal happiness of their souls is supposed to be secured; but they are detained for a time in a state of purgation, in order to be fitted to appear in the presence of God. See INTERMEDIATE STATE.

PURGSTALL, JOSEPH HAMMER-. See HAMMER-PURGSTALL.

PURIFICATION (Lat. *purificatio*, from *purificare*, to make pure, from *purus*, pure + *facere*, to make). In a biblical sense, the act through which an individual became fit to approach the deity, or regained his place in the community after having been excluded from it by some disability. Purification consisted chiefly in ablutions, but these were sometimes accompanied by special sacrifices as expiations. Priests and Levites were consecrated for the divine service by 'purification' (Lev. viii.), and certain religious acts could only be performed after ablutions. Generally no one was allowed to enter the temple or synagogue without washing or 'sanctifying' himself. In the post-exilic period washing was considered by some (as the Pharisees and Essenes) one of the chief duties of piety. Apart from the temple service, however, many other things required purification. (See UNCLEANNESS.) It is a mistake to assume that the origin of laws of purification is hygienic; they are merely phases of the general notions of

taboo (q.v.). The question of health naturally enters later, in the reflective age, but has no force in primitive times. Laws similar to the Jewish are found among Mohammedans, and with Hindus and Persians laws of purification are even more exacting.

PUR'IM. One of the later Jewish festivals, for which the Jewish Church accepts the Book of Esther as the historical basis. According to this book, the festival was instituted to commemorate the deliverance of the Jews of Persia from a massacre with which they were threatened in the days of Xerxes (B.C. 485-465) at the instigation of Haman, the King's prime minister. It is celebrated on the 14th and 15th of the month Adar and is preceded by a day of fasting as preparation. (Cf. Esther iv. 15-17.) Scholars who hold that the Book of Esther (q.v.) is largely or purely fictitious, think that it may have been written to justify and account for a fast and festival, the origin of which was lost in obscurity. What the earlier significance of fast and festival was is conjectural in the absence of definite data. They are thought to be of Babylonian origin. The occurrence in the spring suggests a solar festival, the fast representing the death of winter, while the festival marks the joyous return of spring. Thus interpreted Haman and Vashti symbolize the disappearance of the old year; Mordecai and Esther, hailed as King and Queen, are the new favorites who bring in fertility and renewal of vegetation. The feast of Purim corresponds in time with a festival, mentioned in the Books of the Maccabees, in celebration of a victory gained by Judas Maccabæus, on the 13th of Adar, B.C. 161, over Nicanor (I. Mac. vii. 49; II. Mac. xv. 36). This seems to have been earlier a festival in honor of the dead. See FESTIVALS.

The name Purim is explained in the Book of Esther as 'lots,' and the application of it to the festival as due to the fact that Haman cast lots to determine a day favorable for the extermination of the Jews (Esther iii. 7; ix. 26). This is probably merely a piece of folk-etymology and illustrates the obscurity as to the meaning of the name at the time of composition of the book. In Babylonian there is a word *puru*, one meaning of which seems to have been 'a round stone,' and then 'lot,' from the use of stones in divination. Possibly the Jewish author of the Book of Esther, living in Persia or Babylonia, had this word in mind, but it does not necessarily follow that *pūrim* is identical with *puru*. The problem may be solved if a festival be discovered among Babylonians or Persians bearing the name *pūrim*, or something sufficiently like it to account for the Jewish form.

As celebrated by Orthodox Jews, the Purim festival is a time of feasting and merry-making. It begins as soon as the stars appear on the evening of the 14th of Adar. Candles are lighted. Consult: Lagarde, *Purim, ein Beitrag zur Geschichte der Religion* (Göttingen, 1887); Erbt, *Die Purimsage in der Bibel* (Berlin, 1900); Frazer, *The Golden Bough*, vol. iii. (2d ed., London, 1900).

PURITAN, THE. A yacht designed by Edward F. Burgess, built for a syndicate by Lawley, and launched in South Boston, May 26, 1885. She combined the features of the centre-board sloop with the outside ballast of the Eng-

lish cutter. Her dimensions were: length over all, 93 feet; on water line, 81 feet 11 inches; beam, 22 feet 7 inches; draught, 8 feet 10 inches. After winning in the trial races, she defended the America's Cup in 1885 against the English yacht *Genesta*, winning in two races on September 14th and 16th.

PURITANS (from Lat. *puritas*, purity, from *purus*, pure). A party title, originally a nickname which came into use about 1564, to designate that section of the Church of England which desired a more thorough reformation of the Church than was effected under Elizabeth, as such reformation was understood by Continental Protestantism, especially of the Calvinistic school. From the beginning of the Reformation age there had been three parties in the Church of England: a Romanizing element which desired to continue the connection with the Pope, whom it regarded as the vicar of Christ; a Protestant party which desired the full modification of the Church of England, at least in doctrine, into conformity with Continental Protestantism; and an intermediate party that, for want of a better designation, may be called Anglican, which wished to see all foreign ecclesiastical authority rejected, disliked monasticism, and welcomed the use of English in the services of the Church, but did not desire such thorough-going modification of its doctrine or organization as the Protestant section sought. This Anglican party looked to the sovereign as the source of ecclesiastical government, and was that which was represented by Henry VIII. and Elizabeth. To the thinking of these energetic monarchs the desirable system of Church government for England was one in which the ruler should be supreme in ecclesiastical no less than in civil affairs. The political condition of England, also, at the beginning of the reign of Queen Elizabeth was such as largely to justify the compromising attitude of the Queen regarding doctrine and ceremony. A minority only of the population was heartily in sympathy with the Reformation. The great bulk of the clergy had been swept almost without question from the Roman obedience of Queen Mary's time into Elizabeth's Establishment; and the Queen's political policy, no less than her personal preferences, counseled her to make the ecclesiastical transition as easy as possible by retaining not a little of the ceremonies and vestments of the older worship and by insisting upon uniformity of ceremonial without very strenuous investigation into the belief or even the conduct of the ministry.

This compromise policy, however, was distasteful to the thoroughly Protestant party in the Church of England. Many of their leaders had fled to the Continent to escape the Marian persecution, and had there come into intimate association with Calvin and the Swiss reformers generally. It was natural, therefore, that the model into accordance with which they desired to modify the doctrine and worship of the English Church was that of Continental Calvinism. Yet at first few of the Puritan leaders desired anything more than the disuse of the vestments which seemed to them to symbolize too great a distinction between clergy and laity, and the abandonment of certain ceremonies which appeared to them to countenance what they deemed Roman sacramental misconceptions. Strongly conscious of the spiritual needs of England, they desired,

furthermore, the establishment everywhere of an earnest preaching ministry and of vigorous discipline. These aims conflicted, however, with the Queen's policy of inclusion, and she set herself vigorously to enforce conformity in ceremony by the aid of the bishops, who, under the Elizabethan policy, were regarded primarily as royal agents.

The result of this policy was a further evolution in Puritanism itself. While a great portion of the Puritans continued to represent the desires of the earlier period of the party which have just been described, a considerable section now went further and questioned the rightfulness of that form of Church government 'by law established' which prevented the reforms that they wished. The typical leader of this second stage of Puritanism was Thomas Cartwright (1535-1603). In his opinion the only biblical system of Church government was one essentially Presbyterian; and, while he was willing to tolerate the existence of an extremely modified episcopacy, he would introduce into each parish the disciplinary and elective features of Presbyterian government. From thence onward until the Restoration, a large portion of the Puritan party walked in Cartwright's footsteps, and sought the modification of the Church of England essentially along Presbyterian lines. A small wing of extreme Puritanism went yet further, and under the leadership of Robert Browne, Henry Barrowe (qq.v.), and others, insisted that the only proper organization of the Church was in separate self-governing congregations, and that it was the duty of Christian men to leave the Church of England and establish such congregations; hence this extreme radical wing of Puritanism was known as the 'Separatists.' These Separatists were vigorously opposed by the more moderate Puritans of Queen Elizabeth's time; but their spiritual sympathizers were to be the founders of Plymouth in New England, and their conception of Church government was ultimately to dominate the Puritan settlers of Massachusetts and Connecticut.

Throughout the reign of Elizabeth the repressive policy of the Government continued, but the Puritan party grew, and on the death of the Queen, in 1603, entertained strong hopes of favor from the new sovereign, James I. These hopes were disappointed, notably at the Hampton Court Conference (q.v.) in 1604. The Puritan party, however, continued to gain adherents throughout James's reign and that of his son Charles I. Under the latter repeated clashes occurred between the Puritans and the Anglican Court party; and when the Civil War broke out in 1642 as a result of the many points of difference between Charles and the Parliament, the Puritans identified themselves strongly with the latter, while the Anglicans cast in their lot with the former. In the struggle that followed, the Presbyterian wing of Puritanism was at first dominant, especially when reinforced by the military and political aid of the Scotch. Episcopacy was done away with, so far as an act of Parliament could abolish it. The acceptance of the 'Solemn League and Covenant' bound the English Parliament to practical Presbyterianism, and Parliament responded to the desire for a modification of the Church of England, always characteristic of Puritanism, by calling an 'Assembly of Divines,' which met at Westminster from July, 1643, onward, to

recommend alterations in doctrine and Church government. (See CREEDS AND CONFESSIONS.) The result of its sessions was the preparation of an essentially Presbyterian Directory for Worship and form of discipline, of a Confession of Faith, and of two Catechisms. This Westminster Confession was accepted by the 'General Assembly' of the Church of Scotland in 1647 as its doctrinal standard, and approved, with some modifications, though not completely given the sanction of law, by the English Parliament in 1648.

But, while the Westminster Assembly had been doing this work, the influence of anti-Presbyterian types of opposition to episcopacy had been growing in the army. The Presbyterian majority in Parliament and in the Westminster Assembly were as strongly insistent on uniformity and as opposed to toleration as the Anglican party had been. But the more radical religious thinkers represented in the army, who were grouped together under the general name of 'Independents,' demanded by their very variety of opinion a certain measure of toleration, and the course of the struggle made the army the dominant force, for the time being, in English political life. The result was that the Presbyterian system was never fully established in England, and the Westminster Confession of Faith never obtained more than a limited recognition there. The forces of Puritanism were divided and Presbyterian Puritanism found it impossible to establish the principles which it desired to make controlling. Under the protectorship of Cromwell to his death, in 1658, the army's principle of partial toleration was dominant, but Cromwell's government, though enlightened and forceful, rested ultimately on the sword, and did not, therefore, enjoy the confidence of a majority of the people of England as a permanent system. His death left no efficient successor, and the restoration of the monarchy and with it Anglicanism was inevitable. Attempts were made at adjustment by which the Presbyterian wing of Puritanism, at least, might be included in the Establishment, and men like Richard Baxter labored to this end, but without success. Puritanism, instead of being a party within the Church of England as it had thus far been, was driven outside that Church and made to assume the attitude of 'Dissent,' to the great spiritual loss of the English Establishment. In spite of the discussions of the previous twenty years, no considerable number of Englishmen had yet accepted the principle of toleration at the time of the Restoration, and the result was that the triumphant Anglican faction adopted a rigorously persecuting policy toward Puritanism. Under the Act of Uniformity (q.v.) all Puritans who would not wholly accept the Prayer Book were driven from their livings. Some two thousand ministers of Puritan sympathies are alleged to have been thus excluded. Episcopal ordination was now made obligatory; and by the 'Conventicle Act' of 1664, any assembly of five or more persons not of the same family, for worship, was forbidden, save in conformity with the Church of England. The 'Five-Mile Act' of 1665 forbade all in holy orders who would not take oath never to attempt any alteration in the government of Church or State to continue to live within five miles of where they had exercised their ministry or of any English borough.

Moved by the desire to favor Roman Catholi-

cism, and anxious to gain, if possible, the support of the Dissenters, James II. modified this repressive policy by issuing a Declaration of Indulgence in 1687; but a permanent legal status was not acquired by Puritan Dissent until after the revolution which put William and Mary on the throne. The Toleration Act of 1689 gave to the evangelical dissenting bodies a permanent and recognized, if limited, freedom of worship and an established legal position. At the time of the Toleration Act about two-thirds of the Puritan Dissenters appear to have been Presbyterian in polity and one-third Congregational or Baptist. The fire and enthusiasm of the movement had been largely spent, but it still continued a strong religious force, chiefly among the middle class of the population. During the course of the eighteenth century the Presbyterian wing of Puritanism became largely affected by Arian and Unitarian opinions, while the Congregational section was not so influenced to any marked extent. By the beginning of the nineteenth century the Congregational wing was the largest, and the spiritual life of Puritanism had been greatly reënforced by the effect of the Wesleyan movement. Its later history may be traced in the story of the religious bodies known as Presbyterian, Congregational, and Baptist.

Outside of England, the chief effect of the Puritan movement is to be seen in the planting of New England and the development of its characteristic religious faith and ecclesiastical polity. See CONGREGATIONALISM.

The literature of Puritanism is very extensive. The following volumes may be cited as of importance in connection with its story: Calamy, *Abridgment of Mr. Baxter's History of His Life and Times* (London, 1702; edited by Palmer as the *Non-Conformist Memorial*, London, 1775); Neal, *History of the Puritans* (London, 1732; annotated editions by Toulmin, Bath, 1793-97; by Choules, New York, 1844); Brook, *The Lives of the Puritans* (London, 1813); Price, *History of Protestant Non-Conformity in England* (London, 1838); Marsden, *History of the Early Puritans* (London, 1853); id., *History of the Later Puritans* (London, 1853); Hopkins, *The Puritans* (New York, 1859-61); Green, *History of the English People*, section "Puritan England" (London, 1874); Gardiner, *The First Two Stuarts and the Puritan Revolution* (London, 1876 and 1888); id., *History of England from the Accession of James I., etc.* (London, 1883 sqq.); Wakeman, *The Church and the Puritans* (London, 1887); Ellis, *The Puritan Age and Rule in the Colony of the Massachusetts Bay* (Boston, 1888); Campbell, *The Puritan in Holland, England, and America* (New York, 1892); Gregory, *Puritanism in the Old World and in the New* (London, 1896).

PURPLE COLORS. Painters in oil and water colors produce the different shades of purple by the admixture of red and blue. Dyers obtain this color from various sources, all of which are curious and interesting. From a very early period, purple has been one of the most highly prized of all colors, and came to be the symbol of imperial and royal power. Probably one great reason for this was the enormous cost of the only purple color known to the ancients, the Tyrian purple, which was obtained in minute quantities only from a Mediterranean species of

molluscous animal or shell-fish, the *Murex trunculus*, and perhaps also *Purpura lapillus*. The chief seat of the industry from most ancient times was Tyre, where it continued to flourish in Imperial Roman times. Tarentum, the modern Otranto, was the seat of one of the great murex fisheries of the Romans, and there they had a number of large dyeing establishments. With the decline of the Roman Empire the employment of this purple color ceased, and it was not until a Florentine of the name of Orchillini discovered the dyeing properties of the lichen now called orchella weed that a simple purple color was known in Europe. The discovery was kept secret in Italy for nearly a century, and that country supplied the rest of Europe with the prepared dye, which received the name of orchil or archil (q.v.). The color was very fugitive, and soon ceased to be used by itself; it, however, was found very useful in combination, and has a remarkable power of brightening up other colors. Many improvements have been lately made in archil dyeing, especially in fixing it. Its value, however, has been greatly lessened by the discovery of the beautiful series of purples yielded by coal-tar as results of the combination of one of its products called aniline with other bodies. Consult: Dedeken, *Ein Beitrag zur Purpurkunde* (Berlin, 1898); Faymonville, *Die Purpurfärberei des klassischen Altertums* (Heidelberg, 1900).

PURPLE-FACED MONKEY. A Ceylonese langur. See LANGUR; WANDEROO.

PURPLE FINCH. A beautiful, crimson-tinted finch of the Eastern United States and Canada. See FINCH; and Plate of FAMILIAR SPARROWS.

PURPLE GRACKLE, HERON, MARTIN, ETC. See GRACKLE, HERON, etc.

PURPLE ISLAND, THE. A long poem by Phineas Fletcher (1633), describing the human body allegorically as an island of which the bones are foundations; arteries, rivers; heart and organs, cities; intellect, the king, attacked by diseases and vices. This unwieldy and involved conception displays much anatomical knowledge, melodious verse, and impressive descriptions of vices and virtues.

PURPLE OF CASSIUS. See CASSIUS, PURPLE OF.

PURPLES. A nematode disease of wheat. See EARCOCKLES.

PURPLE SCALE. A name originating in Florida for *Mytilaspis citricola*, a scale insect

THE PURPLE SCALE.

1. Mature scale: a, upper surface; b, under surface; showing eggs. 2. A scale in formation: a, top view; b, side view.

which occurs exclusively upon citrus plants and swarms in the orange and lemon orchards of the

Southern United States, frequently causing great damage. It was introduced at one or two places in California about 1896, and is even more injurious in that State than in Florida when special efforts are not made to reduce its numbers. The species is probably of Chinese origin, and has now spread to most parts of the world where oranges and lemons are grown. It occurs upon the twigs and branches, but has a strong tendency to overrun the leaves and the fruit. It is apt to infest the lemon, citron, and those varieties of orange which have large oil cells in the skin of the fruit, such as the tangerine. The remedy most in use in Florida is the kerosene emulsion spray.

PURPLE-SHELL. A gastropod mollusk of the genera *Murex* and *Purpura*, whose secretions give a purple stain. Certain other mollusks, as *Janthina* and *Aplysia*, yield a violet-hued liquor, while others, as *Arca*, pour forth red blood. The discovery and use of this color are prehistoric and myths have arisen to explain them. Long before the beginning of the Christian era the gathering of the mollusks and application of the dye were practiced in factories all about the eastern part of the Mediterranean, several species of small *Murex* serving the purpose—principally *Murex trunculus*. The most famous place of production was near Tyre, whence the product came to be called Tyrian purple. It was limited in supply and costly, and from an early time—tradition says from the era of Romulus—was reserved wholly for the use of royalty in Church and State. Hence the terms and symbolism of this color as imperial, and the phrase *porphyro-genitus*—‘born to the purple.’ The color is still reserved in various ceremonial usages to officials of high rank. Accounts of the various tints are given by Pliny (Natural History, Vol. II., Book IX.) and by others. The most highly esteemed Tyrian hue was a deep blood-color, but full violet, heliotrope and intermediate shades were made by blending. Tarentum, in Southern Italy, also produced a famous red, and great heaps of broken shells in that neighborhood remained in 1789 to attest the importance of this ancient industry. The process was one of crushing the shell and macerating the animal. The juices were at first nearly colorless, but on exposure to the light and proper treatment the rich purple hue was developed. Sunlight seems to have been necessary.

Of the mollusks other than *Murex* which yield the dye, the most important is the nearly related *Purpura*, especially the ‘dog-whelk’ (*Purpura lapillus*), a shell the size of an almond or smaller, which abounds on both coasts of the North Atlantic, and which has been used from early times both in Great Britain and in New England as a source of an indelible violet ink for marking, ornamenting and even dyeing textile fabrics. The color appears to be confined to a ‘vein’ or gland near the head, which yields a drop of viscid liquid, which when first dropped upon the cloth, or used with a pen to draw letters or an ornamental design, is colorless, but as soon as it is exposed to the sun, changes rapidly from light to deep green, to blue and at last to a fine purplish red. ‘If the cloth be now washed with scalding water and soap, and laid again in the sun, the color changes to a beautiful crimson,’ which is permanent. This dye was extensively used in Ireland in the 15th century, for orna-

menting women's gowns in drawn designs; and many persons made their living by this art. Consult works on conchology and antiquities; especially Lovell, *Edible Mollusca of Great Britain* (2d. ed. London, 1884).

PURPLE WOOD, or **PURPLE HEART**. The plum-colored heart-wood of *Copaifera pubiflora* and *Copaifera bracteata*, of the natural order Leguminosæ, natives of British Guiana, where it is generally called Mariwayana. It is said that no other wood is so satisfactory for use in gun carriages and mortar beds, since it withstands the violent concussions remarkably well. Its great beauty and smooth grain should attract the attention of cabinet-makers.

PURPURA (Lat., from Gk. πορφύρα, *porphyra*, purple-fish, purple dye). The term applied to a diseased condition in which a number of hemorrhages occur under the skin, so as to produce blotches of a more or less purple color. These spots vary from one to four millimeters in diameter. When small they are termed petechiæ (q.v.); when large they are known as ecchymoses (q.v.). At first bright red in color, they become darker, and gradually fade to brownish stains. They do not fade on pressure. Purpura occurs as a secondary symptom in a large number of diseases, among them being scurvy, rheumatism, scarlatina, measles, smallpox, typhus fever, epidemic cerebro-spinal meningitis, the plague, leucocythæmia, Hodgkins' disease, cirrhosis of the liver, and Bright's disease. It is dependent on an altered state of the blood. Purpura may follow the use of certain drugs, and snake poison produces a rapid extravasation of blood. As a distinct disease purpura occurs mainly in two forms, the simple and the hemorrhagic. These, however, may be regarded as essentially the same, but of different degrees of severity. In its mildest form purpura appears simply as an eruption of purplish spots on the legs alone or scattered over the body, and attended with little constitutional disturbance. Recovery generally takes place in from ten to twenty days. In the hemorrhagic form the spots are larger and more numerous, and bleeding occurs from the mucous membranes. The nose, mouth, stomach and intestines, kidneys, female generative organs, and the bronchi may be the sources of blood. Severe anæmia ensues and great prostration is succeeded by death. There is often a rise in temperature. This form is usually met with in young and delicate individuals, particularly girls. There are instances of purpura hemorrhagica of great malignancy, which prove fatal within twenty-four hours. The treatment of the mild form is simply rest in bed, tonic medicines, and simple food. In the severe cases efforts are made to stop the hemorrhage by the administration of drugs which have the power of contracting the blood vessels, notably ergot and suprarenal extract. Symptomatic purpura depends for its treatment on the nature of the disease to which it is secondary.

PURPURA LAPILLUS.

shores of both coasts of the North Atlantic. It is carnivorous and is supposed to destroy young

barnacles. Other species of *Purpura* inhabit the southern coasts.

PURPURE. The name for purple, one of the tinctures in heraldry (q.v.).

PURPURIN (from Lat. *purpura*, purple) and **ANTHRAPURPURIN**. Two isomeric organic coloring substances similar to alizarin and obtained along with it from madder root. They are formed also in the artificial production of alizarin (q.v.).

PURSCH, or **PURSH**, FREDERICK TRAUOGOTT (?-1820). A German-American botanist. He was born in Grossenhain, Germany, and educated at Dresden. He emigrated to the United States in 1799, and occupied himself with botanical researches until 1811, when he went to England and there published his *Flora Americæ Septentrionalis* (2 vols., 1814), the most valuable work on the subject that had yet appeared. The following year he issued *Hortus Orloviensis*, and he died in Montreal while preparing a work upon the flora of Canada.

PURSE-CRAB, or **ROBBER-CRAB**. Names for the great East Indian cocoon crab (q.v.).

PURSLANE (OF. *porcelaine*, *pourcelaine*, from Lat. *porcilica*, *portulaca*, purslane), *Portulaca*. A genus of plants of the natural order Portulacaceæ, the best known species of which is

COMMON PURSLANE.

common purslane (*Portulaca oleracea*), which grows in cultivated and waste grounds on the seashore in almost all warm parts of the world, and is cultivated as a pot-herb. It is a short-lived annual, with spreading and rather procumbent stems, and obovate fleshy leaves, which, like the young shoots, are used in salads. The young and tender shoots are pickled in France like gherkins.

PURSUIVANT, pûr'swê-vant (OF., Fr. *poursuivant*, follower, from *poursuivre*, to follow, from Lat. *prosequi*, to follow, from *pro*, before + *sequi*, to follow; connected with Gk. *ἠεσθαί*, *hepesthai*, Skt. *sac*, to follow, and ultimately with Eng. *see*). The third and lowest order of heraldic offices. The office was instituted as a novitiate, or state of probation through which the offices of herald and king-at-arms were ordinarily to be attained. There are four pursuivants belonging to the English college of arms: *Rouge Croix*, the oldest, so named from the cross of Saint George; *Blue Mantle*, instituted either by Edward III. or Henry V., and named in allusion to the robes of the Order of the Garter, or perhaps to the color of the arms of France; *Rouge Dragon*, deriving his title from King Henry VII.'s dexter sup-

porter, a red dragon, assumed in allusion to his descent from Cadwaladyr; and *Portcullis*, named from a badge of the same monarch. There are three pursuivants in the heraldic establishment of Scotland (there were formerly six), known by the names of *Bute*, *Carrick*, and *Unicorn*—titles which, as well as those of the heralds, seem to have originated in the reign of James III. The Scottish pursuivants take precedence according to seniority in office. The Ulster King of Arms in Ireland has four, *Athlone* and *Saint Patrick I., II., and III.* In ancient times any great nobleman might institute his own pursuivant.

PURSY MINNOW. A minnow of the typical genus *Cyprinodon*, especially *Cyprinodon variegatus*, a chubby little fish, of which the male measures three inches, and the female two inches, and which abounds in all the brackish waters of the Atlantic coast south of Cape Cod. It is one of the most brightly colored of the minnows, and may be distinguished by the lustrous steel-blue of the head and forward part of the back (but this fades immediately after death), the dusky bar at the tip of the tail, and the coppery tint of the abdomen. See Plate of KILLIFISHES.

PURUÁNDIRO, p̄ōō'ān'dê-rō. A town of the State of Michoacán, Mexico, 43 miles northwest of the city of Morelia. It is the centre of an important local trade and has leather manufactures. Its municipal population, in 1895, was 7782.

PURU-PURUS, p̄ōō-rōō' p̄ōō-rōōs'. A tribe which formerly lived along the middle Purus, a southern affluent of the Amazon, in Western Brazil, and apparently constituting, with one or two other tribes of the same neighborhood, a distinct linguistic stock which Brinton calls the Arauan. The name refers to a peculiar skin disease with which they were nearly all afflicted, and manifested by white and brown blotches, possibly from their habit of sleeping naked upon the sand, without hammocks. They were savages of the lowest order, both sexes going perfectly naked. They were described by Spix and Martius in 1820 and by Castelnau and Wallace in 1847 and 1853, but the name is now extinct and the tribe seems to be represented by the modern *Pamari* or *Pammary*, i.e. 'eaters of the pama berry,' who live in the same region.

PURURAVAS, p̄ōō-rōō'rā-vās. A legendary king of ancient India, renowned for his kingly virtues and personal beauty, and still more famous on account of his love for the Apsaras, or celestial hetera Urvaśi. Seeing Pururavas, and seen by him, their mutual love was sealed on condition that he would never suffer two rams, which she always kept near her bedside, to be carried from her, and that she should never see him naked. The Gandharvas, choristers in Indra's heaven, and lovers of the Apsaras, being jealous of Pururavas, stole the rams during the night. At this Pururavas was enraged, and, trusting that Urvaśi would not see him, as it was dark, rose in pursuit of the robbers. At that moment, however, the Gandharvas caused a flash of lightning to irradiate the scene, and Urvaśi beheld the King. The compact was violated, and Urvaśi disappeared. Pururavas could find her nowhere. Like one insane, he wandered over the world until he saw her at Kurukshetra, sporting with four other Apsaras in a lotus-pool. Urvaśi, however, forbade him to approach until,

at the end of the year, she should be delivered of the son with whom she was pregnant by him; but after the child's birth she visited the King once each year. Urvaśi succeeded in propitiating the Gandharvas who had caused the separation, and eventually she and the King were enabled to pass to the sphere where Gandharvas and Apsaras dwell together. This legend is as old as the Rig-Veda. It forms the subject of the celebrated drama of Kalidasa, the *Vikramorvaśi*, where, however, Urvaśi's disappearance is ascribed to a fit of jealousy, during which she trespassed on the proscribed bonds of a divine hermitage. The myth of Pururavas and Urvaśi has been interpreted in various ways, as sun and dawn, or, perhaps the best explanation, as the thunder and the cloud which produces the fire of the lightning-flash. Consult: Geldner, *Vedische Studien*, vol. i. (Stuttgart, 1889); Maedonell, *Vedic Mythology* (Strassburg, 1897); Bloomfield, "The Myth of Pururavas, Urvaśi, and Āyu," in *Journal of the American Oriental Society*, vol. xx. (New Haven, 1899).

PURÚS, p̄ōō-rōōs'. A large tributary of the Amazon. It rises on the Montaña of Eastern Peru, flows in a general northeast direction through the northwestern corner of Bolivia and the Brazilian State of Amazonas, and empties into the Amazon through a large delta about 150 miles above the mouth of the Rio Negro (Map: Brazil, D 5). It is a sluggish and much winding stream flowing in its course of 1850 miles through the great forest plains. It is entirely unobstructed, and navigable for boats almost to its source; steamers ascend it 800 miles, and it has several large navigable tributaries. There are hardly any settlements along its banks, except a few stations for rubber-gatherers. The river was first explored to its source in 1864 by the English traveler Chandless.

PURUSHA, p̄ūr'ōō-shā (Skt. *puruṣa*, man). In Hindu philosophy, the efficient cause of the universe as contrasted with its material cause, Prakriti (q.v.). The term is also applied to the supreme god Brahma (q.v.).

PUR'VER, ANTHONY (1702-1777). The translator of the 'Quakers' Bible.' He was the son of a poor Hampshire farmer. Though apprenticed to a shoemaker, he found time to learn Hebrew by himself. After a brief period of school teaching, he went to London (about 1726), where he joined the Society of Friends. In 1758 he returned to Hampshire and there passed the rest of his life. His translation of the Bible, begun about 1733, was published in 1764. For the meaning of different passages, Purver depended upon divine inspiration instead of scholarship.

PURVES, p̄ūr'vēs, GEORGE TYBOUT (1852-1901). An American Presbyterian clergyman, born in Philadelphia, Pa. He graduated at the University of Pennsylvania in 1872, and at Princeton Theological Seminary in 1876, and held his first pastorate in Wayne, Pa., from 1877 until 1880. He was in charge of churches in Baltimore and Pittsburg until 1892, when he was appointed professor of New Testament literature and exegesis in Princeton Theological Seminary. In 1900 he became pastor of the Fifth Avenue Presbyterian Church in New York City, of which he was in charge at the time of his death. Dr. Purves was a preacher of unusual force and effectiveness. His publications include *Testi-*

mony of *Justin Martyr to Early Christianity* (1889) and *Faith and Life*, sermons (1902).

PURVEY, JOHN (c.1354-c.1427). A disciple of Wiclif, who revised the Wiclifite translation of the Bible. He was probably born at Lathbury, a village in Buckinghamshire, and very likely he may have been educated at Oxford. For some years he was Wiclif's parochial chaplain at Lutterworth. After the death of Wiclif (1384), Purvey seems to have settled for a time in Bristol. In 1387 he was forbidden to 'itinerate' in the diocese of Worcester, and in 1390 he was imprisoned for being a Wiclifite. Rather than suffer martyrdom, he recanted in 1401. He was given the vicarage of West Hythe, in Kent, but he resigned in two years (1403). His subsequent career cannot be followed. Wiclif and his associates completed their translation of the Bible in 1380. Made from the Vulgate, it abounded in Latinisms. Purvey, helped by other disciples of Wiclif, set about reducing this version to idiomatic English. The new translation was probably completed about 1388. Purvey also composed a work called *Ecclesie Regimen*, in which he assailed the corruptions of the Church. Consult *The Holy Bible in the Earliest English Versions*, edited by Forshall and Madden (4 vols., Oxford, 1850).

PURVEYANCE, ROYAL. In English law, the former right or prerogative of the Crown to demand supplies and services at the lowest price, to be fixed by appraisers, usually those chosen by the royal purveyors, or officers employed in procuring the royal supplies. This was one of the oldest of the royal prerogatives, and gave rise to endless abuses and complaints until it was finally abolished in 1660, when Charles II. was restored to the throne. Those upon whom the purveyors made a demand had no choice but to sell their goods or services, and usually received their inadequate pay in tallies which entitled the recipients to deduct the amount from future taxes, which latter fact was a hardship in itself. Little is known of the early history of the practice, but the abuses arising from it became so serious that the petitions and laws against it became very numerous as early as the 13th and 14th centuries, and the practice is prohibited to the royal bailiffs and constables in Magna Charta. Later legislation against these abuses occur in the ordinances of 1311 abolishing it, the law of 1322 repealing these ordinances, and the laws of 1362 limiting purveyance to the personal wants of the king and queen. Consult: Stubbs, *Constitutional History* (Oxford, 1878); Hallam, *Constitutional History* (1827).

PUS (Lat., white viscous matter from a sore). A well-known product of inflammation. It occurs as a thick yellow creamy fluid, differing from all other morbid exudations in containing a large number of corpuscles, having a soft and fatty feeling when rubbed between the fingers, a peculiar odor, usually an alkaline reaction, and a specific gravity of about 1.032. Like the blood, it consists of certain definite microscopic elements, and of an intercellular fluid or serum in which they swim. The microscopic elements are: (1) The pus-corpuscles, which, both in their microscopical and chemical relations, seem to be identical with the lymph-corpuscles, or colorless blood-cells; in diameter, they range from 0.004 to 0.005 of a line, and each corpuscle consists of a

cell-wall, which often appears granular, of viscid transparent contents, and of a nucleus which is adherent to the cell-wall, and which can be rendered much more apparent by the addition of acetic acid; (2) molecular granules; and (3) fat-globules. The serum of pus is perfectly clear, of a slightly yellow color, and coagulates on heating into a thick white mass.

The chemical constituents of pus are water (varying from 769 to 907 in 1000 parts), albumen (from 44 to 180), fats (from 9 to 25), extractive matter (from 19 to 29), and inorganic salts (from 6 to 13); in addition to which, mucin, pyin, glycin, urea, etc., are occasionally present. Of the inorganic or mineral constituents, the soluble salts are to the insoluble in the ratio of 8 to 1 and the chloride of sodium (the chief of the soluble salts) is three times as abundant as in the serum of the blood. See **INFLAMMATION**; **SUPPURATION**.

PUSAN, pōō-sān'. See **FUSAN**.

PUSEY, pū'zī, EDWARD BOUVERIE (1800-82). A distinguished English divine and leader of the Oxford Movement. He was born at Pusey House, in Berkshire, August 22, 1800. He was the second son of the Hon. Philip Bouverie, who changed his name to Pusey as a condition of his succession to the Pusey estate in 1789. He was educated at Eton and Christ Church, Oxford, where he obtained a first-class in classics in 1822 and won the university prize for a Latin essay in 1824. In the same year he was elected fellow of Oriel. About this time he spent two years in Germany, and his first published work was an admirable summary of the history of German theology since the Reformation. It appeared in 1828, and in the same year he was appointed to the regius professorship of Hebrew at Oxford, with the attached canonry of Christ Church, a position which he held until his death.

Owing to delays from sickness and other causes, he was not ordained to the diaconate until June 1, 1828, and his ordination to the priesthood followed in November of the same year in order that he might occupy his stall as canon. His life, though profoundly influential, was singularly uneventful. His habits were simple. He lived in his books, mingling but little in general society. He had few personal friends. His chief characteristics were accurate and extensive learning, an innate aptness for the study of languages, rigorous devotion, and dislike of luxurious living. He was deeply and unaffectedly religious, but not morose, and was bright and cheerful in the circle of his intimates.

His domestic life was one of suffering, saddened by successive losses of parents, brothers, wife, and daughter, and finally of his only son, Philip, his companion in scholarship and research, who was taken from him after many years of painful bodily affliction.

Pusey will always be remembered, as he was chiefly known, for his connection with the Oxford Movement. His sermon on the Rule of Faith in 1851 stemmed the tide of secessions to the Roman Catholic Church after the Gorham judgment. The revival of the practice of private confession in the English Church dates from his two sermons on "The Entire Absolution of the Penitent," in 1846. His teaching on the Real Presence in the Holy Communion became the accepted teaching of the Catholic school. He

was the theologian of the new movement. His great learning, enforced as it was by the strictness and purity of his life, gave it its vitality. His suspension for preaching his celebrated sermon on the Eucharist in 1843 only enhanced his influence.

His power of sustained work was remarkable and his painstaking diligence proverbial. His correspondence as a spiritual adviser alone was enormous. His life was one of continuous controversy. He was the editor-in-chief of the *Library of the Fathers*, and there was no important controversy in the Church of England from the time of the publication of his tract *On Baptism* in 1835 to his tilt with Farrar on everlasting punishment in 1879 in which he did not have a part.

His monument is the memorial building at Oxford which bears his name, enshrines his library, and perpetuates his teaching. The Pusey House with its staff of clergy, its daily worship, and devout life is a home of sacred learning and a rallying-point of Christian faith. Besides several volumes of sermons, his more important works were commentaries on Daniel (1864) and on the Minor Prophets (1860 sqq.); his discussions of the possibility of the reunion of Christendom generally known by their sub-title of *Eireneon*, in three parts (1865, 1869, 1870); and the eschatological treatise already alluded to, *What is of Faith as to Everlasting Punishment?* (1880). Consult an admirable biography begun by Canon Liddon and completed after his death by J. O. Johnston and R. J. Wilson (4 vols., London, 1893-96); a brief, more popular one by the author of the *Life of Charles Loider* (ib., 1898); also Grafton, *Pusey and the Church Revival* (Milwaukee, 1902); and many of the works referred to under OXFORD MOVEMENT.

PUSHAN, पुष्यशान (Skt. *Pūṣan*, prosperer, from *puṣ*, to cause to thrive). A deity of Vedic India. He is frequently mentioned in the Vedas (q.v.). He beholds all creatures, and has his home in heaven, where he rides in a golden car drawn by goats. He furthermore conducts the souls of the dead to the Pitris (q.v.), and is consequently a guardian of roads, and, by implication, a discoverer of what is hidden. In his character he is beneficent, protecting not only men, but beasts, and is therefore a deity of wealth, while as a god of fertility he is invoked in the wedding ritual, being himself the lover of his mother, or, according to other hymns, of his sister. He has a unique and somewhat grotesque quality in his toothlessness, in consequence of which his food is gruel. The data concerning him make reasonable the view that he is a pastoral deity representing the sun in its beneficent aspect. Consult: Muir, *Original Sanskrit Texts* (London, 1868-74); Perry, "Notes on the Vedic Deity Pūṣan," in *Classical Studies in Honour of Henry Drisler* (New York, 1894); Macdonell, *Vedic Mythology* (Strassburg, 1897).

PUSHKIN, пушкін, ALEXANDER SERGEYEVITICH (1799-1837). The greatest poet of Russia. He was born at Moscow of a noble family, inheriting African blood from a maternal ancestor. According to the fashion of the time, his education at home was purely French, and his knowledge of Russia was obtained from nursery tales, legends, and songs. In 1811 he entered the Imperial Lyceum at Tsarskoye Selo, where he soon

attracted general attention by his outspoken criticisms of everything and everybody, his neglect of study, his bold epigrams, and his poetic endowments. His first published poem bears the date of 1814, and at the public examination in 1815 he aroused the admiration of the veteran poet Derzhavin by his *Recollections of Tsarskoye Selo*. On graduating in 1817, Pushkin became a clerk in the Ministry of Foreign Affairs. He was now a well-known figure in Russian literature and was immediately accepted as a member of the literary society Arzamas, whose members were the shining lights of the day. His first important long poem, *Ruslan and Lyudmila* (1817-20), a bold combination of fancy and realism, attracted much attention. About this time, because of his objectionable political views, Pushkin was sent to Southern Russia with General Inzoff's colonizing bureau. The life in Bessarabia, the Crimea, the Caucasus, and Odessa was an important period for Pushkin; the variety and gorgeosity of the natural scenery, life among new people, the influence of Byron, with whose works he now became acquainted—all these are set forth in glowing colors in his works of this period. *The Prisoner of the Caucasus*, *The Fountain of Bakhthchisarai*, the first three cantos of *Yevgen Onegin* (Eugene Onegin), a novel in verse, and *The Gypsies* are all a direct product of his Byronism. In 1824 he was transferred to his mother's estate, Mikhaylofskoye (Government of Pskov). The two years spent in this remote corner of Russia were the most fruitful in his life. Cantos four to six of *Yevgen Onegin*, *The Brother Murderers*, and the drama *Boris Godunoff* were written in this exile. Pushkin freely admitted his indebtedness to Shakespeare, Karamzin, and the Chronicles, but the drama is entirely original in character. All the characters, as well as the masses and historical background, are Russian through and through and drawn with a marvelous fidelity to the epoch. In 1829 appeared his *Poltava* (finished in less than a month), depicting the struggle between Peter the Great and Charles XII. and the treachery of Mazeppa. In 1831 he produced the last two cantos of *Yevgen Onegin*. Written within a period embracing about nine years, this picture of society reflects various incidents of the poet's life during its composition.

In 1831 Pushkin was attached to the Foreign Ministry with a yearly salary of 5000 rubles to write a history of Peter the Great. In 1833 he received 20,000 rubles to print his *History of the Pugatcheff Insurrection*. During this period his works were chiefly in prose: the novels *The Captain's Daughter* (1836) and *Dubrovski* (published 1841), and the history, gave Russian prose its highest degree of perfection. He was killed in a duel with D'Anthès, adopted son of the Dutch Ambassador, whose association with Mme. Pushkin had caused much gossip.

Pushkin is the flowering of all that was best in Russian literature before him. He possessed an original intellect, reinforced by a quick intuition. His humor was gentle and his wit keen; his epigrams are among the best ever produced in any language. He had an extraordinary mastery of the technique of his art. A monument to him was erected at Moscow in 1880.

BIBLIOGRAPHY. The best among the numerous editions of his works is that by P. O. Morozoff, in seven volumes (Saint Petersburg, 1887). English translations: *Poems*, by Ivan Panin (2d ed.,

Boston, 1888); *Prose Tales*, by T. Keane (New York, 1896); *Translations from Pushkin*, in memory of the one hundredth anniversary of the poet's birthday, by C. E. Turner (Saint Petersburg, 1899); *Russian Romance*, by Mrs. J. B. Telfer (London, 1875). In German: *Gedichte*, two volumes, by Bodenstedt, in *Gesammelte Schriften*, vols. iv. and v. (1865-69). Consult Flach, *Un grand poëte russe* (Paris, 1894).

PUSH'TU. See AFGHAN.

PUSS IN BOOTS. The popular nursery tale of the clever cat, which secures a fortune and a princess for his master, a young miller, who passes under the name of the Marquis of Carabas. The story was told by Perrault as "Le Chat Botté," in his *Contes de Fées* (1697). He found it in Straparola's *Piacerele Notte*, translated in 1585, in which the hero is called "Constantine's Cat." A celebrated German version is Tieck's *Der gestiefelte Kater*.

PUSS-MOTH. A name in England of *Cerura vinula*, a notodontid moth common throughout Europe and Northern and Western Asia. It expands from 2 to 2.5 inches; the fore wings are white suffused with gray and with dull dark-gray transverse lines; the thorax is spotted with black. The larva feeds on poplar and willow and discharges an acrid fluid from an opening in the throat. At the end of the body the caterpillar has a pair of tubes in which are concealed two long flexible whips which may be rapidly thrust out and withdrawn (see Plate of BUTTERFLIES AND MOTHS, Fig. 14), and which are supposed to protect the larva from its natural enemies, as are also the terrifying attitudes which it assumes and the secretion which it ejects. When full grown it spins a solid and impervious cocoon.

PUSTULE, MALIGNANT. See MALIGNANT PUSTULE; ANTHRAX.

PUTEAUX, py'tô'. A town in the Department of Seine, France, 6¼ miles west of the centre of Paris by rail (Map: Paris and vicinity). It is situated northeast of and at the base of Mont Valérien, on the left bank of the Seine, opposite the Bois de Boulogne, with which it is connected by a bridge which crosses the Ile de Puteaux. It is a favorite residential suburb of Paris. It has dye and calico-printing works, manufactures of chemical products, and artillery works. Population, in 1901, 24,341.

PUTIGNANO, pō'té-nyä'nó. A town in the Province of Bari, Italy, 23 miles southeast of Bari (Map: Italy, M 7). The chief industry is weaving, and there is a trade in wine, oil, and fruit. Population (commune), in 1901, 13,969.

PUTLITZ, put'lits, GUSTAV HEINRICH GANS (von und zu) (1821-90). A German dramatist and novelist, born March 20, 1821, at Retzin, Brandenburg. He studied law in Berlin and Heidelberg. From 1846 to 1848 he was a functionary in the Government of Magdeburg, and thereafter he lived partly on his estate at Retzin, partly in Berlin. In 1863 he became director of the Court Theatre in Schwerin; from 1867 to 1868 he was Court marshal of the Prussian Crown Prince, after which he devoted himself to literature, dwelling in Berlin. Between 1873 and 1889 he managed the Court Theatre in Karlsruhe. Among his works are the poetic fairy stories *Was sich der Wald erzählt* (1850), *Walpurgis* (1869), and *Vergissmeinnicht* (1853); two plays

much read in American schools, *Badekuren* and *Das Herz vergessen*; and the dramas *Das Testament des Grossen Kurfürsten* (1858) and *Rolf Berndt* (1881). Consult *Gustav zu Putlitz, ein Lebensbild*, by his widow, *Elisabeth* (Berlin, 1894-95).

PUTNAM. A city and one of the county-seats of Windham County, Conn., 34 miles north of Norwich, and 28 miles west by north of Providence, R. I., on the Quinebaug River, and at the junction of the New York, New Haven and Hartford and the Norwich and Worcester railroads (Map: Connecticut, II 2). It has a public library and the Day Kimball Hospital. The Cargill Falls in the vicinity are of scenic interest. Putnam is situated in an agricultural region, but is interested chiefly in iron-working and in the manufacture of cotton and woolen goods, silks, boots and shoes. The government is vested in a mayor, elected biennially, and a unicameral council. Putnam was incorporated in 1855 and obtained its present city charter in 1895. Population, in 1900, 6667.

PUTNAM, FREDERIC WARD (1839-). An American anthropologist, born in Salem, Mass. In 1856 he was curator of ornithology in Essex Institute (Salem), and published a *List of the Birds of Essex County*; and in the same year he entered Lawrence Scientific School and took a special course under Louis Agassiz, to whom he was assistant until 1864. He was in charge of the Museum of Essex Institute from 1864 to 1867, then superintendent of the East India Marine Society, and afterwards director of the Peabody Academy of Sciences. He was instructor in the School of Natural History on Penikese Island in 1874, and in the same year was appointed assistant in the Kentucky Geological Survey. In 1875 he was made curator of the Peabody Museum of Archaeology and Ethnology of Harvard University, and was afterwards appointed Peabody professor of American archaeology and ethnology. He was chief of the Department of Ethnology of the World's Columbian Exposition and in 1894 he became curator of anthropology in the American Museum of Natural History of New York City. His researches in American Archaeology covered a wide field, including extensive explorations in Ohio, where he was instrumental in having the Great Serpent Mound preserved, and in New Jersey. He originated the *Naturalist's Directory* in 1865, and was one of the founders of the *American Naturalist* in 1867, and in 1898 he was president of the American Association for the Advancement of Science.

PUTNAM, GEORGE PALMER (1814-72). A grandnephew of Israel Putnam, and a New York publisher. He was born in Brunswick, Me., February 7, 1814. At fourteen he entered the bookstore of D. and J. Leavitt, New York. In 1840 he became partner in the house of Wiley & Putnam, of which he established a London branch in 1841. In 1848 he returned to New York and founded the publishing house which later became the firm of G. P. Putnam's Sons. Bookmaking interested him as an art from the beginning. In 1852, with the aid of George William Curtis, he established *Putnam's Magazine* (discontinued in 1857, revived 1860-70). In 1861 he organized the Loyal Publication Society, suspended his business for three years (1863-66)

to become United States Collector of Internal Revenue, and then refounded his publishing house in conjunction with his sons, George Haven and John Bishop. He was a founder of the Metropolitan Museum of Art, of which he was made honorary superintendent in 1872. He was also Chairman of the Committee on Art at the Vienna Universal Exposition. He died in New York City December 20, 1872. Putnam was the author, among other works, of: *Chronology, or an Introduction and Index to Universal History, Biography, and Useful Knowledge* (1833); *American Book Circular with Notes and Statistics* (1843); *American Facts, Notes and Statistics Relative to the Government of the United States* (1845); *The World's Progress—a Dictionary of Dates* (1850), and a supplement to this work (1861). His son, GEORGE HAVEN (1844—), was born in London and was educated in New York City, at the Sorbonne, and in Göttingen. He served in the Union Army during the Civil War, and rose to the rank of brevet major. Like his father, he took an ardent interest in copyright law, becoming secretary of the American Publishers' Copyright League in 1887. His publications include: *Authors and Publishers* (1882, with J. Bishop Putnam); *Question of Copyright* (1891); *The Artificial Mother* (1894); and *Books and Their Makers in the Middle Ages* (1896). To Mason and Lalor's *Political Encyclopædia* he contributed a valuable paper on "Literary Property."

PUTNAM, HERBERT (1861—). An American lawyer and librarian, born in New York City. He graduated at Harvard in 1883, studied for a time in the Columbia Law School, and in 1886 was admitted to the Minnesota bar. He was librarian of the Minneapolis Athenæum from 1884 to 1887, and of the Minneapolis Public Library from 1887 to 1891; practiced law in Boston from 1892 to 1895; and was librarian of the Boston Public Library from 1895 to 1899, when he became librarian of Congress. In 1898 he was president of the American Library Association.

PUTNAM, ISRAEL (1718-90). An American soldier, prominent in the French and Indian and the Revolutionary wars. He was born in Old Salem Village (now Danvers), Mass.; removed to Pomfret, Conn., in 1740, and became a farmer and wool-grower there. In the winter of 1742-43, according to tradition, he gave evidence of unusual coolness and intrepidity by entering a cave alone and, by the light of a torch, shooting a wolf which had taken refuge there. In August, 1755, during the French and Indian War, he was commissioned lieutenant by the Connecticut Legislature, later in the year became one of Rogers's Rangers, in March, 1756, became captain, saved Fort Edward from being destroyed by fire in the winter of 1757, and in March, 1758, became major. In August, 1758, he was captured near the present Whitehall, N. Y., in an engagement with a force of French and Indians under the partisan leader Marin, but after undergoing many hardships and narrowly escaping death, was exchanged, in November, through the influence of Col. Peter Schuyler, himself a prisoner. He served under Amherst in the Montreal expedition, went as acting colonel of the Connecticut regiment on the expedition to the West Indies, and participated in the attack on Morro Castle, Havana, July 30, 1762. In Pontiac's War he was a major

of Connecticut troops under Bradstreet. In 1765 he was an ardent opponent of the Stamp Act, and closely identified himself with the radical Whigs, becoming one of the leaders of the Sons of Liberty in Connecticut, and chairman of one of the committees of correspondence. In 1766 he was elected to the Connecticut Assembly. He opened a tavern at Brooklyn, Conn., in June, 1767. He was made a member of the so-called exploring committee of the Company of Military Adventurers organized by Gen. Phineas Lyman (q.v.) in 1772, and as such visited the Lower Mississippi Valley and West Florida, where land grants had been promised to the company.

In 1774 he was among those who sent material assistance to the Bostonians, who, through the operations of the Port Bill and their attitude thereto, were put in immediate need of the necessities of life. In April, 1775, tidings of the battle of Lexington reached him while he was plowing; he left his plow in the field and, mounting his horse, rode to Cambridge in one day, a distance of sixty-eight miles. Returning, he was made brigadier-general by the Legislature, organized and drilled a regiment, and in a week was on his way back with his men to Cambridge. In May of that year he led a battalion to Noddle's Island, burned a British schooner, captured a sloop, and killed and wounded many of the enemy. By his advice it was decided to fortify Bunker Hill, in the engagement at which place he is considered by many to have been the commanding officer, though others claim this honor for Prescott. In this engagement Putnam displayed great energy and bravery, though he does not seem to have been present in the main redoubt on Breed's Hill, where Prescott commanded. On the arrival of Washington at the camp to take command in July, 1775, he brought commissions from Congress for four major-generals, one of whom was Putnam. On the evacuation of Boston in the spring of 1776, Putnam was placed in command of New York. He held the chief command within the fortified lines during the battle of Long Island; was sent to Philadelphia to fortify that city in December, 1776; was afterwards stationed at Crosswick and Princeton; and in May, 1777, was ordered to take command in the Highlands of New York. In the summer of that year he was removed from his command in the Highlands on account of the surprise and loss of Forts Montgomery and Clinton, though he was acquitted of blame by a court of inquiry and restored to his command. In 1779, when stationed in Connecticut, Horse-neck, one of his outposts, guarded by 150 men and two cannon, was attacked by the British officer Tryon, with 1500 men. Putnam, being closely pursued while on his way with his men to a swamp, is said to have dashed down a steep hill and escaped. Riding to Stamford and collecting the militia, he formed a junction with his troops, pursued Tryon in his retreat, and took 50 prisoners. In the summer of 1779 he had command of the troops in the Highlands, and completed the fortifications at West Point. The army going into winter quarters, he returned home, and on starting out again for camp was stricken with paralysis, from which he never completely recovered. He died May 19, 1790. Consult Livingston, *Israel Putnam, Pioneer, Ranger, and Major-General* (New York, 1901).

PUTNAM, MARY TRAILL SPENCE (LOWELL) (1810-98). A poetess, translator, and essayist, daughter of Rev. Charles Lowell, sister of James Russell Lowell. She was born in Boston, Mass., December 10, 1810. She married, in 1832, Samuel R. Putnam, a Boston merchant. Besides numerous contributions to magazines, especially on Polish and Hungarian literature and history, she wrote two metrical dramas on slavery, *A Tragedy of Errors* (1862) and *A Tragedy of Success* (1862); a novel, *The Records of an Obscure Man* (1861); *A History of the Constitution of Hungary*, made timely by the visit of Kossuth (1850); *Memoir of William Lovell Putnam*, her son, killed at Ball's Bluff (1862); *Fifteen Days* (1866); *Memoir of Charles Lowell* (her father) (1885); and a translation from the Swedish of Fredrika Bremer's *The Neighbors*.

PUTNAM, RUFUS (1738-1824). An American soldier. He was born in Sutton, Mass.; was a millwright's apprentice there from 1754 to 1757; enlisted as a private soldier for service in the French and Indian War in 1757; and became an orderly sergeant in 1759 and an ensign in 1760. While an apprentice he studied diligently during his leisure hours, gaining a fair knowledge of mathematics and history, and after 1760 devoted himself to the study of surveying, in which he soon became markedly proficient. He entered the Continental Army as lieutenant-colonel in May, 1775, planned the defenses at Roxbury, and in August, 1776, was appointed chief engineer of the army with the rank of colonel. Preferring field service, however, he was placed in command of a Massachusetts regiment in November, and in 1777 served with great gallantry in the campaign against Burgoyne. In 1779 he aided his cousin, Israel Putnam, in completing the West Point fortifications, and in 1783 was made brigadier-general. He was a member for several terms of the Massachusetts Legislature, and during Shays's Rebellion was General Lincoln's aide. In 1786 he, with Gen. Benjamin Tupper, organized a company, composed of officers and soldiers of the Revolutionary War, to form a settlement in what is now Ohio. He was one of three directors appointed by this company (the Ohio Company) in 1787 to secure a tract of land from Congress, and, chiefly through his efforts, 1,500,000 acres were obtained at 66 2-3 cents per acre. This tract was located at the junction of the Ohio and Muskingum rivers, whither in 1788 Putnam led the first party of settlers, laying out Marietta (q.v.), the first organized settlement in the Northwest Territory. He was one of the judges of the United States Court in the Northwest Territory from 1790 to 1796, concluded an important treaty with the Indians at Vincennes, Ind., in 1792, was Surveyor-General of the United States from 1796 to 1803, and was a member of the Ohio constitutional convention in 1802. In 1812 he organized the first Bible society west of the Alleghanies. He died in 1824. His manuscript diary is in the New York Public Library, and an autobiography, written in 1812 and also in manuscript, is deposited in the college library, Marietta, Ohio. Consult *Journal of General Rufus Putnam, 1757-60* (Albany, 1886); also Cone, *Life of Rufus Putnam* (Cleveland, 1886).

PUTREFACTION. See FERMENTATION; PTOMAINES.

PUTRID FEVER. See TYPHUS.

PUTRID SEA. A lagoon on the coast of the Crimea. See SIVASII.

PUTS AND CALLS. See STOCK EXCHANGE.

PUTTENHAM, GEORGE (?-c.1590). The reputed author of a treatise entitled *The Arte of English Poesie, contrived into three bookes; the first of Poets and Poesie, the second of Proportion, the third of Ornament* (1589). The work has also been claimed for his elder brother, RICHARD PUTTENHEIM (c.1520-c.1601). It was issued anonymously. In his dedication to Lord Burghley, the publisher asserted that he had received the book without the name of the author. In his *Hypercritica* (1618), Edmund Bolton said that common fame ascribed the work to "one of the Queen's gentlemen pensioners, Puttenham." Internal evidence points to one of the brothers as the author; but whether George or Richard is uncertain. The book is the most solid of all the early treatises on poetry in English. Consult the reprint by Edward Arber (London, 1869).

PÜTTER, put'ter, JOHANN STEPHAN (1725-1807). An eminent German jurist, born at Iserlohn. He studied at Madgeburg, Halle, and Jena, and after 1747 was professor of law at the University of Göttingen. He exerted great influence on the law institutions of his time, and some of his works, which are written with care and originality, are still valuable. His principal work is *Historische Entwicklung der heutigen Staatsverfassung des Deutschen Reichs* (1786-99); and his other writings include *Vollständiges Handbuch der deutschen Reichshistorie* (1762-72) and *Elementa Juris Publici Germanici* (1754).

PUTTKAMER, put'ká-mêr, ROBERT VIKTOR VON (1828-1900). A Prussian statesman, born at Frankfurt-on-the-Oder. He studied in 1846-50 at Heidelberg, Geneva, and Berlin, entered the Government service in 1854, and became *Regierungspräsident* (president of an administrative district) at Gumbinnen in 1871, and at Metz in 1874. In 1873 he was elected to the Reichstag, where he was prominent as a strong Conservative, in 1877 became chief president of the Province of Silesia, and in 1879 Minister of Education and Public Worship. He took measures against the undenominational schools, and made concessions to the orthodox Evangelicals. In 1881 he was appointed Minister of the Interior and vice-president of the Ministry. His conservative administration, and particularly the methods employed by him in favoring the election of Government candidates, was attacked by the Radicals, notably in a speech by Eugen Richter, and disapproved by Frederick III. upon the latter's accession. He therefore resigned (1888), and held no other office until his appointment as chief president of Pomerania by William II. in 1891.

PUT YOURSELF IN HIS PLACE. A novel by Charles Reade (1870). It is a story of an English manufacturing town, in which Henry Little, a workman and inventor, is persecuted by the trades unions, jealous because he was better trained than his fellows. Squire Raby, Little's uncle, is a forcible character, and a pleasant love-story offsets the labor troubles.

PUVIS DE CHAVANNES, pu'vès' de shá-ván', PIERRE (1824-98). The leading mural painter of France in the nineteenth century. He was

the creator of modern mural painting, which he restored to its real function, that of decoration. Born at Lyons, December 14, 1824, the son of a distinguished engineer, he took the classical course in a lycée, and then studied in a technical school, preparatory to his father's profession. After deciding to become a painter he worked without profit under Henri Scheffer, Delacroix, and Couture, but studied to more effect the works of the early Florentines, especially those of Giotto in Italy, being, therefore, in the main self-taught. He first exhibited in the Salon of 1850, not 1859 as is commonly stated. His first decorative works, "War" and "Peace," exhibited in 1861, were received with disfavor by most critics, but met the approval of the more thoughtful, like Théophile Gautier. They were acquired by the Government for the Museum of Amiens, in which his early decorations can best be studied, such as "Work and Rest" (1863); "Ave, Picardia Matrix" (1865); "Ludus Pro Patria" (1880); "Young Picard Exercising with the Lance" (1882). After the time of the Universal Exposition of 1867, when he received the cross of the Legion of Honor (officer 1887, commander 1889), his position was secure. He was constantly employed upon Salon juries and artistic commissions, and the greater part of his time was taken by great series of paintings for French public buildings. Among the principal of these are two fine representations of Marseilles in ancient and modern times for the museum there; two historic scenes for the Hôtel de Ville, Poitiers (1874-75); the "Infancy of Saint Geneviève" (1876-77), in the Pantheon at Paris—a beautiful idyllic scene; a series of splendid decorations for the museum of his native town, Lyons, among which are "Sacred Grove, Dear to the Arts and Muses" (1884), "An Antique Vision" and "Christian Inspiration" (1886). In 1889 he decorated the great hemicycle of the Sorbonne with an allegory of the noble purposes of its foundation, entitled "Alma Mater."

Puvis de Chavannes was the moving spirit in the secession of the Société Nationale des Beaux-Arts from the Salon in 1890, and in the following year he succeeded Meissonier in the presidency, which he retained till his death. All his later works are remarkable for the tasteful use of modern costume in ideal representation. His decorations in the Hôtel de Ville, Paris, include "Hommage à Victor Hugo" (1894), in which the poet is represented as dedicating his lyre to the city, and two fine landscapes, "Summer" and "Winter." In 1896 he completed his decorations of the Boston Public Library, "The Muses Saluting the Spirit of Enlightenment" and eight fine panels of the "Arts" and "Sciences." His last monumental work was three other large paintings of the life of Saint Geneviève in the Pantheon. The last years of his life passed in quiet at Neuilly, but were saddened by the illness of his wife, the Princess Cantacuzene, and soon after her death the painter himself died, October 24, 1898. His large collection of admirable drawings and careful studies was left by his nephews to the Luxembourg Museum, the City of Paris, and the provincial museums possessing his works. Besides his monumental productions he painted a number of smaller works of which it is sufficient to mention "Girls on the Seashore" (1879); the "Poor Fisherman" (Luxembourg, 1881); "Le Doux Pays," which received the medal of honor in 1882. Of his portraits the most interesting

are those of himself at twenty-five and of his wife, exhibited in 1891.

PUY, pu-é', LE. The capital of the Department of Haute-Loire, France, 37 miles southwest of Saint-Etienne, at the junction of the Loire, Borne, and Dolezon valleys (Map: France, K 6). It is picturesquely situated on the steep southern slopes of Mont Anis, from the summit of which rises precipitously the huge basaltic mass called Rocher de Corneille, crowned by the colossal statue of Notre Dame de France, 52 feet high, on a pedestal 20 feet in height, made in 1860 from 213 Russian cannon captured at Sebastopol. The most notable building of Le Puy is the cathedral, situated in the highest part of the town and reached by a grand stairway of 136 steps. Other notable features are the prefecture, the palais de justice, the Crozatier Museum with a fine art collection, and the monumental Crozatier Fountain. Guipure and other lace, bells, and clocks are manufactured. Le Puy is the ancient *Podium*. It was the capital of the mediæval District of Velay. Population, in 1901, 20,507.

PUYALLUP, pù-ál'úp. A tribe of Washington Indians. They speak the same language as the Nisqually and joined with them in the Treaty of Medicine Creek in 1854. They formerly claimed the entire territory of Puyallup River and exercised a dominating influence among the neighboring tribes. They are now chiefly confined to a reservation in the vicinity of Tacoma. The number on the reservation in 1901 was 536, a decrease of 20 from the previous year.

PUY-DE-DÔME, pu-é' de dôm'. A south-central department of France, formerly a part of Auvergne (q.v.) (Map: France, J 6). Area, 3073 square miles. Plateau and mountain occupy three-fourths of the surface; plain and valley the rest. The volcanic peaks of the Auvergne Mountains, grand in their desolation, and presenting numerous extinct craters, render this region orographically one of the most interesting in France. The highest peak in the Mont Dore group has an elevation of 6187 feet. Puy-de-Dôme, 4086 feet, gives its name to the department. The principal river is the Allier (a tributary of the Loire), which from south to north traverses the fertile valley of Limagne. Rye, wheat, oats, apples, chestnuts, and grapes are cultivated. Coal is mined. There are numerous mineral springs. The mountain forests yield timber. Capital, Clermont-Ferrand. Population, in 1896, 555,078; in 1901, 544,194. Consult Joanne, *Géographie du département du Puy-de-Dôme* (Paris, 1876).

PUZZUOLANA, pùt'sò-ò-li'na, or **POZZUOLANA**. A volcanic rock which has hydraulic properties when ground and mixed with lime. It is named from its occurrence at Pozzuoli, near Naples. It is earthy in character, consisting of particles in a very loose state of aggregation, but its chemical composition may agree very closely with that of basalt (q.v.). This composition may run as follows: Silica, 52 to 60 per cent.; alumina, 9 to 21 per cent.; ferric oxide, 5 to 22 per cent.; lime, 2 to 10 per cent.; water, 0 to 12 per cent. Pozzuolana occurs in the vicinity of Naples and Rome. Trass is a volcanic ash of similar properties found in the Rhine district of Germany; and santorin earth is still another volcanic ash used as a cement, which is found on the island of Santorin in the Greek Archipelago. Trass is

much used in Holland in fresh water and marine engineering work. Similar volcanic ash is found in Central France. Artificial pozzuolanas may be made from slag, brick dust, or ashes. The use of pozzuolana as a hydraulic agent was known to the ancients. Consult: Heath, *A Manual of Lime and Cement* (London, 1893); Schoch, *Die moderne Aufbereitung und Wertung der Mörtel-Materialien* (Berlin, 1896). See CEMENT.

PYÆMIA (Neo-Lat., from Gk. πύον, *pyon*, pus + αἷμα, *haima*, blood). This term and that used to designate the closely allied condition, septicæmia, originated before the idea of bacteria as the etiological factor in the diseases was developed. They have become so fixed in medical nomenclature, however, that they are still retained. Before the discovery of bacteria as the exciting cause, it was the general belief that septicæmia was a condition caused by the presence in the blood of substances undergoing putrefaction, while pyæmia was due to the presence of pus itself in blood channels. In the light of our present bacteriological knowledge, we recognize septicæmia as a condition in which both bacteria and their toxins are scattered throughout the body by means of the vascular and lymph systems; while pyæmia represents a form of septicæmia in which, in addition to the general distribution of septic material throughout the body, this material containing bacteria becomes lodged at different points, thus setting up local foci of infection known as metastatic abscesses. These new abscesses usually occur along lines of easiest blood and lymph communication with the point or points previously infected. Thus in suppuration of the intestines the most common seat of metastasis is the liver, while from septic foci in bones, muscles, skin, etc., abscesses may develop in lungs, kidney, spleen, and other organs. After death from pyæmia there may be no visible changes, even the localized foci of infection being too small to be seen by the naked eye. The wound from which the infection originated may look inflamed or gangrenous. Extensive thrombi in the near-by veins are not uncommon.

Thrombosis may also occur in veins at a distance from the wound. In infections following amputation of the leg it is not uncommon to find the femoral vein filled with a purulent mass as high up as Poupert's ligament. As a result of the thrombosis, infarction or death of tissue from interference with its nutrition occurs. Metastatic abscesses may be found in the lungs, kidneys, liver, intestines; in fact, in any of the viscera. Those in the lungs are chiefly near the pleural surfaces and in the lower lobes. Serous effusion, often with much fibrin, may occur into the pleural and pericardial cavities. Local inflammation of joints, especially of the knee and shoulder, may occur. With the exception of those occurring in serous membranes, these inflammations are usually purulent in character and of the same general nature as the metastatic abscesses. Microscopical examination frequently shows congestion of the viscera, with acute degeneration of the parenchyma cells of the kidney, liver, spleen, etc. Chromatolysis of the cells of the brain and spinal cord occurs, also swelling of the lymph nodes with proliferation of their elements. An increase in the number of white blood cells is of almost constant occurrence. While other species of bacteria act as occasional excitants of pyæmia and septi-

cæmia, two species are so frequently associated with this condition that they have received the name of the pyogenic cocci. They are known as the staphylococcus and the streptococcus. The staphylococcus pyogenes aureus is the micro-organism most frequently associated with suppuration. It is a small round coccus averaging about one micron in diameter. It grows in groups somewhat resembling bunches of grapes, from which characteristic its name is derived. It is non-motile. It grows well on the ordinary culture media, such as beef broth, agar, gelatin, milk, and potato, at room temperature. On some of the media it develops a rich golden color, whence its name of aureus. It stains easily with aniline dyes, and does not decolorize with Gram's method. The staphylococcus pyogenes albus, so called from the whiteness of its colonies, is a less frequent and less violent inciter of suppuration than the staphylococcus pyogenes aureus. It may occur in association with the latter or alone. The staphylococcus epidermidis albus is a rather weak pyogenic coccus sometimes found in stitch abscesses.

The streptococcus pyogenes is also a common cause of suppuration and may occur either alone or in association with the staphylococci. Its effects are quite similar to those of the staphylococci. Upon culture media it grows somewhat more slowly than the staphylococci and differs from the latter in not fluidifying gelatin. Its colonies are apt to be of a grayish color. It is non-motile, and when seen under the microscope shows its tendency to form chains, whence its name.

While the above are the most common excitants of suppuration, other micro-organisms may act as causative factors. Thus the typhoid bacillus has been found in pure culture in acute suppurative inflammations of the middle ear, in osteomyelitis, in empyæma, and in localized peritonitis occurring during or after an attack of typhoid fever. The pneumococcus has been found alone in abscesses of the soft parts, in purulent cerebro-spinal meningitis, synovitis, pericarditis, and suppurative inflammation of the middle ear. The bacillus coli communis has been found in pure culture in abscess of the liver, in appendicitis, in acute peritonitis, in purulent inflammation of the gall bladder, and in other inflammatory conditions. Among the less common excitants of suppuration may be mentioned the gonococcus, the micrococcus tetragenus, the bacillus pyocyaneus, the bacillus of glanders, the diplococcus of cerebro-spinal meningitis, and the bacillus pyogenes fetidus.

PYAT, pyá, FÉLIX (1810-89). A French Communist and journalist. He was born at Vierzon, and trained for the law. After the failure of the Socialist call to arms in 1849, he escaped to Switzerland. Thence he went to Belgium and England as a member of the European Revolutionary Committee. The events of 1870 brought him back to France to take active part in the Commune. He was a prime mover in the overturning of the Vendôme Column, and on the collapse of the Commune escaped to London. In his absence he was condemned to death (1873), but he was pardoned (1880) and elected Deputy from Marseilles (1888). Pyat died at Saint Gratien, August 4, 1889. He contributed to many newspapers and edited several revolutionary journals. He wrote several very popular

Socialistic plays, of which *Mathilde*, *Diogène*, and *Le chiffonnier de Paris* are characteristic. His attempts in non-dramatic fiction are insignificant.

PYATIGORSK, pyá'tyé-górsk', or **PIATIGORSK**. A noted watering place in the Territory of Terek, Northern Caucasia, situated on the southern slope of the Mashuka and south of the Beshtau, 124 miles by rail northwest of Vladikavkaz (Map: Russia, F 6). There are about twenty sulphur springs ranging in temperature from about 84° to 117.5° and used both for bathing and drinking. Population, in 1897, 18,638.

ΠΥCNOΓON'IDA. See PANTOPODA.

PYDNA (Lat., from Gk. Πύδνα). A Greek settlement in ancient Macedonia, on the west coast of the Thermaic Gulf. It seems to have passed early into the power of the Macedonians, but appears from time to time as independent. In the fourth century B.C. it was a dependency of Athens, but was captured by Philip, who converted it into a strong fortress. Near it took place in B.C. 168 the great battle between the Romans, under Æmilius Paullus, and the Macedonian King, Perseus, in which the latter was defeated and the Macedonian Empire destroyed. Under the Romans the town seems steadily to have declined.

PYE, HENRY JAMES (1745-1813). An English poet laureate, eldest son of Henry Pye of Faringdon, in Berkshire. He was educated at Magdalen College, Oxford (M.A. 1766; D.C.L. 1772). He entered Parliament, but retired in 1790. In 1792 he was appointed police magistrate for Westminster. Beginning verse writing at an early age, he published several small volumes, and collected his poems in 1787 under the title *Poems on Various Occasions*. Though he was a tame versifier, he became laureate in 1790 through the favor of Pitt. The appointment met with ridicule. The annual ode, which appeared regularly, was long a merry incident among literary men. Pye's most ambitious poem was an epic in six books on Alfred (1801). He also translated Bürger's *Lenore* (1785), and wrote two novels and several plays. See LAUREATE, POET.

PYELITIS (Neo-Lat., from Gk. πύελος, *pyelos*, trough, pan, pelvis). Inflammation of the pelvis of the kidney. It may be caused by kidney-stones, inflammation extending from the bladder or stagnation of the urine. Severe pains in the loins accompany the disease. The urine contains a variable amount of pus and blood. The severe forms due to the presence of kidney-stones require surgical treatment (removal of the calculi). In lighter cases regulation of the diet and avoidance of all stimulating drinks will prove beneficial.

P'YENG-YANG, pyéng'án', or **P'YUNG-YANG**. A town of Korea. See P'ING-YANG.

PYGMA'LION (Lat., from Gk. Πυγμαλίων). A legendary king of the island of Cyprus, who, disgusted with the dissolute character of the women of his island, resolved never to marry. Enamored of a beautiful ivory statue which he had made, he requested Venus to give it life. His prayer was granted, and the vivified statue bore him a daughter, Paphos, who, according to some, became by Apollo mother of Cinyras, the founder of Paphos. Others told how Cinyras

married Metharme, daughter of Pygmalion. The love of Pygmalion for his statue is told by Ovid (*Metam.*, x. 243). According to another version, Pygmalion conceived a passion for the temple statue of Aphrodite herself.

PYGMIES (Lat. *Pygmaeus*, from Gk. Πυγμαίος, *Pygmaios*, pygmy, dwarf, of the length from the elbow to the knuckles, from πυγμή, *pygmé*, measure from the elbow to the knuckles, fist; connected with Lat. *pygnus*, fist). A dwarf negroid population of equatorial Africa across the continent from Uganda to the Gabon, including Akkas, or Tiki-Tiki, Afii, Wambutti, Batwa, and Obongo. They are under five feet in stature, brown in color, and are not to be confounded with the Bushmen. The present habitat of the pygmies is the inter-tropical forest zone, between six degrees north and south of the equator, where they exist in small groups, though formerly they had a more extensive range toward the north. Remains of Neolithic dwarfs have been found at the Schweizersbild Station in Switzerland, but they differ in cranial features from the African pygmies. Besides the African pygmies there are dwarf races in the Malay Peninsula (Pangan tribe), and in islands in Micronesia and Melanesia. In the Philippines are interesting pygmies (see ÆTA), who scarcely differ in appearance from those of Africa, but are somewhat taller. The pygmies have, as a rule, shapely bodies, and small hands and feet. They have woolly hair, dark skin, small oval eyes, high cheek bones, broad foreheads, and thick lips. The mean stature of some of the tribes is four feet three inches. They are retiring and live in the forests, usually under the protection of the taller tribes, whom they serve in various ways. They are expert hunters, and kill game by stealth with poisoned arrows. In character, so far as known, they show childish traits, are born mimics, and delight in songs and posture dances.

Consult: Quatrefages, *Les pygmées* (Paris, 1887); Flower, "The Pygmy Races of Men," *Journal of the Anthropological Institute*, vol. xviii. (London, 1888-89); Keane, *Man: Past and Present* (Cambridge, 1899); Johnston, *Uganda* (London, 1903).

PYGOP'ODES (Neo-Lat. nom. pl., from Gk. πυγή, *pygē*, rump + πούς, *pous*, foot). An order of birds, originally including the grebes, loons, auks, murrets, and puffins. This is now known to be an unnatural assemblage, and the use of the term has been abandoned in this sense. It is properly retained by some writers as the name of an order equivalent to 'Colymbiformes' of others, including only the loons and grebes.

PYLE, HOWARD (1853—). An American illustrator and author. He was born in Wilmington, Del., March 5, 1853, and studied art at a private school in Philadelphia. After practicing his profession in New York City from 1876 to 1879, he returned to Wilmington, where he has since resided. Pyle is one of the foremost American illustrators, being especially successful in juvenile work. A master of linear composition, he is bold and original in his sense of design, and equally efficient in pen-and-ink, wash drawings, and color compositions. His best subjects are taken from the colonial periods of New England and New Amsterdam, and from the life of adventurers

and seafaring men. He sometimes writes the text for his illustrations, being author and illustrator of the *Merry Adventures of Robin Hood* (1883); *Pepper and Salt* (1885); *The Rose of Paradise* (1887); *A Modern Aladdin*, and *Men of Iron* (1891); *Jack Ballister's Fortunes* (1894); *Twilight Land*; and *The Garden Behind the Moon*.

PYLUS, or PYLOS (Lat., from Gk. Πύλος). An ancient town of Messenia, in the Peloponnesus, on the promontory of Coryphasium at the northern entrance to the Bay of Pylos (Navarino). Strabo says that it was originally inland at the foot of Mount Ægaleum, and that Coryphasium was only settled by part of the population on the destruction of the old city. However this may be, after the conquest of Messenia by the Spartans, the place seems to have been abandoned, until in B.C. 425 it was occupied by the Athenian general Demosthenes, who fortified the high and precipitous promontory, and successfully repelled assaults of the Spartans by sea and land. The Athenian fleet, which arrived after the first assault, forced an entrance into the bay at both ends of the long island of Sphacteria, defeated the Spartan fleet, and blockaded 420 Spartans on the island, where they were subsequently forced to surrender to an Athenian force under Demosthenes and Cleon. The Athenians held Pylos for fifteen years, when it was recaptured by the Spartans, and again fell into obscurity, though after the restoration of the Messenians it became the port of the country. At the end of the thirteenth century it was fortified with a strong Venetian castle, and another was built at the southern entrance to the bay, near the town of Navarino, now called Pylos. The mediæval name is probably due to the settlement here in 1381 of Navarrese mercenaries, though some derive it from Avarino and trace it to an Avar settlement 800 years earlier. In the bay was fought, on October 20, 1827, the great naval battle of Navarino, in which the Turkish-Egyptian fleet was destroyed by the united English, French, and Russian fleets under Admiral Codrington.

PYM, JOHN (1584-1643). An English Parliamentary leader, born at Brymore, in Somersetshire. In 1599 he entered what is now Pembroke College, Oxford, but did not graduate, and in 1602 entered the Middle Temple, though he was never admitted to the bar. There is some doubt whether Pym sat in the Parliament of 1614, but in any case he was not prominent until the Parliament of 1621. He was a Puritan, and his interests during this period were chiefly religious, his first speeches in Parliament being directed against the Catholics. He became so obnoxious to the Court that he was imprisoned for three months in his home in London. In the first three Parliaments of Charles I. he was the leader in the impeachment of Montagu and Manwaring, two clergymen who had attacked Calvinistic doctrines and treated the Parliament with scant respect, and he was prominent in the impeachment of Buckingham. He was also prominent in the agitation which preceded the Petition of Right (q.v.). Nothing is heard of him in the intervals between Parliaments. During the eleven years of Charles's personal government he was intimately connected with various schemes for the settlement of the Connecticut Valley. In 1640, on the meeting of the

Short Parliament, Pym became its real leader, though no formal leadership was recognized in those days, and his influence over the Puritan party continued undiminished until his death. He opened the Short Parliament with a speech two hours in length, setting forth the grievances of the nation, and persuaded the Parliament to postpone the supplies until these grievances were redressed. On the opening of the Long Parliament, which met likewise in 1640, Pym was resolved to proceed to extremities. He introduced and conducted the impeachment of Strafford for high treason in attempting to subvert the Constitution, but he resisted in vain the dropping of the impeachment and the introduction of the bill of attainder, though it was due to his efforts that, notwithstanding the bill of attainder, Strafford was heard in his own defense. The Triennial Act (q.v.) was largely his measure. The adherence of the bishops to the cause of Charles I. led to the demand for their abolition, and Pym supported the 'Root and Branch' bill which was introduced for this purpose, though it was not his intention to introduce Presbyterianism.

He naturally took a prominent part in drawing up and passing the Grand Remonstrance (q.v.) in 1641, and he even proposed at this time to hold the King in check by making his ministers responsible to Parliament. On the unsatisfactory outcome of the campaigns in 1642 Pym favored and carried out, though reluctantly, the union with the Scots, with the unwelcome condition of the acceptance of the Covenant and the introduction of a Presbyterian form of Church government. Even before the meeting of the Long Parliament, Pym may have had communication with the Scots, and he was the leader of the five members whom Charles on January 4, 1642, attempted in vain to arrest in person on the floor of the House of Commons on the charge of treasonable conspiracy with that nation. He in turn suspected Charles of treasonable designs, and was ever on guard, in order to prevent the King from using force successfully against Parliament. Pym, like Hampden, favored a vigorous prosecution of the war, and, like Hampden, died soon after its beginning, December 8, 1643. Consult: Gardiner, *Great Civil War* (4 vols., London, 1893); Forster, *Statesmen of the Commonwealth of England* (5 vols., London, 1841-44); Goldwin Smith, *Three English Statesmen* (London, 1867).

PYNCHON, pin'chon, CLIFFORD. A broken-down elderly man in Hawthorne's *House of the Seven Gables*, imprisoned many years on a false charge of murder. His sister, Hepzibah, keeps a little shop in the ill-fated house, and both inherit Judge Pyncheon's property on his tragic death.

PYNCHON, JOHN (1621-1703). An American colonist, born in Springfield, Essex County, England. He was brought to Massachusetts when a child by his father, William Pynchon (q.v.). By inheritance and by purchase from the Indians, he obtained large tracts of land in the Connecticut Valley, on which he established Northampton, Hadley, and other towns. His diplomacy in treating with the Indians was of great service to the colony. He held many important public offices, including that of councillor under Sir Edmund Andros in 1688-89, and again under the new charter from 1693 until his death.

PYNCHON, THOMAS RUGGLES (1823—). An American clergyman and educator, born in New Haven, Conn. He graduated at Trinity College, Hartford, and in 1849 was ordained. His first charge was in Boston, and afterwards he had churches in Lenox and Stockbridge, Mass. (1849-54). He was Scoville professor of chemistry and natural sciences at Trinity from 1854 until 1877, and from 1874 until 1883 was president of that institution. In 1887 he took the chair of moral philosophy there.

PYNCHON, WILLIAM (1590-1662). An American colonist and theologian. He was born at Springfield, Essex. He emigrated to the colony of Massachusetts in 1630, and was treasurer of the colony in 1632-34. He was one of the first settlers of Springfield in 1636. On a visit to England in 1650 he published *The Meritorious Price of Our Redemption, Justification, etc., Clearing it from Some Common Errors*. The strongly anti-Calvinistic position of this work made it very unacceptable to the Puritan clergy, and on his return to Massachusetts he was condemned by the Legislature, which, on October 16, 1650, ordered his book to be burned the next day in Boston market 'after the lecture.' He was himself cited to appear before it. As the result of further study he retracted some of his opinions, but his position in America continued unsatisfactory, and in 1652 he returned to England and settled at Wraysburg, near Windsor. He replied to his principal critic, Rev. John Norton, in the second edition of his book (1655).

PYNE, PIN, JAMES KENDRICK (1852—). An English organist and composer. born in Bath, where his father was organist in the Abbey. The boy at eleven became organist of All Saints' Church, and in the next year was put under Dr. S. S. Wesley. In 1874 he was appointed organist in Chichester Cathedral. He spent a year as organist of Saint Mark's in Philadelphia, and upon his return to England was appointed to a like position in Manchester Cathedral. He acted as professor in the Manchester Royal College of Music in 1893, and in 1901 was lecturer on ecclesiastical music at Victoria University. He published vocal music and compositions for cathedral use, and for organ and piano. Of his songs the best known are those for the words of Edwin Waugh, the Lancashire poet.

PYNE, LOUISA FANNY (1832—). An English soprano singer. She was the daughter of G. Pyne, a celebrated vocalist, and was trained almost entirely by Sir George Smart. She made her first public appearance in 1842, and five years later was successfully received in Paris. Her debut in opera was in 1849 at Boulogne, when she appeared as Amina in *La Sonnambula*. From 1854 to 1857 she toured the United States, and was uniformly successful. Her greatest reputation was obtained as the prima donna of an English opera company, in which she was associated with Harrison at the Lyceum, Drury Lane, and Covent Garden theatres. In 1868 she was married to Frank Bodda, a barytone singer.

PYN'SON, RICHARD (?-1530). One of the early London printers, by birth a Norman. He undoubtedly learned his trade in Normandy, and not under Caxton, as has been often asserted. Some time before 1593 he began printing near Temple Bar, and about ten years later he moved to Fleet Street. Pynson issued some of the most

beautiful books published at that time in England. From his press proceeded more than three hundred books. Among the earliest were Chaucer's *Canterbury Tales* (1493); Parker's *Dialogue of Dives and Pauper* (1493); Terence (1496), the first classic printed in England; the *Morton Missal* (1500), representing his finest work. He became printer to Henry VIII., from whom he received a pension.

PYRA, πέρ'α, IMMANUEL JAKOB (1715-44). A German poet. He was born in Kottbus, studied theology at Halle, where he joined Lange's *Dichterbund*, and with Lange lived at Laublingen. The two poets published *Freundschaftliche Lieder* (1746), which, with their delight in friendship and their unrhymed verse, foretell Klopstock. Pyra boldly, and rather pedantically, attacked Gottsched in 1736 with *Erweis dass die Gottschedianische Sekte den Geschmack verderbe* (1743), and his premature death was partly due to the bitter personalities with which the attack was returned. Consult Waniek, *Immanuel Pyra* (Leipzig, 1882).

PYRAMID (Lat. *pyramis*, from Gk. *πυραμίς*, pyramid, from Egyptian *per-em-us*, coming out in breadth, denoting probably the ratio of the base to the height). A polyhedron (q.v.) one of whose faces (the base) is a polygon and whose lateral faces are triangles. Thus a pyramid is a prism (q.v.) whose upper base is zero. A pyramid is said to be *regular* when the base is a regular polygon and the vertex lies in the perpendicular to the base erected at its centre. The altitude is the perpendicular distance between the base and the vertex. The *slant height* of a regular pyramid is the altitude of any one of the triangles which make up its lateral faces. When a pyramid is cut by a plane, the portion containing the base is called a *truncated* pyramid; if the intersecting plane is parallel to the base, a *frustum*. The formula for the volume of a pyramid is $V = \frac{1}{3}bh$, and for the frustum $V = \frac{h}{3}(b + b' + \sqrt{bb'})$, where b and b' are the bases, and h is the altitude. Consult Holzmüller, *Elemente der Stereometrie* (Leipzig, 1900-02).

PYRAMID. A solid structure, usually of stone, having a square base and triangular sides meeting in an apex. True pyramids are found only in Middle Egypt, and date from the period between the Fourth and Twelfth dynasties, though a few may be somewhat older. Pyramidal buildings occur elsewhere, but they differ in important particulars. The pyramids of Mexico, for example, have flat tops and the sides form successive stages or steps. Those of Abydos and Meroë are merely imitations of pyramids on a small scale; they are really sepulchral chambers having the pyramidal form externally, and are usually provided with porticoes representing the funerary chapels of older tombs. The pyramids found at Cenchræ and at Rome are sporadic attempts to reproduce the Egyptian type.

With regard to the mode of construction of the pyramids of Egypt, two principal theories have been advanced. Lepsius, followed by Ebers, and more recently by Borchardt, believed that each king, on ascending the throne, began to build a pyramid as a tomb and monument for himself. This was usually laid out upon a comparatively small scale, so that if the builder

had but a short reign his tomb might be complete. As time passed, successive layers were added, and the size of the monument was thus proportioned to the length of the builder's reign. This theory is combated by Petrie (q.v.), who believes that each pyramid was begun and carried out upon a definite design of size and arrangement. The plan was occasionally altered, but in such cases the alteration was not gradual, but sudden. The outer casing of the pyramids was invariably of massive blocks of fine stone, well joined, and carefully polished. The interior of the mass varied at different periods. In the oldest pyramids it was formed, so far as is known, of courses of rough-hewn blocks laid with a little mortar. In later times the core was formed of brick and rubble inclosed between inner and outer walls of solid masonry, and under the Twelfth Dynasty the core is almost entirely of sun-dried bricks. Each pyramid contained a sepulchral chamber which was always low down, and was usually excavated in the rock underlying the structure. It was reached by a passage opening from the northern face of the pyramid and passing, in its course, through one or more lesser chambers. The external entrance was usually situated above the level of the sepulchral chamber, and the passage sloped downward at a moderate angle. Pyramids seem to have stood originally within walled inclosures, and traces of the walls are still to be found in many cases. To each pyramid was attached a temple in which the funerary worship of the deceased Pharaoh was conducted by priests who were supported by a regular endowment. Such temples are still to be seen at Ghizeh, and the priests of the various pyramids are frequently mentioned in the Egyptian inscriptions. Around the pyramid of each king are grouped the tombs (mastabas) of the nobles and high functionaries who had lived under his reign.

The pyramids that now exist in Egypt, some seventy-five in number, extend in groups from Abu Ro'ash on the north to Medum on the south. The group of Abu Ro'ash consists of three pyramids all ruined; the largest of them has lost its outer casing, and is now a shapeless mass of Nile mud inclosing a nucleus of massive stone. One of the others still contains a sepulchral chamber and the passage leading to it. Farther to the south lies the group of Ghizeh, by far the most important among the Egyptian pyramids. The largest of the group is the *Great Pyramid*, the tomb of Cheops (q.v.), the second King of the Fourth Dynasty. It was called by the Egyptians *Yechwet Chufu*, 'the glory of Chufu' (Cheops). Its present perpendicular height is 451 feet, but originally, including the nucleus of rock at the bottom and the apex which has disappeared, it measured 482 feet, or more than 50 feet higher than Saint Peter's at Rome. The sloping sides, which rise at an angle of $51^{\circ} 50'$, are now 568 feet in slant height and have a length of 750 feet at the base. The cubic contents amount to about 3,057,000 cubic yards, representing a weight of no less than 6,848,000 tons. According to Petrie's estimate, the pyramid contains about 2,300,000 blocks of stone averaging some 40 cubic feet in size. In its present condition this immense edifice covers a space of nearly thirteen acres. The material of which it is constructed consists of stone from the Mokattam and Tura hills on the opposite

side of the Nile. Traces of the road by which the stone was conveyed are still visible. The outer casing of this pyramid has long since disappeared, and the underlying courses of rough-hewn stone now form a series of steps. The entrance is in the north face of the pyramid at the height of about 48 feet from the ground. From it there was a narrow passage, 3 feet 4 inches high by 3 feet 11 inches wide, which, after descending into the interior at an angle of $26^{\circ} 41'$ for a distance of 293 feet, terminates in a horizontal corridor, 27 feet long, 3 feet high, and 2 feet wide, leading to a subterranean chamber hewn in the solid rock. This chamber is 46 feet long, 27 feet wide, and $10\frac{1}{2}$ feet high. Its floor lies $101\frac{1}{2}$ feet below the level upon which the pyramid is built, and a blind passage opens from its farther end. Some 60 feet from the external entrance a second passage branches off from the long descending passage and ascends at about an equal angle for a distance of 121 feet, when it enters the Great Hall. At this point a horizontal corridor leads from the ascending passage to the so-called Chamber of the Queens, which is 17 feet long, 18 feet 10 inches wide, and 20 feet high. The Great Hall, which continues the ascending passage, is 28 feet high and 155 feet long, but is very narrow, the width of the lower part being 3 feet 4 inches, and that of the upper part only 2 feet 7 inches. It terminates in a horizontal passage 122 feet long and 3 feet 8 inches high, expanding about the middle into an antechamber. At the end of the horizontal passage is the King's Chamber, the most remarkable of all the chambers in the pyramid. The northern and southern sides are each 17 feet in length, the eastern and western sides $34\frac{1}{2}$ feet, and the height is 19 feet. The floor is $139\frac{1}{2}$ feet above the plateau upon which the pyramid stands. The chamber is lined with finely polished granite slabs, and the ceiling is formed of nine great blocks of granite, each $18\frac{1}{2}$ feet long. Within the chamber is a mutilated stone sarcophagus, the lid of which has disappeared. In order to relieve the roof of the pressure of the superincumbent mass of masonry, five hollow chambers have been constructed above it. The first four have flat ceilings, while the last is roofed with blocks bearing obliquely against each other. Two air shafts (8×6 inches) run from the King's Chamber to the northern and southern faces of the pyramid. Near the Great Pyramid, on the east side, are three small pyramids built for members of Cheops's family; a few hundred yards to the southeast is the Sphinx (q.v.).

The *Second Pyramid*, situated about 200 yards southwest of the Great Pyramid, was erected by Chephren (q.v.), the successor of Cheops, and was called by the Egyptians *Wer-Chafré*, 'great is Chephren.' Its present perpendicular height is 450 feet (formerly 458 feet), while the sloping sides, measuring each $694\frac{1}{2}$ feet at the base, rise at an angle of $52^{\circ} 20'$ to the height of $566\frac{3}{4}$ feet. Part of the original casing still remains at the top. The fact that it stands upon a higher level than the pyramid of Cheops gives it the appearance of greater height. The rocky ridge upon which it is built rises somewhat toward the west and north, and a considerable part of it had to be cut away in order to secure a level surface. The leveled space around the base of the pyramid was paved with blocks of

PYRAMIDS
PYRAMIDS OF CHEOPS AND CHEPHREN SPHINX AND TEMPLE OF CHEPHREN

limestone. Two passages, both on the north side, give access to the interior. One of these is in the pavement in front of the pyramid, the other is 38 feet above the surface of the ground. The upper passage descends at an angle of $25^{\circ} 55'$ to a depth of 105 feet, and leads through a horizontal corridor to the sepulchral chamber called, from its discoverer, Belzoni's Chamber. It is hewn in the rock and is $46\frac{1}{2}$ feet long, $16\frac{1}{3}$ feet wide, and $22\frac{1}{2}$ feet high. Belzoni, who opened the pyramid in 1818, found in this chamber a granite sarcophagus filled with rubbish. The lower passage, beginning in the pavement in front of the north face of the pyramid, first descends at an angle of $21^{\circ} 40'$, then runs horizontally for 59 feet, and then ascends, terminating in the horizontal corridor leading to Belzoni's Chamber; the total length of the passage is 97 feet. Near the middle of its horizontal portion a small chamber is introduced, and a descending passage, 22 feet long, leads to another chamber, 34 feet 3 inches long, 10 feet 4 inches wide, and 8 feet 5 inches high.

The *Third Pyramid*, called by the Egyptians *Neter-Menkauré*, 'Menkauré is divine,' was built by Menkauré, the successor of Chephren, and the Mycerinus of Herodotus. Its perpendicular height is 204 feet, and the sides, which slope at an angle of 51° , rise to the height of $262\frac{3}{4}$ feet. Each side measures $356\frac{1}{2}$ feet at the base. The lower part of the pyramid is cased with slabs of polished red granite. The entrance is about 13 feet above the ground on the north side. From it a passage slopes down at an angle of $26^{\circ} 2'$ for a distance of $104\frac{1}{2}$ feet, then, becoming nearly horizontal, passes through an antechamber 12 feet long, 10 feet wide, and 7 feet high, and finally enters a large chamber $44\frac{1}{2}$ feet long, $12\frac{1}{2}$ feet wide, and 13 feet high, in which were found the remains of a stone sarcophagus. From the floor of this chamber a shaft leads to the tomb chamber, which lies below. It is paved with fine granite blocks, and has an arched roof formed of blocks placed against each other at an angle, and hollowed out on the inside. In this chamber Colonel Vyse found the basalt sarcophagus of Mycerinus, but it was lost at sea in 1838 while being conveyed to England. In the chamber above were found a part of the wooden coffin of the King and some fragments of his mummy. To the south of this pyramid are three small pyramids, probably constructed for members of the family of Mycerinus.

South of Ghizeh are the pyramids of *Abusir*, the ancient Busiris, erected by kings of the Fifth Dynasty. The entrances of these pyramids are, as usual, on the north side, and in all of them the tomb chamber is reached by a passage at first slanting and afterwards horizontal. The northernmost of the three largest pyramids (originally fourteen in number) is that of Sahurê, the second King of the Fifth Dynasty. Its perpendicular height, originally $163\frac{1}{2}$ feet, is now only 118 feet. The central pyramid is that of Rê-en-woser, the sixth King of the same dynasty. The largest of the three, which has a perpendicular height of 165 feet (formerly 229 feet), has not yet been identified. The other pyramids of this group are mere heaps of ruins.

The burial field of Saqqâra contains a considerable number of pyramids. Of special interest is the so-called 'step pyramid,' the tomb

of Zoser, the second King of the Third Dynasty. It rises in six steps which are respectively 38, 36, $34\frac{1}{2}$, 32, 31, and $29\frac{1}{2}$ feet in height; the width of each step is from 6 to 7 feet. The perpendicular height is 197 feet. The interior of the pyramid contains a very numerous and complicated series of passages and chambers. According to Petrie, it is not a true pyramid at all, but a mastaba enlarged by successive additions into the pyramidal shape. The slope of the sides (about 75°) differs considerably from that of the true pyramids. Near it is the pyramid of Unas, the last King of the Fifth Dynasty, and in the vicinity are the pyramids of the Pharaohs Teta, Pepi I., Mer-en-rê, and Pepi II. of the Sixth Dynasty. These pyramids were opened in 1881, and the walls of their chambers were found to be covered with long religious texts.

South of Saqqâra are the pyramids of Dahshûr, which are in a simple and massive style much like those of Ghizeh. The group consists of two large and two smaller pyramids of stone, and two of mud bricks, the latter being usually known as the 'black pyramids.' The more northerly of the two brick pyramids, which formerly had a casing of stone, is the tomb of Usertesen III. of the Twelfth Dynasty. Its present height is 90 feet. To the southwest of it is a large stone pyramid 326 feet high and 702 feet in width. To the south and east are the remains of other pyramids, and still farther to the south is a pyramid of peculiar form, usually termed the 'blunted pyramid.' The lower portion slopes at an angle of $54^{\circ} 41'$, while the sides of the apex form an angle of $42^{\circ} 59'$. It is 321 feet in height and 620 feet square. The name of the builder is unknown, but it probably belongs to the oldest period of Egyptian history.

The next group of pyramids, south of Dahshûr, is the group of Lisht, of which the more southerly is the tomb of Usertesen I. of the Twelfth Dynasty. Still farther south is the pyramid of Medum (q.v.). To the west of Medum, on the edge of the Fayum, are the pyramids of Illahun and Ilawâra, the former the tomb of Usertesen II., the latter that of Amenemhat III. The pyramid of Illahun is built with a framework of stone filled up with mud bricks, while that of Ilawâra is built entirely of mud bricks, though it was doubtless originally cased over with fine stone.

PYRAMUS (Lat., from Gk. *πύραμος*) AND **THISBE**, *this'be* (Lat., from Gk. *Θισβή*). Two lovers whose tragical history is told by Ovid in the fourth book of his *Metamorphoses*. They were natives of Babylon and immediate neighbors. But though tenderly attached to each other, their parents would not consent to their marriage, and they were obliged to content themselves with stolen interviews through an opening in the wall between their gardens. On one occasion they

arranged to meet at the tomb of Ninus, where Thisbe, who was first at the trysting-spot, was startled by a lioness. She fled, leaving her veil behind, which the fierce animal tore and covered with blood. Soon after Pyramus appeared, and, seeing the bloody veil, believed his mistress had been murdered, whereupon he killed himself. Thisbe now returned, and, beholding her lover lying dead on the ground, put an end to her own life.

PYRARGYRITE (from Gk. πῦρ, *pyr*, fire + ἀργυρος, *argyros*, silver). A silver-antimony sulphide that crystallizes in the hexagonal system, has a metallic lustre, and is dark red or black in color. It occurs with arsenic, lead, and silver ores in the Harz, Saxony, Bohemia, Hungary, Spain, and Cornwall, England; also in Mexico and South America. In the United States it is found with silver ores in Colorado, New Mexico, Arizona, Utah, and Nevada, and when found in quantity is a valuable silver ore.

PYRENEES, pir'é-néz. A high mountain chain of Europe extending from the southeast corner of the Bay of Biscay to the Mediterranean. The Cantabrian Mountains of the north coast of Spain are a continuation of the Pyrenees, so that the entire mountain system extends from Cape Creus in the Mediterranean to Cape Toriñana on the northwest coast of Spain, a distance of 630 miles; but the name Pyrenees is applied only to that part of the system which forms the boundary between France and Spain, and which has an east and west extension of about 280 miles. The mountains, with an area of over 20,000 square miles, form the water parting between the rivers of France and Spain, and are an effective barrier between the two countries. Unlike the Alps, which have a number of passes practicable for wagon roads, the Pyrenees are a true sierra whose saw-like ridges are notched only a little below the level of the peaks, so that the few passes are not practicable for wagons. The highways that start as roads merge into mule paths and are valueless for commerce. The two railroads between France and Spain cross the low coastal strips at the extremities of the mountains, and are thus greatly deflected from direct routes, so that most of the commerce between the two countries is carried by sea. Thus while the Alps oppose no great obstacle to commerce, the Pyrenees are a barrier to it.

The Pyrenees were upheaved above the sea during the latter part of the Eocene epoch, when a large part of Europe was buried under the ocean. Granite forms the kernel of the mountain system, and is overlaid by masses of chalk and sandstone. The culmination of the mountains is only 11,168 feet above sea level; and, owing to the far extending southern slope which falls gently to the plain of Spain, the mean height of the mountain mass is only about 3500 feet.

Contrary to earlier opinion, the mountains do not form a continuous chain or two chains, as has often been asserted, between the Atlantic and the Mediterranean. The later investigations of the French Alpine Club modify this view. The surveys, especially on the Spanish side, seem to show that no continuous line forms the culminating portion of the Pyrenees, but that this backbone of the mountains is a series of broken chains which do not coincide with the water parting between France and Spain, but cross this divide obliquely. Some of these broken chains extend from northwest to southeast, and

others intersect them from southwest to northeast, so that by alternately digressing from one of these directions to the other the irregular crest of the Pyrenees acquires its general direction, which from the Atlantic to the Mediterranean is 9° south of due east.

The northern slopes of the Pyrenees are shorter and much steeper than those on the southern or Spanish side. Few mountain chains exhibit a more regular succession of increasing altitudes than the Pyrenees summits from the Atlantic to and through the Central or High Pyrenees. In the west near the ocean the summits are only 2000 to 3000 feet high. Farther east the peaks become more and more alpine till the Pic du Midi d'Ossau (9465 feet) is seen rising above all its western neighbors. The central regions of the mountains, extending about 150 miles, are next reached, and the Pic d'Enfer (10,109), Balaitous (10,318), Vignemale (10,820), Mont Perdu (10,994), Pic des Posets (11,047), and Maladetta, or the Pic d'Anethou (11,168), rapidly succeed one another, all in the region of the High Pyrenees. The mountains to the east of the culminating summits are abruptly reduced in elevation, and only two, Montcalm and Pic d'Estats, approach the height of the Central or High Pyrenees. The Eastern Pyrenees in their three high summits (Pic Carlitte, Puigmal, and Canigou) and the High Pyrenees rise into the region of permanent snow. The snow line is nearly 1000 feet higher than in the Alps, while the general level of the mountains is considerably lower. Most of the highest summits are on the boundary crest, but the culminating point of the Maladetta is in Spain. The extent of the snow fields and glaciers is therefore insignificant as compared with that of the Alps. The entire area of glaciers is estimated at 13 square miles, the largest glaciers being on the Maladetta (1760 acres) and on the Mont Perdu group (1472 acres). Under these circumstances the mountain climber gives much less attention to weather and snow conditions than in Switzerland. While the Pyrenees have great beauty and grandeur, they have not vied with the Alps as a field for climbers. This is partly explained by the fact that most tourists prefer mountains which may be easily reached from comfortable hotels with highly skilled and painstaking mountain guides. One of their most attractive spots, easily reached from several French resorts, is the Cirque de Gavarnie. Along the northern slope of the Pyrenees are a number of famous watering-places, including Bagnères-de-Bigorre and Bagnères-de-Luchon. The little Republic of Andorra (q.v.) lies among the Eastern Pyrenees on the southern slope. The two most famous passes of the Pyrenean range are the Col de Portus or Perthus (traversed by Hannibal), in the east, and the pass of Roneesvalles, in the west.

PYRÉNÉES, pé'rá'ná', BASSES. A southwestern department of France. See BASSES-PYRÉNÉES.

PYRÉNÉES, HAUTES. A southwestern frontier department of France. See HAUTES-PYRÉNÉES.

PYRENEES, PEACE OF THE. A treaty of peace concluded between France and Spain, November 7, 1659, on an island in the Bidassoa River. It brought to an end the struggle between the two powers, which with intervals of peace had continued since the beginning of the sixteenth century, when Louis XII. of France and Ferdinand the Catholic entered into the contest for supremacy in Italy. Spain ceded to France most of Artois, and parts of Flanders, Hainault, and Luxemburg; in the south it surrendered Roussillon and a part of Cerdagne, thus making the Pyrenees the boundaries between the two countries. The Infanta Maria Theresa was promised in marriage to the young Louis XIV. (q.v.).

PYRÉNÉES-ORIENTALES, pé'rá'ná' zó'rè-án'tál'. A southern maritime department of France (q.v.), bounded on the east by the Mediterranean, and on the south by the Pyrenees (Map: France, J 9). Area, 1592 square miles. The department presents a series of three parallel valleys formed by spurs from the Pyrenees, which run east and west, and are watered by the Agly, the Tet (the principal river), and the Tech. The southwest corner is drained by the Sègre (Segura), a tributary of the Ebro. An extensive plain occupies all the north and east of the department. The climate is equable. The vegetable products include fine grain and some of the choicest fruits. Wines constitute the wealth of the district, and include the red wines of Roussillon and the white muscadel of Rivesaltes. The chief exports are wine, cocoons, live stock, and animal products, anchovies, etc. Capital, Perpignan (q.v.). Population, in 1896, 208,387; in 1901, 212,121. Consult Companyo, *Histoire naturelle du département des Pyrénées-Orientales* (Perpignan, 1862-64).

PYRÉNOID (from Gk. *πυρήν*, *pyrēn*, stone of a fruit + *εἶδος*, *eidos*, form). A differentiated portion of a chromoplast (q.v.) of proteid nature, which, since starch grains are usually formed around it, is sometimes called an amyllum body. It is regarded as a food reserve.

PYRETHRUM, pí'rēth-rím. See INSECT POWDER and Colored Plate of CHRYSANTHEMUMS.

PYR'GOS. A town of Greece, capital of the Nomarchy of Elis. It is situated near the west coast of the Morea, 40 miles southwest of Patras, in a fertile region producing great quantities of currants, grapes, and oranges (Map: Greece, C 4). These products are exported through the port of Katakolon, with which the town is connected by a short railroad. Railroads also run to Patras and to the ruins of Olympia. Population, in 1896, 12,708.

PYRHELIOMETER (from Gk. *πῦρ*, *pyr*, fire + *ἥλιος*, *hēlios*, sun + *μέτρον*, *metron*, measure). The name given by Pouillet to an instrument devised by him for the purpose of measuring the amount of heat received from the sun in a unit of time by a unit surface. This quantity is sometimes called the 'solar thermal constant,' and all apparatus expressly designed to measure the intensity of radiant heat may properly be called pyrheimeters; but, owing to the progress in our views with regard to the effects of solar radiation, it is not now generally recognized that

the latter may produce either thermal, optical, or chemical effects, according to the nature of the substance upon which it falls, so that the pyrheiliometer is really a special form of actinometer (q.v.) or radiometer. Pouillet's instrument, devised in 1837, "consists of a thermometer whose bulb is inclosed in a thin flat metallic box filled with water. The upper surface of the box carefully blackened is placed perpendicularly to the rays of the sun. The heating of the thermometer during five minutes' exposure to the solar action is noted, and also its cooling during five minutes when the sunlight is cut off by a screen. The elevation of temperature produced by the heat of the sun in five minutes, corrected for the effect of cooling or warming when the sun's rays are cut off, is to be divided by the mass of the water in the apparatus and the area of the surface; this gives the quantity of heat expressed in calories as received by a unit surface in a unit time." In 1885 Professor Knut Angstrom devised his differential pyrheiliometer, composed of two identical disks of copper, each carrying a thermo-electric junction and exposed alternately to the action of the sun, a galvanometer placed in the circuit of the two junctions measuring their difference of temperature; and in 1893 he brought out his compensating pyrheiliometer. "Two thin strips of blackened metal identical in every way are placed side by side. One of these is exposed to the rays of the sun, while the other is kept in the shade; the latter is warmed up by an electric current until its temperature is identical with that of the strip that is warmed by the sunshine. This exact equality is shown by the fact that at this moment no thermal electric current passes between the two strips. Therefore at this moment the thermal effect of the solar radiation per unit of time is equal to that of the electric current. The intensity of the latter can easily be measured, and from it is calculated the absolute intensity of the solar radiation. A complete observation consists in making each of the two blackened strips become successively the exposed and the unexposed calorimetric body." In 1893 Chwolson constructed a pyrheiliometer consisting essentially of two thin plates gilded on the back and blackened in front, alternately exposed to and shielded from sunshine, and whose differences of temperature can be measured many times in rapid succession by thermo-electric methods. Chwolson's apparatus has been adopted by the Russian meteorological service, while Angstrom's apparatus has commended itself to the Weather Bureau of the United States. Crova's mercury pyrheiliometer consists of a mercurial thermometer bulb carefully blackened and receiving the solar rays through a narrow aperture of known area. The bulb is alternately shaded and exposed several times in succession and the differences between the readings give the correct effect of the sunshine. When the bulb has been properly calibrated and its water equivalent is known, its changes of temperature can be converted into calories and the instrument becomes an absolute actinometer. The results of the best work that has been done with pyrheiliometers give for the value of the solar thermal constant at the mean distance of the earth from the sun 4.0 calories per minute per square centimeter, but in general all such figures are affected by our ignorance of the absorption by the earth's atmosphere. A

very complete review of pyrheiliometers is given in the report on radiation by Jules Violle, published in the report of the meeting at Saint Petersburg, 1899, of the International Meteorological Committee.

PYRIDINE, C_5H_5N . A powerful basic compound of carbon, hydrogen, and nitrogen. It is usually prepared on a commercial scale from coal-tar; it combines with the sulphuric acid used in purifying the coal-tar hydrocarbons, and when the acid is neutralized with soda, a mixture of pyridine and several other bases (notably quinoline) separates out in the free state; from this mixture pyridine is isolated by fractional distillation, and it may then be obtained pure by transforming it into one of its salts and purifying the latter by repeated crystallizations. Pure pyridine is a colorless liquid that boils at $115^\circ C.$ ($239^\circ F.$) and may be readily identified by its peculiar odor. The derivatives of pyridine include many of the alkaloids (q.v.); nicotine, for example, is closely allied to it, and when subjected to a process of oxidation yields nicotinic acid, $C_6H_7N_2COOH$, a compound evidently derived from pyridine by substituting a carboxyl group ($COOH$) for one of its hydrogen atoms. Another important derivative of pyridine is *piperidine*, $C_5H_{10}NH$, a colorless, powerfully basic liquid that boils at $106^\circ C.$ ($222.8^\circ F.$) and may be identified by its pepper-like odor. Piperidine may be obtained, on the one hand, from pyridine, by the action of nascent hydrogen; on the other hand, it may be prepared from the alkaloid piperine, a characteristic constituent of pepper, by the action of caustic potash. The chemical constitution of pyridine and of piperidine is represented, respectively, by the following graphic formulas:

Pyridine.

Piperidine.

PYRITE (Lat. *pyrites*, from Gk. *πυρρης*, flint, millstone, relating to fire, from *πῦρ*, *pyr.* fire). An iron disulphide (FeS_2) that crystallizes in the isometric system, has a metallic lustre, and is of a brass-yellow color. It is widely disseminated, occurring in rocks of all kinds and of all ages, sometimes in the form of grains disseminated throughout the mass of a rock or along the line of contact between basic eruptives and sedimentaries; as irregular and sporadic and concretionary masses in sedimentary rocks and modern sands and gravels; in the form of true fissure veins; and as interbedded, often lenticular masses, sometimes of immense size, lying conformably with the stratification of the inclosed rock. The origin of the mineral in the older crystalline rocks is frequently somewhat obscure, but in sedimentary rocks it is regarded as due to the precipitation of the included ferruginous matter by sulphureted and deoxidizing solutions produced by decomposing animal and vegetable matter. When found on the surface the mineral is often considerably altered by oxidation and hydration, forming limonite. Py-

rite is found in many localities, including Freiberg, Saxony; Píbram, Bohemia, Schemnitz, Hungary; Langban, Sweden; Kongsberg, Norway; Cornwall and Derbyshire, England; and Peru. In the United States numerous localities where large crystals occur are known in Maine, New Hampshire, Vermont, Connecticut, New York, Pennsylvania, Virginia, North Carolina, Colorado, and California. The amount produced in the United States in 1901 was 234,825 long tons, valued at \$1,024,449. The mineral finds its principal use in the manufacture of sulphuric acid and ferrous sulphate (green vitriol). Small quantities are used in the manufacture of vermilion paints, and some varieties are cut into squares, ovals, and other shapes for use as settings for rings, scarf pins, trinkets, etc. Owing to its yellow color, pyrite has been frequently called *fool's gold*, and many stories are told of the disappointment of miners, who, thinking they had found a fortune, were undeceived only when the mineral was submitted to experts.

The name *pyrites* is applied by Dana to a group of isometric sulphides and arsenides, including, besides that of iron, those of manganese, cobalt, nickel, etc.

PYRKER, pĕr'kĕr, JOHANN LADISLAUS, von Felső-Eör (1772-1847). An Austrian poet. He was born at Lángh, in Hungary, studied at Stuhlweissenburg, where he had for teachers Anyos and Virág, both classical scholars and poets in the vernacular, and, after many adventures, entered a Cistercian cloister at Lilienfeld. There he showed much executive ability and rose rapidly. He was made Archbishop of Erlau in 1827, and in this office did many good works. His poetry is ambitious epic for the most part, full of patriotism and piety. *Tunisia* (1819) told of the conquest of Tunis by Charles V.; *Rudolf von Habsburg* (1824) sang the glorious deeds of Rudolf of Hapsburg; and the *Perlen der heiligen Vorzeit* (1821), *Legenden der Heiligen* (1842), and *Bilder aus dem Leben Jesu und der Apostel* (1843) are biblical and ecclesiastical. But if his epic is flat in its attempts at Homeric simplicity, it cannot be denied that there is the true 'lyric cry' in his *Lieder der Sehnsucht nach den Alpen* (1845). Pyrker's collected works in three volumes appeared 1853-56. Consult: Sauer's critique in *Allgemeine Deutsche Biographie*, vol. xxvi., pp. 790-94).

PYRMONT, pĕr'mōnt. A small town in the the Principality of Waldeck, Western Germany, 15 miles northeast of Detmold. It is celebrated for its mineral springs, which were formerly among the most famous in Europe, and are still visited by over 18,000 patients annually. Permanent population, in 1900, 1483.

PYRMONT. A former principality of Germany, united with Waldeck (q.v.).

PYR-OLIG-NEOUS ACID. See ACETIC ACID.

PYR-OLU'SITE (from Gk. *πῦρ*, *pyr.* fire + *λοῦσις* *lousis*, bath, from *λόειν*, *loucin*, to wash). A mineral manganese dioxide that crystallizes in the orthorhombic system and has a metallic lustre and a dark iron-black or steel-gray color. Manganese oxides are believed to have been formed from the decomposition of preëxisting manganiferous silicate constituents of the older crystalline rocks and the subsequent decomposition of the oxides in secondary strata. Pyrolusite

is found in Thuringia, Moravia, Bohemia, and Transylvania; also in Australia and India, and abundantly in the United States in Vermont, Massachusetts, Connecticut, Virginia, Arkansas, and California. Pyrolusite is the common ore of manganese, and is extensively worked for that purpose, being used in the manufacture of alloys, such as ferromanganese and manganese bronze; as an oxidizing agent, as in the manufacture of chlorine and oxygen; and as a coloring material in the manufacture of glass, pottery, and paints.

PYROMANIA (Neo-Lat., from Gk. πῦρ, *pyr*, fire + μανία, *mania*, madness). A variety of periodic insanity, classed with the degenerative insanities, i.e. the insanities depending upon an hereditary or acquired constitutional condition. During certain periods the patient manifests an uncontrollable desire to commit arson, and feels relief and pleasurable sensation when watching flames. Between these attacks the patient is apparently sane, but in reality the interval is only sub-lucid. The patient is capable of attending to his affairs, perhaps, but is nervous or hysterical, and evinces morbid irritability. Attacks of pyromania are generally sudden, though sometimes preceded by brief depression. The impulse, or imperative conception, is strong and the patient obeys. The morbid impulse to incendiarism occurs not infrequently in epileptics and menstruating girls, rarely in pregnant and hysterical women, frequently in any lunatic with destructive tendencies. See **DIPSOMANIA**; **KLEPTOMANIA**; **INSANITY**.

PYROMETER (from Gk. πῦρ, *pyr*, fire + μέτρον, *metron*, measure). An instrument used for measuring high temperatures where the ordinary mercurial thermometer is not available, as mercury boils at 358° Centigrade. The first pyrometer was that invented by the Dutch physicist Musschenbroek, about 1725, and consisted of a metallic bar which expanded under the influence of heat. Wedgwood's pyrometer, which was devised about 1780, employed cylinders of fire-clay which were exposed to a high temperature and then allowed to cool. The degree of heat was ascertained by measuring the amount of contraction in length experienced by the clay. This method, however, was found unreliable, and the apparatus invented in 1821 by Daniell formed the first really serviceable pyrometer. Here the temperature was measured by the relative expansion of a bar of metal such as iron or platinum contained in a tube of black-lead earthenware. The metal rod was in contact with a lever which moved an indicator over a graduated scale. This instrument was subsequently improved by the substitution of graphite for the platinum rod, and could be used for the measurement of temperature as high as 1000° Centigrade. Numerous other pyrometers have been devised depending on the property possessed by metals expanding with an increase in temperature, but the most accurate instrument is the air thermometer (q.v.), which is the ultimate standard of reference in all high-temperature measurements. It is usually constructed with a bulb of porcelain or platinum containing either air or hydrogen, and the expansion of the gas under the influence of heat increases its pressure and raises the level of a column of mercury. As the pressure of a gas is proportional to its temperature, it follows that by determining the height of the mercury column supported by the air at

the different temperatures, a determination can be made with considerable accuracy, though there are numerous practical difficulties necessitating an experienced observer. A form of pyrometer much used is that invented by Dr. C. W. Siemens, in which the temperature is measured by the increase in the electrical resistance of platinum wire exposed to the heat. This wire is wound on a cylinder of refractory fire-clay inclosed in a shield of platinum wire, which can be determined easily and quickly with a galvanometer and resistance coils by the application of the Wheatstone bridge method. The platinum thermometer, now made in many forms, can be standardized by direct comparison with an air thermometer, and a reference table constructed enabling an observer to ascertain readily the temperature of a furnace or substance with a high degree of accuracy. The pyrometer which is considered the most useful for extremely high temperatures is that used by Le Chatelier, and may be taken as typical of those making use of the thermo-couple. This instrument consists essentially of two pieces of wire of but slightly different composition, which are inclosed in a long tube of porcelain or fire-clay. These wires are platinum and an alloy of 90 per cent. platinum and 10 per cent. of the rare metal rhodium, and the current produced at an increase in temperature is measured by a galvanometer. The instrument measures readily and accurately temperatures in the neighborhood of 1200° Centigrade. To Le Chatelier is also due a photometric method of determining high temperatures by measuring the intensity of the light emitted by a glowing metal. The spectroscope can also be used to measure high temperatures as well as the calorimeter, in which case the temperature of a given piece of metal whose specific heat is known is determined by noting the increase in temperature of a mass of water in which it is immediately placed upon removal from the furnace. This principle is employed in a number of instruments, but it does not afford especially accurate results, as the specific heat of metals is different at different temperatures. The thermo-couple and the platinum are on the whole the most useful forms of pyrometers, as they can be used over an extended range of temperature, from that of liquid air in hydrogen almost to the melting point of platinum, and readings can be made without undue difficulties either of manipulation or of calculation. Consult: Preston, *Theory of Heat* (New York, 1894); Barus, "Thermo-Electric Measurement of High Temperatures," *Bulletin 54 United States Geological Survey*; id., *Report on High Temperature Measurements, International Congress of Physicists* (Paris, 1901).

PYROMORPHITE (from Gk. πῦρ, *pyr*, fire + μορφή, *morphē*, form). A mineral lead phosphate and chloride that crystallizes in the hexagonal system, has a resinous lustre, and in color is of various shades of green, yellow, and brown. It occurs with lead ores, usually in veins. The principal localities where it is found are in Saxony, Bohemia, Nassau, Siberia, Derbyshire and Cumberland, England; and in the United States in Maine, Massachusetts, New York, Phenixville, Pa., and Davidson County, N. C.

PYROPE, πῦρ (from Gk. πυρρός, *pyrros*, sort of red bronze, fire-eyed, from πῦρ, *pyr*, fire + ὤψ, *ops*, eye). A name applied to the magne-

sium-aluminum garnet, commonly called 'the precious garnet.' (See GARNET.) It is usually deep red to black in color, and if it is also transparent, as it often is, it is valued as a gem. The principal localities where the gem varieties occur are different places in Bohemia, Saxony, and at Kimberley, South Africa; also at Elic, in Fife, Scotland, where they are popularly called 'Elic rubies.' This gem is often called *carbuncle* and *hyacinth* by lapidaries.

PYROPHORUS (Neo-Lat., from Gk. *πυροφόρος*, fire-bearing, from *πῦρ*, *pyr*, fire + *-φόρος*, *-phoros*, bearing, from *φέρειν*, *pherein*, to bear). Any solid substance which is capable of taking fire on exposure to the air at ordinary or but slightly elevated temperatures. This property is possessed chiefly by finely divided solid bodies, such as metallic iron reduced from the oxide by ignition in hydrogen. The spontaneous inflammability in such cases is explained by the capacity of the powders for rapidly condensing air within their pores, thereby causing a considerable rise of temperature, while at the same time they present a large surface to the action of oxygen. The substances possessing this property include numerous salts, such as lead citrate or tartrate, which after ignition in a glass tube until gaseous matter is no longer evolved, and then being left to cool, take fire instantly on being thrown out into the air. 'Homborg's pyrophorus' is obtained by heating alum with lampblack or similar carbonaceous matter.

PYROPHOSPHORIC ACID. See PHOSPHORIC ACID.

PYROPH'YLLITE (from Gk. *πῦρ*, *pyr*, fire + *φύλλον*, *phyllon*, leaf). A hydrous aluminum silicate that is believed to crystallize in the monoclinic system, although it is not usually found in distinct crystals. It has a pearly lustre, and in color ranges from white, through various shades of yellow, to green. It has a soapy or greasy feeling that suggests its similarity to various forms of tale, which it closely resembles. It occurs in some of the older rocks, and is found in the Urals, Sweden, Brazil, and in the United States in North Carolina, Georgia, and Arkansas. It is used for the manufacture of slate pencils, the variety employed for this purpose being known as 'pencil stone.' It is further used for making tailors' chalk ('French chalk'). The compact varieties, which are known as *agalmatolite*, or *pinite*, have been extensively used by the Chinese and Japanese in the manufacture of small images and objects of art.

PYRO'SIS (Neo-Lat., from Gk. *πύρωσις*, a burning, from *πυρῶν*, *pyroun*, to burn, from *πῦρ*, *pyr*, fire), or WATERBRASH. A symptom of certain forms of indigestion in which there occurs at intervals a regurgitation of a considerable quantity of a watery acrid or acid fluid, generally accompanied by a burning sensation in the epigastrium, frequently extending up behind the sternum to the throat. In common parlance the regurgitation is called 'waterbrash,' and the sensation 'heartburn.' See INDIGESTION; DYSPEPSIA.

PYROSO'MA. A compound, pelagic, luminous tunicate. See ASCIDIAN; LUMINOSITY OF ANIMALS.

PYROTECHNY, *pīr'ō-tēk'nī* (from Gk. *πῦρ*, *pyr*, fire + *τέχνη*, *technē*, art). The art of making fireworks. The origin of pyrotechny is un-

known, but the art was early practiced in the East and has attained to the highest degree of perfection among the Chinese and Japanese. Although inflammable compositions, known as Greek fire, were used in European warfare before gunpowder had become known among the Western nations, fireworks, as now denominated, became known to them about the middle of the fourteenth century, and we find record of their having been used as an accessory of public pageantry in 1588. The early development of fireworks in Europe was due to the Florentines, and the Italians long retained their supremacy in this field, since the popularity of pyrotechnic exhibitions was greatly increased during the eighteenth and the early part of the nineteenth century through the ingenuity of the famous Italians Ruggieri, father and son, who charmed Rome and Paris by their displays.

The prime materials employed in the manufacture of fireworks are gunpowder, or its constituents, charcoal, sulphur, and saltpetre, or other oxidizing salts; metals and metallic salts which on burning give rise to various shaped sparks, or a brilliant light, or which impart color to the flame; touch-paper and fuze or quick-match, by which the charges are ignited and inflamed; paper and wood from which to construct the cases and sticks; and resin, camphor, lycopodium, soaps, gum, lampblack, and similar bodies with which to modify the character of the reaction. In the use of gunpowder three effects are produced—heat, light, and sound. To produce reports, as with crackers, the gunpowder is used in the granulated condition and strongly confined in the rolled paper envelope which it is to rupture. When, on the other hand, the gunpowder is first reduced to dust and then compacted by pressure in a case, with an open end when burning, as in a rocket or a pinwheel, it may burn with the evolution of light and heat and the production of gases which cause the rocket to rise or the pinwheel to revolve, but without a report.

ROMAN CANDLES. In the Roman candle we have the stars or balls, made up of gunpowder ingredients mixed with color or light-giving materials compacted into hard masses by the aid of gum or shellac, resting on loosely confined layers of granulated gunpowder, interspersed between well-compacted masses of slow-burning composition, all enclosed in a stout paper or cardboard case. The stars are hollow and provided with a piece of quick-match by which they are ignited. The end of the case is primed with powder and capped with touch paper. When the latter is ignited the priming powder is inflamed and this sets fire to the composition, or 'dark fire' as it is technically called, which slowly burns with the production of flame and sparks until the star is reached, when the grained gunpowder upon which it rests is ignited, burns rapidly, and expels the star with a loud report. Great care must be exercised in loading the cases of Roman candles, since a smaller charge of powder is necessary to propel a star to a given height the deeper the star is inserted in the case, and it is desired that the stars shall all be thrust out with equal force so as to describe the same path.

ROCKETS consist of a cylindrical paper or

cardboard body, or *fusee*, filled with propelling composition, to the upper end of which is attached a shorter and wider paper tube called the *pot*, which contains the *garniture*, or material that produces the brilliant clusters of golden, ruby, emerald, or sapphire-like stars, or showers of golden or colored rain, or of fiery serpents, which appear when the rocket has risen to a great height. The pinched upper end of the *pot* is covered with a conical cap, which by cleaving the air assists the rocket in its flight, and the whole is attached to the end of a stick which guides the rocket in its flight. When a rocket is stuck into the ground; or better, the rocket is placed in an inclined wooden trough and the touch paper at the base of the fusee which communicates with the priming in the centre of the fusee is lighted. The garniture is ignited by the flame which flashes through a hole in the clay plug at the top of the fusee as the rocket reaches its greatest altitude.

PINWHEELS and other revolving pieces are constructed by coiling the paper case, when not too tightly filled with composition, about a flat wooden block or frame which in use is attached to a tree or board by a nail upon which it may freely revolve, the revolution being determined by the pressure of the gas evolved as the composition burns.

TOUCH PAPER consists of a thin, rather tough paper which has been sponged with a weak solution of saltpetre until saturated and then dried.

QUICK-MATCH consists of cotton wick which has been saturated with a weak solution of saltpetre, then coated with a thick paste of gunpowder and gum, spread evenly over it, and then dried.

COLORÉD FIRE. In producing light and color, there is added to the gunpowder composition steel filings for brilliant fire or cast-iron filings for Chinese fire. Copper filings give a greenish tint to flame; zinc filings a fine blue color; powdered magnesium a dazzling white light; amber, colophony, or common salt affords yellow fire. Lampblack produces a very red color with gunpowder, and a pink with nitre in excess, and it serves for making golden showers. Yellow sand or glistening mica communicates to fireworks golden radiations. Verdigris imparts a pale green; sulphate of copper and sal ammoniac a palm-tree green; barium salts a grass green; strontium salts crimson; calcium salts orange. Potassium picrate on burning produces a whistling sound and has recently been introduced for use in whistling bombs and rockets. Camphor yields a very white flame and aromatic fumes. Lycopodium burns with a rose color and a magnificent flame. The published recipes and formulas for the manufacture of the materials used in fireworks are very numerous, while each manufacturer has his special mixtures and methods of treatment. For example, *yellow stars* and *yellow showers* are made of nitre 16 parts, sulphur 10, charcoal 4, gunpowder 16, and lampblack 2, all being finely ground and intimately mixed. A deeper and richer golden color is produced by using 2 parts less of sulphur and of charcoal respectively and 4 parts more of gunpowder in the mixture. To produce stars either of the above mixtures is moistened with gum water, rolled into a sheet and cut into cubes which are then dried. For *red* mixture for colored fires potassium chlorate

29.7 parts, sulphur 17.2, charcoal 1.7, strontium nitrate 45.7, black antimony sulphide 5.7. For *green*, potassium chlorate 32.7 parts, sulphur 9.8, charcoal 5.2, barium nitrate 52.3. For *blue*, potassium chlorate 54.5 parts, charcoal 18.1, ammoniacal copper sulphate 27.4. For *white*, sulphur 20 parts, saltpetre 60, black antimony sulphide 5, flour gunpowder 15.

All fireworks mixtures and compositions should be handled with extreme care. All friction should be avoided, especially while the ingredients are being mixed. Compositions containing chlorates, and particularly chlorates and sulphur, are especially sensitive to friction and percussion, and furthermore are liable to explode spontaneously. The sensitiveness of such mixtures may be noted in the *toy torpedo* or *throw-down*, in which a very small amount of the mixture, mingled with gravel to give the device weight, are enveloped in tissue paper. Owing to frequent accidents to person and property, through explosions and fire, arising from the use of *firecrackers*, and especially the larger sizes known as *cannon crackers*, *giant crackers*, and *dynamite crackers*, a straw-board cracker containing a chamber filled with compressed air has recently been invented as a substitute. *Greck fire* (q.v.) is supposed by some to have been composed of asphaltum, nitre, and sulphur, by others to have had approximately the composition of gunpowder. A modern composition known by this name consists of a solution of phosphorus in carbon disulphide with or without sulphur, potassium chlorate, and mineral oil. Rockets, known as *Congre rockets*, carrying explosive shells and incendiary compositions in the pot, were used in the siege of Boulogne in 1806 and in the British war with the Burmese. *Bengal lights* are used as distress signals at sea, while *Roman candles*, or similar devices throwing colored stars, are used, with a telegraphic code, for over-water communication. In 1900 there were produced in the United States \$1,785,271 worth of fireworks, nearly one-half of the total amount being produced in the State of New York.

BIBLIOGRAPHY. The literature of pyrotechny contains the following works, whose scope is indicated by their titles: Babington, *Pyrotechnia, or a Discourse of Artificial Fireworks* (London, 1635); d'Orval, *Traité des feux d'artifice pour le spectacle et pour la guerre* (Bern, 1750); Ruggieri, *Pyrotechnie militaire* (Paris, 1812); Cutbush, *A System of Pyrotechny* (Philadelphia, 1825); Chertier, *Nouvelles recherches sur les feux d'artifice* (Paris, 1843); Tessier, *Chimie pyrotechnique* (Paris, 1859); Browne, *The Art of Pyrotechny* (London, 1879); Cesare Sonzogno, *Il pirotecnico moderno* (Milan, 1892). See EXPLOSIVES; GREEK FIRE; GUNPOWDER; SIGNALING AND TELEGRAPHY, MILITARY; SIGNALS, NAVAL.

PYR'OXENE (from Gk. πῦρ, *pyr*, fire + ξένος, *xenos*, guest), or AUGITE. A name applied to a group of mineral metasilicates, of which the mineral pyroxene is the type. The latter is a metasilicate of calcium and magnesium, often with iron, and sometimes with manganese, and zinc, that crystallizes in the monoclinic system, and is usually found in prismatic crystals, although sometimes granular, coarse or fine. According to its composition the species is divided by Dana into the following sub-species: *Diopside*,

called also malacolite, or alalite, a calcium-magnesium pyroxene, whose color varies from pure white and yellowish or grayish white to green; *hedenbergite*, a calcium-iron pyroxene of a black color; *schefferite*, a manganese pyroxene sometimes containing iron, of a brownish color; and *augite*, an aluminum pyroxene sometimes containing small quantities of the alkalis, of a black color. These varieties are common minerals, and are found in crystallized limestone and dolomite, and frequently in the older rocks. Pyroxene is an essential constituent of many igneous or eruptive rocks, and with labradorite or anorthite and magnetite it forms basalt. Certain varieties, as diopside, have been obtained as furnace products at iron works. Artificial crystals of diopside have been obtained by the action of silicon chloride on magnesia.

PYROXENITE (from Gk. πῦρ, *pyr*, fire + ξένος, *xenos*, guest). An igneous rock of ultrabasic composition free from feldspar, and chiefly composed of one or more varieties of pyroxene or amphibole, and sometimes magnetite or ilmenite. The average chemical composition of pyroxenite is: Silica, 53 per cent.; alumina, 4 per cent.; sesquioxide of iron, 2 per cent.; protoxide of iron, 7 per cent.; oxide of lime, 13 per cent.; magnesia, 21 per cent.; oxides of the alkalis, 1 per cent. Pyroxenites easily suffer alteration from weathering, the principal products being talc (soapstone) and serpentine. They are closely allied to the peridotites (q.v.).

PYROXYLIC SPIRIT. See METHYL ALCOHOL.

PYROXYLIN. A name for guncotton (q.v.).

PYRRHIC DANCE (Gk. ἡ Πυρρική, *hē Pyrrhikē*). The oldest and most famous of the ancient Greek war dances. As to its origin and name accounts varied, some attributing it to a Cretan or Spartan named Pyrrhichos, others to Pyrrhos, son of Achilles, others to the Dioscuri or Curetes. The Cretan name is said to have been πρῶτος, *prytis*. There can be little doubt that the dance originated among the Dorians of Crete or Laconia, and it was especially cultivated by the Spartans as valuable training for the soldier. It seems to have been presented by a chorus of armed youths, who divided into two bands and represented in pantomime attack and defense, including the feints and parries needed in individual contest. It was also danced as a solo, and sometimes by women, as is clear from Xenophon's account in the *Anabasis* and the testimony of the vases. At Athens it was cultivated by the Ephebi, and danced in the competitions of the Panathenæa. In later times a Bacchic element was introduced and we are told the adventures of Dionysus were depicted. In Rome it was very popular as a pantomimic spectacle. The time of the music is said to have been rapid, and in Greek metre two short syllables (~ ~) are known as a Pyrrhic foot. This, however, occurs rarely, and is always to be measured as containing three metrical units, the smallest number which can form a foot.

PYRRHIC VICTORY. A phrase denoting a success won at a ruinous cost, referring to the battle of Aesulum, in which Pyrrhus gained the victory over the Romans with such heavy losses that he is said to have exclaimed, "Another such victory, and Pyrrhus is destroyed."

PYRRHO, πῦρρῶ (Lat., from Gk. Πύρρων, *Pyrrhon* (c. 365-c.275 B.C.). A Greek philosopher born in Elis; the founder of the Skeptical School of philosophy. He was a painter in his youth, but later was attracted to philosophy by the works of Democritus and became the pupil of Bryson, a disciple of Stilpo. Afterwards he attached himself to Anaxarchus, and with him accompanied Alexander the Great on his expedition to the East, where, according to Diogenes Laertius, he became acquainted with the teachings of the Persian Magi and the Indian Gymnosophists. During much of his long life he lived in retirement. He was so highly esteemed by his fellow-citizens that they made him their chief priest and honored him with a statue after his death; the Athenians gave him the rights of citizenship. As Pyrrho left no writings, little is certainly known of his doctrine; the chief source of information is the work of his follower, Timon the Sillographer. The main principle of his teaching seems to have been that to attain the highest good, happiness, we must know the nature of things and the relation we should bear to them. But since we know things only as they seem to us, their real nature cannot be definitely apprehended, and hence objective knowledge is impossible of attainment. Therefore the correct attitude for the philosopher is complete suspense of judgment, and in this lies freedom from trouble and peace, which is man's chief good. Consult: Waddington, *Pyrrhon et le Pyrrhonisme* (Paris, 1877); Zeller, *Philosophie der Griechen*, vol. iii. (3d ed., Leipzig, 1880); Ueberweg, *History of Philosophy*, Eng. trans., vol. i. (New York, 1872); Erdmann, *History of Philosophy*, Eng. trans., vol. i. (New York, 1890).

PYRRHOTITE (from Gk. πυρρός, *pyrrhos*, reddish, from πῦρ, *pyr*, fire). A mineral iron sulphide, frequently containing nickel, that crystallizes in the hexagonal system, has a metallic lustre, and in color is bronze-yellow to copper-red. It occurs with magnetite and apatite, also with other sulphides in the older rocks, as well as sometimes in meteorites. This mineral is found in Norway, Sweden, Bohemia, the Harz, Saxony, England, and Brazil; while in the United States it is found in various parts of New England, New York, New Jersey, Pennsylvania, and in Tennessee.

PYRRHUS, πῦρρῦς (Lat., from Gk. Πυρρῦς) (c.318-272 B.C.). A King of Epirus, son of Æacides and Phthia, and a distant kinsman of Alexander the Great. According to one account he was a descendant of Neoptolemus (otherwise called Pyrrhus), son of Achilles. When Æacides was deposed by a faction of his people and driven from his kingdom, Pyrrhus, who was then but an infant two years of age, was rescued by some faithful attendants of the King and carried to Glaucias, King of a tribe of the Illyrians. By him he was restored to his kingdom when twelve years old, but in 302 was again driven out and took refuge with Demetrius Polioretetes. After serving in the battle of Ipsus, he went as a hostage for Demetrius to Egypt, where he married the stepdaughter of Ptolemy Soter. Thence returning to Epirus, he regained possession of his throne, and immediately directed his attention to the conquest of Macedonia. He obtained possession of the western part of that country, and, when his former friend Demetrius

became King joined a coalition with several others to drive him out. He was successful, and in B.C. 287 the kingdom was divided between Pyrrhus and Lysimachus. Pyrrhus reigned but a few months, however, and was then himself expelled in favor of Lysimachus.

In B.C. 281 the Tarentines, a Greek colony in lower Italy, then at war with the Romans, sent an embassy to Pyrrhus, in the name of all the Greek colonies in Italy, offering him the command of all their troops against their enemies. Taking up their cause, Pyrrhus in B.C. 280 arrived at Tarentum with 25,000 troops and 20 elephants. The first battle between Pyrrhus and the Romans, who were commanded by the consul, M. Valerius Laevinus, took place at the river Siris in Lucania. Only through the help of the elephants, whose strange appearance and gigantic size excited a sudden panic among the Romans, did Pyrrhus win the victory.

He now advanced into Central Italy, on his way toward Rome, but, finding the city well defended, he withdrew to Tarentum and wintered there. In the following year (B.C. 279) he was victorious at Asculum, in Apulia, but lost so heavily that, unable to follow up his victory, he withdrew to Tarentum. Having been invited by the Greeks of Sicily to assist them in their struggles with the Carthaginians and the Mamertines Pyrrhus effected a truce with Rome (B.C. 278) and crossed into Sicily. His first exploits in that island were both brilliant and successful, the Carthaginians being confined in Lilybæum and the Mamertines in Messana. Then the Sicilians began to murmur at the burdens put upon them and to treat with the enemy, and in B.C. 276 Pyrrhus left the island and returned to Tarentum. On his way he fought the Carthaginian fleet off Syracuse and the Mamertine army near Rhegium. In the following year (B.C. 275) he was completely defeated by Manius Curius Dentatus near Beneventum, and in B.C. 274 he returned to Epirus, leaving Milo with a garrison at Tarentum. In B.C. 273 he once more invaded Macedonia, over which Antigonus Gonatas was King, and established himself a second time as ruler of that country. In B.C. 272, at the request of Cleonymus, the rightful but excluded King of Sparta, he led a force into the Peloponnesus. He attacked Sparta, but was repulsed, and then withdrew to Argos, to assist Aristetas, one of the leading citizens of the place, in his rivalries with Aristippus. Here he met Antigonus of Macedonia, the champion of the opposite faction, and a fight took place in the streets of the city. Pyrrhus was thrown from his horse and stunned by a tile thrown from a house-top by the mother of the man whom he was about to kill, and was then killed by one of the soldiers of Antigonus. Consult the standard histories of Rome, and also Droysen, *Geschichte des Hellenismus* (2d ed., Gotha, 1877-78); Mahaffy, *Alexander's Empire* (New York, 1888).

PYRRUS (variant spelling of Lat. *pirus*, pear). A genus of trees and shrubs of the natural order Rosaceæ to which belong some of the most valuable fruits and ornamental trees and shrubs of temperate climates, having a five-celled fruit called a pome with a cartilaginous endocarp and two seeds in each cell. It includes species differing very much in appearance, in foliage, and in almost everything except the character of the

flower and fruit. Some botanists separate the apples (*Pyrus Malus*) as a distinct genus. See APPLE; PEAR; ROWAN TREE; BEAM TREE.

PYTHAGORAS (Lat., from Gk. Πυθαγόρας). A traditionally famous Greek philosopher and geometer, born at Samos, probably in the 49th Olympiad (B.C. 584-581). He was the son of Mnesarchus, and is said to have been the pupil of Pherecydes. He had become known in Ionia as a man of great learning when, perhaps driven from home by disgust at the tyranny of Polycrates about B.C. 530, he migrated to Magna Græcia and settled at Crotona. Here he founded an exclusive brotherhood among the aristocracy of the place. The fame of it spread abroad and attracted into its circle men and women not only from other neighboring colonies, but from all parts of South Italy. The original purpose of this brotherhood was probably not political, and yet the society became involved in the fierce struggles between the aristocracy and the democracy that were at this time raging in lower Italy; and when the popular party gained the upper hand, in its wild fury it turned upon the Pythagorean brothers and burned them in their meeting places. Only a few escaped. It is not certain whether Pythagoras himself perished in this outbreak, or whether he had previously died peacefully in Metapontum, whither he is said to have retired when the storm was gathering. Neither do we know the date of this event. Everything else pertaining to the biography of Pythagoras, found in the so-called *Lives* of Pythagoras composed by Iamblichus, Porphyry, and Diogenes Laertius, is probably mythical. He is said to have traveled from Persia to Gaul in search of wisdom, to have become initiated in Egypt into the venerable mysteries of that country, and there to have acquired mathematical lore and a belief in the transmigration of souls. Much of this may be true, but the accounts are conflicting and found in late and unreliable sources. He is even reported to have been the son of Hermes in a previous metempsychosis, and to have been permitted to bring with him into his earthly life the memory of all his past experiences. He is credited with all sorts of miraculous performances, such as appearing at two places at the same time, exhibiting to the assembled spectators at Olympia his thigh of gold, and taming wild beasts at a word of command. All this testifies to the wonder excited among his disciples by his superior knowledge and to the religious veneration in which he was held by them.

The exact character of his own personal teachings is a matter of dispute. His name is mentioned only three times in the whole Aristotelian corpus, and two of the three passages are of doubtful authenticity; in the third they are enlightened by the remark that Alcmæon flourished in the old age of Pythagoras. Both Plato and Aristotle speak frequently of Pythagoreans; they evidently knew nothing definite of the views actually promulgated by Pythagoras himself. The main reason for this ignorance is to be found in the fact that Pythagoras committed nothing to writing, and every disciple strove to gain credit for his own phase of Pythagoreanism by attributing it to the venerated master, whose *ipse dixit* carried so much weight. It is quite probable that the brotherhood founded by Pythagoras was not a philosophical coterie to which he gave learned

discourse on abstract mathematics and recondite philosophy. It was perhaps rather a religious cult in which primitive ideas of totemism and taboo were revived. We know that throughout Greece in his day there was a strong reaction against the newer national theology. The old clan and tribal deities had been long displaced by the Homeric gods, and yet these greater gods were not showing themselves able to save their devoted worshippers from the impending Persian peril. In the deep depression and gloom that settled over the Hellenic world in prospect of an Oriental invasion, it was small wonder that the older cults should be revived and eagerly cultivated in the hope that the local deities might be of service in preserving Greek civilization. This motive no doubt accounted for the rapid spread of the many Greek mysteries in the sixth century B.C.

It seems reasonable, in the light of all we know, to suppose that the early Pythagorean brotherhood was one of these mystic circles, founded with a view of purifying its members from some imaginary guilt, and accomplishing this end by the observance of taboo. Among the *akousmata*, or exoteric teachings of the later Pythagoreans, we find such prohibitions as these: not to sit on a quart measure; not to step across the beam of a balance; not to eat beans or the heart of animals; not to stir fire with iron; not to look in a mirror beside a light. Two very curious precepts enjoined the stirring of the ashes when a pot has been lifted from resting on them, so as to obliterate the marks it has made, and the smoothing of the bedclothes when one has risen from one's couch, so as to smooth out the impress of the body. All these punctilios point almost unmistakably to primitive magic. As Burnet remarks, we find in such practices, so senseless to the outsider, an explanation of the popular outburst against the society. The domination of such a religious order ruling the State must have been galling enough. "The 'rule of the saints' would be nothing to it; and we can still imagine and sympathize with the irritation felt by the plain man of those days at having all his legislation done for him by a set of incomprehensible pedants, who made a point of abstaining from beans, and would not let him beat his own dog, because they recognized in its howls the voice of a departed friend. This feeling would be aggravated by the private religious worship of the society. Greek democracies could never pardon the introduction of new gods. . . . This introduced, as it were, an unknown and incalculable element into the arrangements of the State, which might very likely be hostile to the democracy, and was in any case a standing menace to the mass of citizens, who had no means of propitiating the intruding divinity."

But although the main motive of the brotherhood was thus superstitious, there is no doubt that a certain philosophic doctrine was taught to the brethren by its learned founder. Like all the early Greek philosophies, it was probably cosmological; and it was likewise dualistic. "The two primary opposites, the Limited and the Unlimited, were brought together in a 'harmony' which could be numerically determined." (Burnet.) The Unlimited was space, the Limited were the definite forms in which space manifested itself. Space was not regarded as an abstract

entity; it was rather a material sensible thing, probably identified with air. Hence the universe was said to breathe. The unlimited air is in its essence dark; the principle of limitation is fire, the bright element which reveals definite spatial outlines. Such is the most plausible reconstruction of early Pythagoreanism as taught by its founder.

How much mathematics Pythagoras knew is likewise uncertain. To him without question is to be ascribed the first proof of the theorem known to the Egyptian 'rope-stretchers' concerning the right-angled triangle (see TRIANGLE), which they knew in the case of the triangle with sides 3, 4, 5, without giving a rigorous proof. Of other matters, what is to be ascribed to Pythagoras himself, and what to his pupils, it is difficult to decide. Therefore we generally speak of a mathematical truth as being due to the Pythagoreans, a treatment of whose discoveries, as far as known, is given in the article PYTHAGOREANISM.

Consult: Zeller, *Philosophie der Griechen* (5th ed., Leipzig, 1892; Eng. trans. of 4th ed., London, 1881); Ritter and Preller, *Historia Philosophiæ Græcæ* (7th ed., Gotha, 1888); Ueberweg, *History of Philosophy* (Eng. trans., New York, 1887); Windelband, *History of Ancient Philosophy* (Eng. trans. by Cushman, New York, 1899); Burnet, *Early Greek Philosophy* (London, 1892); Schroeder, *Pythagoras und die Inder* (Leipzig, 1884); Cantor, *Verlosungen über Geschichte der Mathematik* (ib., 1900); Gow, *Greek Mathematics* (Cambridge, 1884); Fink, *History of Mathematics* (Chicago, 1900); and for the later developments of Pythagoreanism, see that article.

PYTHAGORAS OF RHEGIUM. A famous Greek sculptor of the first half of the fifth century B.C. He is commonly called a Rhegian, but on a pedestal at Olympia bearing his signature he calls himself a Samian, and it is probable that he was one of the emigrants from Asia Minor to Magna Græcia about B.C. 496. He belongs to the period of transition from the archaic art to the great masters of the time of Phidias. He was especially celebrated for his statues of athletes and, we are told, first introduced 'symmetry and rhythm' into his works. This seems to refer to the careful adjustment of the harmony between the parts by a study of proportions and to the endeavor to secure graceful and flowing lines, removed from the stiffness and schematic treatment of the archaic school. He also was said to have been the first to render the hair, veins, and muscles in a natural manner. His importance was evidently great in the development of Greek art, but none of his works can be identified with certainty, though some gems may preserve reminiscences of his statue of the lame man, probably Philoctetes, who made the spectators feel the pain of his wound. The Choiseul-Gouffier Apollo has been thought by Waldstein to be a copy of his Olympian statue of the pugilist Euthymus of Locris, but the attribution has not been generally accepted. Consult the histories of Greek sculpture by Collignon and Gardner, and Waldstein, *Essays on the Art of Phidias* (London and New York, 1885).

PYTHAGOREANISM. The philosophical system advocated by the followers of Pythagoras. No point in Greek philosophy is more disputed than the proper interpretation of Pythagorean-

ism. According to Zeller's exposition "the Pythagorean system started from the proposition that all is, in its essence, number. From this results the doctrine of the primitive opposites; and consequently, the opposition of the odd and the even, the limited and the unlimited precede all others. The unity likewise of these opposites was sought in number alone, which was therefore defined more particularly as harmony. Many of our authorities, however, represent the matter differently. They assert that the entire system was founded on the opposition of unity and duality, which is then reduced to the opposition of spiritual and corporeal, of form and substance, of the Deity and matter, and is itself derived from the Deity as the original Unity. According to another theory, the starting point of the system was not the arithmetical conception of number and its constituents, but the geometrical conception of the limits of space and of unlimited space." A fourth opinion "bases the system not on the consideration of number, but on the distinction of the limited and unlimited."

This is not the place to canvass the arguments for and against each of these interpretations. The probability is that there was no one single consistent theory accepted by all Pythagoreans, but that each of these theories was held by some one or more of their number. The real question is not what Pythagoreans taught, but what was the earliest statement of philosophical problems given by accredited Pythagoreans. Even this question cannot be answered with assurance, as far as the fundamental principle of the system is concerned. Pythagoras himself probably gave no clear expression of philosophical opinion, because he was not so much interested in philosophical theory as in religious and moral reform. See PYTHAGORAS.

Philolaus, a contemporary of Socrates and Democritus, was probably the first distinctively philosophical Pythagorean, and although he committed his views to writing, unfortunately we have only fragments of his works, and even they are of doubtful authenticity. Nor is the witness of Plato and Aristotle to his teachings wholly unambiguous. Although the weight of Zeller's great name is given to the arithmetical interpretation of his views, it seems more satisfactory to regard Philolaus as having started from geometrical facts and the phenomena of sounds presented by the strings of the heptachord. If this hypothesis be correct Philolaus held an atomistic view of the constitution of the world. The ultimate units of reality were considered to be perceptible spatial points of material character. Two such points made a line, three made a surface, and four made a solid. By number he did not mean an abstraction, but the concrete quantum of such points. "The Pythagorean Unlimited is, in fact, the *res extensa*; it is an early attempt to conceive Space in a realistic way and not merely as the place of body. Being an early attempt, it was not very successful; and, if the Pythagoreans did not make the Unlimited a mere predicate of Air like Anaximenes, they fell into the opposite extreme of simply identifying it with Air and the Void. The Limit must, of course, be strictly correlative with the Unlimited. It will then be a spatial limit, and not an ideal one. The theory that things are numbers, then, comes simply to this, that things are built up of geometrical figures, that they are portions of

space limited in a variety of ways." (Burnet.) The smallest constituent parts of the earth were considered cubical, those of fire tetrahedral, those of water icosahedral, while those of "the fifth element which embraces all the others" were dodecahedral. But the Pythagoreans went further and gave quantitative values to things immaterial, which were thus construed in a material way. The soul was correlated in some way with the number six; reason, health, and light with seven; love, friendship, and prudence with eight. Such phantasy is the result of an attempt to reduce all reality to terms found satisfactory in explaining sensible reality. Along with this curious fiction went a mystical significance of numbers. The Pythagoreans were fond also of arranging things by opposites and finding ten such pairs. Thus one favorite classification gives us the following ten antitheses: (1) Limited and unlimited; (2) odd and even; (3) one and many; (4) right and left; (5) male and female; (6) rest and motion; (7) straight and crooked; (8) light and darkness; (9) good and evil; (10) square and rectangle.

The Pythagorean cosmology is interesting as it was a guess that came so near the truth concerning the solar system. Much of it was fanciful, but in spite of these vagaries we must recognize the fact that Pythagoreanism taught that the earth is a sphere revolving around a central fire, the centre of gravity of the universe, around which the stars likewise revolve, carried around by transparent shells. The central fire, however, was not the sun, but an invisible object, because toward it the farther side of the earth is always turned. The sun and stars shine by light reflected from this self-luminous centre. The heaven of the fixed stars, the sun, the moon, the five then known planets, and the earth made only nine objects; hence to fill out the perfect number of ten, a counter-earth was invented. Solar eclipses were due to the intervention of the earth between the central fire and the sun; lunar eclipses to the intervention of some heavenly body, sometimes the counter-sun, between the central fire and the moon. "When the earth is on the same side of the central fire as the sun, we have day; when it is on the other side, night." (Zeller.) "The distance of the spheres from the central fire was determined according to simple numerical relationships. Corresponding to this, they assumed that from the revolution of the spheres there resulted a melodious musical sound, the so-called harmony of the spheres." (Windelband.) Following Pythagoras, the Pythagoreans accepted the doctrine of metempsychosis, but the doctrine of the world soul, sometimes ascribed to the Pythagoreans, was probably not a part of their system.

The Pythagoreans laid much emphasis on music, as can be seen from their doctrine of the music of the spheres and from their insistence on the all-importance of harmony. But besides the discovery of the relation between the length of the strings of the lyre and the tones emitted, they did not contribute much to the theory of music.

While the Ionic school founded geometry, the main progress was due to the Pythagorean school in Italy. The Pythagoreans were the first to give the rigorous proofs now demanded and to use mathematics in a specialized meaning. To Pythagoras himself is due the first rigorous

proof of the proposition known by his name (Euclid I. 47; see TRIANGLE). The school was concerned chiefly with the questions 'how many' and 'how great,' i.e. with number and magnitude, and the Pythagorean geometry is mostly concerned with those relations of areas, volumes, and lines which admit of arithmetical expression. Geometry was to them a means for investigation in the theory of numbers. This is seen in the remarks concerning gnomon-numbers. Among the Pythagoreans a square out of which a corner was cut in the shape of a square was called a gnomon. The gnomon-number of the Pythagoreans is $2n + 1$, since the square on n can be made equal to the square on $n + 1$ by adding the square $1 \cdot 1$ and the two rectangles $1 \cdot n$, we then have $n^2 + 2n + 1 = (n + 1)^2$. Expressions like plane and solid numbers used for the contents of spatial magnitudes of two and three dimensions also serve to indicate the constant tendency to objectify mathematical thought by means of geometry. The knowledge of the Pythagoreans in the field of elementary series was quite comprehensive (see SERIES), and the three proportions, arithmetical, geometrical, and harmonical, were known to them. The so-called most perfect or musical proportions, e.g. $6 : 8 = 9 : 12$, was invented by the Babylonians and is said to have been first brought to Greece by Pythagoras. By improvement in definition, by systematization, and by the use of deduction, the study of geometry at the hands of the Pythagoreans was made a factor of liberal education.

PYTHAGOREAN PROPOSITION. See PYTHAGORAS; TRIANGLE.

PYTHÆAS (Lat., from Gk. Πυθαίας). A Greek navigator, born at Massilia (Marseilles) in the fourth century B.C. He is said to have sailed around the west coast of Europe, and through the English Channel to Thule, the most northern land known to the ancients, probably Mainland, the largest of the Shetland Islands. Nothing is accurately known about his life. He gave an account of his first voyage in his *Description of the Ocean*, in which he stated that he traveled through Britain, and that its circumference was over 40,000 stadia. In regard to the island of Thule, he said there was neither air, nor land, nor sea, but a composition of all of them, in which the whole universe was suspended. This substance, which could not be penetrated by land or sea, he had himself seen, and was told that it was "a connecting link of the universe." He puts Thule six days' sail from Britain. He says that the sun never sets during the summer solstice in Thule. On a second voyage he skirted the shore of Europe, from Cadiz to a river which he called Tanais. This may have been the Elbe, which he may have confused with the Don, the classical name of which was Tanais. He was also a mathematician and astronomer, and was the first to determine the meridian altitude of the sun at the summer solstice by the use of a gnomon. The fragments of his writings were collected and published by Arvedson at Upsala in 1824. Polybius and Strabo speak of him contemptuously, but modern geographers are more favorable in their judgment. It is supposed that he was sent out by the Massilians for the purpose of increasing their commercial connections.

PYTHIA (Lat., from Gk. Πυθία). The priestess of Apollo at Delphi. See DELPHI.

PYTHIAN GAMES (Lat. *Pythia*, from Gk. Πυθία). The second of the four great national festivals of the Greeks, held in the Crissæan Plain, near Delphi. Their origin was attributed to Apollo, in celebration of his destruction of the dragon Python. At first they were celebrated under the superintendence of the priests of Delphi every ninth year, i.e. once in each cycle, and consisted solely of a musical contest between singers to the cithara. After the first Sacred War, the character of the festival was changed, and the Amphictyons assumed charge. The first of the new series was held in B.C. 586, but it was not till the second celebration in B.C. 582 that the laurel wreath was given as a prize, and from this date the Pythian series was reckoned. They were from this time held in the summer of the third year of each Olympiad, probably in August, and seem usually to have occupied four days. The first day was occupied with the musical contests which always held the chief place. Among them the most important was the Pythian Nomos, a solo on the double flute, which represented the victory of Apollo over the dragon. On the second day came athletic games, much like those at Olympia (q.v.), and on the third the horse-racing. The latter contests were held in the Crissæan plain. On the fourth day seem to have come the festival procession and sacrifices. The musical contests were increased in later times; even poets and historians competed. Consult: Krause, *Die Pythien, Nemeen und Isthmien* (Leipzig, 1841); Mommsen, *Delphika* (ib., 1878); Schömann-Lipsius, *Griechische Altertümer*, vol. ii. (Berlin, 1902); Stengel, "Griechische Kultus-Altertümer," in Müller's *Handbuch der klassischen Altertumswissenschaft*, vol. v. (Munich, 1898).

PYTHIAN ODES. See PINDAR.

PYTHIAS. See DAMON AND PHINTIAS.

PYTHIAS, KNIGHTS OF. A fraternal and beneficial order founded in Washington, D. C., in 1864, by Justus H. Rathbone and five associates. Its objects are the practice of friendship, benevolence, and charity toward the members. It is asserted that the ritual, which is mainly Rathbone's work, is purely American. Its most binding obligation is complete and absolute secrecy. The first lodge instituted was Washington Lodge. A Grand Lodge for the District of Columbia was created on April 12th, and the work of creating subordinate lodges began with the institution of Franklin Lodge No. 2. In 1868 a new constitution was adopted at Washington under which was organized, as the central governing body, the Supreme Lodge Knights of Pythias of the World. The growth of the order was not rapid in the earlier years of its existence. In 1866 it had a membership of only about 380. In 1867 there were only 674 on the roll, but when the twentieth year was reached the membership had increased to more than 100,000, while in 1895 the membership was over 450,000, and at the end of 1902, 587,506.

The endowment or insurance branch was established in 1877. This branch is under the management of a president and board of officers, but is subject to the control of the Supreme Lodge. The members of this branch enjoy no greater privileges than other members outside of the insurance which they pay for. It had at the close of 1902 a total membership of nearly

60,000, representing an insurance of nearly \$102,500,000, and had disbursed up to that date \$18,105,000. The Uniform Rank is another division of the order. It is under the control of the Supreme Lodge also, but is directed by an officer whose title is major-general. The members of this grade are on the same plane with the other members, but only those members who have received the rank of Knight are eligible for membership. At the close of 1902 there were about 900 companies in the Uniformed Rank with a membership of nearly 45,000. Pythian Knighthood confers three ranks or degrees, viz.: the initiatory rank of 'page;' the armorial rank of 'esquire;' and the chivalrie rank of 'knight.' The motto of the order is: "Be generous, brave, and true."

The Order of Rathbone Sisters, organized in 1888, is made up of the mothers, wives, sisters, and daughters of Knights of Pythias, and such Knights as may desire to be associated with the organization. The membership in 1902 was about 50,000 sisters and 25,000 Knights.

PYTHON (Lat., from Gk. Πύθων, from Πυθῶ, *Pythō*, Πυθῶν, *Pythōn*, older name of Delphi and the surrounding region). In Greek mythology, a horrible serpent produced from the slime of

PLATECARPUS CORYPNEUS (restored).

Deucalion's flood. He lived in Paranasus and was slain by Apollo.

PYTHON. Any large snake of the subfamily Pythonidae of the family Boidae. The pythons differ from the boas (q.v.) in such anatomical particulars as the presence of certain supraorbital bones, and two rows of subcaudal scales. The best known species is the common 'adjiga' or 'rock-snake' (*Python molurus*) of Ceylon, India, and eastward to China, specimens of which have been seen 30 feet long. It is yellowish, with a series of large, reddish brown, dark-edged patches along the back, and another of smaller blotches on the sides. A snake 30 feet long could undoubtedly overcome a tiger, bear, or buffalo under favorable conditions, as has been related of these monsters. Another very large species of the Indo-China and Malayan region is *Python reticulatus*, more common eastward than the rock-snake, and marked in a lozenge pattern. Their habits are described at length in the (London) *Field* for 1894 and in the *Proceedings of the Zoological Society of London* for 1899, pages 631-634. Africa possesses several beautiful pythons, especially numerous on the equatorial west coast, where they are venerated by certain tribes and kept and tended in temples. All the pythons lend themselves easily to captivity and taming. These snakes lay a hundred or so eggs, which are regularly incubated by the female.

PYTHONOMORPHA (Neo-Lat. nom. pl. from *Python*, python + Gk. μορφή, *morphē*, form). A suborder of extinct marine reptiles of serpent-like appearance, found fossil in the Upper Cretaceous rocks of Europe, North and South

America, and New Zealand. The long vertebral column is made up of from 115 to 130 vertebrae, both pairs of limbs are modified into paddles for swimming; the long depressed skull is lizard-like, and the mandibles could be moved in a horizontal plane, thereby enabling them to swallow large prey. The jaws are provided with large conical teeth of formidable aspect. These animals were essentially sea serpents. The best specimens have been obtained from the chalk beds of Kansas. *Tylosaurus*, of which a finely preserved complete skeleton showing even the cartilages may be seen in the American Museum of Natural History in New York City, had a length of 30 feet. *Platy-carpus* is a similar, smaller animal with body from 10 to 15 feet long, abundant in the Cretaceous of the Western United States and France. *Clidastes* was one of the smallest members of the group with a body 6 to 12 feet long, and is from the Cretaceous of the United States. *Mosasaurus*, with its jaws armed with powerful teeth, was the largest of the group and attained a length of 40 feet. It is found in the Upper Cretaceous of Western Europe and of the United States.

etc.," *Kansas University Quarterly*, vol. ii. (Lawrence, 1893); also in *University Geological Survey of Kansas*, vol. iv. (Topeka, 1898); Williston and Case, "Kansas Mosasaurs," *Kansas University Quarterly*, vol. i. (Lawrence, 1892); Osborn, "A Complete Mosasaur Skeleton," *Memoirs of the American Museum of Natural History*, vol. i., part iv. (New York, 1899).

PYX, pike (Lat. *pyxis*, from Gk. πύξις, box, from πύξος, *pyxos*, box-tree, boxwood). The sacred vessel used in the Roman Catholic Church to contain the consecrated host. Anciently it was sometimes of the form of a dove, which was hung suspended over the altar. More commonly, however, it was, as its name implies, a simple box, generally of the precious metals, or, at least, of metal plated with gold or silver, sometimes of ivory, whose use, however, was forbidden in 1588. At present the pyx is commonly cup-shaped, with a close-fitting cover of the same material. The interior is ordered to be of gold, or at least plated with gold. The tabernacle from which the pyx hung over the altar received from it the name *eiborium*, which is now often applied to the pyx itself. A special class of pyx is that containing relics, which may be of silver or ivory.

PYXIE, PINE BARREN BEAUTY, FLOWERING MOSS (*Pyxidantha barbulate*). A small creeping shrub of the natural order Diapensiaceae. It is a common plant in New Jersey and North Carolina upon moist, sandy soil, and is esteemed for its pink buds and white, five-petaled blossoms, which appear in early spring. It is rarely cultivated, though the flowers are often sold in cities near where the plants grow wild.

Q

The seventeenth letter of the English alphabet. In Greek this letter was called *koppa*, and in Semitic *qoph*. It was early displaced in Greek by *kappa* (*k*), surviving only as a numeral sign for 90. The development of the character was

as follows:

Ϡ	Ϡ	Ϡ	Q
Phœnician.	Greek.	Early Latin.	Later Latin.

Soon after the Norman Conquest the letter was introduced into English from Norman French words in *q*. It replaced Anglo-Saxon *ow* in several Germanic words, as *queen*, from *cwēn*; *quick* from *cwīc*; *quoth* from *cwāþ*.

In sound the letter is the velar explosive. Since *q* in English is always followed by *u* plus a vowel, the usual phonetic value (*kw*) is that of the velar explosive labialized. This sound is formed simultaneously in two places, the soft palate (velum) and the lips.

Qu (pronounced *kw*) represents Indo-Germanic velar *g* in its labialized form *gʷ*. Indo-Germ. *gʷana*, 'woman'; Skt. *gṃā*, Bœotian Gk. *βᾰῶν*, AS. *cwēn*, Eng. *queen*; Skt. *jiv*, 'live,' Gk. *βίος*; AS. *cwīc* Eng. *quick*. Almost all the English words containing *qu* are of Latin or French origin, as *quadrangle*, *quart*, *etiquette*. In some words borrowed from the French the sound is that of a simple *k*, as *pique*, *coquette*. *Qu* does not occur medially except in such compounds as *inquire*, *requite*, *inquisition*.

As a mediæval Roman numeral Q = 500. In Latin Q. was the abbreviation for Quintus.

Q. C. stands for Queen's Counsel; Q. E. D. (Latin, *quod erat demonstrandum*) = which was to be proved; *qr.* = quarter or quire; *qt.* = *quart*; q.v. (Latin, *quod vide*) = which see.

QUACK'ENBOS, GEORGE PAYN (1826-81). An American educator, born in New York City. He graduated at Columbia in 1843, and studied law, but became a teacher in New York private schools. He edited the *Literary American* (1848-50), wrote a novel, translated Hauff's *Märchen* (1849), edited Spiers and Surenne's French dictionary (1852), and published many school books, including one on United States history (1854), one on rhetoric (1854), one on natural philosophy (1859), one on English grammar (1862), and one on ancient literature (1878).

QUA'COLTH. A North American Indian tribe. See KWAKIUTL.

QUA'DI. An ancient Germanic people of the Suevic race, inhabiting that part of Southeastern Germania (q.v.) which lay between the Gabreta Sylva, the Hercynian Forest, the Sarmatian Mountains, and the Ister or Danube. They were allies of the Marcomanni, their neighbors on the northwest. The Emperor Tiberius placed them under his protection, and made Vannius, one of his generals, King over them. During the reign of Marcus Aurelius the Quadi rose in alliance with the Marcomanni and other Germanic tribes. It was only after stubborn resistance that they were conquered in A.D. 174. Six years later Commodus, the successor of Marcus Aurelius, recognized their independence. Their subsequent history was uneventful, and nothing is known about them after the end of the fourth century.

QUADRANT (from Lat. *quadrans*, fourth part, from *quattuor*, four). In mathematics, one of the four equal parts into which a circle is divided by two perpendicular lines passing through the centre. (See TRIGONOMETRY.) In astronomy, the quadrant signifies an instrument similar in all respects to the sextant (q.v.) and formerly much used for the determination of angular measurements; it consisted of an arc of a circle equal to the fourth part of the whole circumference, graduated into degrees and parts of degrees. The quadrant employed by Ptolemy was of stone, with one polished side, on which the graduations were made. Tycho Brahe (1546-1601) used a similar quadrant, called by him the 'Quadrans muralis sive Tichonia,' at the observatory of Uranienborg. For an illustration of this quadrant, consult Brahe, *Astronomiæ Instauratæ Mechanica* (Wandsbek, 1598). Picard was the first who applied telescopic sights to this instrument. About this time the large mural quadrant (of 6 to 8 feet radius) began to be introduced into observatories. But these quadrants possessed various inherent defects, such as the impossibility of securing exactness of the whole arc, concentricity of the centre of motion with the centre of division, and perfect stability of the centre-work, which led to the use of the repeating circle, otherwise called the mural circle. See SEXTANT.

QUADRATIC EQUATION. See EQUATION.

QUADRATIC RESIDUES. See NUMBER.

QUADRATURE (Lat. *quadratura*, from *quadrare*, to square, from *quadra*, *quadrus*, square, from *quattuor*, four). In mathematics, the

process of determining the area of a surface. The term comes from the conception that we find a square whose area is equal to that of a given surface. The quadrature of the circle is one of the three great problems of antiquity, the others being the trisection of an angle (q.v.) and the duplication of the cube. (See CUBE.) These problems, like that of perpetual motion, have had their devotees in all ages since the advent of geometry and physics. The quadrature of the circle means the determination of the area of a circle of given radius, or the construction by the use of only the straight edge and the compasses of a square whose area is equal to that of the given circle. It was known to the Greek geometers that the area of a circle is half the rectangle whose sides are its radius and circumference respectively; so that the determination of the length of the circumference of a circle in terms of the radius, or the evaluation of π , is precisely the same problem as that of the quadrature of the circle. A brief outline of the history of attempts to evaluate the ratio π is given in the article CIRCLE.

The quadrature of curves can often be effected by means of another curve, a so-called 'quadratrix.' An important type of this curve is that probably invented by Hippias of Elis (c.400 B.C.), used both for quadrature and trisection, and called the quadratrix of Dinostratus. The curve, probably the most ancient of the transcendental ones, may be defined as the plane locus of the intersection of a straight line revolving uniformly about a point, and another straight line moving uniformly parallel to a given direction.

QUADRATRIX.

defined as the plane locus of the intersection of a straight line revolving uniformly about a point, and another straight line moving uniformly parallel to a given direction.

If in the figure $CO = r$ is the uniformly revolving radius, and PQ, the line moving parallel to OY, the locus of P, their intersection, or the curve OPR, is the quadratrix. Its rectangular equation is $y = (r-x) \tan \frac{\pi x}{2r}$; r is a mean proportional between the quadrant OB and the segment CD; and thus the circumference of a circle may be expressed in terms of the radius. Whence, if it were possible to construct D geometrically, the quadrature of the circle would be effected by elementary geometry, a condition which is always understood when it said that the quadrature of the circle cannot be effected. Another important form of the quadratrix is that of Tschirnhausen (1687). This curve may be defined as the locus of the point P, lying at the same time upon LQ parallel to BO, and upon MP parallel to OA (OAB being a quadrant of radius $OA = r$), where L moves over the quadrant and M moves over the radius r uniformly.

The equation of the curve is $y = r \sin \frac{\pi x}{2r}$. It has been used for the multisection of angles and the quadrature of curves.

Consult: Montucla, *Histoire des recherches sur la quadrature du cercle* (Paris, 1754); Newton, *Tractatus de Quadratura Curvarum* (Lon-

don, 1706); Klein, *Famous Problems of Elementary Geometry* (Göttingen, 1895; American ed., Boston, 1897); Schellbach, *Ueber mechanische Quadratur* (Berlin, 2d ed., 1884).

QUADRATURE. In astronomy, a planet is said to be in quadrature when there is a right angle at the earth between the direction of the planet and the direction of the sun.

QUADRINIUM UTILE. ū'ti-lè (Lat., useful four years). In Scotch law, the four years after majority during which a person is entitled to revoke or set aside any deed made to his prejudice during minority. This protection was also given by the Roman law to minors, to enable them to neutralize any unfair advantage that may have been taken of their inexperience during minority. See INFANT.

QUADRILATERAL (from Lat. *quadrilaterus*, four-sided, from *quattuor*, four + *latus*, side). A polygon (q.v.) of four sides. Among the remarkable properties of the quadrilateral are the following: The lines joining the mid-points of the successive sides form a parallelogram; the lines joining the mid-points of the opposite sides bisect each other. The bisectors of the four angles of a quadrilateral form another quadrilateral whose opposite angles are supplemental; a quadrilateral of the latter kind is inscribable in a circle. The sum of the squares on the four sides of a quadrilateral is equal to the sum of the square on the diagonals plus four times the square on the line joining their mid-points. A square can be constructed equal to any polygon, and hence equal to any quadrilateral, but the area of a quadrilateral cannot in general be expressed as an algebraic function of the sides.

ISOSCELES TRAPEZOID.

A *trapezium* is a quadrilateral no two of whose sides are parallel, and a *trapezoid* is a plane quadrilateral having two of its sides parallel. If the angles at the extremities of either parallel side are equal, the trapezoid is said to be isosceles. If the other two sides of the trapezoid are parallel, the figure becomes a parallelogram. See MENSURATION; PARALLELOGRAM.

TRAPEZOID.

QUADRILATERAL. A common designation for the strong military line formed by the four fortresses of Mantua, Peschiera, Verona, and Legnago, which constituted a great bulwark for Austria in maintaining her dominion in Northern Italy in the nineteenth century. See ITALY; FORTIFICATION.

QUADRILLE, kwá-dril' (Fr., square). A dance of French origin, consisting of consecutive dance movements, generally five in number, danced by couples, or sets of couples, opposite to and at right angles to one another. The name is derived from the fact that the dancers are arranged into squares consisting each of four couples. The dance originated in the French ballets of the eighteenth century and was almost immediately adopted by society. Its modern form dates from the beginning of the nineteenth century. The names of the figures are: *Le pan-*

talon, l'été, la poule, la pastourelle, or la trenise, and la finale. The music accompanying these figures alternates between triple and duple time, 3-8, or 6-8, and 2-4. Musard was the most distinguished composer of quadrille music, and under his treatment it became for a time one of the art forms. In the American quadrille there are five figures: (1) *La promenade*, (2) *les moulinets*, (3) *les chevaux de bois*, (4) *la passe*, and (5) *la eorbeille*; but these all vary greatly at different times or places.

QUADRILLE. A game of cards which, as its name denotes, is played by four persons. The number of cards employed is forty, the tens, nines, and eights being discarded from the pack. The rank and order of the cards in each suit vary according as they are or are not trumps, and are different in the black and red suits. The ace of spades is always the highest trump, and is called *Spadille*; the ace of clubs or *Basto* is always the third highest trump; while the deuce of spades or clubs, or the seven of hearts or diamonds, known as *Manille*, is the second highest trump, according to the suit which is the trump, being always of the trump suit. When the black suits are not trumps, the black cards rank as in whist; and when they are trumps the order is the same with the exception as above mentioned of the deuce, which (in the trump suit only) becomes *Manille*, the deuce of the black suit which is not trumps retaining its position as the lowest card. The game is now practically obsolete, and has a value only to the student of late seventeenth and early eighteenth century customs and literature. It was complicated by a great number of conditions, making a complete description of it here impossible, but a good description of the game of *Ombre* or *L'hombre*, practically the same game as quadrille, except that it was arranged for three players, will be found in Pope's *Rape of the Lock*.

QUADRIVIUM (Lat., four branches of mathematics, place where four roads meet). The name given, in the language of the schools of the West, to the higher course of the mediæval studies, from its consisting of four branches, as the lower course, for an analogous reason, was called trivium (q.v.), or 'three roads.' The quadrivium consisted of arithmetic, music, geometry, and astronomy. These four studies compose the secondary part of the curriculum outlined by Plato in *The Republic*, and are described in the seventh book of that work. The history of this organization of human learning is briefly sketched in the article on **ARTS, SEVEN LIBERAL**, where references to the literature of the subject will be found.

QUADROON (from Sp. *cuarterón*, quadroom, fourth part, from *cuarto*, from Lat. *quartus*, fourth, from *quattuor*, four). The name given to a mixture of European and negro in which the relative proportion of blood is three-fourths white and one-fourth black. The first mixture is called mulatto, the second tierceeroon, the third quadroom, the fourth quindroon, etc. See **MISCEGENATION; MIXED RACES**.

QUADRUMANA (Neo-Lat. nom. pl., from Lat. *quattuor*, four + *manus*, hand). In the system of Cuvier, an order of Mammalia which contained the animals most nearly resembling man in their form and anatomical characters—viz. the monkey and lemur families. The name indicates that the extremities of all limbs are

hands, formed for grasping; in fact, the anterior limbs have in many monkeys less perfect hands than the hind ones, through the want or rudimentary character of the thumb. None of the Quadrumana are naturally adapted for an erect posture. The term is no longer used, as these animals are now classed with man in the order Primates (q.v.).

QUADRUPED (from Lat. *quadrupes*, quadrupes, four-footed, from *quattuor*, four + *pes*, foot). A term often employed as a synonym of 'mammal,' a use which is inaccurate, since some mammals, as man, have only two feet, properly speaking, and others, as the whales, none at all; while alligators, lizards, and turtles are all 'four-footed.' The term, therefore, has no exact zoological meaning.

QUADRUPLE ALLIANCE (Lat. *quadruplus*, fourfold, from *quattuor*, four + *-plus*, -fold). (1) A league formed by Great Britain, France, Austria, and the Netherlands against Spain in 1718, when the policy of that country under the guidance of the ambitious Alberoni (q.v.) threatened to destroy the laboriously established balance of power in Southern Europe.

(2) A league formed by Great Britain, Austria, Prussia, and Russia in 1840, for the purpose of checking the power of Mehemet Ali (q.v.), whose victory over the Turks at Nisib (1839) threatened the overthrow of the reigning Ottoman dynasty. Mehemet Ali was compelled to surrender Syria, which he had overrun, and to content himself with the hereditary rule over Egypt.

QUADRUPLET (from Lat. *quadruplare*, to make fourfold, from *quadruplus*, fourfold). In music, a rhythmical group of four notes, the time-value of which is equal to three or six of the regular rhythm. It is written thus:

QUÆSTOR, kwēs'tôr (Lat., investigator). The title of a class of Roman magistrates, reaching as far back, according to all accounts, as the period of the kings. The oldest quæstors were the *quæstores parricidii*, two in number, whose office was to conduct the prosecution of persons accused of murder, and to execute the sentence that might be pronounced. They ceased to exist as early as B.C. 366. A far more important though later magistracy was the *quæstores classici*, to whom was intrusted the charge of the public treasury. They appear to have derived the epithet of *classici* from their having been originally elected by the centuries. At first they were only two in number, but in B.C. 421 two more were added. As province after province was added to the Roman Republic, the number was increased, and in the time of Cæsar it was forty. On its first institution the quæstorship was open only to patricians; but after B.C. 421 plebeians also became eligible.

QUAGGA (Hottentot name). One of the wild horses of South Africa (*Equus quagga*), intermediate between the horse and zebra, and now extinct. In length of ears and character of the tail it resembled the horse, although it agreed with the asses in wanting the callosity in the inner side of the hind leg. It was rather smaller than the zebras, which it resembled in its reddish

brown color, and in having a dorsal stripe, and its head and fore quarters irregularly banded and marked with dark brown stripes, which became fainter until lost on the body. In some cases these transverse stripes reached back to the haunches, but they were always absent from all four legs, which were nearly white. The quagga originally wandered in great herds over the plains of South Africa, and its name was derived from its shrill, barking neigh, the last syllable of which was prolonged into a sort of scream. The flesh and hide were both of great value to the early settlers, and the animal was killed with ruthless waste by the Boers, as food for their slaves, and also because, by their curiosity and alertness, the quaggas interfered with hunting, alarming all other game in the neighborhood as soon as they discovered the hunter's presence. Thus by 1850 it was nearly exterminated. The quagga seemed easily susceptible to domestication and training, but few attempts seem ever to have been made in South Africa to utilize the animal. Consult Bryden, *Nature and Sport in South Africa* (London, 1897), and early writers on zoölogy and sport in South Africa. See EXTINCT ANIMALS; ZEBRA; and Plate of EQUIDÆ.

QUAGLIO, kwä'lyò. An Italian-German family of artists, originally from Laino, near Lake Como, and afterwards residents of Austria and Bavaria. The family produced several generations of painters, etchers, lithographers, and architects, all eminent in their respective branches. The earliest on record is GIULIO, born at Como, 1601, who painted, in the manner of Tintoretto, many frescoes and altar-pieces in Vienna, Salzburg, and Laibach and was ennobled by Emperor Leopold I.—GIUSEPPE (1747-1828), born at Laino, was noted for his scene paintings, and became Court architect at Munich (1801). He left four sons, all born in Munich and his pupils.—ANGELO (1778-1815), painter and architect, is remembered especially for his masterly drawings for Boissérée's publication on the Cathedral of Cologne. Of his easel pictures, an "Interior of Saint Peter's in Rome," and a "Gothic Church by Moonlight," are in the New Pinakothek.—DOMENICO (1787-1837), architectural and landscape painter, was the most illustrious member of the family. After practicing painting scenery with rare skill in Munich from 1808 to 1819, he studied under Mettenleiter and Karl Hess and traveled extensively in Germany, the Netherlands, France, and Italy to study and paint the most remarkable monuments of mediæval architecture. His numerous productions in that field bear witness to his thorough appreciation of the famous Dutch masters in architectural painting of the seventeenth century. Of the fourteen specimens in the New Pinakothek the "Interior of Saint Sebaldus at Nuremberg" (1816), "Villa Malta in Rome" (1830), the "Cathedral at Orvieto" (1831), and the "Views in Old Munich" are the most interesting. The National Gallery in Berlin contains the "Fish Market at Antwerp" (1830) and five others, and the Leipzig Museum the "Minster at Freiburg" (1821). Of other examples may be pointed out the cathedrals of Cologne, Strassburg, Rheims, and Rouen, and the picturesque views of Burg Eltz and the castles of Heidelberg and Hohen-schwangau. Intrusted with the reconstruction and entire decoration of the last-named, he died there before his task was completed. He also

left some rare etchings and published *Sammlung merkwürdiger Gebäude des Mittelalters in Deutschland* (1810), *Ansichten merkwürdiger Gebäude in München* (1811), and *Denkmäler der Baukunst des Mittelalters in Bayern* (1816).—LORENZ (1793-1869) was a genre painter of merry scenes from popular life, often combined with the grand surroundings of Alpine scenery, such as "Card Players in Tyrolese Inn" (1824, National Gallery, Berlin), "Target Practice in Tyrol" (Cassel Gallery).—SIMON (1795-1878), pupil also of his brother Angelo, early excelled as a scene painter, and was appointed Court theatre architect in 1815.—His son and pupil, ANGELO the Younger (1829-90), followed in his footsteps, as did also his grandson, EUGEN (1857—).

QUAHOG, kwä'häg. See CLAM.

QUAI D'ORSAY, kâ dôr'sâ'. The name of a portion of the left bank of the Seine at Paris, opposite the Place de la Concorde. From the fact that the Chamber of Deputies and other Government buildings front on it, its name is used to denote the French Government as Downing Street denotes the English. The buildings facing the Quai d'Orsay suffered severely during the bombardment of Paris in 1871, when the Palais d'Orsay, built in 1810, was destroyed.

QUAIL (OF. *quaille*, Fr. *caille*, from ML. *quaquila*, from MDutch *quakele*, *quackel*, quail, from *quacken*, Dutch *kwaeken*, to quack; onomatopoeic in origin). Originally and strictly, a small game bird of the Old World of the genus *Coturnix*, nearly allied to partridges, but having a more slender bill, a shorter tail, longer wings, no spur, and no red space above the eye. Quails never perch on trees, but always alight on the ground and far excel partridges in their power of flight. They are among the smallest of gallinaceous birds. The common quail (*Coturnix coturnix*, or *communis*) is found in most parts of the Old World, and in the Mediterranean region, where it is most familiar, is migratory. Species of quail are found in different parts of Asia, although no other is so abundant as the common quail, and none migrates as it does. The rain quail (*Coturnix Coromandelica*) is numerous in India. The Chinese quail (*Coturnix exalpathoria*), only about four inches long, is abundant in China, and is there kept for fighting the males, being very pugnacious. It is also said to be used for another singular purpose—the warming of the hands of its owner.

In America the word quail is used for all those small birds which have no feathers on the tarsus. In the United States only one species occurs east of the Mississippi, the well-known bob-white ('partridge' of the Southern States, 'quail' of the North), *Colinus Virginianus*, which occurs as far north as southern Maine and Minnesota. It is about 10 inches long. The upper parts are reddish-brown variegated with black, buff, and gray; the forehead and band on breast, black; the cheeks, throat, breast, and belly white, the latter barred with black; the sides chestnut, marked with black and white. The female has the forehead, cheeks, and throat buff. Bob-white is one of our most popular game birds and is in great demand for the table. It feeds on seeds, berries, and other vegetable matter. The nest is on the ground, and the eggs, 10 to 18 in number, are pure white. Its loud clear notes,

imitated in its name, are the three-syllabled 'ah bob white,' accented sharply on the last; but the first is not always plainly heard. It is one of the most characteristic and pleasing sounds of American rural scenes, for the bird is everywhere numerous, under protective laws. In the Western and Southwestern States are found several relatives (Odontophorinae), five of which differ markedly from *Colinus*, not only in their coloration, but in the presence of a noticeable crest. In the California quail (*Lophortyx Californica*) and Gambel's quail (*Lophortyx Gambelii*) the crest consists of six feathers, erect and recurved; in the mountain or painted quail (*Orcortyx pictus*) the crest is made of two long, drooping feathers; in the blue quail (*Callipepla squamata*) the crest is composed of numerous rather short, soft feathers, and the same is true of the remarkable Massena 'fool' quail of Arizona (*Cartotyx Montezumae*). All of these birds are exceptionally handsome, the prevailing tints being slaty-blue, olive-brown, chestnut or tawny, black and white. The head, especially in the male, is noticeably marked with black or brown and white. The mountain quail is the largest (a foot long), while the Massena quail is the smallest (only nine inches long). The eggs of *Lophortyx* and *Callipepla* are remarkable for being speckled. Consult authorities cited under PARTRIDGE; and see Plate of PARTRIDGES, ETC. See Colored Plate of GAME BIRDS, accompanying article GROUSE; and of EGGS of GAME and WATER BIRDS.

QUAIN, JONES (1796-1865). An English anatomist. A brother of Richard Quain, born in Mallow, Ireland. He received his medical education in Dublin and Paris. He was lecturer on anatomy and physiology in Aldersgate School of Medicine, in London, 1829-31; professor of the same branches, 1831-36. He was the author of *Quain's Elements of Anatomy* (1828; 10th ed. 1890), and of a translation of Martinet's *Pathology* (1835), and also published in 1858 a series of *Anatomical Plates*.

QUAIN, RICHARD (1800-87). An English anatomist and surgeon, born at Fermoy, Ireland. He studied medicine in London and Paris. He was appointed demonstrator in 1828, professor of anatomy in 1832 in the University of London; assistant surgeon in 1834 and surgeon in 1850 to the North London Hospital, from which he resigned in 1866. He was president of the Royal College of Surgeons in 1868, and served as surgeon extraordinary to the Queen. Among his works are: *Anatomy of the Arteries* (1845); *Diseases of the Rectum* (1854); *Observations on Medical Education* (1865); *Some Defects in General Education* (1870); *Clinical Lectures* (1884). Dying, he bequeathed nearly £75,000 to University College, London, for education in modern languages (especially English) and in natural science.

QUAIN, SIR RICHARD (1816-98). An English anatomist and physician, born in Mallow, Ireland, a cousin of Richard and Jones Quain. He became fellow in 1857 and vice-president in 1889 of the Royal College of Physicians, and was appointed physician extraordinary to Queen Victoria as well as Lumleian lecturer for 1872 and Harveian orator in 1885. Edinburgh conferred the degree of LL.D. upon Sir Richard in 1889, and the General Medical Council elected him its president in 1891, the same year in which he was

created a baronet. He published *Diseases of the Muscular Walls of the Heart* (1872), and *The Healing Art in Its Historic and Prophetic Aspects* (1885), and edited the *Dictionary of Medicine* (1882; 3d ed. 1902).

QUAKER CITY. A popular name of Philadelphia, Pa., in allusion to its early settlers.

QUAKER POET. A title given to John Greenleaf Whittier. It has also been used of Bernard Barton and John Scott.

QUAKERS. See FRIENDS.

QUAKING GRASS (*Briza*). A small genus of mostly European grasses, with loose panicles; drooping, generally broad, compressed spikelets, suspended by delicate stalks, and tremulous in the slightest wind. The panicles are often used in winter bouquets. *Briza media* is considered a valuable pasture grass for dry situations in Central Europe. It has become sparingly naturalized in the United States. *Briza maxima*, a larger species, and *Briza minor*, a smaller one, are similar in habit.

QUALITY. A term used in philosophy to designate one of the categories under which reality is supposed to be thought or in which it is described. In this sense it is particularly distinguished from quantity, the latter taking into account the amount or mass of given phenomena, while quality denotes distinctive character. Quality has, in modern philosophy, a psychological connotation, denoting characteristics of perception as much as of real things. It is thus the individual attribute of sensation, that which characterizes or individualizes one kind of sensation so that it cannot possibly be mistaken for any other kind—redness, nausea, hunger, triangularity, are examples of quality. In psychology quality is especially distinguished from intensity, duration, and, in the case of special perceptions, from extension, as an attribute of sensation, and it furnishes the only test for distinguishing kinds of sensations. Of course, in ordinary experience qualities come to us fused, such a thing as a pure quality being seldom, if ever, experienced. Things are made up of compositions of qualities, and these compositions, in a certain sense, may themselves be considered as qualities in that they form the qualitative texture of actual experience and are the basis for our discriminations of things. See CATEGORY.

QUAM'ASH (from the North American Indian name), or BISCUIT ROOT (*Camassia esculenta*). A North American bulbous plant of the natural order Liliaceae, nearly allied to hyacinth, abounding on the prairies. The roasted bulbs are agreeable and nutritious, and are much used by the Indians for food. The scapes, which are sheathed at their bases, are a foot or more tall and bear 10-40 blue or purple flowers. A smaller species, *Camassia Fraseri*, is found from Pennsylvania south and west. Other species, indigenous to the Pacific coast region, are sometimes cultivated in the East.

QUANA. A Comanche chief and the most influential leader among the three confederated tribes of Kiowa, Comanche, and Apache, in southwestern Oklahoma. He was born about 1845, and was a half-breed, the son of a captive white woman, who was married to a chief of the Kwahadi band. Upon the death of his father, Quana became chief. He was prominent in 1874, when

he led 700 warriors of the confederated tribes in a desperate attack upon the fort known as the Adobe Walls on the South Canadian River in the Texas Panhandle. In the subsequent encounters he took an active part until the final surrender a year later, being the last man to come in with his band. Recognizing the advent of a new order of things, he went down into Texas to learn something of the white man's ways, and returned to his tribe an apostle of civilization. In 1882 he began to advocate the leasing of the surplus pasture lands of the reservation, in which he finally succeeded, thus increasing the revenues of the tribes by more than \$100,000 yearly. In 1888 he was appointed a judge of the Indian court to try minor Indian offenses. In 1892 he was the first signer of the treaty by which the lands of the reservation were opened to settlement in 1901. He made many visits to Washington as a delegate for his people and traveled extensively in other parts of the country. After the Indians were made citizens by the opening of the reservation he filled one or two local offices under the county government.

QUANTICS. See FORMS; FUNCTION.

QUANTZ, kvänts, JOHANN JOACHIM (1697-1773). A German flautist, born at Oberscheden, Hanover. In 1716 he went to Dresden, where he joined the town orchestra under Heine. He was at first an oboist, but, after a thorough course of instruction under Buffardin, he exchanged the oboe for the flute. In 1728 he played before Frederick the Great (then Crown Prince) at Berlin, and so delighted him that he arranged for personal instruction on the flute. When Frederick ascended the throne, in 1740, the flautist was called to Berlin as chamber-musician and Court composer, which position he held till his death. His compositions include 6 flute sonatas with bass (1734), 6 duets for flutes (1759), choral melodies to 22 odes by Gellert (1760), and *Application pour la flûte traversière a deux clefs*. Quantz improved the flute by the addition of a second key and the sliding top for tuning the instrument.

QUAPAW, kwä'pä (from *Uga'pa*, downstream). A tribe of Siouan stock (q.v.) prominent formerly, under the name of Arkansas, as the allies of the French in the early days of the Louisiana colony. The Quapaw, Omaha, Ponca, Osage, and Kaw speak dialects of the same language, and according to their traditions, borne out by historical evidence, formerly lived as one people in the eastern part of the United States, but migrated westward and separated near the mouth of the Ohio, where the Quapaw turned southward, while the others continued west or north. Under the name of Capaha they are mentioned in the De Soto narrative of 1540; they were then located on the Mississippi apparently not far above Memphis. In 1818 they sold all of their claims in Arkansas, upper Louisiana, and on the east bank of the Mississippi, excepting a reservation extending from the Arkansas southward to the Saline River. They were then rapidly declining from whisky and wars with other tribes, but were still estimated at 1000. They drifted westward until the remnant, a few hundred, including mixed bloods, was finally gathered upon their small reservation in the northeastern corner of the Indian Territory. In their former aboriginal characteristics and customs they resembled the Osage, but seem to have been of

more warlike spirit and fixity of purpose. The few that remain appear to be prosperous and able to hold their own with their white neighbors.

QUARANTINE (It. *quarantina*, from ML. *quarantena*, period of forty days quarantine, number forty, Lent, from Lat. *quadraginta*, forty). Originally, the period of forty days during which a ship arriving in port and suspected of being infected with a contagious or malignant disease was forbidden to land freight or passengers. From the second half of the 14th century, the Italian republics established quarantine regulations, directed toward the East against the invasion of pestilence. In 1403 Venice instituted the first maritime quarantine, followed by Genoa in 1467. During the latter part of the eighteenth century Austria stretched a permanent cordon of troops across her eastern frontier, but even this failed to shut out the plague, which ravaged her provinces. The example of the Italian cities was early adopted by Marseilles and an efficient system of sanitary supervision was developed, finally passing under the control of the sanitary magistrates. Other European seaport cities enforced rules and regulations of varying effectiveness. In 1850 delegates from the principal States bordering the Mediterranean convened in Paris, and adopted a convention and code of international sanitary regulations, which was subsequently generally adopted by all powers and is enforced in their commercial relations with one another. These uniform regulations have relieved commerce from the restrictions which were imposed by the former conditions. Under its provisions a ship clearing is given a *clean bill* or a *foul bill* according as the port from which she sails is free or infected with a contagious disease, the plague, cholera, and yellow fever being especially guarded against. Ships entering port are at once put under quarantine, varying in length with the character of the contagion feared. For the plague, from 10 to 15 days is generally required; for yellow fever, 5 to 7 days; and for cholera, 5 days, including the term of the voyage. These periods may be modified somewhat according to the length of the voyage and the health prevailing during this time. Further regulations are laid down regarding the disinfecting and handling of merchandise in cargo. Special restrictions have also been adopted against the Oriental countries, Egypt, and Turkey, and for this purpose sanitary boards are maintained in Alexandria, Constantinople, and other frequented ports, with physicians located in different parts of the countries liable to epidemic diseases, whose duty it is to investigate and report to the local authorities and consular offices the condition of the general health.

In modern usage the term quarantine is also applied to the sanitary rules and regulations adopted within a State to restrict the spread of contagious diseases within its own boundaries. They are enacted by the State in the exercise of its sovereign right of police power (see POLICE POWER), and so absolute is this that even summary proceedings invading the rights of the individual or destroying valuable property are upheld as constitutional. Besides the Federal quarantine regulations providing for the protection of the United States in its intercourse with foreign nations, the various State jurisdictions have general statutes authorizing the organization of State

boards of health and similar local boards in cities, villages, and towns, prescribing how they shall be constituted and defining their powers and duties. This power is usually conferred upon municipal corporations by the charter granted by the legislature or by general statute, but in the absence of such express authority, it cannot be implied as incident to the ordinary powers of the corporation. Conflict between the United States and State authorities is provided for by the terms of the Federal statutes (U. S. Rev. Stats., §4792; Rev. Stats., U. S. Sup., 1874-91, p. 157, c. 66, §5) requiring customs, revenue, and other Federal officers to observe State health and quarantine laws. Reasonable charges for quarantine services may be imposed upon a vessel under State authority, and there can be no recovery from the State or municipality for losses resulting from the quarantining or disinfecting of premises infected with contagious disease, where the method employed was proper and the use made of the premises was a necessary one, for the courts are generally liberal in construing empowering statutes. Further, a municipality cannot be held liable for an act of its health officer in wrongfully confining in quarantine a citizen reasonably believed to be afflicted with a contagious disease, since the act done is governmental in its character; but the officer may become personally liable where he acted wrongfully or in excess of his duty. A carrier is protected from liability for non-delivery of goods or passengers where such act would be a violation of quarantine regulations.

The *widow's quarantine* was the term applied under the common law to her right to remain in the mansion house 40 days after her husband's death, during which time her dower should be admeasured and assigned. This right was guaranteed by section 7 of the Magna Charta (spelled "Carta" in the original document), and has been perpetuated with various modifications in the statutes of the several States. Consult the authorities referred to under DOMESTIC RELATIONS; REAL PROPERTY.

Consult: Parker and Worthington, *Public Health and Safety* (1892); Baker, *Laws Relating to Quarantine* (London, 1879); and the various statutes and regulations of the different State and municipal governments.

QUAREGNON, ká're-nyón'. A mining town of Belgium, in the Province of Hainault, situated four miles west of Mons. There are large and important coal mines and blast furnaces. Population, in 1890, 14,361; in 1900, 16,249.

QUARITCH, BERNARD (1819-99). An English bookseller, born at Worbis, in Prussian Saxony. He worked at the bookseller's trade in Nordhausen and Berlin and went to England in 1842. After serving in Bohn's publishing and bookselling shop and spending a year in Paris, he established himself in London as an English citizen in 1847. In 1860 he removed from Castle Street to larger quarters at 15 Piccadilly, his permanent stand. Throughout his life he had made a specialty of Oriental literature, and he printed grammars in the Turkish, Persian, and Arabic languages, besides making a collection of Oriental manuscripts. Probably the best-known books from his press were the first four editions of FitzGerald's Omar Khayyam. (See FITZGERALD, EDWARD.) He was represented at all the

book sales of importance in Europe and America, and thus acquired a great number of rare and costly works. The catalogues he issued from time to time are invaluable to bibliographers. His first complete indexed catalogue appeared in 1860; this was followed by others as he continued to add to his stock. The most noteworthy of these are the great catalogue of 2395 pages (1880), the *Biblioteca Xylographica, Typographica, et Palæographica: Catalogue of Block Books and of Early Productions of the Printing Press in All Countries, and a Supplement of Manuscripts* (1873), and the last he prepared, *General Catalogue of Old Books and Manuscripts* (1887-88, supplements 1894 and 1897). Quaritch was especially interested in rare manuscripts; Shakespeareana, early English literature, Americana, Bibles, and liturgies. He was one of the founders and first president (1878) of the celebrated club, the "Sette of Odd Volumes." Some of his lectures were printed for the "Sette" in 1883, 1885, 1886, 1887, 1889, 1890, 1891 and 1894. Consult: Wyman, B. Q., *A Biographical and Bibliographical Fragment* (London, 1880), and "Bernard Quaritch," in the *Atlantic Monthly* for June, 1900.

QUARRY, QUARRYING (OF. *quarriere*, Fr. *carrière*, from ML. *quadraria*, quarry, place where stones are squared, from Lat. *quadratus*, p.p. of *quadrare*, to square). The open excavation from which any useful stone is taken for building and engineering purposes is called a quarry; the operations required to obtain rock in useful form from a quarry is called quarrying. Quarrying processes are three in number, viz. by hand tools, by explosives, and by channeling and wedging. To understand the operations of the quarryman, it is necessary to bear in mind that all rocks belong to one or other of two great classes, namely, the stratified and the unstratified. The former are sedimentary rocks, occurring in parallel beds or strata, and consist chiefly, in so far as we are at present concerned, of sandstone and limestone. Unstratified or igneous rocks, which include greenstone or whinstone, granite, and porphyry, have no distinct bedding, that is, they do not lie in separate layers. Roofing-slate is a stratified rock, but it splits into thinner laminae in the direction of its *cleavage* than in the direction of its bedding, the former being often at right angles to the latter. Granite and other igneous rocks have also a natural jointage or cleavage, although they are not stratified. Advantage is taken of these peculiarities in quarrying the different rocks, but in the main the systems adopted do not greatly differ.

Hand tools alone may be successfully used for quarrying stone which exists in beds. The principal hand tools are the pick, the crowbar, the drill, hammer, wedge and plug, and feathers. With the drill and hand hammer a row of holes a few inches apart is drilled partly through the layer or stratum, perpendicular to its plane of stratification and along the line at which it is desired to break the stone. These holes are usually drilled from $\frac{3}{8}$ in. to $\frac{3}{4}$ in. in diameter. In each hole are placed a plug and two feathers. The plug is a narrow wedge with plane faces; the feathers are wedges flat on one side and rounded on the other. When a plug is placed between two feathers the three together will slip into a

cylindrical hole, and by driving the plug down between the feathers it exerts a splitting or cleaving force of great intensity. In quarrying, as first stated, each hole in a long row is filled with a plug and feathers; by striking each plug a sharp blow with a hammer, hitting them in succession, and by repeating the operation again and again, the combined splitting force of the plugs and feathers finally becomes great enough to rupture the rock. Generally the plugs and feathers are used only for effecting the larger subdivisions of the rock, the smaller pieces being split and broken by hammers and wedges. Sometimes this method of quarrying is called the plug and feather method.

Explosives are the means most commonly employed for detaching large blocks of stone in quarries, these blocks being afterwards split and broken into smaller stones by wedges or by the plug and feather method. In this method of quarrying the drill holes are put down to the depth to which it is required to break the rock and are then partly filled with some explosive, which is discharged by the usual methods of blasting (q.v.). The kind of explosive used depends upon the character of the result which is sought. In quarrying rock to be crushed into small fragments for road work, concrete making, etc., the object sought is a rather finely broken mass of stone, and here, because of its great shattering effect, some form of high explosive, as dynamite, is employed. When building stone of large size is to be quarried, weaker and slower acting explosives, as gunpowder, are employed. In each quarry the structure of the rock has to be carefully studied with the view of taking advantage of the cleavage planes and natural joints, and for each class of rocks there is a characteristic method employed. The drill holes are usually made by rock drills operated by power, though hand drills and churn drills are also used. The drill holes are driven vertically in a row some distance back of and parallel to the edge of the working face of the quarry, and are blasted simultaneously so as to force outward a rectangular mass of rock.

Channeling is the process of cutting long narrow channels in rock to free the sides of large blocks of stone. Channeling machines, or channelers, are made in a variety of forms, the most common of which is a vertical steam boiler mounted on wheels and provided with mechanism for self-pulsation, having on the same carriage with the boiler a steam cylinder which operates, like a percussion drill, a flat bar with a cutting edge. In operation the machine is run forward and back so as to carry the cutter back and forth along the line on which the channel cut is to be made. If the rock is in layers the channel cut is often not made the full depth of the layer, but is sunk deep enough to permit the insertion of wedges by which the rock is split, the cut or groove guiding the fracture. When the rock is not in layers it is often necessary to undercut the block as well as to cut a channel around it. This is done by drilling a series of holes along the bottom, the process being called gadding by quarrymen. Wedges inserted in the drill holes serve to separate or split the rock at the bottom. A special form of machine called a gadder is used for undercutting. It consists essentially of a rotary drill, generally a diamond drill, ar-

ranged to be operated horizontally and receiving motion from an engine taking steam from a vertical boiler, the whole being mounted on a carriage. The channeling and wedging process of quarrying is extensively used in quarrying marble, sandstone, limestone, and the other softer rocks, but is not a successful process for granite and other similarly hard stones. For a description of the methods and tools used in cutting quarry stone into suitable shapes for structural purposes, see *STONE CUTTING AND DRESSING*. For full details of quarrying processes and machinery, consult Merrill, *Stones for Building and Decoration* (New York, 1891), and *Report on the Quarry Industry*, vol. x., Tenth United States Census. See illustration under *MARBLE*; also *BUILDING STONE*; *DRILL*; *EXPLOSIVES*.

QUART. See *WEIGHTS AND MEASURES*.

QUARTAN FEVER. See *MALARIA AND MALARIAL FEVER*.

QUARTER. See *WEIGHTS AND MEASURES*.

QUARTER-CRACK. A form of sandcrack, a disease of the horse; specifically a vertical crack on the lateral part of the wall of the foot. When the crack is directly in front it is called a toe crack. Toe cracks are most common in the hind feet, while quarter-cracks nearly always affect the fore feet and similarly the inside quarter is more liable to the injury than the outside one, in that when in motion it is subject to a greater part of the weight of the horse. In the normal foot the coronet or, for authorities differ, the sensitive lamina, which cover the external surface of the pedal bone, secretes an adhesive material which binds firmly together the fibres of the wall of the hoof. When the secreting membrane is prevented from carrying out its functions the material secreted under such conditions loses its power, and the horn which it supplies becomes deficient in strength. Where this disease is of hereditary tendency the horn is so weak that it would seem to split, if subjected to a violent strain. Ordinarily, the various forms of sandcrack are caused by the much to be condemned system of using seated shoes and of paring the frog, an unnatural custom by which the entire weight of the animal is thrown on the crust of the foot, instead of being properly distributed between the wall, the frog, the outer portion of the sole, and the bars. Among other causes of perverted secretion may be mentioned the strain of fast work, and hard ground. Cracks or splits naturally occur in that part of the hoof which receives the greatest amount of strain, usually the inner quarter of the fore, and the toe of the hind foot, although it sometimes cracks at the toe of the fore foot, if the hoof is of a flat conformation. Cart and cab horses are especially liable to sandcrack. The usual treatment is: (1) To prevent movement between the edges of the crack; (2) to heal the exposed tissues should they be wounded or inflamed; and (3) to encourage the downward growth of sound horn from above the crack, for it is evident that as the edges of the crack cannot reunite the growing down of the crack is the only effective remedy. See *VACHETTE CLASP*. An authoritative and comprehensive treatment of this subject may be found in Hayes, *Veterinary Notes for Horse Owners* (London, 1897).

QUARTER-DAYS. Conventional dates on which, by custom or agreement, leases begin and

terminate and rent becomes payable in England. Rents are generally made payable by the express terms of the lease on the usual quarter-days. These are, in England and Ireland, Lady day, March 25; Midsummer day, June 24; Michaelmas day, September 29; and Christmas day, December 25. In Scotland there are two 'legal terms' in each year, and two 'conventional terms,' the latter being only adopted when expressly so agreed. The legal terms are Whitsunday, May 15, and Martinmas, November 11; and the conventional terms are Candlemas, February 2, and Lammas, August 1. The law of Scotland differs from that of England in this, that if nothing is said between the parties on letting houses and lands, these legal terms are impliedly included as part of the agreement, both as regards time of entry and payment of rent.

QUARTERING. In heraldry, the bearing of two or more coats on a shield divided by horizontal and perpendicular lines. See *HERALDRY*, section on *Marshaling of Arms*.

QUARTERMASTER. In the United States Army, a commissioned officer serving in the quartermaster's department at an army post or in a regiment; in which latter instance he is a regimental officer, usually of lieutenant's rank, detailed by the commanding officer to perform the duties of *regimental quartermaster*. He is assisted by the *regimental quartermaster-sergeant*, and is responsible for the proper assignment of quarters for officers, men, animals, and stores, and the superintendence and procurement of all regimental supplies. There is a *quartermaster-sergeant* to each company, battery, or troop. The Quartermaster's Department at Washington, D. C., is one of the most important bureaus of the War Department, and is charged with the duty of providing means of transportation of every character which may be needed in the movement of troops and material of war. It furnishes also all public animals employed in the service of the army, the forage consumed by them, wagons and all articles necessary for their use, except the equipment of cavalry and artillery. It furnishes clothing, camp and garrison equipage, barracks, storehouses, and other buildings; constructs and repairs roads, railways, bridges; builds and charts ships, boats, docks, and wharves needed for military purposes; and attends to all matters not expressly assigned to some other bureau. The Quartermaster's Department in 1902 consisted of 1 quartermaster-general, with rank of brigadier-general; 4 assistant quartermaster-generals, with the rank of colonel; 8 deputy quartermaster-generals, with the rank of lieutenant-colonel; 14 quartermasters, with the rank of major; and 31 assistant quartermasters, with the rank of captain (including 1 military store-keeper). Under the terms of the Army Act of 1901, vacancies in this and other staff departments which cannot be filled by promotion within the department will be filled by details of line officers.

In the British Army regimental quartermasters are usually non-commissioned or warrant officers of long service, who receive the commission of honorary lieutenant with their appointment of quartermaster. They combine subsistence with their regular quartermaster's duties, being responsible for the quantity of all food supplies required by the regiment or corps with which

they serve. There are no company or troop quartermaster-sergeants, color-sergeants (q.v.) of companies being responsible for that branch of work. There is also a quartermaster-general with a staff. See *ARMY ORGANIZATION*.

In the navy and merchant service a quartermaster is a petty officer who assists in the navigation of the ship. At sea he superintends the steering of the helmsman, looks out for the log, writes up the 'columns' in the log book, and has charge of the navigator's stores. He also keeps a lookout with his spy glass both in port and at sea, reporting such occurrences as are of interest to the commanding officer or officer of the deck.

QUARTER SESSIONS. In England, a court or meeting of justices of the peace, who assemble every quarter of the year, for judicial as well as miscellaneous business. It is an inferior court of record, having power to punish contempt of court, to adjourn cases, and summon juries for adjourned sittings. The meetings are fixed by statute to be held in the first full week after December 28th, March 31st, June 24th, and October 11th, respectively. The chief officer of the Court of Quarter Sessions is the clerk of the peace. The original jurisdiction of the Court of Quarter Sessions is largely confined to criminal business, but it has certain minor civil jurisdiction by virtue of statutes, and also appeals from certain courts of summary jurisdiction. Most of the administrative business formerly attended to by the Court of Quarter Sessions was transferred to the county councils in 1888. In Scotland there is also a court of quarter sessions of the peace, held four times a year at the county town. Consult: Pritchard, *Jurisdiction, Practice, and Procedure of the Quarter Sessions* (London, 1903); Archbold, *Practice of the Quarter Sessions* (London, 1898).

QUARTET (It. *quartetto*, from *quarto*, Lat. *quartus*, fourth, from *quattuor*, four). A concerted composition for four voices or instruments, in which all the parts are real, i.e. no one can be omitted without injuring the proper effect of the whole. As early as the fifteenth century four-part writing had been recognized as the kind most suitable for combining harmonic fullness and clearness with ease of execution. Since then it has been regarded as the groundwork of all composition. During the seventeenth century, however, the tendency was toward the employment of large masses in double and triple choruses (Schools of Rome and Venice. See *MUSIC, SCHOOLS OF COMPOSITION*.) But during the eighteenth century the development of the string quartet led to a return to four-part writing. In the nineteenth century Mendelssohn and Schumann did much to popularize the male quartet. One of the highest forms of modern music is that written for the string quartet, which consists of two violins, viola, and cello. Although this combination of instruments was established by Monteverde (q.v.) as the foundation of his orchestra, no music was written for it until a century and a half later, when Haydn recognized the possibilities of this group of instruments. Haydn is the father of the symphony. He took the sonata form and in 1755 wrote a miniature symphony for the string quartet. Although this first quartet is very crude, Haydn soon acquired mastery of the form. He wrote in all 83 quartets. Mozart, who greatly developed

the quartet, did not, like Haydn, regard it as a miniature symphony to express only miniature ideas. Some of the boldest effects in Mozart's works are found in his quartets. During the lifetime of Haydn and Mozart the quartet was assiduously cultivated by lesser composers, such as Gossec, Grétry, Sannmartini, Romberg, Ries, Onslow, and others. They were succeeded by the unrivaled master of the string quartet, Beethoven. The first violin no longer had the principal melody; he placed all four instruments on a footing of absolute independence. He wrote only 16 quartets, but in these monumental works all the possibilities of the form are exhausted. Schubert wrote 20 quartets which are scarcely inferior to those of his predecessor either in profound ideas or mastery of technical workmanship. While Beethoven occasionally allows one or two instruments to rest (producing a certain thinness of tone), Schubert keeps every instrument at work from beginning to end. Schumann wrote only three quartets (op. 41), but they can be ranked with those of Beethoven and Schubert. Spohr wrote 33 quartets and four double quartets. His quartets are more like those of Haydn and Mozart; the independence of the several instruments is sacrificed to the predominance of melody in the first violin. The same is true of Mendelssohn's quartets. The second violin and viola too frequently have only filling-up work, like tremolo, etc. Another master is Brahms, whose quartets are written entirely on the lines of his great predecessors. Some of the most important quartet organizations, with their original members are: The *Florentine*, Becker, Masi, Chiostrì, Hilpert; the *Hellmesberger*, Georg, Joseph, Joseph, Jr., and Ferdinand Hellmesberger; the *Schuppanzigh*, Schuppanzigh, Sina, Weiss, Kraft; the *Joachim*, Joachim, De Abna, Wirth, Hausmann; the *Kneisel*, Kneisel, Roth, Svecenski, Schroeder; the *Bohemian Quartet*, Hoffman, Suk, Nedbal, Wihom; the *Brodsky Quartet*, Brodsky, Becker, Sitt, Klengel.

QUARTIER LATIN, kár'tyá' lá'tán' (Fr., Latin quarter). The famous student section of Paris, a district south of the Seine, containing the Sorbonne, the Collège de France, the Institute, the Luxembourg, Panthéon, and various schools. The name *quartier* or *pays latin* was given to it because Latin was the language of mediæval scholasticism. The Latin quarter has always been the centre of youthful revolutionary ideas and a synonym for Bohemian life.

QUARTILE. See ASPECTS.

QUARTLEY, kwárt'li, ARTHUR (1839-86). An American marine painter, born of English parentage in Paris. He lived in London as a child, and came to the United States in 1851. He studied without instruction in Baltimore and New York City, and was elected a National Academician in 1886. His works include: "New York from North River;" "Afternoon in August—Coast of Maine" (1878); "Low Country on the North Shore of Long Island" (1881); and "Off the Isle of Shoals" (in the Union League Club, New York City).

QUARTODECIMAN. A name applied to the party in the early Christian Church which believed in celebrating Easter on the fourteenth day after the full moon, by analogy with the Jewish usage regarding the Passover. See EASTER; NICEÆ, COUNCIL OF.

QUARTZ (MIG. *quartz*, Ger. *Quarz*, rock crystal, quartz). A mineral composed of silica or silicon dioxide, crystallizing in the hexagonal system. It is very hard, scratching glass readily, and has a specific gravity of from 2.5 to 2.8, depending upon the amount of impurity present. When pure it is colorless and perfectly transparent, but it often has some shade of yellow, red, brown, green, blue, or black. By friction it becomes positively electrified. It is a very abundant and widely distributed mineral, largely composing the sands found on beaches and being also a constituent of most rocks. (See Rocks.) The mineral species includes two important groups: those that are crystallized and have a vitreous lustre, called 'pheno-crystalline,' and those that are massive and flint-like, called 'crypto-crystalline.'

The pheno-crystalline varieties of quartz include amethyst, asteriated or star quartz, aventurine, cairngorm, morion or smoky quartz, cat's-eye, citrine or false, Saxon, Scottish or Spanish topaz, ferruginous quartz, or rubasse, (sometimes called 'acona' or 'Mont Blanc ruby'), hyaline, milky or greasy quartz, rock crystal (including the Brazilian pebble, 'Lake George diamonds,' etc.), rose quartz, sagenite quartz, and sapphirine, or siderite. The crypto-crystalline varieties include agate ('banded' or 'eye agates,' 'fortification' or 'ruin agates,' dendritic agate, moss agate, agatized wood, etc.), basanite (lydian stone or touchstone), beekite, bloodstone or heliotrope, carnelian, chalcodony, chrysope, flint, hornstone, jasper, onyx, plasma, prase, sard, and sardonyx. In addition to the foregoing should be mentioned *quartz rock* or *quartzite* (q.v.), which is a sedimentary sandstone converted into a very hard compact rock by metamorphic action. Although it is distinctly granular, the grains seem to melt into each other, or to be enveloped in a homogeneous paste. Of similar nature are the different varieties of pseudomorphous quartz, such as the agatized wood and beekite previously mentioned.

The common variety of crystallized quartz is employed in the arts as an abrasive, principally in the manufacture of sandpaper. It is also crushed and used for polishing marble and as a filler for wood. For the latter purpose it is ground to an impalpable powder and combined with japans or oils to make a paste which is then applied to the surface of the wood. Quartz sands are of importance in the manufacture of glass, refractory brick, mortar, cements, etc. The occurrence of quartz in the form of veins is noteworthy from the fact that such veins are the sources of many of the valuable metals, including gold, silver, copper, and lead. (See ORE DEPOSITS.) Further information concerning the principal varieties of quartz will be found under their special names.

QUARTZITE (named from the mineral quartz, which is its principal constituent). A metamorphic rock composed essentially of quartz, and produced from the alteration of sandstone (q.v.). The process of alteration consists of the enlargement of the sand grains which compose the sandstone through accretion of silica in aqueous solution. This accretion of silica cements neighboring grains together by crystallizing around them, and forms as a result a dense vitreous rock which usually disposes little if any

evidence of its original nature. Exceptionally, however, the microscope reveals the original rounded surface of the sand grain in the centre of each mass of silica. Quartzites frequently contain small amounts of other minerals, especially feldspar and mica, and thus grade into other varieties of metamorphic rocks (q.v.).

QUARTZ VEIN. A term applied to a fissure filled with quartz. Such veins are usually formed by precipitation from solution, but may be of igneous origin. The quartz material of the vein when pure is crushed and used for glass manufacture, as a wood filler, for pottery and other purposes. At times the quartz carries gold or other metals and is valuable as an ore. See ORE DEPOSITS.

QUASI (Lat., as if, as it were) **CONTRACT.** This is a generic term in law, of modern origin, invented to denote all those obligations to pay money which do not arise from either true contract or tort. (See **CONTRACT.**) The distinction between true contracts and quasi contracts lies in the source of the two classes of obligations. All true contracts are founded upon intention, there being no true contract which does not result from the intention and meeting of the minds of the parties to it. Quasi contracts, on the other hand, do not depend upon the intention of the parties; but they are obligations to pay money imposed by law without reference to the intent or consent of the party whose legal duty it is to perform the obligation.

The term 'implied contract' as used in earlier classifications of contracts was applicable either to a real contract, that is one flowing from intent, which might be inferred from the acts of the parties, the term 'implied' being used as a mere term of evidence; or it might signify a so-called contract implied in law, which was not a true contract, but a quasi contract.

Quasi-contract obligations resemble torts in that both are obligations imposed by law; but, while in general the duty imposed by the law of tort is to forbear, a quasi-contract obligation imposes the duty of action, namely, the payment of a definite sum of money. A tort also is in general the violation of a right *in rem*, for which the wrongdoer must respond in damages; but the defendant who is liable in quasi contract has either not acted at all, as in case of one who is required to pay a tax or penalty, or if he has acted has done so with the consent and coöperation of the plaintiff, as one who has received money paid by mistake. There is a still further distinction between tort and quasi contract, which has some value, although not of universal application. While the liability of the tortfeasor is to pay damages for the injury which the plaintiff has suffered from his tortious act, the liability in quasi contracts is generally the restoration to the plaintiff of money or the money value of property which the defendant has secured at the plaintiff's expense and which upon legal or equitable grounds should be returned to him. Thus the remedy for negligent injury of the plaintiff's property is a tort action. The remedy for appropriation of the plaintiff's property by the defendant may be an action in quasi contract to recover the value of the property, or, as will appear, the plaintiff may seek his remedy in tort to recover damages for its conversion, the same act giving rise to an action

either in quasi contract or tort at the election of the plaintiff.

As will appear, also, many quasi-contract actions which are based on the plaintiff's right to compel the restitution of money or the money value of property rest upon purely equitable doctrines, although the remedy is pursued at law. The reason for this is historical. Inasmuch as the relief sought in a quasi-contract action was always a money judgment, and as by the extension of the use of *indebitatus assumpsit* the plaintiff using that form of action might show any state of facts entitling him to recover, the machinery of the law courts was, or rather became, perfectly adapted in preference to equitable doctrines when the only relief sought was the recovery of money.

The following is a classification of quasi-contractual obligations which has been followed to some extent, and which, although not free from criticism, is perhaps as satisfactory as any which has been suggested:

Quasi contracts may be said to be founded: (1) upon a record; (2) upon statutory or official or common-law duty; (3) upon the doctrine that no one shall be enriched at the expense of another.

(1) It is clear that record obligations or judgments are not true contracts, since they are imposed without the consent of the judgment debtor and properly form one distinct class of quasi contracts.

(2) The second class includes all obligations to pay money imposed by some positive rule of law, whether by statute or common law. It includes the obligation to pay penalties imposed by statute, the obligation of a sheriff to pay the proceeds of a levy to the judgment creditor, the obligation of an infant or lunatic to pay for necessities, the obligation of a husband to pay for necessities supplied to his wife—being examples of true quasi contract.

(3) The third class embraces all other recognized quasi contracts, and in all there is present the element of unjust enrichment of the defendant at the plaintiff's expense. It cannot be said, however, that unjust enrichment is a definite rule or principle of decision such that a plaintiff is entitled to recover in every case of unjust enrichment at his expense. The scope of this subdivision of quasi contracts will be best understood by referring briefly to more important groups of quasi contracts included within it.

MONEY PAID BY MISTAKE. It is a general rule that money paid or the value of property delivered to another under mistake of fact may be recovered in a quasi-contract action. If, however, the mistake is one of law, no recovery is allowed.

WAIVER OF TORT. As has already been said, there are certain circumstances under which one who has suffered injury by the tortious act of another may at his election sue either in tort or quasi contract. As the remedies are not concurrent, the election of the plaintiff to sue in *indebitatus assumpsit* or quasi contract is said to be a waiver of the tort. Strictly this is a misuse of terms. The plaintiff still relies on the tortious act of the defendant as the basis of recovery, but he will not then be allowed to resort to an action in tort. The basis of recovery upon theory of waiver of tort is restitution, the return to the plaintiff of the money value of

property taken from the plaintiff by the defendant's tortious act. Torts therefore give rise to quasi contracts only when the tortfeasor has by his wrongdoing enriched himself at the expense of the plaintiff. Thus, if the defendant's tort consists in merely the injury to or destruction of the plaintiff's property without direct benefit to the defendant, the sole remedy is in tort.

THE PLAINTIFF IN DEFAULT UNDER A CONTRACT. In general a plaintiff who is in default under a contract has no right either upon the contract or in quasi contract. If, however, performance by the plaintiff has become impossible and the contract is one which may be said to contemplate impossibility of performance so that the impossibility is an excuse for the plaintiff's non-performance, he may recover in quasi contract the value of the performance which he has already given under the contract. Thus in contracts for personal service, if one is unable to perform because of sickness or death, he or his estate is entitled to recover the reasonable value of services rendered, up to the time of the impossibility of performance. When the plaintiff is in default under a contract which the courts will not enforce because it is illegal, he may recover the actual value of his performance already rendered if the contract is *malum prohibitum* (q.v.) only, but in case of contracts *malum in se* the law leaves the parties to it without relief.

THE DEFENDANT IN DEFAULT UNDER A CONTRACT. When a defendant is in default under a contract because performance by him has become impossible, the plaintiff is entitled to recover in quasi contract for benefits conferred by him upon the defendant provided the defendant's failure to perform is total, or if partial only it may be apportioned to the excess of benefits given by the plaintiff; and this is permitted irrespective of the liability of the defendant to respond in damages for breach of contract. Thus freight money paid in advance may be recovered from the carrier if performance by him becomes impossible; or if one has paid in advance for the personal services of another who is unable to perform because of sickness or death, he may recover in quasi contract the proportion of the compensation remaining unearned. The same rule of recovery is applied whenever the defendant is willfully or inexcusably in default under his contract under such circumstances that he may be said to have abandoned the contract. In case the defendant is in default under a contract which is illegal, the plaintiff's right of recovery in quasi contract depends upon the character of the contract. If the contract is *malum in se* there can be no recovery in quasi contract. If it is *malum prohibitum* there can still be no recovery if the plaintiff is in equal wrong (*in pari delicto*) with the defendant. If, however, the plaintiff is not *in pari delicto*, he may recover the value of the performance which he has given to the defendant under his contract.

In general, whenever a defendant is in default under a contract which cannot be enforced because it does not comply with the statute of frauds, the plaintiff may recover the money value of the performance which he has given to the defendant under his contract. The measure of recovery, as in all other cases of quasi contract, is the value of the benefit conferred on the defend-

ant by the plaintiff, and not necessarily the contract price.

In all cases the basis of recovery is the duty of the defendant to restore to the plaintiff money or money value of property which he has received at the plaintiff's expense and which upon legal or equitable grounds he should return to the plaintiff. Consult Keener, *The Law of Quasi Contracts* (New York, 1893).

QUA'SIMO'DO, *Fr. pron. ká'zè'mò'dò'*. In Hugo's *Notre Dame de Paris*, the hunchback bell-ringer of Notre Dame, so named by Archdeacon Frollo, who found him on Quasimodo Sunday. His love for the gypsy Esmeralda led him to save her from punishment as a witch and to give her an asylum in the cathedral. When she was enticed away by Frollo and finally abandoned by him to death for witchcraft, Quasimodo threw Frollo from the cathedral battlements, and died in the cave where Esmeralda's body had been cast.

QUASSIA (Neo-Lat., from *Quassi Coissi*, name of a Surinam slave who used its bark as a remedy for fever). A genus of trees and shrubs of the natural order Simarubaceæ. *Quassia amara*, a native of tropical America, is a shrub 10 to 15 feet high, with racemes of bright-red flowers, and large pinnate leaves, with remarkably winged and pointed leafstalks. The wood, and particularly that of the root, is intensely

QUASSIA.

bitter, and was formerly used in medicine under the names of quassia-wood, bitterwood, etc. Cabinet work made of it is free from insect attacks. The wood of *Picraea excelsa* (see BITTERWOOD) is used as a substitute for quassia to increase the bitterness of beer, being cheaper than hops. Beer so made is said to become muddy and flat.

QUATERNARY PERIOD (Lat. *quaternarius*, consisting of four, from *quaterni*, four each, from *quattuor*, four). A term employed to characterize the Post-Tertiary strata. See PLEISTOCENE PERIOD.

QUATERNIONS (Lat. *quaternio*, group of four, from *quaterni*, four each). A branch of mathematics invented by Sir William Rowan Hamilton (q.v.) in the first half of the nineteenth century. It extends the idea of complex numbers (see COMPLEX NUMBER) to three-dimensional space, and besides being interesting as a

branch of pure mathematics, it finds numerous applications in physics. The first concept peculiar to the quaternion theory is that of *vector*. A line-segment AB has not only length, but

also direction, and two line-segments AB, A'B' are considered equal when they have the same absolute length and the same direction, e.g. in the parallelogram ABB'A', AB, A'B' are called *vectors* (Latin, *vectores*, carriers), because they are considered as 'carrying' the points A, A' to the points B, B', respectively.

It is therefore evident that a vector may be transported parallel to its original position without alteration in character, and hence that it may be considered as a symbol of translation. The sum of two vectors, AB and BC, is considered to be that vector which carries A to C, viz. AC. This does not mean that the absolute value of AB plus that

of BC equals that of AC, but that (direction being also considered) a force AB plus another

BC, or AB + AC in the figure, equals the force AD. It is therefore evident that, with this definition of addition, the sum of the sides of a triangle or of any other closed polygon, considered as vectors, is zero. Therefore, if we have three given

rectangular vectors, OX, OY, OZ, and OP, any other vector, OP, can be resolved into three vectors respectively, parallel to (hence equal to parts of) OX, OY, OZ. These are RQ, QP, OR; for OR + RQ = OQ, and OQ + QP = OP, as above explained. If, now, we lay off units on OX, OY, OZ, and designate them respectively by i_1, i_2, i_3 , or, as is more common in

English works, by i, j, k , and designate OP by ρ , we shall have $\rho = xi + yj + zk$, the absolute length of ρ being $\sqrt{x^2 + y^2 + z^2}$. These geometric ideas are elementary, and had already been used by Möbius (q.v.) in his barycentric calculus before Hamilton invented quaternions. A few illustrations of their use will be of value. Let

OABC be a parallelogram, the diagonals intersecting at X: then

$$\begin{aligned} \text{OX} + \text{XA} &= \text{OA} = \text{CB} = \text{CX} + \text{XB}, \\ \therefore \text{OX} - \text{XB} &= \text{CX} - \text{XA}; \end{aligned}$$

but vectors cannot be equal unless parallel, and OXB intersects CXA; hence in the last equation

it is necessary that $\text{OX} - \text{XB} = 0 = \text{CX} - \text{XA}$, and hence that $\text{OX} = \text{XB}$ and $\text{CX} = \text{XA}$. It is thus proved that the diagonals of a parallelogram bisect each other. Suppose a, β are two adjacent sides of a parallelogram, and X a line

joining the mid-points of two opposite sides, then it is required to prove that x is parallel and equal to a . Drawing ρ it is seen that $\rho = \frac{\beta}{2} + x = a + \frac{\beta}{2}$, whence $x = a$, which (considering x and a as vectors) shows them to be equal and parallel.

Consider, now, what is meant by the ratio of two vectors OA and OB, or rather on how many distinct numbers this ratio depends. To change OA into OB requires in general, (1) a variation in length, or the application of a stretching factor; (2) a variation in direction, which requires three angles. Hence the required ratio depends upon four distinct numbers, whence the name *quaternion*. The term may be defined as a number that alters a directed line-segment in length and direction. The stretching factor is called the *tensor* and is indicated by prefixing T to a quaternion. The turning factor is called the *versor* and is indicated by prefixing U. A scalar is a quaternion whose product lies on the same line as the multiplicand, and hence is merely a positive or negative number. A *vector* is a quaternion that turns 90° , or $\frac{1}{2}\pi$. The symbol for tensor of a quaternion is Tq; for versor

of a quaternion, Uq; for scalar, Sq; for vector, Vq. The *conjugate* of a quaternion q , written Kq, has the same tensor, plane, and angle, but the angle is reversed. Suppose I, J, K to be unit lengths on rectangular coördinates as in the figure. These are so situated that a positive (counterclockwise) rotation, through 90° , of J about I brings J to K; a similar rotation about K brings I to J; a similar rotation about J brings K to I. Call the operator that turns K into J, i ; i.e. $i = \frac{K}{J}$, or $iJ = K$. Similarly, let $j = \frac{I}{K}$, or $jK = I$; and $k = \frac{J}{I}$ or $kI = J$. It therefore follows that $-\frac{J}{K} = i, -\frac{I}{J} = j, -\frac{K}{I} = k$. Hence $-J = iK = i(iJ) = i^2J$, or $-1 = i^2$. Similarly $-1 = j^2$, and $-1 = k^2$. Also, since $iK = i(jI) = -jI$, and $iK = -J = -kI$, it follows that $-jI = -kI$, or that $ij = k$. Similarly $jk = i, ki = j$. A similar line of reasoning

shows that $ji = -k, kj = -i, ik = -j$, whence

$$\begin{aligned} ij &= -ji = k, \\ jk &= -kj = i, \\ ki &= -ik = j. \end{aligned}$$

These relations, together with the consequent equation $ijk = -1$ and the relation already mentioned, that $i^2 = j^2 = k^2 = -1$, form the basis of the quaternion theory. They show at once that in this theory multiplication is not commutative.

To illustrate the application of quaternions, let $a = xi + yj + zk$, and $\beta = x'i + y'j + z'k$. Then $a\beta = -(xx' + yy' + zz') + (yz' - zy')i + (zx' - xz')j + (xy' - yx')k$, and $\beta a = -(x'x + y'y + z'z) - (yz' - zy')i - (zx' - xz')j - (xy' - yx')k$. Hence $Sa\beta = S\beta a$ (i.e. the scalars are equal), $Va\beta = -V\beta a$ (i.e. the vectors are opposites), and $a\beta + \beta a = 2Sa\beta$. Now $(a + \beta)^2 = a^2 + a\beta + \beta a + \beta^2 = a^2 + 2\delta a\beta + \beta^2$, which is the ordinary trigonometric formula for $c^2 = a^2 - 2ab \cdot \cos C + b^2$. Also $V(a + \beta)(a - \beta) = Va^2 - Va\beta + V\beta a - V\beta^2 = -Va\beta + V\beta a$, because $Va^2 = -Va^2$

and hence is zero; and this equals $= 2Va\beta$. Taking the tensors of both sides of the equation $V(a + \beta) = -2Va\beta$, we have the theorem: The parallelogram whose sides are parallel and equal to the diagonals of a given parallelogram has twice the area of the latter. Furthermore $\delta(a + \beta)(a - \beta) = a^2 - \beta^2$, and vanishes only when $a^2 = \beta^2$, or $\tau a = \tau \beta$; whence the diagonals of a parallelogram are perpendicular to each other when and only when the sides are all equal. The chief application of quaternions, however, is in physical problems, and for these reference must be made to works upon the subject. It is evident that the complex number admits of still further generalization, to the form $a = a_1i_2 + a_2i_3 + a_3i_4 + \dots + a_{n-1}i_{n-1} + a_ni_n$. This theory has been developed by Weierstrass (*Göttinger Nachrichten*, 1884-86), Schwarz, Dedekind, Hölder, and others.

The leading works on quaternions and the related *Ausdehnungslehre* of Grassmann (q.v.) are the following: Grassmann, *Ausdehnungslehre* (1844); Hamilton, *Lectures on Quaternions* (Dublin, 1853); *Elements of Quaternions* (London, 1866; 2d ed. 1899); Taft, *Elementary Treatise on Quaternions* (Oxford, 1867); 2d ed. 1873; Hoüel, *Théorie des quaternions* (Paris, 1874); Laisant, *Méthode des quaternions* (Paris, 1881); McAulay, *Utility of Quaternions in Physics* (London, 1893).

QUATRIN, kwót'rân (Fr. *quatrain*, from *quatre*, from Lat. *quattuor*, four). A name given (originally by the French) to a little poem of four verses (lines) rhyming alternately, or even sometimes to four verses of a longer poem, such as a sonnet, if they contain a complete idea within themselves. Epigrams, epitaphs, proverbs, etc., are often expressed in quatrains.

QUATRE-BRAS, kâtr' brâ. A village in the Province of Brabant, Belgium, about 19 miles southeast of Brussels (Map: Belgium, C 4). It is situated at the intersection of the great roads from Brussels to Charleroi, and from Nivelles to Namur, whence its name. On June 16, 1815, two days before the battle of Waterloo, Quatre-Bras was the scene of a desperate and sanguinary battle between the British and their German allies under Wellington and the French under Ney, in which the former were victorious.

The severe defeat of Blücher the same day at Ligny rendered Wellington's hard-won victory almost valueless; and the British commander retired next morning through Jemappes to Waterloo in order to keep up his communication with the Prussian army. The Duke of Brunswick, commanding the German troops, was killed in this battle. See WATERLOO.

QUATREFAGES DE BRÉAU, kâ'tr'fâzh' de brâ'ô', JEAN LOUIS ARMAND DE (1810-92). A French naturalist, born at Berthezène (Gard). He was educated at Strassburg, where he obtained a doctorate in medicine in 1832, began practice at Toulouse, and established there the *Journal de médecine et de chirurgie de Toulouse*. From 1838 to 1840 he was professor of zoölogy in the faculty of sciences of the University of Toulouse, and from 1842 was at Paris, where he designed plates for the *Régne animal illustré*, wrote for the *Revue des Deux Mondes*, in 1850 was appointed professor of natural history at the Lycée Napoleon, Paris, and in 1855 professor of anthropology at the Musée d'Histoire Naturelle. He was elected to the Academy of Sciences in 1852. He was a noteworthy teacher, and became particularly known for his anthropological investigations and his studies of the invertebrates, especially the annelids. The doctrine of phleboterism, according to which the intestinal ramifications of a certain division of gastropods, known as Phleboterata, have a respiratory function, was first expounded by him. He published an extensive list of works, including: *Souvenirs d'un naturaliste* (1854); *Histoire naturelle des annelés marins* (1865); *La race prussienne* (1871), which involved him in a scientific controversy with Virchow; *Hommes fossiles et hommes sauvages* (1884); and *Introduction à l'étude des races humaines* (2 vols., 1887-89), considered his most important publication. For a complete list of his works, consult Malloizel, Godefroy, *Liste chronologique des travaux de M. Armand de Quatrefages de Bréau* (extrait du bulletin de la Société Naturelle d'Autun) (Autun, 1893).

QUATREFOIL (OF. *quatrefeuille*, from *quatre*, from Lat. *quattuor*, four + *feuille*, from Lat. *folium*, leaf). An heraldic bearing meant to represent a flower with four leaves. See HERALDRY.

QUATREMÈRE, kâ'tr'mâr', ETIENNE MARC (1782-1857). A learned French Orientalist, born in Paris. He studied at the College de France under the celebrated Arabist Silvestre de Sacy, and in 1807 was employed in the manuscript department of the Bibliothèque Impériale. In 1809 he became professor of Greek in the College of Rouen, and in 1815 was elected a member of the French Institute. In 1819 he was called to the chair of Hebrew in the Collège de France, and in 1838 was made professor of Persian in the school for modern Oriental languages. He died at Paris. Quatremère's earliest works were devoted to Egyptian subjects. In his *Recherches critiques et historiques sur la langue et la littérature de l'Égypte* (1808) he demonstrated that Coptic is the true representative of ancient Egyptian, but he later declined to accept the discoveries of Champollion, and would never admit that the Egyptian hieroglyphics could be read phonetically. His geographical and historical works are of very great value, especially

his *Mémoires géographiques et historiques sur l'Égypte* (1811); his *Histoire des sultans Mamelouks* (1837-45), translated from the Arabic of Makrizi; and his *Histoire des Mongols de la Perse* (1836), from the Persian of Rashid-Eddin. He was the author of many valuable articles in the *Journal Asiatique* and the *Journal des Savants*, and he edited the Arabic text of the *Prolegomena of Ibn-Khaldun* (1858). His *Mélanges d'histoire et de philologie* was published after his death by Barthélemy de Saint-Hilaire. Quatremère's library (45,000 volumes), his Arabic manuscripts, and his manuscript notes were purchased by the King of Bavaria; they are now in the royal library at Munich.

QUATREMÈRE DE QUINCY, kân'sé'. ANTOINE CHRYSOSTOME (1755-1849). A French archaeologist and politician, born in Paris. He was actively concerned in the events of the French Revolution, and occupied various political positions during the Republic, Consulate, and Empire. He became intendant of arts and public monuments in 1815, perpetual secretary of the Academy of Beaux-Arts in 1816, editor of that department in the *Journal des Savants*, and was Deputy in 1820-21. His chief works are: *Dictionnaire de l'architecture* (3 vols., 1786-1825); *Jupiter olympien, ou l'art de la sculpture antique* (1814); *Histoire de la vie et des ouvrages de Rafaël* (1824); *Monuments et ouvrages d'art antique restitués* (2 vols., 1826-28); *Histoire de la vie et des ouvrages des plus célèbres architectes*, etc. (1830); and *Canova et ses ouvrages* (1834).

QUATRE-VINGT-TREIZE, kâ'tr' vān trāz (Fr., ninety-three). The last novel of Victor Hugo (1874) and one of his best works. The action takes place principally in La Vendée in 1793, though a part of the book describes scenes in Paris and the Convention. It depicts, in a really epic spirit, the great conflict between the old régime and the new on their last battlefield in the west of France, and the clash of human passions aroused by this conflict.

QUAVER. In music, an eighth note. Its measure is equal to half a crotchet, one-fourth of a minim, or one-eighth of a semibreve. It is

represented thus:  ; or when two or

more are conjoined, thus: 

QUAY. A landing place or wharf for unloading vessels, often supplied with mechanical devices for the loading and discharging of cargoes. Quays usually are of masonry, though they may be constructed of wood or iron on piles, but in such cases the term wharf is generally applied. In Europe such structures have been more permanently constructed than in the United States, and often elaborate systems of railways connect the various docks with each other and with the principal railway systems. There are also steam, hydraulic, or electrical cranes to facilitate the handling of the cargoes, and in the best docks a vessel comes alongside of the quay and the cargo is removed directly to or from railway cars or warehouses. See DOCK; HARBOR.

QUAY, kwā, MATTHEW STANLEY (1833—). An American politician, born in Dillsburg, York County, Pa. He graduated at Jefferson College

in 1850, studied law, and was admitted to the bar in 1854. During the Civil War he was successively assistant commissary-general of the State, colonel of the 134th Pennsylvania Regiment, State military agent at Washington, and military secretary to the Governor. He was a member of the Legislature from 1865 to 1867; was Secretary of State for Pennsylvania from 1872 to 1878; was Recorder of Philadelphia from 1878 to 1879; was again Secretary of State from 1879 to 1882; was elected State Treasurer in 1885; and was chosen United States Senator in 1887. He was for years the most influential of the Republican politicians in Pennsylvania, and also took a very active part in national politics. In 1888 he was chairman of the Executive Committee of the Republican National Committee, and as such conducted the successful Presidential campaign of that year. He was re-elected to the Senate in 1893, but failed to succeed himself in 1899, because of a deadlock which lasted throughout the session of the Legislature. His failure was partly due to an accusation that he had been instrumental in the misapplying of public funds. After he had been acquitted he was appointed Senator *ad interim* by the Governor, but the Senate refused to recognize the appointment. He was, however, nominated to succeed himself by the Republican State Convention, and in 1901 was reelected for the term to expire in 1905. In 1902-03 he attracted attention by his championship of the admission of New Mexico, Oklahoma, and Arizona to Statehood, and by his opposition to the Panama Canal Treaty.

QUAYLE, kwā, WILLIAM ALFRED (1860—). An American Methodist clerical author and educator. He was born in Missouri soon after his people came to the United States from the Isle of Man; he graduated at Baker University, Baldwin, Kan., in 1885; and became adjunct professor of ancient languages, 1885; professor of the Greek language and literature, 1887-90; and president of the university, 1890-92. He entered the pastorate in the Saint Louis Conference on his resignation, and has since been pastor of large churches in Kansas City and Indianapolis. He is widely known as an eloquent lecturer. He has published: *The Poet's Poet and Other Essays* (1897); *A Hero and Some Other Folks* (1900); *The Blessed Life* (1901); *The Gentleman in Literature* (1887-92); *Hero: Jean Valjean* (1902); *In God's Out of Doors* (1902); *King Cromwell* (1902).

QUEBEC, kwè-bèk', formerly LOWER CANADA. One of the eastern provinces of the Dominion of Canada. Its greatest east and west measurement is nearly 1000 miles, that from north to south, 500 miles. It touches Hudson Bay on the northwest, its boundary extending thence slightly northeast to Hamilton Inlet on the Atlantic coast, a strip of Labrador separating Quebec from the open sea. The province borders for about 400 miles on the Gulf of Saint Lawrence. A long strip of its territory lies south of the Saint Lawrence River and borders three of the New England States and the northeast corner of New York. On the southwest the Ottawa River separates the province from Ontario. The remainder of the boundary on the side of Ontario is formed by a line running due south from the southern extremity of Hudson Bay to the Ottawa River.

QUEBEC

SCALE OF MILES
0 10 20 30 40 50
Railways thus

Longitude 72 West D from Greenwich

(CONTINUATION OF EASTERN PART)

There are 344,450 square miles of land area and 2900 of water area, exclusive of the Gulf of Saint Lawrence and the territorial seas.

PHYSICAL CHARACTERISTICS. Physically and geologically, Quebec is divided into three parts. Almost all the vast region to the north of the Saint Lawrence is a portion of the so-called Laurentian Plateau, which belongs to the most ancient geological era (Archaean). This is a barren, rocky, undulating region, the hills oft-times standing out in great boldness, but nowhere reaching a high elevation. The highest portion—the Height of Land—constituting the watershed between the river systems, scarcely exceeds 1000 feet in the west, but becomes gradually higher to the eastward, averaging 1700 feet in the centre of the Labrador peninsula. The second division consists of the narrow strip of lowlands on either side of the Saint Lawrence west of Quebec. Here the general level rises but a few hundred feet above that of the sea, except where the later strata are pierced by rocks of igneous formation, which in a few instances rise quite high, Mount Royal at Montreal being the best known of these. To the eastward of these lowlands the strata have been violently upheaved, the line of dislocation running from Lake Champlain to Quebec, and thence following the estuary of the Saint Lawrence, the disturbed area occupying the greater portion of Quebec south of the Saint Lawrence, and constituting the third division. It is a part of the so-called Acadian region. This is simply the northern extremity of the great Appalachian mountain chain. This portion of Quebec is broken and hilly throughout, rising nearly 4000 feet in Sutton Mountain, in the Notre Dame range.

The greater portion of the province is drained by the Saint Lawrence River system. This river has been the all-important factor in the history and development of the province. The numerous southern tributaries are short, the northern tributaries longer, but, owing to the frequent falls and rapids along their courses, they are of little value to navigation. These features, together with the precipitous channels through which the streams flow, and the ruggedness of the adjacent highlands, combine to produce grand scenery which annually attracts thousands of tourists, the Saguenay River being the most frequented. The most important southern tributary is the Richelieu. It drains Lake Champlain. The region north of the Saint Lawrence has numerous water-covered areas which vary from swampy lands to lakes of considerable size—the Saint John and the Mistassini being the most important. The island of Anticosti, at the mouth of the Saint Lawrence, and the Magdalen group, north of Prince Edward Island, are the most important of the large number of islands which belong to the province.

CLIMATE. The winters in Quebec are long and cold; the summers warm, though not to excess. The mean annual temperature ranges from 45° at Montreal to 29° in southern Labrador. The annual precipitation in the Saint Lawrence valley is quite adequate for agricultural purposes. The air is in general remarkably dry and free from fog, and therefore extremely healthful and bracing, not even the extremes of the winter's cold being intolerable. The deep winter snows last from November to April (except in the farthest district south), and afford a necessary

protection for the vegetation against the winter's cold. They are especially welcomed by the lumberman, as he is thereby enabled to get his supply of logs to the banks of the streams.

MINERALOGY AND MINING. The province is favored with large mineral resources, but has not yet reaped any great benefit therefrom. Like Ontario, Quebec is unfortunate in not possessing coal. The tariff levied by the United States practically prohibits the exportation of ore into that country. The southeast portion of the province is most productive of mineral wealth, and has recently become noted for its asbestos mines, which yield practically all the asbestos marketed in the world. In 1900 the product exceeded \$700,000 in value, and averaged annually more than \$400,000 between 1890 and 1900. Iron is mined in the region east of the Richelieu River, and is found at various points along the north bank of the Saint Lawrence and farther west in the region of Ottawa. During recent years the annual output of iron ore has averaged about 20,000 tons. For a long time small quantities of gold have been taken from the gravels of the Chaudière River. Platinum also exists in these gold placers. The southeast townships abound in cupriferous pyrites, and considerable copper is mined, the product being used for the manufacture of sulphuric acid. Plumbago is found near Ottawa, and phosphate and mica exist to the northward. Lead is found farther west and north along the course of the Ottawa River. Some graphite and small quantities of gems of inferior quality have been placed upon the market. The limestone of the eastern counties has been liberally drawn upon for building purposes, but its greatest use and service have been in the production of lime, the output of which has reached \$400,000 for a single year. Granite is quarried in the counties adjacent to Vermont and New Hampshire, while just to the north of this section slate is quarried in considerable quantities. Peat is found in inexhaustible quantities, but has not yet come into use.

FISH AND FURS. Fishing is an important occupation. In common with the other provinces Quebec enjoys the benefits of the bounty given by the Dominion Government for engaging in sea fishing. Latterly the returns show that the number of men engaged in boat fishing has annually exceeded 7000. The vessel fishing is of small and decreasing importance. The annual catch approximates \$2,000,000 in value, the income from the cod fisheries constituting more than one-third of this amount. Herring, lobster, and salmon are next in importance. Quebec still furnishes the world's market with a valuable quota of furs, but in certain regions the fur-producing animals have become almost or quite extinct. Moose and deer in the south, and cariboo in the north, not to mention smaller varieties of game animals, are still abundant, but these, too, are rapidly being killed.

FORESTS. In the Ottawa and Saint Lawrence valleys and the highlands south of the Saint Lawrence there is a mixed forest such as is typical of the New England States to the south. Here are found maples, oak, beech, elm, and other hard woods, together with the red and the white pine, the cedar, spruce, birch, and other varieties of evergreens. The region south of the Saint Lawrence

still contains extensive valuable forest areas, as is the case with the Upper Ottawa region. In the highland region to the north the sub-Arctic species of flora prevail, and there are but few varieties, in marked distinction from the southern section. The best forest land lies south of the watershed, and though not equal in value to the forests of northern and central Ontario, is yet very valuable, and is to-day the great lumbering region of Quebec. The tamarack and the spruce occupy the wet boggy lands in the southern portion of this region, becoming common also on the drier lands farther north. The Banksian pine flourishes in the sandy and rocky soil, but is inclined to be scrubby as compared with the noble proportions it attains farther west. It is estimated that one-half the area of the province is still forest or woodland. Arctic flora is well represented along the gulf coast.

AGRICULTURE. Farming is the most important occupation, though cultivation is confined largely to the fertile river valleys. In the cultivated portions the soil is loamy and of great fertility. In the vast stretch of highland north of the Saint Lawrence it varies greatly in richness, much of the region being either swampy or rocky and barren, the barrenness increasing to the northward. The townships adjacent to Vermont resemble that State in physical characteristics, being better adapted to stock-raising than to farming. Formerly this section produced enormous crops of hay for shipment into the States, but more recently dairying has been given great prominence, and the products of the soil are consumed at home. The products of the dairy are now the farmers' greatest source of income. Oats, wheat, and buckwheat are the leading cereals. Potatoes, peas, turnips, and tobacco are each important. Parts of the province are noted for their superior apples and plums, while the hardy varieties of smaller fruits grow everywhere. Stock-raising receives great attention. Farming is not yet extensive on the interior lands north of the Saint Lawrence. South of the watershed the summers are sufficiently warm and the soil in many places is sufficiently fertile to guarantee an extensive agricultural development. This is especially true of the Lake Saint John and the Upper Ottawa regions.

BUSINESS INTERESTS. The navigable Saint Lawrence River has been the determining factor in the development of Quebec. The largest ocean steamers ascend the river as far as Montreal, 500 miles from its mouth. The shipping industry of this port has made it the metropolis of Canada. Here is collected almost the whole of the interior Canadian product which is destined for foreign shipment, to which are added also large quantities of food products from the Northern United States. The navigation of this stream has been greatly improved (as has been also that of its north and south tributaries, the Ottawa and the Richelieu) by the construction of canals at points where their courses are interrupted by rapids. For foreign shipments, see the article on CANADA. The principal export products of Quebec are lumber, beef, apples, and dairy products—butter and cheese.

The construction and maintenance of railroads have been aided by the Dominion, provincial, and municipal governments—the provincial aid

averaging \$15,000,000 annually. The mileage in 1900 was 3414—about half that of Ontario. Most of the lines are south of the Saint Lawrence. The only line running into the northern interior is the one from Quebec to Lake Saint John. Shipbuilding, which was formerly an important industry, has almost entirely ceased. Logs used to be shipped in the rough to British ports, but now numerous sawmills have been established, and the timber is sawed into lumber before shipment. The presence of tanning barks, notably the hemlock, has given rise to an extensive tanning industry. The spruce is being largely manufactured into wood pulp and its products. Boots and shoes are made at Montreal and Quebec. Cottons are also manufactured, and there is an increased trade in printed cotton goods. The manufacture of matches, potash, and other chemical products is of some importance. A number of the river rapids have been utilized in the generation of electrical light and power.

GOVERNMENT. A Lieutenant-Governor, appointed by the Governor-General of Canada, is at the head of the Provincial Government. He is assisted by a council of usually six, who are responsible to the legislative bodies—the Council, with 24 members, and the Assembly, with 74 members. The province sends 24 members to the Dominion House of Commons. For the year ending June 30, 1901, the principal sources of revenue were received from the sale of timber limits (\$1,471,004), Dominion subsidies (\$1,278,987), and liquor licenses (\$661,968), which with other revenues aggregated \$4,563,432. The total expenditure for the same year was \$4,516,258, of which the largest item was \$1,436,510 interest on the national debt.

FINANCES. The principal sources of revenue are the subsidy from the Dominion Government and income from the sale of forests. The total revenue in 1900-01 was \$4,563,432, and total expenditures \$4,516,251. The gross debt in 1902 was \$33,597,659, against which the treasury held assets of \$11,364,132, leaving a net debt of \$22,233,527.

POPULATION. The population of Quebec increased from 1,488,000 in 1891 to 1,621,000 in 1901. This was a much larger rate of increase than is found in any of the other eastern provinces, and was made in spite of a very heavy emigration into the New England States. The gain is accounted for by the unusually large birth rate, the average size of the families being 5.5. The Indians of the province number 10,700, most of whom are well advanced in civilization. Quebec was originally settled by the French, whose descendants still form a large majority of the population. Their race has remained practically intact: it is still French in language, manners, and temperament. This fact is of first importance when the government of the province is considered, and is the predominant factor in almost every phase of its social life. The Eastern Townships received a large number of loyalists from the American colonies during the Revolution.

CITIES. In 1901 the population of Montreal was 266,800; Quebec, the capital, 68,800; Saint Henri, 21,192; Hull, 13,900; and Sherbrooke, 11,700. Montreal is the largest city in the Dominion, and the large number of racial elements represented give it a cosmopolitan air. The population of Quebec is mostly French.

RELIGION. Quebec was first settled by French Catholics and was the centre of the great missionary activity of the Jesuits. The Catholic faith still continues strongly predominant, its adherents outnumbering the Protestants more than 6 to 1. They constitute two-thirds of the total Catholic population of the Dominion. Of the Protestants, the Episcopalians, Presbyterians, and Methodists are strongest.

EDUCATION. The educational system is unlike that of any other Canadian province. As in the case of the others, however, there is a 'Department of Public Instruction' with a superintendent at its head. But the administration is represented by two committees, Catholic and Protestant, having the care of the schools of the respective faiths, prescribing such religious instruction as they see fit, and receiving proportionate support from the public funds. All Catholic bishops are members of the Catholic committee. The individual schools are in the hands of local boards. There were, in 1900, 4980 Catholic schools and 966 Protestant. Each class of schools contains some pupils of the opposite faith, 80 in every 1000 in the Protestant schools being Catholics. The study of agriculture receives special attention. There are one dairy and four agricultural schools. The expense of the public schools averages about \$9 per enrolled pupil. About 11 per cent. of this is met by Government grants, the rest being raised by assessment of the people. The higher institutions of learning are provided by private or denominational enterprise. These are the Laval University (Catholic) at Quebec, with a branch at Montreal; Bishop's University (Anglican), at Lennoxville; and McGill University (non-denominational), at Montreal. The last institution in particular has a wide reputation.

HISTORY. (For the period preceding permanent settlement, see CANADA.) In 1608 Champlain laid the foundations of the colony of Quebec; and as a result of his twenty-seven years of activity in exploring the Saint Lawrence and the Great Lakes as far west as Huron, in cultivating the friendship of the Canadian Indians, and in curbing the power of the Iroquois, there were in Quebec at the time of his death, on Christmas Day, 1635, some 150 colonists, who derived a precarious existence largely from the fur trade. (See CHAMPLAIN, SAMUEL DE.) Champlain's efforts were supplemented in a degree by the work of the Recollet missionaries, who arrived in 1615, and the Jesuits, who came in 1625; but the pitiable condition of the colony for the next thirty years, during which period occurred the failure of the Hundred Associates under Richelieu, clearly proved that no true elements of colonial prosperity could be expected from the initiative of individual Frenchmen. During this period, in 1642, came the founding of Montreal and the laying of the foundation of those religious establishments that under Monseigneur de Laval, the first Roman Catholic Bishop of Canada, assumed the commanding position which they continued to hold while French domination lasted. When, in 1663, Canada was made a royal government, its French population amounted to only 2500, largely centred at Quebec, Montreal, and Three Rivers.

The coming of the Marquis de Tracy in 1665, followed by his successful campaigns against the Mohawks, two years later, was the signal for a

more rapid immigration. Under the *intendant* Talon (q.v.) the colony enjoyed a moderate degree of prosperity. The ablest Governor of this period, whose energy transformed Canada into the semblance of a colonial power, was the Count de Frontenac, whose two terms practically comprised the last three decades of the seventeenth century. Under him the Iroquois were led to respect the French power, while the area for the fur trade was greatly extended; and to accomplish this double purpose Fort Frontenac was established as an outpost on Lake Ontario. In 1690 an English expedition under Sir William Phipps was defeated before Quebec. The total immigration for the years 1663 to 1713, largely from the French provinces of Perche and Normandy, did not exceed 6000, and the population of the territory included within the present Province of Quebec at the latter date was less than 20,000; but Frontenac had made Canada a power to be feared by its English neighbors. The system of seigniorial tenure had built up the nucleus of an agricultural community on the banks of the Saint Lawrence, but the vast forests of the West still attracted the more vigorous spirits of the population and rendered settled conditions of social and political order almost impossible.

The religious Orders were often in sharp conflict with the Government officials, yet their influence on the life of the colony was generally helpful. The Jesuit College at Quebec, founded in 1635, antedated Harvard, and doubtless was largely responsible for the evidence of culture in the cities noted a century later by the traveler Charlevoix, and the Swedish botanist Kalm.

The memorable battle on the Plains of Abraham, September 13, 1759, resulting in the fall of Quebec, which was followed by that of Montreal in the next year, brought Canada under the dominion of England. At that time, of the 60,000 French in the Valley of the Saint Lawrence, 8000 were gathered at Quebec, 4000 at Montreal, and 1000 at Three Rivers, the total population of the three hardly equaling that of Boston. These three cities formed the centres of the judicial districts into which the English divided the colony, with a Superior Council at Quebec. During the eleven years preceding the Quebec Act of 1774, the small English minority petitioned for themselves a representative system, wholly unsuited to the French population, which would have placed all power in their hands. Though their action gave rise to a race antagonism, the evident policy of both the home Government and the local officials was to deal justly with their new subjects and thus secure their good will. This was shown by the liberal terms of the Quebec Act (q.v.). For this reason, largely, all attempts of emissaries from the Continental Congress to stir up the Canadians against England and the expedition of Montgomery and Arnold in 1775 alike failed of their object. Much of the credit of this result is due to the wise rule of Sir Guy Carleton, the Military Governor.

By the end of the Revolution at least 10,000 exiled loyalists had sought the valley of the Saint Lawrence and the region bordering upon the lakes beyond, and they now petitioned for a separate western district. By the terms of the Constitutional Act of 1791 their prayer was granted, but the period down to 1812 was marked by a

growing race hostility in Lower Canada, as Quebec was then called. During the second war between the United States and Great Britain the province suffered little; on the contrary, the general effect was a greater unity of sentiment among the two leading elements of its population, although up to 1836 the relations between the elective assembly and the royal governors were far from cordial. This fact, however, led but few French-Canadians of prominence to take part in the Rebellion of 1837-38, which resulted in the collapse of Papineau's scheme of 'La Nation Canadienne.' (See PAPINEAU, LOUIS JOSEPH.) In the latter year the population of Lower Canada approached 300,000, of whom one-fourth were of British origin, and this element largely controlled the industry of the province. Quebec and Montreal each boasted a population of 35,000.

Following the Rebellion, the two provinces were again united for general purposes by the Act of 1841, and a Parliament of two elective Houses constituted. As there was some opposition to the provision that all debates in this Parliament must be conducted in English, this was shortly repealed in favor of the French representatives from Quebec. By the Act of 1867 Quebec became a part of the Dominion of Canada, of which the course of her leaders has made her a conservative, though consistently loyal member, despite scattered attempts to stir up race feeling during the Riel Rebellion of 1885 (see RIEL, LOUIS) and the recent Boer War. See CANADA.

(Madison, 1896); *Quebec Lands, Forests, and Fisheries* (Quebec, 1898).

QUEBEC. The capital of the Province of Quebec, and the oldest city in Canada, in latitude 46° 48' N., longitude 71° 12' W., 180 miles north-east of Montreal, 430 miles north-northeast of New York (Map: Quebec, E 4). Quebec is situated on a promontory called Cape Diamond, named from the prevalence of quartz, and formed by the confluence of the Saint Lawrence and Saint Charles rivers. Its picturesque position, and the fact that its historical sites have never been defaced and altered, make it one of the most romantic and interesting towns in North America. It resembles a mediæval European town rather than a city in the New World, and, owing to its impregnable aspect, has been termed the Gibraltar of America. Grouped on and below the rocky, precipitous bluff, with its low, irregular buildings and river craft at the base, it presents a quaint appearance. The city is divided into an upper and a lower town. Access to the former, perched high on the precipitous eminence, is obtained by several flights of narrow steps, an elevator, and a steep and winding street. The portion of the upper town near which lie the suburbs of Saint John and Saint Louis is surrounded by a massive wall, but several of the fortifications have been destroyed. Three gates have been removed, the two remaining being Saint Louis and Kent Gate. The summit of Cape Diamond is crowned by a citadel, covering forty

acres, at a height of 333 feet above the level of the river, dating in its present form from 1823, and garrisoned by Canadian militia. The upper town contains the principal residences, churches, buildings, public walks and gardens, and shops. One of its most interesting points is the Dufferin Terrace, a promenade, 1400 feet long and 200 feet above the river, opened in 1879 and affording a fine view. This was constructed on the site of the residence of the early French governors, the Château Saint Louis, destroyed by fire in 1834. In the Governor's garden, overlooking the Saint Lawrence River, stands a monument to the memory of Wolfe and Montcalm, and on the Saint Foye Road an iron pillar surmounted by a bronze statue commemorates the battle of Saint Foye, fought on that site.

Quebec's chief attractions are: the Parliament and departmental buildings; the court-house, custom-house, and city hall; the Masonic hall; the Basilica, formerly the cathedral, with specimens of several of the greatest painters; the Seminary of Quebec; the Laval University, deriving its name from the first Bishop of Quebec, and well equipped with a library, museum, a picture gallery, and scientific apparatus—the largest educational Roman Catholic institution in Canada; and the Ursuline Convent, where Montcalm is buried. Quebec has the Hôtel Dieu Convent and Hospital; Morrin College (Presbyterian), called after its founder and connected with McGill University of Montreal; and the Marine Hospital. There are many educational institutions, several public libraries, and a literary and historical society, founded at Morrin College in 1824, which possesses valuable records and historical manuscripts.

The lower town is the seat of commerce, and much rock has been cut to construct its narrow, irregular streets. Near it are the districts of Saint Roch and Saint Sauveur, containing many manufactories. The chief industry is the shipping of lumber brought in rafts and collected into coves which extend for six miles above the town. The principal manufactures and exports are leather, iron castings, boots, shoes, furs, grain, cattle, musical instruments, cutlery, machinery, nails, india-rubber goods, rope, and steel. Quebec early achieved a reputation for ship-building, and the *Royal William*, one of the first vessels to cross the Atlantic by means of steam alone, was built here in 1831. The rocks and wharves extend three miles from the mouth of the Saint Charles, where the spacious Louise Basin is inclosed by the Louise Embankment, which forms a fine river-front promenade.

Quebec is supplied with water from Lake Saint Charles, and is lighted by electricity, the power for which is obtained from Montmorency Falls, seven miles distant. Quebec sends three members to the Dominion House of Commons and three to the Provincial Legislature.

Interesting localities in the neighborhood include the Plains of Abraham, named after a pilot of the Saint Lawrence who owned this tract of land, and containing a monument to Wolfe in honor of the victory of 1759; Wolfe's Cove, where the British encamped; Près de Ville, where General Montgomery fell in 1775; Montmorency Falls, where Montcalm resisted Wolfe, noted for its beautiful scenery and cataract; Beauport and its asylum; Levis, with its three forts; Lorette (q.v.), with its falls, Indian church, and

Indian settlement; the Chaudière Falls; Saint Anne de Beaupré, a place of pilgrimage, whose church contains relics of Saint Anne, supposed to effect marvelous cures; Château Bigot, an historical house near Charlesburg; Cap Rouge; and Isle d'Orléans, where General Wolfe established his camp prior to the siege of Quebec.

An Indian town named Stadacona occupied part of the present site of Quebec in 1535 when Jacques Cartier explored the Saint Lawrence. An unsuccessful attempt at settlement was made by Sieur de Roberval in 1542-43. Its real founder was Champlain, who established a small trading post here in 1608, and gave it the name of Quebec. In 1629 Sir David Kirke captured the settlement, but it was restored to the French three years later. When the colony was made a royal government in 1663, Quebec became the capital. The English made two unsuccessful attempts to capture it in 1690 and 1711, and through the daring of General Wolfe in 1759 it finally fell into British possession, which has never been interrupted. A fruitless effort was made by the Americans to capture the city by assault on December 31, 1775, when General Montgomery was killed. For several years Quebec was the capital of United Canada, and the famous Confederation Debate took place in the old Parliament House in 1864. The growth and progress of Quebec have not been rapid. The population, in 1881, numbered 62,446; in 1891, 63,090; in 1901, 68,834, five-sixths being French, and Roman Catholics. Consult: Russell, *Quebec as It Was and as It Is* (Quebec, 1860); Parker, *Quebec, The Place and the People* (New York, 1903).

QUEBEC ACT. An act of the English Parliament passed in 1774 providing a government for the Province of Canada, which had been acquired by the Treaty of Paris of 1763. The three features of the act which have called forth the most extended discussion were: (1) the extension of the boundaries of the province so as to include all the territory northwest of the Ohio River and east of the Mississippi, thus confining the Atlantic colonies within the Alleghanies, in spite of their claims to the land to the west; (2) the substitution of the French civil law therein for English law; and (3) the withholding of representative English institutions, such as existed in the other English provinces. The act excited great indignation among English-speaking peoples both at home and especially in the thirteen English colonies. The reason assigned by the English for the extension of the boundaries was the necessity of annexing the Northwest Territory to some civil government in view of the almost anarchical conditions there prevailing; and having reached that conclusion, the Government decided that there were good reasons why it should be annexed to Canada. With regard to the substitution of the French legal system for the English, the Government claimed that on account of the predominance of the French element it was found impossible to put English law into practice except in commercial matters, and as the French customary law had, for the most part, continued undisturbed, the act of Parliament in question merely legalized the existing status. Finally, the English justified the withholding of representative institutions on the ground of the religious difficulties involved. In view of the Roman Catholic majority, it was deemed inex-

pedient to exclude Catholics from the assembly; on the other hand, it was thought unsafe to admit them, and as a consequence an appointed council took the place of a representative assembly. The act was regarded by the English colonists as a blow aimed directly at them, and was a factor in bringing on the Revolution.

For the American view of the spirit and purpose of the act, consult Baneroft, *History of the United States* (New York, 1883-85); for the English view, consult an article in the *Annual Report of the American Historical Association* for 1894 (Washington, 1895).

QUECHUA, kā'chwá. A tribe of South American Indians. See QUICHUA.

QUEDAH, kā'dá, or **KEDAH**. A tributary State of Siam on the west coast of the Malay Peninsula, north of Perak and of the British Province of Wellesley (Map: Siam, D 6). It formerly included the island of Penang and the territory of the Province of Wellesley. Area, 3600 square miles. Population (estimated), 30,000.

QUEDLINBURG, kvéd'lin-bōrk. A city in the Province of Saxony, Prussia, on the Bode, 34 miles southwest of Magdeburg (Map: Prussia, D 3). It preserves in part its ancient walls and towers, and on a rocky height is an old castle, the seat of the famous Abbey of Quedlinburg, founded early in the tenth century by Henry the Fowler, King of Germany, the first four abbesses of which were daughters of German emperors. The Abbey of Quedlinburg, with its district, constituted a State of the German Empire down to 1803. It became Protestant in 1539. The abbey church, restored in 1862, with its mediæval relics, is of great interest, and there are other noteworthy ecclesiastical remains, an ancient town-hall, and fine sculptural monuments, including statues of Klopstock and Karl Ritter, who were born here. Quedlinburg is the centre of the second largest seed-producing district in Germany, and manufactures machinery, aniline dyes, starch, cloth, and wire goods. There is a large annual cattle market. Quedlinburg was a member of the Hanseatic League. Population, in 1890, 20,761; in 1900, 23,378.

QUEEN ANNE'S BOUNTY. The fund formed by the liberality of Queen Anne to augment the poorer livings of the Church of England. The basis of the fund was the annates, or the first year's whole profits of a spiritual preferment. This tax, which at one time went to the Pope, was annexed to the Crown during the reign of Henry VIII. and received by his successors down to Queen Anne, who formed it into a trust fund for the benefit of the poorer clergy of the kingdom. During the year 1900 the administrators of the bounty augmented 96 livings, and made benefactions to the extent of £30,000 and grants to the extent of £16,930.

QUEEN ANNE'S WAR. The name commonly given to that part of the struggle known as the War of the Spanish Succession which was fought in America. In America the war began in the fall of 1702 by an unsuccessful expedition from South Carolina against the Spaniards in Saint Augustine. In the north the brunt of the war fell upon New England, for, in consideration of the fact that the Iroquois promised to remain

neutral, the French decided it would be wisest not to attack New York. At first the New England Indians also promised Governor Dudley that they would remain neutral, but in a few weeks they broke their promise, and, in conjunction with the French, ravaged the whole New England frontier. On March 1, 1704, a party of French and Indians under Hertel de Rouville captured the town of Deerfield, killed about 50 of the inhabitants, and carried 112 into captivity. In August, 1708, the town of Haverhill, on the Merrimac, suffered a like fate. The British colonists in 1704 and again in 1707 attempted, but without success, to capture Port Royal in Acadia. In 1709 a grand expedition against Canada was planned, but the non-arrival of an expected English fleet caused the plan to miscarry. In September of the following year six English vessels, with thirty from New England and four New England regiments, sailed from Boston, and after a short siege Port Royal was compelled to capitulate. In honor of the Queen the place was renamed Annapolis. Encouraged by this victory, the English again planned the conquest of Canada. One expedition was to march from Albany and attack Montreal; another and the more important, the nucleus of which consisted of fifteen English ships of war, forty transports, and seven battalions of Marlborough's veterans, was to operate against Quebec. The fleet, reinforced by many colonial vessels, sailed from Boston on July 30, 1711, but on the night of August 22d eight vessels and about a thousand men were lost upon the rocks of the Egg Islands in the Saint Lawrence. Discouraged by this event, the incompetent commander, Sir Hovenden Walker, gave up the attempt, and the whole campaign ended in a miserable failure. The remainder of the struggle was marked merely by border raids, and no important operations were undertaken by either side. In 1713 the War of the Spanish Succession was brought to a close by the Peace of Utrecht, but hostilities with the Indians continued for some time longer. So far as the terms of the treaty concerned North America, the French gave up the territory around Hudson Bay, and surrendered all claim to sovereignty over Newfoundland, although they retained the privilege of drying fish on the west coast. Acadia was also ceded to England, but the French were allowed to keep Cape Breton, with the right to fortify it. Consult: the *Massachusetts Historical Collections: the Massachusetts Historical Society Proceedings*; Church, *Entertaining Passages* (Boston, 1716); *The Redeemed Captive* (Boston, 1707; Northampton, 1853), by Rev. John Williams, one of the prisoners taken at Deerfield; Drake, *The Border Wars of New England* (New York, 1897); and Parkman, *A Half-Century of Conflict* (Boston, 1892; later ed. 1897).

QUEEN CHARLOTTE (shär'löt) **ISLANDS**. A group of islands off the coast of British Columbia, 130 miles northwest of Vancouver Island (Map: Canada, D 6). Area, 5100 square miles. They are mountainous, rising to a height of 5000 feet, except Graham Island, the largest and northernmost, which is chiefly a rolling plain. All of them are densely forested, and the climate is very humid. They are inhabited by the remnants of the Haida (q.v.) tribe, and a few white settlers, chiefly engaged in fishing.

QUEEN CHARLOTTE SOUND. The northern part of the channel separating Vancouver Island (q.v.) from the mainland.

QUEEN CITY, or **QUEEN OF THE WEST**. A popular name of Cincinnati, Ohio. Buffalo, New York, is called the *Queen City of the Lakes*; and Sydney, Australia, the *Queen City of the South*.

QUEEN CONCH. A local name in the West Indies for one of the large helmet shells (*Cassia cameo*) extensively used for cameo-cutting (see *CAMEO*), the under layer giving a deep claret-colored background to the white design carved in the superficial layers.

QUEEN-FISH, or **WHITE CROAKER**. A small sciaenid fish (*Sciriphus politus*) of the southern part of California, which is common on sandy shores, is about a foot in length, and is an excellent pan-fish. It is bluish above and bright silvery below, with the fins bright yellow.

QUEEN OF THE ADRIATIC. A name given to Venice on account of its situation and its early importance in the commerce of the East.

QUEEN OF THE ANTILLES. Cuba, so called because of its natural beauties and advantages.

QUEEN'S BENCH. See **KING'S BENCH**.

QUEENSBERRY, **WILLIAM DOUGLAS**, fourth Duke of (1724-1810). A British rake and sportsman, known as 'Old Q.' He was notorious for his shameless excesses. As Earl of March he was Vice-Admiral of Scotland from 1767 to 1776, and inherited the title of Duke, with a large fortune, in 1778. He is chiefly remembered through the poems written in his dishonor by Burns and Wordsworth. In Thackeray's *Virginians* he appears as the Earl of March.

QUEENSBERRY PLOT. A supposed Jacobite plot in Scotland in 1703, revealed, it was claimed, through the relations of the Duke of Queensberry with the notorious Lord Lovat (q.v.).

QUEENSBERRY, **JOHN SHOLTO DOUGLAS**, Marquis of (1844-1900). An English patron of sport. He succeeded his father as marquis in 1858, served in the army from 1859 to 1864, and was a representative peer for Scotland from 1872 to 1880. He became best known as a patron of sparring. He was one of the founders of the Amateur Athletic Club in 1860, and in 1867 took part in drawing up the rules bearing the name of 'Queensberry rules.' See **PUGILISM**.

QUEEN'S COLLEGE. A college at Cambridge, England. It was founded in 1448 by Queen Margaret of Anjou, consort of Henry VI., replacing a foundation called the College of Saint Bernard, established two years earlier by her husband. The new foundation was known as Queen's College of Saint Margaret and Saint Bernard, but was refounded by Elizabeth Woodville, consort of Edward IV., under its present name. The site was given by Richard Andrew of Cambridge, and the endowment chiefly gathered by the first master, Andrew Docket. Recently the college has had an enrollment of about eighty undergraduates and it presents to eight livings. The buildings, which preserve their early character, are among the most interesting in the university. The library contains about 30,000 volumes. Queens'

was the residence of Erasmus during his stay in Cambridge.

QUEEN'S COLLEGE. A college at Oxford, England. It was founded in 1340-41 by Robert de Eglesfield, chaplain to Philippa, Queen of Edward III., for a provost and twelve scholars, in imitation of Christ and the Apostles. Poverty was enjoined; the college was very ecclesiastical in its tone, the fellows being required to be in holy orders, and, as a charity, twelve poor boys were supported out of its revenues. The positions in the college were practically confined to the North Country, of which the founder was a native. Under the new statutes of 1882, the college has a provost, from fourteen to sixteen fellows, about twenty-five scholars, and two Bible clerks. There are actually, however, thirty-five scholars, and twenty exhibitioners, besides a number of honorary fellows and lecturers, and college officials. The buildings date from the late seventeenth century, the hall by Sir Christopher Wren and the library, with about 60,000 volumes, being especially noteworthy. Various quaint customs prevail in the college, particularly the ceremony of the boar's head at Christmas, and the New Year's custom of presenting each of the fellows with a needle, and admonishing him to thrift. Among the distinguished members of the college have been John Wielif (probably), Edward the Black Prince, Henry V., Addison, Wycherley, Jeremy Bentham, Mitford, and Jeffrey.

QUEEN'S COLLEGE. An institution of higher education, situated at Belfast, Ireland. It was founded in 1845 and constituted part of the Queen's University in Ireland until the passage of the University Education Act in 1879. In 1902 it had an attendance of 349, with a teaching staff of 22 professors, offering courses in the liberal arts, medicine and law. The library contained about 55,450 volumes.

QUEEN'S COLLEGE. An institution of higher education situated at Galway, Ireland. It was founded in 1845, together with the colleges at Cork and Belfast as a part of Queen's University, but became independent in 1850. It gives instruction in law, medicine, and the liberal arts.

QUEEN'S COLLEGE. An institution of higher education, situated at Cork, Ireland. It was founded in 1845, forming a part of Queen's University until 1879, together with Queen's College in Belfast and Queen's College in Galway. It offers courses in the liberal arts and medicine.

QUEEN'S COUNSEL. See KING'S COUNSEL.

QUEEN'S COUNTY. A southeastern inland county of Leinster, Ireland, bounded north by King's County, east by Kildare and Carlow, south by Kilkenny, and west by Tipperary and King's County (Map: Ireland, D 4). Area, 664 square miles. The Barrow is the chief river. On the northwestern border lie the Slieve Bloom Mountains, and the Dysart Hills occupy the southeast, the rest of the surface being flat or gently undulating. Dairy farming is the principal industry. Coarse linen and cotton cloths are manufactured in small quantities, and coal is mined. The capital is Maryborough. Population, in 1841, 154,000; in 1851, 111,700; in 1891, 63,855; in 1901, 57,225.

QUEENSLAND. A State of Australia, occupying the northeastern part of the continent. It is bounded on the north by the Gulf of Carpentaria and Torres Strait, on the east by the Pacific Ocean, on the south by New South Wales, and on the west by South Australia (Map: Australia, G 3). Its extreme length from north to south is 1260 miles, its extreme breadth 940 miles, and its area is estimated at 668,497 square miles, or nearly one-fifth of the area of the United States.

Queensland has a coastline of 2230 miles. Its eastern coast, from Point Danger to Cape York, the northern extremity of York Peninsula, is indented with numerous small bays, affording several good harbors, such as Moreton Bay, the harbor of Brisbane. This coast is lined, at a distance away of 20 to 150 miles, by an immense coral reef called the Great Barrier Reef, which is about 1000 miles long and incloses a broad sheet of quiet water filled with numerous islands. The Great Dividing Range, which runs along the entire eastern coast of the continent, here recedes farther from the sea than in the two southern States. But it sends out a number of spurs, and divides into parallel coast ranges, so that the whole eastern part of the State for 300 miles from the coast is rugged and mountainous, the ranges having an average elevation of 2000 to 3000 feet, with a maximum height of 5400 feet. The western half is an undulating plain traversed in its north central part by a western spur of the Great Divide. There are four principal drainage systems: first, the rivers flowing eastward to the Pacific Ocean, which, though short, are navigable tidal streams for considerable distances; second, those flowing through the plain southward to the Darling; third, those flowing north to the Gulf of Carpentaria; and fourth, those flowing westward and losing themselves in the great central plains of the continent. Queensland is better watered than any of the other States.

Though lying to a great extent within the tropics, Queensland enjoys a comparatively equable climate. The mean annual temperature in the southeastern part is 69°, and even in the arid western plains the temperature seldom rises above 95°. The rainfall is very unevenly distributed. On the east coast it ranges from 50 inches at Brisbane to 100 and even 150 inches farther north. It decreases very rapidly toward the interior, being generally less than 20 inches west of the mountains, and falling to 6 inches in the extreme west. The rainfall throughout the State is very uncertain.

The great western plains have a rich black soil, but are generally treeless, though covered with grass and shrubs. The valleys along the coast are filled with thick deposits of alluvial soil of great fertility, and here we find a luxuriant tropical forest growth. Though the predominant species are Australian types, such as Eucalyptus and Acacia, the flora of Queensland differs from that of the other States in having a large admixture of Indian, Malayan, and Polynesian types, notably among the cycads and palms. Here grow the screw-pines (*Pandanus*) and the Araucarias, while the coasts and tidal streams are lined with mangrove thickets. The fauna, on the other hand, is typically Australian.

The great western plains are Cretaceous, partly consisting of the series known as Desert sandstone. It incloses a large area of metamorphic rocks in the northwest, and disappears under the Tertiary strata fringing the shores of the Gulf of Carpentaria. The eastern mountain belt consists very largely of granites and igneous rocks, with extensive volcanic areas of more or less recent origin. The granite ranges are flanked by large areas of Paleozoic rocks, chiefly Devonian and Carboniferous. There are extensive coal beds in the State, both in the Carboniferous and in the Cretaceous strata of the west. Auriferous quartz veins are also scattered through the mountain region, and lodes of silver, copper, mercury, bismuth, antimony, tin, and cobalt are also found.

The mineral resources, especially its gold, have contributed much to the development of Queensland. The total gold production to the end of 1900 was £50,209,783. Since 1889 the annual output has not fallen below two million pounds in value. The highest figure reached, £2,871,700, was in 1900. The output of tin, formerly an important source of income, has been much reduced during recent years, the value having been estimated at £74,041 in 1900. The value of the copper output fluctuates greatly. In 1900 it was £23,040. The value of silver lead in the same year was £12,712, which was several times less than was common a decade earlier. The value of the coal output increased steadily from £24,573 in 1880 to £157,071 in 1890, and after a subsequent decrease, stood in 1900 at £173,705.

General agricultural interests are not yet extensively developed. The vast region west of the mountains is too arid to admit of successful farming. Along the coast, however, the rainfall and the soil favor the growth of a very great variety of products both temperate and tropical. The area under crops increased from 242,629 acres in 1891 to 457,397 in 1900-01, not including grass and fallow lands. The most extensively grown crop in the latter year was corn, to which 127,974 acres were devoted. Wheat is grown in the southeast, there being, in 1900-01, 42,497 acres. In the same year there were 42,497 acres in hay, 11,060 acres in Irish potatoes, and 3584 in sweet potatoes. By far the most important crop is sugar-cane, the area devoted to which increased from 50,922 acres in 1890 to 108,535 in 1900-01. The rich lands at the mouths of the numerous streams are well adapted to sugar culture. Formerly the plantation system prevailed, the labor being done by Kanakas brought into the country for this work. There has been much objection to the introduction of colored labor, and under Government aid a system is developing which it is thought will dispense with the necessity for such immigration. The Government aids a combination of small farmers to erect mills which are operated upon the coöperative plan. A great variety of fruits are successfully grown. In 1900 there were 2019 acres in grapevines. Bananas, pineapples, and oranges are extensively produced along the coast.

Queensland is still largely a pastoral country. Much of the region west of the mountains is adaptable to pastoral industries, though too dry for farming, and the sheep are mainly found in that part. The number of sheep increased from 6,935,967 in 1800 to 21,708,310 in 1892, but de-

creased since that year to 10,330,185 in 1900. This decrease was attributed to drought. In many places the drought of late has been effectually guarded against by the boring of Artesian wells, and occasionally by damming streams and other means. Queensland has more than twice as many cattle as any other Australian State. The number increased from 3,162,752 in 1880 to 7,012,997 in 1894, since which time it has decreased to 4,078,191 in 1900. The introduction of improved methods of caring for meat—freezing, preserving, etc.—makes possible larger shipments of meat products, and increases the profit accruing in stock-raising. Dairy farming is beginning to receive much attention, and many coöperative creameries have been established in the southern part of the country. In 1900 there were 456,788 horses and 122,187 hogs in the State.

Queensland has a variety of industries such as the manufacture of flour, sugar, butter and cheese, brewing and distilling, meat-packing, tanning, and the sawing of lumber. In 1899, 28,883 hands were employed in the various branches of manufacturing.

In the external trade the imports increased from £5,066,700 in 1890 to £7,184,112 in 1900, but decreased in the following year. The exports gained from £8,554,512 in 1890 to £11,942,858 in 1899, but declined in the two subsequent years. The most valuable items of export are gold, wool, frozen meat, sugar, hides and skins, preserved and salted meats, and tallow. The largest imports are textiles and clothing, metal and metal goods.

In December, 1901, there were 2801 miles of railroads, mostly in the hands of the Government. Up to that time the Government had expended £20,139,023 in the construction of them. Three lines—one in the south, one in the centre, and one farther north—extend westward into the interior, but there is no connecting line between these. The postal service and the telegraph lines are in the hands of the Government.

The Governor is appointed by the British Crown. He has an Executive Council of 9 members, 8 of whom hold portfolios. There is a Parliament of two Houses—the Legislative Council and the Legislative Assembly. The members of the former are nominated by the Crown for life, and in 1902 numbered 39. The 72 members of the popular House are elected for three years. There is universal male suffrage. After a residence of 6 months certain classes of property-holders are allowed to vote in any district in which their property is located. Queensland sends 9 members to the Australian House of Representatives.

The ownership of public utilities on the part of the State has incurred heavy debt and a large annual revenue and expenditure. The debt in 1900 was £35,898,414. In the fiscal year 1900-01 the revenue and receipts amounted to £4,327,345. Of this, £1,117,472 were collected from taxation, mainly customs, and duties on bank notes, probate and succession duties, and other stamp duties. The land revenue brought in £585,229, the largest item being 'pastoral occupation.' The income-earning public works, chiefly railways and tramways, had a gross income of £1,481,608. The working expense of the railways was £1,056,132. The largest item of expenditure—the charges upon the public debt—

was £1,415,180. The total expenditure was £4,855,533.

The population increased from 28,056 in 1860 to 391,080 in 1890, and 503,266 in 1901. In the latter year there were 280,092 males and 223,174 females. The excess of immigration over emigration has become very small in recent years. The white inhabitants are mainly from the United Kingdom. The aborigines number 3862 males and 2808 females, not including those who live in camps. The population is confined largely to the coast region, and is most numerous in the south. Brisbane is the capital.

In 1901 there were 185,023 adherents of the Church of England; 120,663, of the Church of Rome; 57,615 Presbyterians; 29,791 Wesleyans; 25,505 Lutherans. The Mohammedans and Pagans numbered 19,124. There is no State Church. Education is compulsory between the ages of six and twelve years, but in some parts it is not enforced. Primary education is free and unsectarian. In 1901 it was estimated that 98 per cent. of the adult white population could read and write. The expenditure of the State for education in 1901 was £299,866.

With the early history of Queensland are associated the Spaniard Torres, whose name is perpetuated in the strait separating that land from New Guinea, and that of the explorer Cook, who, in 1770, coasted from Moreton Bay to Torres Strait and made a chart of the coast. The explorations of Lieutenant Flinders, in 1799, opened the way for the settlement of the Moreton Bay district, but his work seems to have been neglected, until Queensland was practically rediscovered by Oxley in 1823. In 1826 a penal settlement was established on Moreton Bay and the Brisbane River, but the convicts were soon removed and subsequent attempts to introduce a criminal population into the country failed before the strong opposition of the free inhabitants. The country was admirably adapted for grazing and drew a large immigration from the southern settlements, the population, in May, 1859, when Queensland was set off as a separate colony, being about 25,000, mostly squatters. Brisbane and Ipswich were the only towns of importance. A severe financial panic in 1866 was followed by the discovery of gold in the years 1867-72, the mining interests henceforth playing a prominent part in the shaping of public policy. The importation of coolies for work on the sugar plantations led to many conflicts in Parliament. The importation of Kanaka labor was forbidden in 1890, but was resumed two years later, owing to the alarming condition into which the sugar industry had fallen. The Labor Party exercised an important influence on affairs after 1890, though its power was not as fully developed as in the more southern colonies. In the winter of 1899 Queensland ratified the Constitution for the new Australian Commonwealth. See AUSTRALIAN FEDERATION.

1896-98); Roth, *Ethnological Studies Among the Northwest Central Queensland Aborigines*, contains bibliography (ib., 1897); Jack and Etheridge, *The Geology and Palaeontology of Queensland and New Guinea* (ib., 1892); *Year Book of Queensland* (ib., annually).

QUEEN'S METAL. A silver-like alloy resembling pewter. It is made by fusing tin, 9 parts, and antimony, bismuth, and lead, each 1 part; or tin 100 parts, antimony 8 parts, copper 4 parts, and bismuth 1 part. It has been largely used in the manufacture of teapots and similar articles for domestic use.

QUEEN'S (or KING'S) TOBACCO PIPE. The popular nickname of a peculiarly shaped kiln or furnace in the northeast corner of the tobacco warehouses belonging to the London docks, in which contraband goods, such as tobacco, cigars, tea, which had been smuggled, and books were burned. Damaged and worthless goods are still burned, but seized and unclaimed goods are now sold generally at the periodical 'customs sales,' or distributed among public institutions.

QUEENSTOWN, formerly COVE OF CORK. A seaport town on the south side of Great Island in Cork Harbor, Ireland, 18 miles east-southeast of Cork (Map: Ireland, C 5). It is important as the port of call of the American mail steamers. The town is built amphitheatrically in parallel streets on the sides of a steep acclivity. During the winter it is much frequented by invalids, owing to its mild and healthful climate. A fine Roman Catholic cathedral, 100 feet high, surmounted by a tower 230 feet high, is a conspicuous building. The famous yacht club, the Royal Cork, is the oldest in the world. The Cove of Cork became important during the Napoleonic wars as the port of embarkation for troops going on foreign service, and is now an admiral's station. In honor of Queen Victoria's visit in 1849 the name was changed to Queenstown. Population, in 1901, 7909.

QUEENSTOWN. A town and railway station, capital of the district of the same name, in Cape Colony, about 100 miles northwest of East London (Map: Cape Colony, L 7). It is the centre of a productive farming region situated in the valley of the Great Kei River. Population, over 4000.

QUEERUMMA'NIA. In Carey's burlesque *Chrononhotonthologos*, the name given to the country over which that King ruled.

QUEIROZ, kã'ê-rôsh', JOSÉ MARIA EÇA DE. See EÇA DE QUEIROZ.

QUELIMANE, k'ê'lê-mã'nã. A town of Portuguese East Africa. See QUILIMANE.

QUELLINUS, ARTUS (1609-68). A Dutch sculptor, born in Antwerp. He was the pupil of Duquesnoy in Rome. His principal works were the decoration of the façade of the new Town Hall in Amsterdam, begun in 1648, and the numerous statues he executed inside the building. His decorative groups are robust and imaginative, but the interior sculptures, such as the Caryatide, are more severe in treatment. There are other works by him in the Museum and the churches of Antwerp. His son, ARTUS, was also a sculptor, and assisted his father in several of his undertakings.

QUELPAERT, kwêl'pärt. The name by which the Korean island of Tamra is known to foreigners. It lies about 60 miles south of the mainland in latitude 33° 25' N. and longitude 126° 37' E. (Map: Korea, G 5). It is nearly oval in form, measures 40 by 20 miles, and is covered almost entirely with mountains, which end steeply on the coast, and culminate in Han-ra-san, or Mount Auckland, with a height of 6700 feet and visible far out at sea on account of its whiteness. On its summit are three extinct craters, within each of which is a lake of pure water, whence, according to local legend, issued the first three men of the world. Area, about 780 square miles. Population, about 80,000. The chief industries are agriculture, fishing, straw-plaiting, and the manufacture of the very fine split-bamboo hats which are peculiar to Korea. Quelpaert is also noted for its fine breed of cattle. Its chief town is Chyei Chyu, where the moksä, or governor, resides. The island was first surveyed and mapped by the officers of the British ship *Samarang* in 1843. Consult: Belcher, *Narrative of H. M. S. Samarang* (London, 1848); Hamel, "Narrative of Captivity in Korea," in *Griffith's Korea Without and Within* (New York, 1885).

QUENIULT, kwê'nî-ült' (properly *Kwi-naiult*). A small tribe of Salishan stock (q.v.), formerly claiming the territory upon the river of the same name on the Pacific coast of Washington, where they still hold a reservation. They first entered into Government relations in 1855. They are attached to the Puyallup agency, and in their general habit and present condition closely resemble the Puyallup (q.v.). They have greatly declined and number only 130. The Quaitso, a sub-tribe, number about 60 more.

QUENSTEDT, kwên'stêt, FRIEDRICH AUGUST (1809-89). A German mineralogist and geologist. He was born at Eisleben, studied at Berlin, and in 1837 became professor of geology and mineralogy at Tübingen. In geology Quenstedt made a special study of the sedimentary formations in Swabia, the basis of modern knowledge of the Jurassic system. His great contribution in mineralogy was in applying the analytic method to the study of crystalline systems. He published: *Methode der Kristallographie* (1840); *Handbuch der Mineralogie* (1854; 3d ed. 1877); and *Grundriss der bestimmenden und rechnenden Kristallographie* (1873).

QUENTAL, kân-täl', ANTHERO DE (1842-91). A Portuguese poet, born at Ponta-Delgada, on the island of San Miguel. He studied law at the University of Coimbra, and early began to write verse. As a poet he belongs to the Romanticists, and is perhaps the most individual of the 'Young Portuguese' school. He also wrote critical and philosophical articles, like his poetry, deeply pessimistic in tone. His works include a collection of sonnets (1863); *Beatriz* (1864); *Odes modernas* (1865), reprinted with additions (1875); *Primaveras romanticas* (1872); *Sonetos* (1881); *Os sonetos completos* (1886); and the critical and philosophical *Bom-sensoe e bom-gosto* (1865); *A dignidade das letras* (1865); *Considerações sobre a filosofia da historia litteraria portugueza* (1872); and *A poesia na actualidade* (1881). Consult Björkman, *Anthero de Quental* (Upsala, 1894).

QUENTEL, kwên'täl, HEINRICH (?-1501). A German printer, of Cologne. He was born in Strassburg, and about 1478, having married in Cologne, there established a press near the great Cathedral, whence the place-mark *prope summum* in his books. The earliest dated work from Quentel's press is *Fratrie Astecani Opus de Casibus Conscientia* (1479). But it seems probable that the earliest Low German version of the Scriptures, which is usually reckoned as printed about 1470, is from Quentel's types, and possibly from his press. The business for some time after Heinrich's death still bore his name, several books having the imprint *In Officina Pelicis Memorie Henrici Quentell*. His two sons carried it on until 1520, when Peter became sole owner. His chief publication was a map of the city of Cologne (1531).

QUENTIN DURWARD, kwên'tin dūr'wërd. A novel by Sir Walter Scott (1823). The scene is France in the time of Louis XI., where the hero goes to seek his fortune. Having gained the King's favor by saving him from a boar, Durward is sent to conduct two great ladies to the Bishop of Liège, and succeeds in spite of treachery on the part of Louis. The Bishop is murdered in an attack, but Durward and Isabella escape and are married. The treacherous and superstitious King is admirably portrayed.

QUÉRARD, ká'rär', JOSEPH MARIE (1791-1865). A French bibliographer, born in Rennes. He worked in a bookseller's shop in his native town as a youth, and went to Paris in 1822. The next two years he spent in the printing and bookselling business in Vienna, and then returned to Paris to begin the publication of *La France littéraire ou Dictionnaire bibliographique, etc.* (1827-42; 2 vols. of sup. 1854-64). This work is an invaluable bibliography of eighteenth-century French authors. *La littérature française contemporaine* (1842-57) is a continuation of it. Through Guizot, Quérard obtained a small pension which enabled him to continue his study and writing, and he was helped by the bibliographer Poltoratzky, but he died in poverty. Quérard's other works include: *Les auteurs déguisés de la littérature française au XIXe siècle* (1845); *Les supercherries littéraires dévoilées* . . . (1846-54); *Omissions et bévues* . . . (1848), and *Les écrivains pseudonymes, etc.* (1854-56). He also began a great *Encyclopédie du bibliothécaire*, and published *Le Quérard Archives d'histoire littéraire de biographie et de bibliographie françaises, etc.* (1855-56).

QUER/CETA'NUS. See DUCHESNE, ANDRÉ.

QUERCIA, kwär'chä, JACOPO DELLA. See JACOPO DELLA QUERCIA.

QUERO/CITRON (from Lat. *quercus*, oak + *citrus*, citron). The name both of a dyestuff and of the species of oak of which it is the bark. This oak (*Quercus tinctoria*), also called dyer's oak, is a native of North America—one of the noblest forest trees of the United States, found in New England, and as far south as Georgia, although there only at a considerable elevation. The wood is reddish, coarse-grained, and porous, but much esteemed for strength and durability, and is used in America for ship-building. The bark is used for tanning as well as for dyeing. It is the inner bark which is the quercitron

of dyers. It yields a yellow crystallizable substance, *quercitrin*, $C_{28}H_{38}O_{20} + 3H_2O$, which may be extracted by means of alcohol; the tannic acid, which is simultaneously taken up, must be precipitated by the addition of gelatin, after which the liquid will, on evaporation, yield crystals of quercitrin. On the addition of alum, its solution assumes a beautiful yellow color. When boiled with dilute acids, quercitrin breaks up into glucose and *quercetin*, $C_{24}H_{36}O_{11} + 3H_2O$ —a yellow crystalline substance, soluble in alkaline solutions, to which it communicates a golden-yellow color. It is brought into commerce under the name of *flavin*. The decomposition shows that quercitrin belongs to the glucosides, or compounds which, when broken up, yield sugar.

QUERCUS. The generic name for oak (q.v.).

QUERÉTARO, ká-rá'tá-rò. An inland State of Mexico, bounded by the State of San Luis Potosí on the north, Hidalgo and Mexico on the east, Michoacán on the south, and Guanajuato on the west (Map: Mexico, J 7). Area, 3,556 square miles. Querétaro belongs geographically to the Plateau of Anahuac (q.v.), is traversed by mountain ranges in the northern part, while in the south plains and valleys prevail. The State is watered by a number of small rivers, and the climate is temperate, with moderate frost and rainfall. The valleys are very fertile, and the chief agricultural products are cereals and sugar. The mineral wealth is considerable and mining is carried on to some extent. The most famous opal mines in Mexico are located here. There are also some manufactures of cotton and woolen goods. The province is traversed by the Mexican Central Railway. Population, in 1895, 224,848; in 1900, 228,489. Capital, Querétaro.

QUERÉTARO. The capital of the State of Querétaro, Mexico, situated on an elevated plateau 110 miles northwest of the City of Mexico, on the Mexican Central Railroad (Map: Mexico, J 7). It is a pleasant and well-built city, and has several fine avenues leading to the beautiful parks which surround it. There are two large squares, on one of which stands the city hall, and on the other the cathedral. Other notable buildings are the Government palace, built of basalt, the custom house, several fine churches and hospitals, the elegant and historic Iturbide Theatre, and the bull ring. There is a good water supply brought by an aqueduct of 74 arches and 80 feet high. The city is an important industrial centre, and contains some of the largest cotton mills in the country. Population, in 1895, 34,567.

Querétaro is one of the most historic cities of the Republic. It was here that the movement for independence began. It was the last place of refuge of Maximilian, and he and his two generals were executed here in 1867.

QUESADA, ká-sá'dá, GONZALO XIMENEZ DE. See XIMENEZ DE QUESADA.

QUESNAY, ká'ná', FRANÇOIS (1694-1774). A French economist, born at Méré. He first distinguished himself as a surgeon and physician. His *Observations sur les effets de la saignée* (1730), in which he successfully opposed the theories of bleeding of the leading contemporary authority, led to his selection as secretary of the Academy of Sur-

gery at Paris. Defective eyesight compelled him to abandon surgery for medicine. In 1749 he became physician to Madame de Pompadour, and he was appointed physician to the King in 1752. This position gave him leisure for philosophical and economic study, and in 1756 he published in the *Encyclopédie* articles on "Fermiers" and "Grains," in which he correctly analyzed the deficiencies of French agriculture, and advocated the adoption of capitalistic methods in farming and the abolition of the vexatious taxes and restrictions which were impoverishing French agriculture. In these articles Quesnay advanced the doctrine that the sole source of national wealth is the surplus of agriculture, the *produit net*. (See PHYSIOCRATS.) In 1758 he published his *Tableau économique*, a work which disappeared in the early nineteenth century, but was found in 1890, and reproduced in facsimile at London in 1894. Its purpose was to make intelligible at a glance the dependence of a nation's wealth upon the *produit net*. Quesnay published several minor economic works, which, however, added nothing to the doctrines of the *Tableau*. His chief influence upon economic thought was exercised through his disciples, who formed the sect afterwards known as the 'Physiocrats' (q.v.). Quesnay's works were collected and published in 1768 by Dupont de Nemours, under the title of *Physiocratie*. Consult: Higgs, *The Physiocrats* (London, 1897); Oncken, *Œuvres économiques et philosophiques de Quesnay* (Frankfort, 1888).

QUESNAY DE BEAUREPAIRE, de bô'r'-pâr', JULES (1838—). A French jurist and author, born at Saumur. He became especially conspicuous during the Boulanger and Dreyfus affairs, and was president of the courts of cassation before which Dreyfus was tried in 1889 and 1899. His publications, some of them under the pseudonym of Jules de Glouvet, include *Histoires du vieux temps* (1882); *Les forestier* (1880); *Le marinier* (1881); *Le berger* (1882); and *L'idéal* (1883).

QUESNEL, ká'nél'. PASQUIER (1634-1719). A French Jansenist theologian. He was born in Paris, July 14, 1634, and having been educated in the Sorbonne, entered the Congregation of the Oratory (q.v.) in 1657. At the age of twenty-eight he was appointed director of the Paris house of his congregation. It was for the use of the young men under his charge that he commenced the series of his afterwards celebrated *Réflexions morales* on the New Testament. Soon afterwards he published an edition of the works of Saint Leo (1675), much criticised by reason of its Gallicanism, and in 1676 put among the prohibited works by the Pope. His residence at Paris, however, was cut short by the disputes about Jansenism. Having refused to sign certain propositions, subscription to which was, by a decree of 1684, required of all members of the Oratory, Quesnel left the congregation and retired to Brussels, where he attached himself to the party of Arnauld, the Jansenists, in which he speedily rose to the first position of influence and authority. He continued his *Réflexions morales* while living there in concealment; and in 1693-94 they were published in a complete form, with the approval of Cardinal de Noailles, Bishop of Châlons, and ultimately Archbishop of Paris. The work, however, on examination, was

found to contain all the most obnoxious doctrines of Jansenius; and Quesnel, having been denounced to the authorities, was arrested by order of Philip V. and put into prison. He escaped to Amsterdam, where he died December 21, 1719. But his book was condemned, first by the decree of an assembly of the bishops of France, afterwards by a decision of Clement XI. in 1711, and finally by the celebrated bull *Unigenitus*. See JANSENISM.

QUETELET, kô'tlâ', LAMBERT ADOLPHE JACQUES (1796-1874). A Belgian statistician and astronomer, born at Ghent. He studied at the lycœum of his native city, where in 1814 he became professor of mathematics. In 1819 he was appointed to the same chair at the Brussels Athenæum; and in 1826 was chosen by William I. to superintend the construction of the royal observatory in the capital, of which he became director in 1828. In 1836 he was made professor of astronomy and geodesy at the Brussels Military School. His numerous and valuable writings include: *Astronomie élémentaire* (1826; 4th ed. 1848); *Recherches sur la population*, etc. (1827-32); *Sur l'homme et le développement de ses facultés ou essai de physique sociale* (1835); *Du système sociale et des lois qui le régissent* (1848); and *Physique* (1855). He also published numerous papers on meteorology, astronomy, terrestrial magnetism, etc., in the *Mémoires* and *Bulletins* of the Belgian Royal Academy.

QUETTA, kwët'tâ. The chief town of British Baluchistan, 104 miles north of Khelat. It is situated among high mountains in a position of great strategic importance, commanding the Khojok and Bolan passes (Map: India, A 2). There are extensive fortifications, with a strong garrison and an arsenal. The town is connected by rail with the railway system of India and is the centre of considerable trade. Quetta has grown rapidly since 1876, when a residency was established by Sir Robert Sandeman. Population, with cantonment, in 1891, 18,802; in 1901, 24,584.

QUETZAL (Nahuatl *quetzalli*, green feather). A celebrated trogon (*Pharomacrus mocinno*) of Central America, adopted as the national bird or symbol of Guatemala, because in ancient times it was regarded with veneration and its decorative feathers were reserved for chiefs of the native tribes. It inhabits the higher districts of Guatemala and Southern Mexico, and has the general habits of the trogons (q.v.). It clings to trees and scrambles about like a woodpecker, as its feet are ill-adapted to walking; and its utterance is described as two sibilant, plaintive notes, gradually swelling into a loud, discordant cry. Its upper plumage is brilliant, iridescent green, golden on the crested head and bluish on the soft tail-coverts, the two central ones of which are elongated to from 28 to 30 inches, or about four times the length of the true tail, the outer feathers of which are white barred with black. The wing-coverts are also enlarged into plumes draped over the upper parts of the wing, and all the under parts below the breast are blood-red. (See Plate of TROGON, HOOPOE, ETC.) This magnificent creature has the further value of having its colors 'fast,' that is, their brilliance does not fade after death, as is usual with such plumage; and this fact, together with the bird's beauty and

grace, have made it so desirable for millinery trimmings that the quetzal is now very rare. The female is less brilliant and lacks the long plumes covering the tail and wings of her mate.

QUETZALCOATL, kôts'âl-kô-ät'l. The traditional beneficent hero King of the Aztecs (q.v.) and the originator of their earliest culture. The meaning of the name is disputed, but the most probable interpretation seems to be 'the admirable twin,' although it may have reference to one adorned with the green plumes of the sacred quetzal (q.v.). In what seems to be the oldest form of the myth, he is represented as a god, one of four brothers born at the same time, sons of the supreme creator. Two of these play no further part in legend, while the other, the maleficent but powerful Tezcatlipoca, whose name seems to have the mystic significance of 'the smoking mirror,' remained to become the great evil-working rival of his brother, who finally, after a long series of creations and destructions, gave up the contest for a time and disappeared in a mysterious manner, but with a promise to return on some recurrence of his natal year, known in the Aztec calendar as *Ce Acatl*, the year of the 'one reed.' Four cycles of 676 years had passed, each terminating in widespread calamity and destruction by flood, fire, storm, or earthquake. The near approach of the fifth and final doom was to be foreshadowed by the return of Quetzalcoatl in some unknown future year of the *Ce Acatl*.

According to the more popular form of the tradition, Quetzalcoatl was an early king of mysterious and miraculous birth, the son of a virgin mother, who reigned at the ancient city of Tollan or Tula, about 40 miles north of the present City of Mexico. He was entirely unlike his people in appearance, being of fair skin, with a long white beard and flowing garments also of white and embroidered with the figure of the cross in red. He was mild and dignified in manner, took no wife, and founded convents of nuns devoted to the worship of the temple and vowed to chastity. He preached universal peace and brotherhood, and under his rule war became a thing unknown. He taught his subjects, known from their chief city as the Toltecs, the arts of agriculture, metal-working, and architecture, and devised for them the calendar. At last by the evil wiles of Tezcatlipoca he was deprived of all his dignities at one blow. He made no resistance, telling his people that it was only the necessary accomplishment of a predestined fate, and that he must leave them to go to the home of his father, Tlapallan, the 'Red Land' in the southeast, but that he would return to them in some far future year of *Ce Acatl*. He started on his long journey, halting twenty years at Cholula, where he taught all his mysteries to the people, who thus became the priests of the Aztec religion, and their city with its great temple pyramid the Mecca of the Aztec Empire. Arrived at the seashore, he sailed on a raft of twisting serpents out into the sunrise.

While this second version has been widely accepted as clouded history, disguised by poetic additions and lapse of time, and various writers have tried to identify the kingly teacher with Saint Thomas, Saint Brendan, or some other early Christian apostle, others have seen in it only another form of the universal myth of day

and night, in which Quetzalcoatl is the god of light and sunshine, his rival the god of night and darkness, Tula or Tollan a syncopation for *Tonatlan*, the 'Sun Place,' and Tlapallan, the 'Red Land,' the eastern horizon. This theory is probably true in the main, but does not preclude the possibility, which is quite in accord with Indian custom, that some early Aztec king bore the same name and in time became invested in popular tradition with the attributes of the god.

By one of the most extraordinary coincidences in history, the year 1519, in which Cortés landed, was the Mexican year of *Ce Acatl*. As the year drew near upon the calendar wheel, three blazing comets swept across the sky, the waters of the lake rose without apparent cause, and a strange light appeared in the east. Montezuma was troubled with presentiments for his empire, and sent for the priests, who gave him only the boding prophecy that some great calamity was at hand. When the news came to him that the white strangers had landed from the east he said, "This is Quetzalcoatl returned to Tula," and on his first interview with Cortés the Indian King addressed him as their lost ruler. See also AZTEC; MEXICO; NAHUATLAN STOCK; TOLTEC.

QUEUE ROUGE, kē rōōzh (Fr., red-tail). A name given in the French West Indies, and also in Jamaica, to a spider of the genus *Latrodectus*, which is very poisonous and occasionally causes the death of human beings. See KATIPO; MALMIGNATTE.

QUEVEDO Y VILLEGAS, kē-vā'pō è vè-lyá'-gás, FRANCISCO DE (1580-1645). A Spanish author. He was born in Madrid, studied at Alcalá de Henares, and became versed in theology, law, Hebrew, Greek, Arabic, and Latin, as well as in modern languages. Although a cripple and defective in eyesight, he figured in many duels, in one of which he mortally wounded a nobleman and had to flee the country in 1611. Soon, however, he was employed in connection with certain diplomatic missions, and when the Duke of Osuna was put at the head of the Administration at Naples, Quevedo was made Minister of Finance under him. Osuna fell in 1620 and Quevedo shared in his misfortunes, being imprisoned for a good part of the next three years. Later he held a nominal appointment as secretary to King Philip IV. In 1639, suspected of having written some satiric verses attacking the extravagance of the King and his Ministers, he was arrested and spirited off to the monastery of Saint Mark in Leon, where he was kept for four years. At the fall of Olivarez, the Prime Minister responsible for this last imprisonment, he was again set free, but his health was now undermined, and he died at Villanueva de los Infantes, September 8, 1645. A moralizing tone prevailed in his earlier prose works, but it is as a satirist that he best showed his powers, especially in the picaresque novel *Historia y vida del Buscón* (also called *El gran Tacaño*), published in 1626, and in his series of *Sueños* (Visions). The former work is excessively coarse, yet one of the most important of the Spanish romances of roguery. At the outset Quevedo was a sturdy opponent of the Gongoristic movement that did so much to vitiate Spanish style, but he yielded to the all-pervading power of Góngora's school and allowed bombast, obscurity, and strained conceit to enter into his own verse and prose. His verse shows no slight

influence of Italian poetry, but in general it is marked by a satiric spirit that goes directly back to Juvenal. His prose writings are to be found in the *Biblioteca de autores españoles*, vols. xxiii. and xlvi.: for his verse, see vol. lxix. Consult Mérimée, *Essai sur la vie et les œuvres de Quevedo* (Paris, 1886).

QUEZALTENANGO, ká-säl'tá-nán'gò. A city of Guatemala, capital of the department of the same name. It is situated on a plateau 7700 feet above sea level and 70 miles west of Guatemala city (Map: Central America, B 3). The town is built on the slopes of a steep ridge which divides it into two portions. There are several well-built public buildings situated on the principal plaza, such as the city hall and the penitentiary, the latter being a fine stone building. The town has a good water-supply and a healthful climate. It is the second city of the Republic in size and importance. It manufactures cotton and woolen fabrics, and has a considerable trade in agricultural products. Population, about 30,000. Quezaltenango was an ancient Indian city, and was settled by the Spaniards in 1524.

QUIANGAN, kē'áng-án', or **KIANGAN**. A head-hunting people in Quiangan Province, Luzon. See PHILIPPINE ISLANDS.

QUIA TIMET. A phrase used in law to designate certain remedies of an equitable nature to prevent anticipated injury. There were formerly six writs which could be sued out *quia timet* before actual injury had occurred, which were as expressed by Lord Coke: "First a man may have his writ or mesne before he be distrained. Second, a *warrantio chartæ*, before he is impleaded. Third, a *monstraverunt*, before any distress or vexation. Fourth, an *audita querela*, before any execution issued. Fifth, a *curia claudenda*, before any default of inclosure. Sixth, a *ne injuste vexes*, before any distress or molestation. These writs, which were formerly of much importance and use, are now obsolete; but the same end is attained by filing a bill *quia timet* in equity. Consult the authorities referred to under EQUITY; PLEADING.

QUIBDO, kēb'dó. A town of the Department of Cauca, Colombia, situated on the Atrato River, 30 miles from the Pacific coast and 90 miles southwest of Medellín (Map: Colombia, B 2). The town is built on piles and the houses are generally of poor construction. The surrounding district was formerly mined extensively for gold. Population, 7,000. Quibdo was the capital of the ancient Province of Choco.

QUIBERON, kē'b'rôn'. A small fishing town and sea-bathing resort in the Department of Morbihan, France, at the extremity of a long narrow peninsula forming the western horn of the Bay of Quiberon, 22 miles south-southeast of Lorient (Map: France, C 4). Population, in 1901, 3,299. Near the neck of the peninsula are the famous megalithic monuments of Carnac. In 1746, during the War of the Austrian Succession, an English force attempted a landing here, but was severely repulsed. In 1759 Admiral Hawke completely defeated a French fleet under Admiral Conflans in Quiberon Bay. A body of French emigrant royalists, under D'Hervilly and Puisaye, landed here from an English fleet in 1795, and endeavored to rouse the people of Brittany and La Vendée against the Convention, but were de-

feated and driven back to their ships by General Hoche, all the prisoners taken being shot by order of the Convention.

QUICHÉ, kè-chá', or **KICHÉ**. An ancient civilized nation of Mayan stock (q.v.) occupying Western Guatemala, with centres at Santa Cruz, Quiché, and Totonicapan, and speaking a dialectic form of the language spoken by the Cakchiquel (q.v.). Their chronicles are said to date back to the beginning of the eighth century. Their national culture hero was Xbalanque, who, like Quetzaleatl (q.v.), was born of a virgin mother, and whose deeds are recorded chiefly in their sacred book, the *Po'ol Vuh* (q.v.). Their culture was that common to most of the tribes of the Mayan stock. Their modern descendants still form a considerable part of the population of Central and Western Guatemala.

QUICHUA, kè-ehwá', **QUICHUA**, **QUECHUA**, or **KECHUA**. The founders and ruling tribe of the great aboriginal empire of Peru. According to Peruvian tradition their empire was established by Manco Capac, the youngest of the four sons of the great creator god Viracocha (q.v.), anthropomorphized as the Sun, who, coming from Paucartambo, 'the House of the Dawn,' journeyed southward to the valley where he gathered his people about him and built the city of Cuzco (q.v.), 'The Navel,' so called because it was destined to become the centre and capital of the empire. His successors, the chiefs of the Inca clan, popularly regarded as 'Children of the Sun,' extended their dominions by slow conquest in every direction, including tribes both cognate and alien, civilized and wild, until under the Inca Yupanqui, about the year 1460, it reached from the present Colombian frontier southward to about Santiago, Chile, and from the coast inland across and beyond the Andes. For centuries after the conquest of Peru by Pizarro (q.v.) the natives cherished the hope of a restoration of their empire, and as late as 1781 Condorcanqui, a descendant of the ancient ruling family, proclaimed himself the reincarnation of the lost Inca Tupac Amaru, gathered an immense Indian army, marched upon Cuzco, and for two years held at bay the whole power of Spain, until at last he was taken and condemned, with all his family, to torture and death. The descendants of the ancient stock still constitute the bulk of the population throughout Peru.

QUICHUAN STOCK. A linguistic group of which the Quichua (q.v.) are the most noted representatives, and including most of the ancient or existing tribes along the Pacific coast and in the Andes region of South America from about 2° N. on the southern border of Colombia, to about 32° S. in the neighborhood of Valparaiso, Chile. Within this general area, however, are the Yuna, Aymara, Puquina, and Atacameño, all of alien lineage, but confined to limited territorial districts. The boundaries of the linguistic stock nearly coincide with those of the ancient Peruvian Empire, but include also a few wild tribes, as the Malaba of Northern Ecuador, never brought under subjection to the Inca rule or civilization. So far as any linguistic evidence can show, the line of migration appears to have been from north to south. The Quito of Ecuador maintained an independent kingdom under nineteen successive

rulers, according to their own tradition, until finally subjugated by the Incas. In physical type all the tribes of this stock are of low stature, heavy build, and very strong. With the exception of the few wild border tribes, they were all sharers in the same general culture that prevailed throughout the ancient empire, although in some cases, as with the Quito, this appears to have been of indigenous growth before the consolidation of the empire. The colonizing policy of the Incas tended to reduce the various cognate languages to one dialectic standard, the Quichua proper, which is still the prevailing language of Peru and Ecuador outside of the large cities. The present number of persons belonging to the Quichuan stock is probably not far from three million. Consult: Tschudi, *Die Kechua-Sprache* (Vienna, 1853); id., *Organismus der Khetzu-Sprache* (Leipzig, 1884); Middendorf, *Die einheimischen Sprachen Perus* (6 vols., ib., 1890-92); Spilsbury, *Lingua indigenas de Sud-américa, el Quichua* (Buenos Ayres, 1898).

QUICK, JOHN (1748-1831). An English comic actor, born in Whitechapel, London. He went on the stage when he was fourteen. His most famous rôles were Tony Lumpkin in *She Stoops to Conquer* (1773) and Bob Acres in *The Rivals* (1775). He retired in 1798. Quick was short in stature, quaint and whimsical, excellent in original parts and in old comedies, too, and especially famous for his personation of old men. As the First Gravedigger, Dromio of Ephesus, Spado, and Launce, he was one of the best actors of his time.

QUICK, ROBERT HERBERT (1831-91). An English educator, born in London. He graduated at Cambridge in 1854 and was ordained the following year. Afterwards he was an assistant to Dr. Merriman at Cranley and assistant master at Harrow; and he was the first to lecture at Cambridge on the history of education (1881). His *Essays on Educational Reformers* (1868; 2d enlarged edition 1890) is a valuable work. He also wrote the article on Fröbel in the ninth edition of the *Encyclopædia Britannica*, and edited Locke's *Some Thoughts Concerning Education* (1880), and reprinted with notes Mulcaster's *Positions* (1888).

QUICK-FIRING GUNS. See RAPID-FIRE GUNS; MACHINE GUNS; ARTILLERY.

QUICKSAND. A loose sand into which solid bodies readily sink. Quicksands are composed of water-worn and rounded particles which under ordinary pressure do not pack together and when moistened behave like a fluid. Any heavy object placed upon the surface is quickly swallowed up, leaving no trace behind; thus at Pueblo, Colorado, in 1875 a locomotive and train sank out of sight after being derailed and could not be located, although probed for to a depth of 50 feet. In conducting mining and engineering operations it is sometimes necessary to freeze the quicksand by sinking pipes at intervals, which are then used for circulating brines or other liquids at low temperature.

QUICKSILVER. See MERCURY.

QUIDOR, JOHN (1800-81). An American figure painter, born in Gloucester County, N. J. In 1826 he removed to New York City, where he studied under Jarvis and Inman. Afterwards he lived for a time on a farm near Quincy, Ill.,

but returned to New York City in 1851, and there established himself in a studio on Pearl Street, as an artist and teacher. His most notable pupil was Charles Loring Elliott (q.v.). Quidor exhibited at the Academy and seems to have held a dignified position among his fellow artists, although much of his work was done for the panels of stage coaches and fire engines. He was a personal friend of Washington Irving, whose *Knickerbocker History of New York* gave him the subjects for the following paintings, all of which are in the Museum of the Brooklyn (N. Y.) Institute of Arts and Sciences: "Dancing on the Battery" (c.1860), "Rip Van Winkle Reaches the Gnomes in the Catskill Mountains" (1861), "Ichabod Crane Pursued by the Headless Horseman" (1862), "Peter Stuyvesant's Wall Street Gate" (1864), "Voyage of the Good Oloff Up the Hudson" (1866), and "The Voyage from Communipaw to Hell Gate" (1866). The most remarkable of these illustrations, "The Dance on the Battery," shows much imagination, a Monticelli-like handling of color, and a genius for composition. Quidor also painted religious subjects, such as "Jesus Blessing the Sick." His work was usually on a large scale.

QUIDS. In American political history, the name applied to a faction of the Republican Party, led by John Randolph (q.v.), which during the years 1805-11 opposed on many points the great majority of the party, led by Jefferson and Madison. Randolph's following in Congress at this time was never considerable. The faction contended against the enactment of the Embargo, and endeavored to prevent the nomination of Madison in 1808. The name 'Quid' is said by some to have been taken from the phrase *tertium quid*, applied to Randolph and his supporters in allusion to their being unidentified with either of the then dominant parties; by others it is said to have been given to the faction in allusion to its having been cast out from the Republican Party.

QUIETISM (Neo-Lat. *quietista*, from Lat. *quies*, quiet, rest). A name applied to the tenets of a somewhat numerous class of mystical sects, who, in different ages and from the earliest Christian times, have held that the most perfect state of the soul is one of quiet in which it ceases to reason, or to reflect either upon itself or upon God, and, in a word, to exercise any of its faculties, its sole function being passively to receive the infused heavenly light which, according to the view of the Quietists, accompanies this state of inactive contemplation. The earliest sects of this kind in Christian history are the Eucharites or Messalines of the fourth century, the Hesychasts among the Greek monks of Mount Athos in the sixth century, and in the West the followers of Scotus Erigena, who in the ninth century taught a form of theosophy with Quietistic tendencies. Besides these there are the Beghards in the twelfth century, the followers of Master Eckhart in the thirteenth and fourteenth centuries, the Brethren of the Free Spirit, and later the Illuminati in Spain.

Not all those called by the common name of Quietists at various times have held the same doctrine. Indeed, there has been a decided difference of opinion between different sects; and some sects called by other names have held Quiet-

ist doctrines. The Quakers, for instance, with so curiously opposite a name, hold the doctrine of infusion of divine light in quiet. The common tendency of the sects consists in making perfection here on earth depend on a state of uninterrupted contemplation during which the soul remains quiet or passive under the influence of God's spirit without forming the ordinary acts of faith, hope, love, etc., without desiring heaven nor fearing hell. Most of these doctrines are of a purely speculative character and involve but little of practical consequence, whether for good or for evil. But from the belief of the lofty and perfect nature of the purely passive state of contemplation there is but a step to the fatal principle in morals that in this sublime state of contemplation all external things become indifferent to the soul, which is thus absorbed in God; so complete is the self-absorption, so independent is the soul of corporeal sense, that the most criminal representations and movements of the sensitive part of the soul and even the external actions of the body fail to affect the contemplating soul or to impress it with their debasing influence. This led to gross immorality in writing at all times, and sometimes to immorality of act. See FÉNELON; HESYCHASTS; BRETHREN OF THE FREE SPIRIT; MOLINOS; MYSTICISM.

QUILIMANE, kē'lé-má'ná. A port in Portuguese East Africa, situated on the River Quilimane, about 6 miles inland (Map: Congo Free State, G 6). It lies in a low unhealthy region, but has a good harbor. Its commerce amounted in 1900 to nearly \$1,000,000. The population is estimated at 7000.

QUILL (LGer. *quiele*, *kiel*, MHG. *kil*, Ger. *Kiel*, quill). One of the large feathers of the wings and tails of birds, remiges and rectrices. (See FEATHER.) Their hollow tubes, properly cleared of all oily or fatty matter and dried, are used as receptacles for gold-dust and various purposes, but chiefly as writing pens, all of which were made from feathers until comparatively recently. Those plucked from geese were most generally used, but swan and turkey quills were not uncommon; and for very fine writing, and for pen-and-ink drawing, crow-quills were preferred to all others. At one time the collection and preparation of quills formed a very large and important branch of commerce; but the introduction of metallic pens has reduced it to very small limits, and few if any quill pens are made in the United States. The conventional representation of a pen as a 'quill pen,' and such words as 'quill-driver' and 'penknife,' are relics of the custom.

QUILLAYUTE, kil'lá-yoot'. A small tribe formerly occupying a portion of the coast southward from Cape Flattery, Washington, and now gathered upon a small reservation of one mile square near the village of their name, in the same vicinity. Together with the Hoh, on another small reservation about twenty miles farther down the coast, and the recently extinct Chemacum of Port Townsend on Puget Sound, they constitute a distinct linguistic group which has been designated the Chimakuan stock. They made their first treaty with the Government in 1855. Like the neighboring Makaw (q.v.), they are entirely seafaring. The three tribes live on fish. The women make baskets and curios for

sale, and some of the Indians sell a few head of cattle during the year. Consumption is always present among them and every year is the cause of several deaths. The Quillayute have a school, but no missionary work has ever been attempted among either them or the Hoh. In 1889 the two tribes numbered respectively 252 and 71. In 1901 they had decreased to 234 and 66.

QUILLBACK, See SKIMBACK.

QUILLER-COUCH, *kwēch*, ARTHUR THOMAS (1863—). An English author. He was born in Cornwall, November 21, 1863, and educated at Clifton and at Trinity College, Oxford, where he remained for two years as classical lecturer after taking his degree. Then he removed to London and devoted himself to literary work. He was one of the original staff of *The Speaker*, and retained his connection with it until 1899, though after 1891 he resided chiefly in his native county of Cornwall, whose scenery, traditions, and characters he has faithfully depicted in most of his books. These include: *Dead Man's Rock* (1887); *Troy Town* (1888); *The Splendid Spur* (1889); *The Delectable Duchy* (1893); *Wandering Heath* (1895); *Ia* (1896); *The Ship of Stars* (1899); *Old Fires and Profitable Ghosts* (1900); *The Adventures of Harry Rerel* (1903). In all of these a vivid and dramatic imagination, free from any touch of morbidity, is shown. This quality, together with his mastery of style, led to his being selected after Stevenson's death to complete the latter's unfinished novel *Saint Ives*. Quiller-Couch, who is widely known by his pseudonym of 'Q,' has also edited two excellent anthologies of English verse, and published some of his own, both serious and playful, as well as a volume of reviews under the title *Adventures in Criticism* (1896).

QUILLIAM, WILLIAM HENRY ABDULLAH (1856—). An English writer on Mohammedanism, born in Liverpool, and educated at the Liverpool Institute and at King William's College, Isle of Man. He became a solicitor in 1878, went to Morocco in 1884, and became a Mohammedan convert in the next year. Afterwards he traveled in Morocco, Turkey, and Persia, and in 1895 received the title Sheik-ul-Islam of the British Isles from the Ameer of Afghanistan. He wrote a few novels and *Faith of Islam* (1887), *Fanatics and Fanaticism* (1888), *Religion of the Sword* (1889), *Moscs, Christ, and Mohammed* (1897), and *Studies in Islam* (1898).

QUILLINAN, EDWARD (1791-1851). A British poet, born at Oporto, in Portugal. Educated at a Roman Catholic school in England, he returned to Portugal and took a position, against his inclination, in his father's counting-house. On the French invasion (1807) the family fled to England. Edward entered the army, and served for some time in the Peninsular War. Retiring from the army (1821), he settled in the Lake District near Wordsworth, whose daughter Dorothy he married. He died at Ambleside. Quillinan wrote a good deal of mediocre verse and one novel. His last years were given to a translation of the *Lusiad* of Camões, which was never completed. His wife, DOROTHY QUILLINAN (1804-1847), was author of a charming book of travel entitled *A Journal of a Few Months' Residence in Portugal and Glimpses of the South of Spain* (1847).

QUILLOTA, *kél-yō'tá*. A town in the Province of Valparaiso, Chile, situated in a pleasant plain on the Aconcagua River, 20 miles northeast of Valparaiso, and on the railroad between that city and Santiago (Map: Chile, C 10). It is the centre of a copper-mining district. Population, about 12,000.

QUILOA, *ké-ló'á*. A seaport town of German East Africa. See KILWA KIVINJE.

QUILP. A repulsive and malicious dwarf in Dickens's *Old Curiosity Shop*, who delighted in tormenting his pretty, timid little wife, Betsy. He called himself a ship-breaker, dealing in old iron and wood on Tower Hill, and at last drowned himself when about to be arrested for felony.

QUIL'TER, HARRY (1851—). An English artist and author, born at Lower Norwood, in Surrey, January 24, 1851. Educated at Trinity College, Cambridge, he subsequently studied art at Bruges and in Italy. In 1878 he was called to the bar at the Inner Temple. Between 1876 and 1888 he was on the staff of several London periodicals. He founded and conducted for two years (1888-90) the *Universal Review*. Among his published books are *Giotto* (1880), *Sententia Artis* (1886), *Preferences in Art, Life, and Literature* (1882), and *Is Marriage a Failure?* (1888). With his wife's help he brought out, at Christmas, 1898, an edition of Browning's *Pied Piper of Hamelin* with beautiful type and border designs.

QUIMPER, *kān'pār'* (Breton *kemper*, confluence). The capital of the Department of Finistère, France, picturesquely situated at the confluence of the Steir and the Odet, about 35 miles south-southeast of Brest (Map: France, B 3). The Cathedral of Saint Corentin, a stately and richly ornamented Gothic edifice commenced in 1424, is the principal building. The eleventh-century Church of Loemaria and the sixteenth-century Church of Saint Mathieu are interesting. The educational institutions include a lyceum, public library, and museum. Potteries, tan-yards, breweries, and paper factories are the chief industrial establishments, and a coasting trade and sardine-fishing are actively carried on. Quimper was the ancient capital of Cornouailles. Population, in 1901, 19,441.

QUIMPERLÉ, *kān'pār'lá'*. The capital of an arrondissement in the Department of Finistère, France, on the Laita, 12 miles northwest of Lorient (Map: France, C 4). Its chief buildings are the fourteenth-century Church of Saint Michel, and the Church of Sainte Croix, modeled after the Holy Sepulchre at Jerusalem. It has fisheries and carries on a coasting trade. Population, in 1901, 9036.

QUIN, JAMES (1693-1766). A celebrated actor of Irish descent, born in London. He made his first appearance on the stage about 1714 at Dublin as Abel in *The Committee*. Shortly after he proceeded to London, where he was engaged at Drury Lane, but for quite inferior parts. In 1716, however, the sudden illness of a leading actor led to Quin's being called on to sustain the character of Bajazet in *Tamerlane*. His success was marked. Next year he went to Lincoln's Inn Fields, where he remained as a principal actor for fourteen years. Among his best parts were Captain Macheath in the *Beggars' Opera*, Falstaff in the *Merry Wives of Windsor*, and Sir

John Brute in *The Provoked Wife*. In 1734-35 he returned to Drury Lane, and until the appearance of Garrick in 1741 he was, by universal consent, the first actor in England. In 1751 he withdrew from the stage as a regular actor and made his home at Bath, where he died. There is an unreliable *Life of Mr. James Quin, Comedian, With the History of the Stage from His Commencing Actor to His Retreat to Bath*, etc. (London, 1766; reprinted ib., 1887). Consult also Doran, *Annals of the Stage* (ed. Lowe, London, 1888); Cibber's *Apology* (ed. Belchambers, London, 1822); Davies, *Life of Garrick* (London, 1780).

QUINAULT, ké'nó', PHILIPPE (1635-88). A French librettist and dramatist, born in Paris, June 3, 1635. He wrote lyric tragedy, for which the music was furnished by Lulli. Quinault was precocious, his first play having been produced in 1653, and his earliest comedies are among his best: *Les rivaux*; *L'amant indiscret* (1654); *Le fantôme amoureux* (1659); *La mère coquette* (1665). His tragedies and tragi-comedies are slight. *Psyché*, the first of his lyric dramas (1671), was written in collaboration with Molière and Corneille. After this he devoted himself almost entirely to libretto-work, remarkable for its ingenious artistry. In this kind his masterpieces are *Amadis* (1684), *Roland* (1685), and, best of all, *Armide* (1686). In 1687 Lulli died and Quinault began to write on the *Destruction of Heresy*, a poem which he did not live to complete. His works were edited in 5 vols. (1739 and 1778); *Selected Works* (1824-42). Consult Fournel, *Les contemporains de Molière* (3 vols., Paris, 1863-75).

QUINCE (variant of obsolete Eng. *quine*, from OF. *coïn*, Fr. *coign*, quince, from Lat. *cydonium*, from Gk. *κυδώνιον*, *kydōnion*, quince, Cydonian, sc. *μήλον*, *mēlon*, apple, from *Κυδωνία*, *Kydōnía*, *Κυδωνίς*, *Kydōnis*, Cydonia, an ancient city of Crete); *Prunus Cydonia*. A shrub or small

than 2000 years, it has developed few varieties. It is chiefly employed as a preserve, for jellies, and for flavorings in other fruit preparations. Certain varieties, notably the Angiers, are extensively employed as a stock for dwarfing pears. The quince is propagated by cuttings or mound layers. It thrives best on strong, rententive, well-drained soil. The trees are set 15 feet apart each way, given clean culture, and headed in sufficiently to hold the leading branches in check and to thin the fruits, which, since they ripen late, should not be gathered until after early frosts. They must be as carefully handled as pears. The most extensive and profitable orchards in the United States are located in western New York. Consult Meech, *Quince Culture* (New York, 1896).

QUINCE CURCULIO. The larva of a weevil, as *Conotrachelus nenuphar*, which attacks the quince and related trees. Its habits and treatment are the same as specified under PEAR INSECTS.

QUINCE INSECTS. The quince is attacked by many of the insects which have the general habit of feeding upon rosaceous plants, and especially very many of those forms which are found upon pears and apples, although it is rather less susceptible than either of these fruits. The quince scale (*Aspidiotus cydonia*) is found upon the quince tree in the Southern United States. It is grayish in color, somewhat resembling the San José scale, but is more transparent and is very convex in form. The quince curculio (*Conotrachelus crategi*) is a species closely related to the plum curculio, although differing in general appearance. It is a broad-shouldered snout-beetle, larger than the plum curculio and having a longer snout. It is ash-gray in color, mottled with ochre and whitish, and with a dusky subtriangular spot at the base of the thorax above. It is indigenous to the United States, and appears in the month of June,

puncturing the young fruit, and making a cylindrical hole in which the egg is placed. The egg hatches in a few days, and the larva burrows in the fruit near the surface. It becomes full-grown in a month and falls to the ground, burying itself to a depth of from two to three inches, remaining there through the winter, and transforming to pupa early in May. The pupa stage is short, and the adult beetle emerges almost as soon as the fruit is set. The adult also feeds upon the quince, burying itself completely in the pulp of the fruit. It occasionally attacks the pear.

Among the caterpillars which feed upon quinces the bag-worm (q.v.) is perhaps the most destructive.

QUINCKE, GEORG HERMANN (1834-). A German physicist, born in Frankfort-on-the-Oder. He received the degree of doctor of philosophy in 1858 in the University of Berlin, after having studied at this university and also at Königsberg and Heidelberg. He became privat-docent at the

QUINCE.

crooked tree of the order Rosaceæ, closely related to the apple and pear, which it resembles in leaf, flower, and fruit, but with solitary terminal flowers on the present season's growth. Since the quince cannot be eaten raw, it has a restricted use, and although cultivated for more

University of Berlin in 1859, was appointed professor at the University of Würzburg in 1872, and was called to Heidelberg in 1875 as professor of physics. His doctor's dissertation was on the subject of the capillary constant of Mercury, and his investigations of all capillary phenomena are classical. He also did important work in the experimental study of the reflection of light, especially from metallic surfaces, and carried on prolonged researches on the subject of the influence of electric forces upon the constants of different forms of matter. His contributions to physics and other fields of science are numerous.

QUINCY. A city and the county-seat of Adams County, Ill., 265 miles southwest of Chicago; on the Mississippi River, here spanned by a splendid railway bridge, and on the Wabash, the Chicago, Burlington and Quincy, and the Quincy, Omaha and Kansas City railroads (Map: Illinois, A 4). It is regularly laid out on an elevated bluff. It is the seat of Saint Francis Solanus College (Roman Catholic), opened in 1860; and has a boys' industrial school (Methodist Episcopal), formerly known as Chaddock College, and Saint Mary's Institute (Roman Catholic), besides commercial schools. Other institutions comprise a Conservatory of Music, Saint Mary's and Blessing hospitals, and several homes for the aged and orphans. The public library contains more than 23,000 volumes. The fine buildings of the State Soldiers' and Sailors' Home, the Federal Government building, the court house, and the city hall are among the architectural features of the town. In the public park system of about 107 acres are South Park, Riverside, Washington, Madison, Indian Mounds, and Primrose parks.

Quincy is admirably equipped with transportation facilities for an industrial and commercial centre. It carries on an active trade, and its industries, according to the census of 1900, represented an aggregate capital of \$6,880,000, with a production valued at \$9,235,000. The more important establishments include stove foundries, machine shops, breweries, show-case works, manufactories of incubators, brick-making plants, carriage factories, lime works, clothing factories, flouring mills, a meat-packing establishment, governor and engine works, plow and hay-press works, canning factories, and manufactories of sawed lumber, egg cases, buttons, brass castings, wire fence, etc. The government is vested in a mayor, elected every two years, and a unicameral council, and in administrative officials, many of whom are named by the mayor. Quincy spends annually in maintenance and operation about \$275,000, the principal items of expense being: For schools, \$83,000; for interest on debt, \$49,000; for the fire department, \$28,000; for the police department, \$21,000; and for municipal lighting, \$20,000. Population, in 1890, 31,494; in 1900, 36,252. Settled in 1822 and laid out three years later, Quincy was incorporated as a town in 1834 and in 1839 was chartered as a city. Consult: Redmond, *History of Quincy* (Quincy, 1869).

QUINCY. A city, including within the municipal limits several villages, in Norfolk County, Mass., adjoining Boston on the south; on Quincy Bay, between the Neponset River on the north

and Fore River on the south; and on the New York, New Haven and Hartford Railroad (Map: Massachusetts, E 3). Its area is more than 16 square miles, 2,530 acres of which are in public parks, the most prominent being Merrymount and Faxon. Quincy has the Thomas Crane Public Library with 20,000 volumes, Adams Academy and Woodward Institute, the latter for girls, and a city hospital. There are many points of historic interest in this vicinity; and here was constructed in 1826-27 the first railroad in New England, built for carrying granite and operated by horses. Quincy is primarily a residential suburb of Boston, but has extensive granite quarrying and cutting interests, a large ship-building plant, and rivet and stud works. The government, under a revised charter of 1900, is vested in a mayor annually elected, and a unicameral council. The mayor controls appointments of the heads of all departments, excepting that of the school committee. Other administrative officers are elected by the council, or confirmed by that body upon nomination of the mayor. The school committee is chosen by popular vote. The water supply of Quincy is furnished through the system of the metropolitan district. Population, in 1890, 16,723; in 1900, 23,899.

Settled in 1625 as Mount Wollaston, Quincy is one of the oldest permanent settlements in Massachusetts. About 1629 Thomas Morton (q.v.) gained control and established his famous "New English Canaan," Merrymount. Becoming obnoxious to the Puritans at Boston because of his encouragement of Maypoles and other reprehensible 'idolls,' because of "his great licentiousness of life in all profaneness," he was captured by Miles Standish and shipped off to England. Until 1792, when it was incorporated under its present name in honor of John Quincy, the settlement formed part of Braintree. It was chartered as a city in 1888. It was the birthplace of John Hancock, John Adams, and John Quincy Adams, the two last being buried here under the old 'Stone Temple.' Consult: an address by Adams, *The Centennial Milestone* (Cambridge, 1892); Pattee, *A History of Old Braintree and Quincy* (Quincy, 1878); Hurd, *History of Norfolk County* (Philadelphia, 1884); Wilson, *Where American Independence Was Born* (Boston, 1902); and Adams, *Three Episodes of Massachusetts History* (Boston, 1892).

QUINCY, EDMUND (1808-77). An American author and reformer, prominent as an abolitionist during the anti-slavery struggle. He was born in Boston, and graduated at Harvard in 1827. After the killing of Elijah P. Lovejoy (q.v.) by a mob at Alton, Ill., in 1837, he became an ardent abolitionist of the radical or Garrisonian school, frequently spoke in public, was secretary, for some years, of the American Anti-Slavery Society coöperated with Garrison and Mrs. Chapman in issuing the *Non-Resistant*, a short-lived anti-slavery paper, and wrote many articles and pamphlets in favor of abolitionism. He wrote a novel, *Wensley, A Story Without a Moral* (1854); an excellent *Life of Josiah Quincy* (1867); and *The Haunted Adjutant and Other Stories* (published posthumously, 1885); and edited *Speeches Delivered in the Congress of the United States* (1874).

QUINCY, JOSIAH (1744-75). An American patriot, born in Boston, Mass., February 23, 1744.

He graduated at Harvard in 1763; read law with Oxenbridge Thacher, and was admitted to the bar, rising to a high rank in his profession. He denounced the Stamp Act through the press and at public meetings in Boston, and took strong ground against the exactions of Parliament. In 1770 he and John Adams conducted, in the face of an excited popular feeling, the defense of British soldiers implicated in the Boston massacre; and in the same year he prepared the address of the merchants of Boston on the non-importation agreement, and also wrote a number of essays for the *Boston Gazette*. Both in 1770 and in 1772 he drafted the instructions of the town of Boston to its representatives in the Legislature, and throughout 1771 and 1772 he was a frequent contributor to the *Gazette*, chiefly under the signatures 'Mentor' and 'Marchmont Nedham.' During all these years he maintained a large practice, though finally his health failed, and in 1773 he went to Charleston, S. C., taking advantage of his journey to enter into relations with the Patriot leaders in the Southern and Middle States, and to arrange for a system of communication between them and the leaders of the same party in Massachusetts. In May, 1774, appeared his *Observations on the Boston Port Bill*, which clearly indicated war as the only means of settling the disputes between Great Britain and the colonists, and intimated that independence must be the result. In September of the same year he went to England as the agent of the Patriot Party and there lived on friendly terms with Barré, the Earl of Shelburne, Priestley, and other friends of the colonies, and had interviews with Lords Dartmouth and North. He sailed for home in the spring of 1775, but died on the voyage, April 26th. His *Life* was written by his son Josiah (2d ed., Boston, 1874); and his *Reports of the Supreme Court of Massachusetts Bay, 1761-72*, edited by his great-grand-son, Samuel M. Quincy, appeared in 1865.

QUINCY, JOSIAH (1772-1864). An American lawyer, orator, and man of letters, son of Josiah Quincy (1744-75). He was born in Boston; graduated at Harvard in 1790; studied law, and took an active interest in politics as a leading member of the extreme wing of the Federalist Party in New England. He was a member of the State Senate in 1804, and in 1805 entered Congress, where he became distinguished as a ready, earnest, and fervent orator, in opposition to the policy of Jefferson and Madison. He was one of the earliest to denounce slavery in Congress, and declared in a notable speech of June 4, 1811, that the purchase of Louisiana was a sufficient cause for the dissolution of the Union. This was the first announcement on the floor of Congress of the doctrine of secession. He opposed the war with England with the same fervor. Disgusted with the triumph of the Republican Party and its advocacy of the War of 1812, he declined a reelection to Congress, and devoted his attention largely to scientific agriculture. He became, however, Speaker of the Massachusetts House of Representatives in 1821, a member of the Senate in the following year, and also judge of the municipal court of Boston. In 1823 he was elected mayor of Boston, his administration being signalized by many notable municipal reforms. In 1829 he accepted the presidency of Harvard College, which he held until 1845, intro-

ducing many improvements and reforms in the administration. Among his published works are a memoir of his father (1825); *History of Harvard University* (1840); *The Municipal History of the Town and City of Boston* (1852); and *Life of John Quincy Adams* (1858).

QUINCY, JOSIAH (1802-82). An American administrator, born in Boston, Massachusetts, son of Josiah Quincy (1772-1864). He graduated at Harvard in 1821, and was admitted to the bar. He became a member of the Boston city council in 1833, and was its president from 1834 to 1837. In 1842 he was president of the Massachusetts Senate, and from 1845 to 1849 was Mayor of Boston. By his efforts and during his mayoralty the Cohituate aqueduct was completed, the police force was reorganized, and a large tract of public marshland near the South Bay was filled in, graded, and sold. A volume of extracts from his diaries, *Figures of the Past*, was published in 1883.

QUINCY, JOSIAH (1859-). An American politician, son of the preceding, born in Quincy, Mass. He was admitted to the bar, but never practiced. He was a member of the Massachusetts Legislature for four years, and in 1893 served as Assistant Secretary of State for six months. From 1895 to 1899 he was Mayor of Boston.

QUINCY, KĀN'sĕ', QUATREMÈRE DE. See QUATREMÈRE DE QUINCY.

QUINET, kĕ'nĀ', EDGAR (1803-75). A French poet, publicist, and historian of literature, born at Bourg, February 17, 1803. He was educated for the army, but refusing a soldier's life, he published at twenty his justification in *Les tablettes du juif errant* (1823). His next work was a translation of Herder's *Ideen zur Philosophie der Geschichte der Menschheit* (1827), to which he prefixed an introduction that won him the friendship of Cousin and Michelet. After travel in Germany, Italy, and England, he was sent by the French Institute to Greece (1829) and wrote *La Grèce moderne* (1830). He now began to contribute political essays to the newly founded *Revue des Deux Mondes* and recurred to the legend of the Wandering Jew in *Ahasvérus* (1833). This was followed by the less successful poems, *Napoléon* (1835) and *Prométhée* (1838). His *Examen de la vie de Jésus* is a philosophy of religion as the substance of humanity and the apotheosis of personality in answer to Strauss's *Leben Jesu*. His *Génie des religions* (1842) brought him a call to the Collège de France, where he roused great enthusiasm by lectures on the Jesuits, Ultramontanism, and Christianity in relation to the French Revolution. At this period Quinet's partisanship began to bias his historical judgment. Michelet shared in his attack on the Jesuits, which was silenced by the Government in 1846. Quinet took an active part in the Revolution of 1848, sought to unmask Napoleon, and was banished (1852). At Brussels he wrote *Les esclaves* (1853) and *La révolution religieuse au XI^{ème} siècle* (1857). Removing to Vevytau, on the Lake of Geneva, he published *Merlin l'enchanteur* (1860), the autobiographical *Histoire de mes idées* (1860), and *Histoire de la campagne de 1815* (1862) and *La révolution* (1865), both tracing national disaster to a disregard of

righteousness. The fall of Napoleon III. brought him back to Paris. He was active during the siege and in the National Assemblies at Bordeaux and Versailles. During this period he wrote *La création* (1870), *La république* (1872), and *L'esprit nouveau* (1874). His *Mémoires d'exil* were published in 1870 and *Le livre de l'exilé* posthumously with two volumes of letters in 1877 and four others (1884-86). Quinet's complete works are in 26 vols. (Paris, 1877-79). Consult: Chassin, *Edgar Quinet: sa vie, ses œuvres* (Paris, 1859); *Edgar Quinet depuis l'exil*, by his wife (ib., 1889); Heath, *Edgar Quinet, His Early Life and Writings* (London, 1881); Dowden, *Studies in Literature* (ib., 1878); Montégut, *Mélanges critiques* (Paris, 1887).

QUINETTE DE ROCHEMONT, kě'nět' de rôsh'môn', EMILE THÉODORE, Baron (1838—). A French engineer, born in Soissons, and educated at the Ecole Polytechnique and at the Ecole des Ponts et Chaussées. He was appointed engineer-in-chief of the port of Havre in 1883, inspector-general of bridges and roads in the Ministry of Public Works in 1892, and the same year took the chair of maritime works at the Ecole des Ponts et Chaussées. His writings include *Mémoire sur le Clyde, Glasgow, Port Glasgow, et Greenock* (1869), *Notes sur les phares électriques de la Hère* (1870), and books on various European ports.

QUINIC ACID. See KINIC ACID.

QUINIDINE. See QUININE; ALKALOIDS.

QUININE, or **QUININA** (Neo-Lat. *quinina*, from Neo-Lat., Sp., Port., Quichua *quina*, quinine). A white amorphous or crystalline powder with a very bitter taste, alkaline, very faintly soluble in water, but soluble in alcohol, dilute acids, ether, or chloroform, and derived from the bark of *Cinchona calisaya*, *Cinchona rubra*, and other varieties of Peruvian bark. The symbol of quinine is $C_{20}H_{21}N_2O_2 + 3H_2O$. Its dose is from one to forty grains. There are five official salts of quinine. *Quinine sulphate* is the white, crystalline powder commonly called quinine, extremely and persistently bitter, faintly soluble in water (1 in 740 parts), moderately soluble in alcohol, soluble in weak acid. Its symbol is $(C_{20}H_{21}N_2O_2)_2 \cdot H_2SO_4 + 7H_2O$. Its dose is from one to forty grains. *Quinine bisulphate* occurs in clear, colorless crystals or needles, very bitter and with an acid reaction, soluble in water and alcohol. The symbol is $C_{20}H_{21}N_2O_2 \cdot H_2SO_4 + 7H_2O$. Dose, one to forty grains. *Quinine hydrobromate* occurs in colorless needles, bitter, soluble in fifty-four parts of water, freely in alcohol. Symbol, $C_{20}H_{21}N_2O_2 \cdot HBr + H_2O$. Dose, one to twenty grains. *Quinine hydrochlorate* occurs in white needles arranged in tufts, bitter, soluble in thirty-four parts of water, freely soluble in alcohol, and suitable for hypodermic use. Its symbol is $C_{20}H_{21}N_2O_2 \cdot HCl + 2H_2O$, and its dose is from one to ten or twenty grains. *Quinine valerianate* occurs in white pearly crystals with the characteristic repulsive odor of valerian, bitter, soluble in alcohol, and in one hundred parts of water. Its symbol is $C_{20}H_{21}N_2O_2 \cdot C_8H_{10}O_2 + H_2O$; its dose, one to three grains.

Among the unofficial salts of quinine are the carbamide hydrochlorate, the amorphous borate, and equinine (the ethyl carbonate).

Quinine is used in medicine as a bitter tonic,

an antiperiodic, and antipyretic. It has also antiseptic properties. It depresses the heart when given in large doses, and after long-continued use it affects the hearing unfavorably. It is excreted with the urine and occasionally produces renal and vesical irritation. Small doses produce hyperemia of the brain, with a feeling of exhilaration, while large doses cause cerebral congestion with vertigo, staggering, headache, deafness, delirium, and even coma, comprising the condition termed cinchonism.

The principal use of quinine is in malarial affections, in which it reduces the fever, increases the numbers of the white blood-corpuscles, prevents the acetification and decay of the blood, and poisons the plasmodia which cause the disease. In some cases it acts more advantageously when combined with capsicum or with arsenic, or with potassium nitrate. The custom of taking quinine frequently for catarrhal attacks or as a prophylactic is very harmful. Besides the injurious effects upon the hearing, which are positive and permanent, it seriously weakens the heart and renders the system so used to it that the drug becomes useless when required. See MALARIA AND MALARIAL FEVER; INTERMITTENT FEVER; AGUE.

QUINISEXT (from Lat. *quini*, five each + *scxtus*, sixth). The name given in Church history to a council which, being regarded as a sort of supplement of the fifth and sixth general councils, is called by a title which combines both. The fifth general council, held in 553, on the subject of the three chapters, enacted no canons of discipline. In like manner the sixth, held against the Monothelites in 680-81, was confined almost entirely to doctrinal decisions. In order to supply the want, a numerous body of bishops, 211 in number, assembled in 692, in a hall of the Imperial palace at Constantinople, called the Trullus, from which the council is sometimes known as the Trullan Synod. It was a purely Oriental council, and was not approved by the Western Church and the Pope. Its decrees are purely disciplinary, and it is chiefly important for its broad distinction between the legislation of the East and that of the West on the subject of clerical celibacy. The Quinisext Council, while prohibiting the marriage of any one who is in priest's orders, permits a married man to receive after marriage the order of subdeacon, deacon, or priest, but not of bishop (canon three). Against this the Roman pontiffs vigorously protested. Another peculiar canon of this synod (fifty-fifth) prohibits fasting on Saturday, even in Lent.

QUINNAT SALMON (North American Indian name). The principal and typical species (*Oncorhynchus tshawytscha*) of Pacific Coast salmon. (See SALMON.) It is found on both coasts of the North Pacific, southward as far as central California and Northern China, and is especially abundant in the Sacramento and Columbia rivers. Other names are 'king,' 'Chinook,' and 'tyee' salmon.

QUINOA (Quichua name), *Chenopodium Quinoa*. An annual plant, native of Chile and the high tablelands of Mexico, cultivated for its seeds, which as meal form the principal food of the people where it is indigenous. They are sometimes fed to poultry in France and Germany. On account of insect attacks, the plant has proved unsatisfactory at the California Experiment Sta-

tion. It is sometimes cultivated as a substitute for spinach.

QUINOLINE, or **LEUCOLINE**, C_9H_7N . An organic base to which many vegetable alkaloids are chemically more or less closely related. It may be obtained by the distillation of quinine, cinchonine, or similar substances, with caustic potash. It occurs, together with isoquinoline, a substance of the same molecular composition as quinoline, in coal-tar, and in bone-oil, and may be isolated in a somewhat impure state from the fraction distilled over between 236° and 243° C. It is now prepared on a large scale by a purely artificial method, known as Skraup's method. This consists in heating 120 parts of glycerin with 100 parts of strong sulphuric acid, 38 parts of aniline, and 24 parts of nitro-benzene, a somewhat violent reaction soon setting in. After the reaction has subsided, the mixture is kept boiling for several hours, then cooled, diluted with water, and subjected to distillation in a current of steam until the portion of the nitro-benzene that has remained untransformed, is completely removed. The quinoline remains fixed in combination with sulphuric acid, but on adding an excess of soda and again distilling in a current of steam, it passes over almost pure; after drying, it may be further purified by fractional distillation. Three chemical transformations probably take place, in successive order, in this process: First, the action of sulphuric acid on glycerin causes the formation of acrolein, $CH_2:CH.CHO$; next, acrolein combines with aniline, $C_6H_5.NH_2$, yielding acryl-aniline, $C_6H_5.N:CH.CH:CH_2$; finally, by the oxidizing action of nitro-benzene, acryl-aniline loses hydrogen and is converted into quinoline, C_9H_7N . Pure quinoline has a specific gravity 1.095 at 20° C. and boils at 239° C. It is scarcely soluble in water, but dissolves freely in alcohol and in ether. It is a tertiary aromatic base and combines with acids to form crystallizable salts. The peculiar odor of quinoline is characteristic. Quinoline is largely used in the arts, especially in the manufacture of aniline colors. In medicine it is used as an antiseptic and as a substitute for quinine; it has also been found of great value in diphtheria, a weak alcoholic solution of quinoline being applied to the diseased membranes.

The chemical constitution of quinoline is represented by the following graphic scheme:

It may be seen that the molecule of quinoline is composed of two nuclei, the benzene nucleus and the pyridine nucleus. The substance *isoquinoline*, mentioned above, has a much similar constitution and its chemical properties are much the same as those of quinoline itself; its boiling-point is, however, 241° C., i.e. two degrees higher than that of quinoline; besides, at ordinary temperatures it is solid, its melting-point being about 22° C.

QUINONES (from Neo-Lat., Sp. Port., *Quicha quina*, quinine). An interesting group of carbon compounds belonging to the so-called aromatic series. Theoretically the quinones may be defined as benzene derivatives in whose molecules

two oxygen atoms are directly linked to the benzene nucleus. (See CARBON COMPOUNDS.) The simplest member of the group is the substance called *benzoquinone*, which may be readily prepared by the action of potassium bichromate and sulphuric acid on aniline; from the mixture obtained by this reaction, benzoquinone is extracted with ether: the ether is then distilled off, and the residue is purified by sublimation or by recrystallization. Benzoquinone has a peculiar, irritating odor; if pure it melts at 116° C.; its molecular formula is $C_6H_4O_2$, and its chemical constitution is represented by one of the following graphic formulas:

QUINQUARTICULAR CONTROVERSY.

See ARMINIANISM.

QUINQUENNIAL PRESCRIPTION (Lat. *quinquennialis*, from *quinquennis*, of five years, from *quinque*, five + *annus*, year). A period of five years allowed by the law of Scotland within which payment of sums on all bargains concerning movables, arrears of rent in some leases, multures, ministers' stipends, arrestments, must be enforced.

QUINSY (formerly also *quincy*, *squincy*, from OF. *squinancie*, *esquinance*. Fr. *esquinancie*, from Lat. *cynanche*, from Gk. *κυνάγχη*, *kynanche*, sort of sore throat, from *κύων*, *kýōn*, dog + *ἀγχειν*, *anchein*, to choke). An acute inflammation of the loose tissue surrounding the tonsil, terminating usually in suppuration. Quinsy is most prevalent between the ages of fifteen and forty, children and old persons seeming to be exempt. A rheumatic tendency predisposes to the disease. The exciting cause is sudden and unequal exposure of the body to cold or wet. The affection is usually confined to one tonsil, but both may be successive or simultaneously involved. One attack predisposes to others. The disease is ushered in with feelings of chilliness and exhaustion followed by a temperature of 102° or 103° F. These symptoms are accompanied by severe pain in the region of the tonsil. The latter becomes so swollen as to interfere with deglutition. The mouth can only be partly opened and with great pain, and the taking of food, except in liquid form, becomes impossible. The peritonsillar tissues become swollen and painful. The voice is muffled and indistinct, and sleep is almost impossible. Severe cases are marked by an intensity of all these symptoms, successive chills and sweats, delirium at night. Although the disease is acute and painful, it rarely proves fatal. Cases have occurred in which bursting of the abscess into the larynx during sleep produced instant death. The ordinary duration of suppurative tonsillitis is from five to eight days. At the end of this time the abscess bursts, all the symptoms disappear, and prompt recovery ensues. In its early stage the affection may often be cut short or aborted if prompt measures for relief are taken. These consist in rest, free purgation by a saline cathar-

tic, followed by a single large dose of quinine; in addition the application of warmth and the use of antiseptic anodyne and astringent gargles. If the tonsillitis is of rheumatic origin salicylate of soda may be given. When suppuration has become inevitable, hot turpentine stupes or poultices applied over the angle of the jaw will hasten the formation of pus. Even before the first indication of pointing the abscess should be freely incised and the pus evacuated. This procedure is attended with immediate relief. Chronically diseased tonsils should be removed to prevent future attacks.

QUINT, ALONZO HALL (1828-96). An American clergyman and army chaplain, born at Barnstead, N. H. He graduated at Dartmouth in 1846, and at the Andover Theological Seminary in 1852. From 1853 until 1863 he was pastor of the Central Congregational Church at Roxbury, Mass., and from 1855 to 1861 he was a member of the Massachusetts Board of Education. At the outbreak of the Civil War he became chaplain of the Second Massachusetts Volunteers and served with them until 1864. After the war he was pastor in turn of several Congregational churches. He was a vigorous and interesting writer, and published *Army Notes* (1864), and *The Records of the Second Massachusetts Regiment 1861-65* (1867); was editor of the *Congregational Quarterly* and the *Congregational Year-book*, and wrote frequently for religious periodicals. He was an organizer, and for many years was secretary of the National Council of Congregational Churches.

QUINTAIN (OF. *quintaine*, *cuintaine*, from ML. *quintana*, *quintain*, Lat. *quintana*, street in the camp between the fifth and sixth maniples, containing the market and place for exercise, from *quintanus*, fifth, from *quincus*, five), or **QUINTIN**. An instrument used in the ancient practice of tilting on horseback with the lance. It consisted of an upright post, surmounted by a crossbar turning on a pivot, which had at one end a flat board, at the other a bag of sand. The object of the tilter was to strike the board at such speed that the rider was past before the bag of sand, as it whirled round, could hit him on the back.

QUINTANA, KÉN-TI'NÁ, MANUEL JOSÉ (1772-1857). A Spanish author and statesman, born at Madrid. He studied at Salamanca, and became a lawyer in Madrid, where his house was a resort of the advanced Liberals of the time. Among his earliest productions were his patriotic "Odes," which gave him a place in the first rank of Spanish poets. On the outbreak of the War of Spanish Independence he made good use of his lyric gift to stimulate the patriotism of his countrymen. He also acted as secretary of the Cortes and regency, and distinguished himself as editor of the *Seminario Patriótico*, and as author of the manifestos of the insurrectionary juntas, and of most of the official statements of the Cortes. On the restoration of Ferdinand VII. in 1814. Quintana's liberalism caused his imprisonment for six years. Released in 1820, he was received in Madrid with acclamations, and was appointed President of Public Instruction in 1821. In 1833 he was made tutor of the Infanta Isabella and was created a Senator in 1835. He also held office as Director-General of Public Instruction up to

1851. He died at Madrid. Quintana held a high place as a poet, but his fame rests chiefly on his celebrated work *Vidas de Españoles célebres* (3 vols., 1807-34). He also wrote several tragedies, and edited a collection of Castilian poetry. His patriotic odes earned him the name of the "Spanish Tyrtaeus." The most complete edition of his works is that of Gonzales Rojas (Madrid, 1897-98). Consult: Menendez y Pelayo, *D. Manuel-José Quintana*, vol. iii. of the *España del siglo XIX* (Madrid, 1887); and Píneyro, *Manuel José Quintana* (Paris and Madrid, 1892).

QUINTET (It. *quintetto*, from *quinto*, Lat. *quintus*, fifth, from *quincus*, five). A musical composition for five voices, or for five instruments, all the parts of which are *real*. The instruments composing a quintet may be of various kinds, most frequently the regular string quartet with pianoforte. Quintets have also been written for two violins, two violas, cello (Bocherini); for two violins, viola, and two cellos (Schubert op. 163); for two violins, viola, cello, and double bass (Onslow); and for one violin, viola, cello, double-bass, and piano (Schubert, Trout-quintet, op. 114). Often wind instruments are also introduced, as the string quartet with clarinet (Mozart). Mozart has also written a quintet for wind-instruments only (oboe, clarinet, horn, bassoon) with piano. An effective quintet was written by B. O. Klein for voice (soprano), violin, cello, horn, and piano. The music written for a quintet is of the same character as that for a quartet (q.v.), although the form is more difficult.

QUINTILIAN (MARCUS FABIUS QUINTILIANUS) (c.35-c.97 A.D.). A Roman rhetorician, born at Calagurris (the modern Calahorra), in Spain. He attended in Rome the lectures of Domitius Afer, who died in 59. After this date, however, he revisited Spain, whence he returned in 68 to Rome, in the train of Galba, and began to practice as an advocate, in which capacity his reputation became considerable. He was more distinguished, however, as a teacher of elocution than as a practicing orator, and his instruction came to be the most eagerly sought after among all his contemporaries, while among his pupils he numbered Pliny the Younger and the two grand-nephews of Domitian. He was the first public teacher who benefited by the endowment of Vespasian and received a fixed salary from the Imperial exchequer, and as a mark of Imperial favor he was invested with the insignia and title of consul. His professional career as a teacher of eloquence, commencing probably with 69, extended over a period of 20 years, after which he retired into private life, and died probably about 97. The reputation of Quintilian in modern times is based on his great work entitled *De Institutione Oratoria Libri XII.*, a complete system of rhetoric, which he dedicates to his friend Marcellus Victorius, himself a Court favorite and orator of distinction. It was written after he had ceased to be a public teacher, and was the fruit of two years' labor. During its composition, however, he was still, in the lifetime of Domitian, acting as tutor to the grand-nephews of that Emperor. In the first book he discusses the preliminary training through which a youth must pass before he can begin those studies which are requisite for the orator. The second book treats of the first principles of

rhetoric, and contains an inquiry into the essential nature of the art. The subjects of the five following books are invention and arrangement; while those of the eighth, ninth, tenth, and eleventh are composition (embracing the proper use of figures of speech) and delivery. The last, and, in the author's view, the most important, book is devoted to the various requisites for the formation of a finished orator, such as his manners, his moral character, his mode of undertaking, preparing, and conducting causes, the style of eloquence most advantageous to adopt, the age at which pleading should be begun, and at which it should be left off, and other allied topics. The entire work is remarkable for its sound critical judgments, its purity of taste, and the perfect familiarity it exhibits with the literature of oratory. The condensed survey of Greek and Roman literature with which the tenth book commences has always been admired for its correctness and animation. The declamations, amounting to 164, which have been ascribed to him, are now believed to be spurious, as they evidently belong to different authors, and even different epochs. The *Dialogus de Oratoribus* of Tacitus was formerly ascribed to Quintilian. Early editions of Quintilian are those of Gronovius (Leyden, 1665); Burmann (Leyden, 1720); and of Spalding and Zumpt (Leipzig, 1798-1829, containing a lexicon). The best modern editions of the *Institutio Oratoria* are by Hahn (2 vols., Leipzig, 1868-69), Meister (2 vols., Prague, 1886-87), and Bonnell (2 vols., Leipzig, 1896). Book I. alone is edited by Fierville (Paris, 1890); and Book X. by Meister (Leipzig, 1887) and Peterson (Oxford, 1891). The last English translation is by Watson (London, 1856). The *Declamationes* are published by Ritter (Leipzig, 1884).

QUINTUPLET, or **QUINTOLE** (from Lat. *quintus*, fifth + *-plus*, -fold). In music, a group of five notes, formed of a note divided into five instead of its proper complement of four parts, the five notes having collectively the value usually expressed by four such notes. Thus, the five semiquavers of the following group are equivalent in value to a quarter note, or four sixteenth notes:

QUINTUS CURTIUS RU'FUS. A Roman historian. See **CURTIUS**, **QUINTUS**.

QUINTUS ICILI'US. A name given by Frederick the Great to Karl Theophilus Guichard (q.v.).

QUINTUS SMYRNÆ'US (or OF SMYRNA). A Greek epic poet, probably of the close of the fourth century A.D. He wrote in 14 books the *Posthomerica*, which completes the story of the *Iliad*, drawing his material from the cyclic poets, and patterning closely no doubt on the work of Arctinus and Lesches. Quintus is sometimes called 'Calaber,' from the circumstance that a manuscript of his work was discovered at Otranto in Calabria. His poem, which is stiff and frigid, is best edited by Kichly (1850) and Zimmermann (1891).

QUINZE JOYES DE MARIAGE, kânz zhwi de zâ'rè-âh', LES (Fr., The Fifteen Joys of Wedlock). A satire composed, in all likelihood, by Antoine de la Sale (q.v.), and written before 1461. It gets its title and its framework from a prayer then widely known—*Quinze Joies de*

Notre Dame. It is a kind of litany on household worries. Consult the edition by Henekenkamp (Halle, 1901).

QUIR'INAL (Lat. *Collis Quirinalis*). One of the seven hills on which ancient Rome stood. It lies due north of the Palatine, and its western slope looks down on the Campus Martius, which stretches from its base to the banks of the Tiber. It was not included in the early Septimontium, or city of the seven hills, but was part of the city of the four regions, and was of course included in the so-called Servian Wall. The most notable ancient structures on the Quirinal were the temples of Quirinus, Flora, and Salus (safety), and on the plateau from which both Quirinal and Viminal project, near the Colline gate, an ancient shrine of Fortuna. In Imperial times the great *thermæ* (or baths) of Diocletian and Constantine were built on the hill.

The residence of the King of Italy, since 1870, previously a summer residence of the popes, occupies a commanding situation on the Quirinal Hill. It was begun in 1574 by Pope Gregory XIII., and completed under Paul V. The palace is modern in its arrangements and decoration. It contains a large ceiling painting by Overbeek, commemorating the flight of Pius IX. in 1848, a cast of Thorwaldsen's Procession of Alexander the Great, and an Annunciation by Guido Reni.

QUIRINUS. In the early Roman religion, the name of the third great god, ranking next to Jove and Mars. Whatever the origin of the god, he seems to have been regarded as a parallel to Mars, representing rather the war god as in time of peace ready for the fray. The original prominence of Quirinus is shown by the fact that the third great flamen was devoted to his worship, which does not, however, seem to have been very exacting, as the flamen appears assisting at several other services unconnected with Quirinus. He was also honored originally by the Colline Salii, as was Mars by the Palatine. His old temple lay on the Quirinal Hill near the Porta Quirinalis. We hear of a new building in B.C. 293, and after its destruction by fire, of the erection by Augustus of a splendid structure, which was dedicated B.C. 16. Early in the first century B.C. the belief arose that Quirinus was the deified Romulus, a theory which was fostered by Caesar and Augustus, and led also to the association of an old goddess *Hora Quirini* with *Hersilia*, the wife of Romulus. The annual festival of Quirinus was on February 17th, the supposed date of the translation of Romulus to heaven.

QUIRITES, kwî-rî'têz (Lat. nom. pl., probably from Sabine *quiris*, spear). The collective name of the Romans in their civil relations, while in connection with foreign affairs they were known as *Romani*. Quirites seems to have been the original name of a Sabine tribe, and the Roman nation, made up of Latin and Sabine elements, was called by the name of either of its component parts. A distinction, however, gradually crept in as to the use of the term Quirites, and while always a title of honor as applied to the Roman citizens, and so used in all public speeches and addresses, in the army it became a term of reproach, implying that he to whom it was given was no true soldier, but fit only for a civilian.

QUIRK, GAMMON AND SNAP. A firm of unprincipled solicitors in Warren's *Ten Thou-*

sand a Year, who discover the flaw in the title by which Tittlebat Titmouse gets the property. They are finally convicted of conspiracy and imprisoned.

QUIROGA, kē-rō'gá, José (c.1687-1784). A Spanish Jesuit explorer and mathematician. He was born in Lugo (or Fabas), near Coruña, studied mathematics and navigation in a naval college, and went to South America as a Jesuit missionary. Philip V. sent him with Alvarez to explore the Patagonian coast (1745-46) and settle the boundary between the Spanish and Portuguese possessions. His later years were spent in Rome, and, after the suppression of the Order, in Bologna. Quiroga was an able mathematician and left many papers on mechanics, navigation, and travels. A *Descripción del río Paraguay* was published in Buenos Ayres in 1836; and his nephew Emmanuel Mendez edited his *Tratado del arte de navegar por círculo paralelo à la equinoccial* (1784) and *De Ratione Inveniendi Longitudinem in Mari*.

QUIROGA, JUAN FACUNDO (1790-1835). An Argentine politician and soldier, born in San Juan (La Rioja), and educated in Spain. Upon his return home he became the leader of a band of ruffians and by 1820 was practically independent ruler of a large part of Northeastern Argentina. He appointed the Governor of La Rioja, and in 1827, having entered politics as a Federalist, made Dorrego President. But Dorrego was captured and killed by Lavalle in 1828, and Quiroga himself was defeated by another antifederalist general, Paz, in 1830. Then the tide turned. Quiroga won several victories, and in 1834 became Governor of Buenos Ayres. But he quarreled with Rosas, and was assassinated near Córdoba, possibly at the instigation of his fellow Federalist leader.

QUI TAM ACTION (Lat., who so well). An action brought under the provisions of a statute permitting an informer against an offender to receive a portion of the penalty prescribed for the offense, and authorizing him to sue on behalf of himself and the Government to recover the same. In England these actions have been permitted since the earliest period of its legal history as an efficient means of enforcing the law as to minor offenses, such as a breach of duty of a public officer, where the penalty was a fine. Offenders liable for a statutory penalty early sought to evade the law by procuring a friend to bring the action, under a collusive agreement not to enforce the judgment. To remedy this the statute 4 Hen. VII., ch. 20, was enacted, providing that all such actions should be brought in the name of the King. This became the common law of the United States on our independence, and to-day, unless a statute expressly provides that the action shall be in the name of the informer, it must be in the name of the State, 'on relation of' (*ex rel.*) the informer. These actions are to be distinguished from the so-called 'popular actions' where the informer is entitled to the whole penalty. See PENALTY.

• **QUITCH**. See COUCH GRASS; AGROPYRON.

QUIT-CLAIM. A deed of conveyance, deriving its title and in large part its form from the ancient instrument of release, whose operative words were "remise, release, and forever quit-claim." Though this language continues to char-

acterize the quit-claim deed, it is in its operation, in many of the United States, much more than a deed of release, and is in fact the form of conveyance usually adopted to make a grant of lands, answering the purpose of either a release or grant. It is, indeed, the simplest form of transfer of a freehold. So far as the conveyance of the title is concerned it has all of the effect of the more usual warranty deed, the principal advantage of the latter being that it adds to the mere conveyance the personal obligation of the grantor to warrant and defend the title transferred. See DEED; GRANT; RELEASE; WARRANTY.

QUIT'MAN, JOHN ANTHONY (1799-1858). An American soldier, born at Rhinebeck, N. Y. He attended Hartwich Academy, Otsego County, N. Y., and in 1816 was appointed a tutor there. In 1818 he was appointed adjunct professor of English in Mount Airy College, Germantown, Pa. He determined to study law and went to Chillicothe, Ohio, in 1819. He was admitted to the bar in 1821 and removed at once to Natchez, Miss. In 1823 he was appointed brigade inspector of the State militia, and in 1827 was a member of the Legislature, where he drew up a new militia system. From 1828 to 1834 he was Chancellor of the State, but resigned and was elected to the State Senate, of which he was president and for a few months acted as Governor of the State. He led a company to the aid of Texas in 1836, but saw no active service. On his return in 1837 he was made brigadier-general of the State militia. At the outbreak of the Mexican War he was appointed brigadier-general of United States Volunteers, and was ordered to report to General Taylor at Camargo. At Monterey, under discretionary orders, he forced his way into the heart of the city with 500 men, for which act he was later presented with a sword by Congress. He was brevetted major-general on September 23, 1846. He was transferred to the army of General Scott, led the assault at Vera Cruz, and commanded the expedition against Alvarado. He was made major-general April 14, 1847, and was with General Worth in the capture of Puebla. He served with distinction at Chapultepec, carried the Belen Gate, and with the capture of the City of Mexico was made Governor by General Scott. He soon returned to the United States, was Presidential elector in 1848, and was elected Governor of Mississippi in 1849. While he was Governor, General Lopez wished him to head a filibustering expedition to capture Cuba. Though he declined, the negotiations became known, and he was indicted in the United States court. He resigned as Governor and was tried before the United States District Court for East Louisiana, but the jury disagreed. He was again nominated for Governor, but after a heated canvass withdrew because the Democrats of his State had accepted the Compromise of 1850. In 1854 he was again interested in an expedition against Cuba, and was arrested, but not tried. From 1855 to 1858 he was a member of Congress and served as chairman of the Military Committee. General Quitman was radical in his views of States' Rights and in 1851 openly advocated the establishment of a Southern Confederacy. Consult Claiborne, *Life and Correspondence of John A. Quitman* (2 vols., New York, 1860).

QUITO, kē'tō. The capital of Ecuador. It is situated 0° 14' south of the equator on a lofty

plateau 9300 feet above the sea (Map: Ecuador, B 4). The location is of almost unrivaled grandeur. The plateau is bounded on all sides by lofty mountains, from which rise in plain sight no less than eight snow-clad volcanoes, some of which are among the highest peaks of the Andes, and the city is built on the very foothills of one of them, Pichincha. The climate of Quito is proverbially healthful, mild and equable. The plan of the city is a perfect square, with outlying suburbs, but as it is built on very uneven ground the streets are steep and generally impassable for wagons. There are several plazas, the largest of which, the Plaza Mayor, has been rendered very handsome with flower gardens and a fountain. It is faced by the cathedral, the Government and municipal buildings, and the Archbishop's palace. Besides the cathedral there are numerous other churches and convents, some of which are in fine Renaissance style, and contrast strangely with the low, mean adobe houses which make up the bulk of the city. At the head of the educational system stands the university, in whose buildings are installed also a library, a museum, an astronomical observatory, and a polytechnic school. There are, besides, two seminaries, several other colleges, and a medical school attached to a large leper hospital. Quito is, on the whole, a quiet and rather dull city. Having very poor means of communication with the outside world, its trade has not been active. A railroad, however, is now under construction to Guayaquil, the chief port of the Republic, and other improvements, such as electric lighting, have been installed. The chief manufactures are saddles, shoes, woolen and cotton cloth, blankets, and carpets. The chief exports are hides and rubber. Population, about 80,000.

Quito is one of the oldest cities of South America. It was the capital of an ancient Indian nation before it was captured in 1470 by the Inca Tupac Yupanqui. It was the northern capital of the Incas until it was taken by the Spaniards in 1534. It has suffered repeatedly from severe earthquakes, notably in 1844, 1859, and 1887, and has also been ravaged by civil wars. Consult: Ternaux-Compans, *Histoire du royaume de Quito* (Paris, 1840); Herrera, *Apuntes para la historia de Quito* (Quito, 1874).

QUIT RENT. Originally, a fixed rent due from a freehold tenant to his feudal superior, so called because received in lieu of all other services. It was a common feature of socage tenure and came in course of time to designate any fixed rent due from a socage tenant. Quit rents were protected from abolition by the provisions of the Statute of Military Tenures. It is probable, however, that they have become entirely obsolete in the United States, excepting in Pennsylvania, where they survive to a limited extent, though there is no legal objection to their survival elsewhere in the States formerly subject to socage tenure. Quit rents still exist to a considerable extent in England, though they have largely been redeemed under the provisions of the Conveyancing Act of 1881. Wherever they exist, however (unless due to the Crown in England or to the State in America), they are of great antiquity, as they always involve a relation of dependent tenure such as could not arise in England after the Statute *Quia Emptores* (1290) nor in this country after the Revolution.

Consult the authorities referred to under **REAL PROPERTY**.

QUITTOR (connected with LGer. *kicater*, *kicader*, rottenness). A fistulous wound at the top of the horse's foot resulting from bruises, pricks, or neglected corns.

QUIX'OTE, *Sp. pron.*, kē-hō'tā, DOX. See **CERVANTES**.

QUODLIBET (Lat., what one pleases). A humorous combination of several melodies in use extensively during the sixteenth and seventeenth centuries. To-day it is a favorite amusement at a 'Commers' (a students' gathering) in Germany to continue the singing of a popular folk or drinking song until a certain word is reached, which happens to be the first word of another well-known song. The air is then broken off suddenly and the new air begun at that word, until another word again affords an opportunity to pass into a new air. Many collections of quodlibets have been published.

QUOITS (from OF. *coiter*, *coitier*, *quoitier*, to press, incite; probably from Lat. *coactare*, to constrain, frequentative of *coagere*, *cogere*, to urge, from *co*, together + *agere*, to lead). A game played on a green at each end of which, 18 yards apart, a mark is placed. At this mark the quoits, iron concave rings 8 inches in diameter (of which the rim is from one to two inches in breadth), are pitched, alternately by two players of opposite sides, and so in rotation by any number of pairs forming the opposing sides. The game is won by the side which, in a given number of pitches, gets the greatest number of quoits nearest the marks or pins. Each player at each turn has two quoits. The sport is very common in Europe, and in America it is the subject of a national contest for the Bell Quoit Medal. The rules laid down in 1869 require the heads of the pins to be one inch above the ground into which they are driven, 18 yards apart, and the player to deliver his quoit from his hand with his first step. They leave the weight of the quoit unlimited, but restrict its external diameter to 8 inches. No quoit counts unless fairly delivered on the clay, free from the outer rim, and no quoit on its back counts, unless it holds clay, or is knocked out by another quoit. No quoit rolling onto clay counts unless it has first struck another quoit or the pin. In counting, the two quoits nearest to the pin count one point each; a 'ringer,' that is a quoit which has been pitched so that the pin shows through the open centre of the quoit, counts two points.

QUORUM (Lat., of whom, abbreviation of the ML. phrase *quorum unum A. B. unum esse volumus*, of whom we wish A. B. to be one). A legal and parliamentary term denoting the number of members of a public or private assembly whose presence is necessary for the transaction of business. In the case of private corporations the quorum necessary to enable the directors to transact business legally is fixed by the charter. In the case of private organizations it is fixed by their constitution or by-laws. In the case of legislative assemblies and constituent bodies it is generally fixed by the constitution, but is sometimes left to the determination of the assemblies themselves. The quorum is usually fixed at a majority of the legal number of mem-

bers elected, although there are notable exceptions to this rule. In the Parliament of Great Britain the quorum is determined by each chamber for itself. In the House of Commons it is fixed at 40 members; in the House of Lords at three. In the German Empire the Constitution fixes the quorum of the Imperial Diet at a majority of the legal number of members. The Federal Council is left to fix its own quorum and the practice requires simply the presence of the chairman, the Lord Chancellor. In France the determination of the quorum in the case of the French Parliament is left to each Chamber separately. By a rule of procedure it is fixed at a majority of the legal number of members of each House. In the United States the Federal Constitution fixes the quorum of the Senate and the House of Representatives at a majority of the whole number of members elected to each House. Until the 51st Congress (1890) it was the practice in the House of Representatives, in ascertaining the presence of a quorum, not to count those present but not voting. This enabled the minority to obstruct the legislative procedure quite frequently and the practice became so annoying to the majority that Speaker Thomas B. Reed (q.v.) introduced the policy of counting, for the purpose of making a quorum, all members present and refusing to vote. His action created something of a furor in the House, and it was denounced by the opposition as arbitrary and revolutionary, but its continued use has commended itself to the members of Congress and bids fair to be a permanent feature of the rules of procedure irrespective of the political complexion of the House.

QUOTIDIAN FEVER. See **MALARIA AND MALARIAL FEVER.**

QUO WARRANTO (Lat., by what warrant). A legal action or proceeding brought to determine the right of an individual or corporation to a public office, franchise, or privilege, and to have a usurper removed by order of a court of competent jurisdiction. This remedy is said to have originated in the twelfth century in England, and was originally commenced by a writ of quo

warranto in the name of the Crown, and commanding the alleged usurper to show 'by what warrant' he claimed the right or privilege in question. The inquiry was made by a royal commission, and the person named in the writ was often deprived of the rights he claimed without judicial proceedings. To remedy this a statute was enacted in the reign of Edward I. requiring that such cases should be tried by the action of quo warranto. This was begun by an 'information in the nature of a quo warranto' being filed by a public prosecutor on behalf of the Crown. By a statute in the reign of Anne, private individuals were permitted, on obtaining leave from a court, to file these 'informations.'

In most of the United States such proceedings are brought in the name of the Attorney-General of the State in his official capacity, or in his name 'on relation of' a private individual. These proceedings can only be brought in the highest courts of original jurisdiction or appellate courts. In most States quo warranto proceedings may be brought against persons wrongfully claiming to occupy public offices; against the officers of private corporations where the latter assume unlawful privileges and powers; against the officers of public or municipal corporations, where franchises are unlawfully exercised by them; or against any person unlawfully claiming and exercising control over a public franchise or privilege such as a ferry franchise or banking privileges. The right of a foreign corporation to do business in a State may be questioned in this manner. Defeated candidates sometimes cause an investigation into the election returns and the rights of their successful opponents by quo warranto proceedings, but many States have provided special statutory proceedings for determining contested elections. A quo warranto proceeding can only be brought to try a right or eligibility to an office, and not to remove a lawful incumbent for official misconduct. The statutes of the various States should be consulted for the details of procedure. Consult also: High, *Treatise on Extraordinary Legal Remedies* (3d ed., Chicago, 1896); Spelling, *A Treatise on Extraordinary Relief* (2d ed., Boston, 1901).

R

R The eighteenth letter of the English alphabet. It is the Latin form of the Greek *rho*, which corresponded to the Semitic *rēsh*, meaning 'head,' the letter rudely representing a face in profile. The development of the form of the letter was as follows:

𐤓	𐤏 𐤏	𐤏	𐤏
Hebrew.	Phœnician.	Early Greek.	Early Latin.
<div style="text-align: center;">R</div> Later Latin.			

The tag was added to the *r* in Latin in order to distinguish it from the sign for *p* (q.v.) when that letter assumed its present form.

In phonetic value *r* may be either consonantal or vocalic, and in Sanskrit this distinction was denoted by different symbols. *R* is a consonant only when it immediately precedes a vowel, as *rill*, *rain*, *crack*. As a consonant it is a continuous spirant, voiced or voiceless, and is sounded by placing the tip of the tongue loosely against the sockets of the upper front teeth and causing it to vibrate with strong breath. Initial English *r* is pronounced thus in such words as *ring*, *ribbon*. The vibration, however, is very slight, and the sound produced is a comparatively smooth one. Before back vowels the tip of the tongue is turned upward and back against the palate, as in *rush*, *roar*. Both these *r*'s are untrilled. Trilled *r*, infrequently heard in English pronunciation, is produced by the vibrations of the uvula. After vowels *r* is often sounded as the obscure vowel *a* (= *a* in *sofa*), *care*, *hirc*, *four*. In some words *r* has become so weakened as to be silent or to result only in lengthening the preceding vowel, as in *far*, *world*, *fern*. *R* influences the preceding vowels, making them more open, as in *ail*, *air*; *old*, *ore*; *pool*, *poor*. Here the sounds are widened to coalesce with the open quality of the glide *r*. This glide sound lies between the consonant and vocalic values, as *ear* (glide), but *carache* (consonant). English *r* in *red* is the medium alveolar sound, but after *t* in *try*, and, to a less degree, after *d* in *dry*, the opening is so restricted that the sound is distinctly buzzed. *R* may be voiceless in combination with other voiceless letters, as *pride*, *bride*.

R represents an original Indo-Germanic *r*, as Skt. *rudhira*, Gk. *ῥυθρός*, Lat. *ruber*, Eng. *red*; Skt. *dvar*, Gk. *θύρα*, Lat. *fores*, Eng. *door*. It may also represent a Germanic *z* (Indo-Germanic

s), which became *r* by the operation of Verner's law (q.v.). It is closely related to *l* (q.v.), with which it frequently interchanges, as in Sanskrit *rabh* and *labh*, to seize, especially as a result of dissimilation, as Greek *κεφαλαγαί*, beside *κεφαλαργία*, 'headache,' Latin *turtur*, English *turtle dove*. The Greeks had two types of *r*, *ρ* (rough breathing) and *ῥ* (soft breathing). The Romans transliterated the former (*spiritus asper*) by *rh*, whence the *rh* in words from the Greek, through the Latin, as *rheumatism*, *rhetoric*. Words derived directly from the Greek, if recently acquired, usually disregard this Latin spelling, as *reometer*, *raphe*.

As a mediæval Roman numeral *R* = 80, *R̄* = 80,000. *R. A.* = Royal Academy, Royal Arch, Royal Artillery; *R. M.*, Royal Marines; *R. N.*, Royal Navy; *R. C.*, Roman Catholic.

In prescriptions *R* (*recipe*) = take.

RA, *rä*. An Egyptian deity. See *Rê*.

RAAB, *räb* (Hung. *Győr*). A royal free city, and the capital of the County of Raab, Hungary, 63 miles west by north of Budapest, at the confluence of the Raab (a river about 150 miles long) with an arm of the Danube (Map: Hungary, C 2). It has handsome new public buildings. The educational institutions include an Obergymnasium and a normal school for girls. The city manufactures spirits, chemicals, oil, agricultural implements, and brick. The horse market is famous. Raab was built on the ruins of the Roman Arrabona. It was taken by the Turks in 1594. Four years later they were driven out, and Raab was made a fortress of the first rank. Population, in 1890, 22,795; in 1900, 27,758.

RAAB, JOHANN LEONHARD (1825-99). A German line-engraver and etcher, born at Schwanningen, near Ansbach. He studied at Nuremberg under Karl Maier and Reindel, then at the Academy in Munich, where he was appointed professor of engraving in 1869, having in the meanwhile worked at Nuremberg. Besides Raphael's "Madonna Tempi" and "Madonna di Foligno," Titian's "Gipsy Madonna," and Veronese's "Marriage Feast at Cana," he engraved after Kaulbach, Lessing, Flügel, Vautier, Schwind, Piloty, and Ramberg, and in 1882-87 reproduced the principal works in the Old Pinakothek at Munich in fifty etchings, for which Reber wrote the text. His daughter, Doris (1851—), born at Nuremberg, also earned a reputation with engravings after Holbein, Rubens, Piloty, and Linden-

schmitt, and etchings after Rembrandt. Van Dyck, Albert Cuyp, Max, F. A. Kaulbach and Toby Rosenthal.

RAABE, rü'bc, HEDWIG (1844—). A German actress, born in Magdeburg. She began to appear upon the boards in childhood, and at fourteen became connected with the Thalia Theatre at Hamburg, then with Wallner's Theatre in Berlin, and in 1864-68 was engaged at the Imperial German Theatre in Saint Petersburg, whence she visited Germany annually on starring tours. Her great success on these occasions induced her to devote herself exclusively to this mode of professional life, in the course of which she also acted in the United States (1886-87). In 1871 she married Albert Niemann, the dramatic tenor. Although she did more than full justice to classical rôles, her forte lay in the representation of native parts and the youthful characters of modern French and German comedy.

RAABE, WILHELM (1831—). A German humoristic novelist. He was born at Eschershausen, Brunswick, September 8, 1831. He first became known as Jakob Corvinus, the surname being a Latinization of his own. He excels in minute delineation of eccentrics. Characteristic among some forty volumes are *Ein Frühling* (1857), *Der heilige Born* (1861), *Unsers Herrgotts Kanzlei* (1862, 4th ed. 1901), *Der Hungerpastor* (1864, 14th ed. 1902), *Abu Telfan, oder die Heimkehr vom Mondgebirge* (1867, 4th ed. 1901), *Der Schüdderump* (1870, 3d ed. 1901), and *Horracker* (1876).

RAB AND HIS FRIENDS. A touching short story of a dog by Doctor John Brown, published in his *Horæ Subsecivæ* in 1855.

RABA'NUS (OR IRABANUS) MAURUS (c.776-856). A great ecclesiastic and teacher of the ninth century. He was born at Mainz of noble family about 776. He began his education at Fulda at an early age, entered the Benedictine Order, and in 801 received deacon's orders. The following year he was sent to continue his studies at Tours, under Aluin, from whom he received his surname, Maurus, after Saint Maur, the disciple of Benedict. In 803 he became head of the school at Fulda, which flourished greatly under his direction. In 814 he was ordained priest; in 822 he was chosen Abbot of Fulda, and performed his duties with much ability till 842, when he resigned and withdrew to the cloister of Saint Peter to devote himself to literature. In 847 he became Archbishop of Mainz. He died at Winkel on the Rhine, February 4, 856. Rabanus took an active part in opposing Gottschalk (q.v.) and his theories about predestination, and also the doctrines of Paschasius Radbertus with regard to the Eucharist. His voluminous writings, upon most diverse subjects, include a Latin-German glossary on the Bible, a sort of encyclopædia, *De Universo Libri XXII*, commentaries on the books of the Old and New Testaments, and poems. They are reprinted in Migne, *Patrol. Lat.*, cvii-cviii. His writings on education have been edited in German by Freundgen (Paderborn, 1889); his *De Institutione Clericorum Libri III*, by Knoepfler (Munich, 1901). For his poems, consult Dümmler, *Poeta Latini Evi Carolini*, vol. ii. (Berlin, 1884), and for his life, Kunstmann (Mainz, 1841), Spengler (Regensburg, 1856), and Turnau (Munich, 1900).

RABAT, râ-lâ't', or NEW SALLEE (also REBAT, RIAT, ARRET, etc.). A seaport and fortified town of Morocco, situated at the mouth of the Bu Regreg opposite Sallee (Map: Africa, D 1). It has numerous European houses, an arsenal, and a high minaret of the old Hassan Mosque. The town is famous for its manufactures of carpets, mats, cloth, pottery, and Morocco leather. The port is not easily accessible, but there is some foreign trade in olive oil, wool, skins, and bones. Population, 25,000, with 100 Europeans.

RABBAH, râ'bâi, or RABATH BENE AMMON (Heb. *Rabbath bâ'ê* 'Ammôn, Rabbah of the Ammonites). The chief city of the Ammonites, known at the present time as Amman. It was east of the Jordan, about 25 miles northeast of the Dead Sea, in the valley of the Jabbok. It did not belong to the possessions of the Hebrews, and with the exception of notices in Deut. iii. 11 and Jer. xiii. 25, is not mentioned till the time of David. It was then attacked by the Israelites and after a long siege was captured by David and Joab (II. Sam. x.-xii.). Later, apparently, it was regained by the Ammonites (Amos i. 13-15; Jer. xlix. 2-3; Ezek. xxi. 20; xxv. 5). Ptolemy II., Philadelphus (B.C. 285-247), captured it, rebuilt it and called it Philadelphia, and for a long time it was a flourishing city. (See PHILADELPHIA.) There was another Rabbah or Rabbath in Moab, which was known to the Greeks and Romans, although not mentioned in the Bible; and still a third in the mountains of Judea (Jos. xv. 60).

RABBI (Heb., Aram. *rabbî*, my lord). An honorary title applied to Jewish teachers of the law, and, in general, to those versed in the law. In the days of Jesus the title had not yet acquired a strictly technical sense, and is properly to be interpreted in the New Testament as a courteous title indicative of respect. Rabboni, which is applied to Jesus in Mark x. 51 and John xx. 16, has the same force, but implies somewhat more of respect. In later times, in consequence of the dissolution of the temple cult, authority in religious matters fell into the hands of the scholars, and the title Rabbi acquired an official significance and became restricted to those authorized to decide ritualistic and legal questions. This usage arose in Palestine, apparently in the second century; in Babylonia the corresponding title was *Rab* or *Mar*. Through Palestinian influence the usage spread to other countries. Rabbi is still maintained, though not strictly, as the official designation of Jewish ministers; formerly it was applied to any scholar, whether engaged in the active ministry or not, and this is, in a measure, still the case in Eastern Europe. Consult: Dalman, *Die Worte Jesu* (Leipzig, 1898); Schürer, *History of the Jewish People*, vol. ii. (Eng. trans., Edinburgh, 1886-90).

RABBIT (connected with dialectic Fr. *rabotte*, O Dutch *robbe*, Dutch *rob*, rabbit, Ger. *Robbe*, seal). A European animal (*Lepus cuniculus*) of the same genus as the hare, but smaller, and with shorter and more equal limbs, which differs essentially from all hares in the fact that the young are born blind and almost hairless, and in its gregarious and fossorial habits. The ears of the wild rabbit are only about as long as the head, and show little black at the tips; the fur is grayish-brown, growing whitish on the under part; the tail rather large and conspicuous,

brown above, white beneath, and ordinarily held upright. The rabbit delights in sandy heaths, dry grounds, covered with scattered bushes, and similar situations, where it digs burrows in colonies called 'warrens.' It feeds mainly in the dusk of the morning and evening. It is monogamous, and wild pairs are said to remain attached during life, but in domestication it ceases to pair. The fertility of rabbits is proverbial. They begin to breed when six months old, and are capable of producing several litters of five to eight young in a year, so that in favorable circumstances they multiply with prodigious rapidity, and were they not killed off would inflict great injury upon crops, gardens, and orchards, especially by barking young trees. The flesh of the European rabbit is excellent food, and the hides and hair may be made useful. They do not become a pest, and in some places not suited to agriculture are raised as a commercial product. This species is a native of the Western countries on the Mediterranean Sea, whence it has spread north in Europe. Its introduction and spread in Australasia furnishes an extraordinary example of the effect which may follow naturalizing animals to a new country. About 1850 a gentleman living in New South Wales imported and turned loose three pairs of rabbits in that colony. They multiplied and flourished so rapidly that they quickly became a public plague. In New Zealand, indeed, where the rabbit obtained a foothold about 1875, it soon became a serious question whether farmers should not abandon some districts altogether. In order to combat the plague, weasels and mungoses were extensively introduced, but these made comparatively little impression upon the hordes of rabbits, while they attacked the poultry, which was almost the only article of farm produce the rabbits had left untouched. An attempt was made to introduce epidemics of parasitic disease among the rabbits, but this also failed. The only way to meet the pest has been to erect around every garden or farm a rabbit-proof wire fence.

An old English name for the rabbit is 'cony,' which has led to the application of this term in English versions of the Bible, and in common speech elsewhere, to quite different animals of small size and burrowing habits. In the United States the word is used interchangeably with hare—or, rather, replaces 'hare' in popular speech, all the American wild species being called rabbits, though none of them are truly of that species.

DOMESTIC RABBITS. There are ten well-established varieties of domesticated rabbits, the original stocks of which were derived from almost as many different countries. These are Angora, Belgian, Dutch, Himalayan, Lop, Siberian, Silver-tip, Polish, and Flemish. Their characteristics are as diverse as their origin. They vary in color through every grade, shade, and mixture, from pure white to all black; in coat from the closest fur to long silky hair; capable of being woven; in style of ears from the 'prick ear,' erect, small, and almost as stiff as metal, to the floppy, broad, soft-skinned ear of the lop, which hangs to the ground. The development of particular characteristics and markings, and their maintenance, are made possible by the animal's remarkable fecundity and adaptability. Their food is simple, a meal of whole oats in the early morning, a mid-day meal of greens and vegetables,

and an evening one of a mixture of cornmeal, bran, and oatmeal, kneaded in warm water, meets nearly all their requirements. They are good mothers, need no attention, and the less they are then disturbed, the better. The breeding-hutch necessarily requires an inner room, dark except for such light as goes through the little round door. In that box, or room, she will make her own nest, and when her young have acquired their sight and fur (about the eighteenth day), they will come peeping out of the door. They should be taken away, one or two a day, when two months old. They can then run together until the fourth month, when the sexes must be separated.

The 'lop-ear' is the oldest variety of the fancy rabbit, having been bred from the English wild rabbit and shown in England considerably over a century. Its most marked feature is the abnormal ears, each 11 to 12 inches in length and 6 in width. The ears fall gracefully from behind the inner corner of the eye, with the convex surface outward; toward the root the ear is narrow and thick, and becomes abruptly broader and proportionately thinner toward the tip. The body in this breed is rather low at the shoulder, and there is a dewlap. The color varies, but the markings should be uniform. A large lop weighs 11 pounds. This is the only variety which requires artificial heat for its full development, and, although the oldest breed, is so entirely artificial that it is maintained and perfected only by the utmost care.

The Belgian, although commonly called Belgian 'hare,' is a true rabbit. It is of large size (10 pounds), and lustrous sandy brown in color. Its body is longer in proportion to its weight than that of any other rabbit, and the hind legs are long, strong, and straight. The head is rather broad, tapering to the nose, the ear about five and a half inches long, thin and transparent, and the eye brown and bright. The flesh is excellent, and between 1895 and 1900 this rabbit was extensively introduced into the Western United States.

The Dutch rabbit, derived from Holland, is one of the smallest of the fancy breeds, not averaging above four pounds. Its hind quarters are solid black, or blue, or lemon, or, rarely, tortoiseshell, except the toes of the hind feet, which are white; its forebody and fore legs are white; it has a white nose and white blaze narrowing to a point on its face between the ears. Its ears, and the patch all round the eye and its side face, are the color of its hind quarters. The whole-color areas must be absolutely free from black or white hairs, and their borders clear and sharply defined. They are a very hardy race and excellent mothers. The Angora, a curious long-bodied rabbit, is a native of Asia Minor, and, like the Angora goat and cat, has a long silky coat, which is so long that it can be combed or clipped periodically, and the wool woven. The hair is all white in typical examples, though sometimes black or fawn, and of two lengths, the first woolly and short, the second long and hanging in semi-curles all over the body. When the wool is white the eye is pink; in other varieties it shades accordingly. They average about nine pounds in weight, and are hardy. The Siberian rabbit, mainly bred in France, and very prolific, is a cross between the Angora and the Himalayan, having the long, silky hair of the one and the dark points of the other. The Himalayan's

native home is Northern China and Tibet, and he is bred in Europe for the value of his skin. His limbs, nose, ears, and tail are black, and the rest of the body white. This black tipping has caused his skin, the coat of which is short and glossy, to be sometimes called 'moek ermine.' The eye is a singularly rich golden crimson, bright and fiery. These rabbits breed as a rule very true, are smart, neat, hardy, and docile. They vary in weight from four to six pounds. The Patagonian derives its name from its great size alone, since it is really little else than a wild rabbit, bred up to 12 to 16 pounds in weight. The same may be said of the 'Flemish giants,' some specimens of which weigh 18 pounds. They grow quickly and are profitable for market sale.

The 'silver-tip' is a fancy breed, characterized by upright ears, large prominent eyes, well-formed body, and a coat evenly silvered, with about 25 per cent. of light hairs. When first born the silver-grays are a slate-blue, and after about a month they look quite black, but at their first molt this changes to a real silvering or light color, which is perfected by the second molt, when they show the much-desired blue tint. The 'silver-browns' are bred from the silver-gray bucks, crossed with deep-colored Belgian does. The 'cream' or 'fawn' varieties result from other cross-breedings. They are medium-sized rabbits, seven pounds being the approved weight. The Pole is a delicate little all-white rabbit, often weighing only three pounds, which inhabits Poland in its wild state, but is distributed all through Switzerland and France, especially in Provence. The ears are short, upright, and soft, and the eyes are light red. See Plate of HARES AND PIKA.

Consult: Knight, *Book of the Rabbit* (London, 2d ed., colored plates, 1889); Morant, *Rabbit Farming* (London, 1890); Rayson, *Rabbits for Prizes and Profit* (London, 1872).

RABBIT BOT. The larva of one of the botflies (*Cuterebra cuniculi*) which is commonly found under the skin of rabbits, where it forms a large tumor. The adult insect is a large fly, almost as large as a bumblebee, and having some resemblance to that insect. The head is black and the thorax is covered with yellow-brown hair, the first segment of the abdomen with yellow hair, and the rest of the abdomen is blue-black. This insect occurs in Europe and in various parts of the United States. See BOT.

RABBIT-FISH (so called because the front teeth resemble the incisors of a rabbit). A rather large, coppery-brown fish (*Promethichthys prometheus*) of the Middle Atlantic, especially frequent about Madeira and the Bermudas. It is one of the escolars (q.v.), and is known to Bermudans as 'cat-fish,' but about Madeira is called 'coelho,' or 'conejo.' Although it cannot be caught except on the bottom at depths of from 100 to 400 fathoms, it is one of the commonest and cheapest market fishes in the islands mentioned.

This name is also given to the common 'burr-fish' of the Southern United States. See PORCUPINE-FISH.

RABELAIS, râ'b'-lâ', FRANÇOIS (c.1490-c.1553). A great French satirist and humorist, born at Chinon, in Touraine. Rabelais's life is surrounded by legend. Even the year of his birth and the occupation of his father are matters of doubt, like the year of his death and his burial

place. The year traditionally assigned to his birth is that of Luther (1483). Some recent biographers put it in 1495, though others, following De Thou, prefer 1490, a date which offers, perhaps, least intrinsic difficulty. His father is said by some to have been an innkeeper, or vintner, by others an apothecary. Tradition records that Rabelais went when he was nine years old to a convent school at Seuillé, near Chinon, and that he passed thence to a similar school at La Basnette, near Angers, where he seems to have made the acquaintance of the three Du Bellay brothers and of Geoffroy d'Estissac, afterwards Bishop of Maillezais. He probably passed either from Seuillé or La Basnette to the Monastery of Fontenay-le-Comte, a Franciscan house in Poitou, where he apparently was advanced to the priesthood; for we find his name on a legal document dated April 5, 1519, among those of some 12 prominent members of the monastery. He seems to have read and studied here after the omnivorous fashion of the Renaissance, certainly in French, Latin, and Greek, possibly in Hebrew and Arabic. His scholarship gained him the friendly patronage of the Bishop of Maillezais, of the distinguished scholar Budæus, and of some influential lawyers. With Budæus he and a monk, Pierre Amy, corresponded in Latin and Greek, and fragments of their letters indicate that the other monks took offense at their studies and annoyed them so much that they left the convent, and doubtless the Franciscan habit, and sought the protection of the Bishop of Maillezais, through whom, possibly by the intervention of Cardinal du Bellay, Rabelais obtained from Clement VII., about 1524, permission to go over to the more scholarly Benedictines. He entered the abbey at Maillezais and soon became the table companion of Bishop Geoffroy d'Estissac, at whose château he was a frequent guest for long periods. But he seems to have grown restless, to have abandoned the abbey, his Benedictine habit, and his patron, and to have gone as a secular priest possibly to Paris and probably to Lyons. On September 17, 1530, we have record of Rabelais's matriculation in the faculty of medicine at Montpellier. He took his baccalaureate degree December 1st of that year, and lectured in 1531 at Montpellier on the *Aphorisms* of Hippocrates and Galen's *Art of Medicine*. We have his own testimony (*Pantagruel*, iii. 34) that he took part in an academic comedy. In November, 1531, he was appointed physician at the Hôtel Dieu of Lyons, but he did not take his doctor's degree till 1537.

At Lyons he seems to have begun publication, dividing his attention between medicine and law. At the same time his humor was finding expression in popular almanacs. Of these he issued between 1532 and 1550 some 18. The underlying purpose appears to have been to mock the astrologers and their art. One of these, the *Prognostication Pantagrueline*, suggests in its title the name of his most famous work, *Pantagruel*, of which the present Book ii. appeared at least as early as 1533. He appears to have revamped also a local Touranian legend of the giant Gargantua, an elaboration of which afterwards served his as prelude to his masterpiece. This new *Gargantua* probably dates from 1534. Early in that year Rabelais accompanied Cardinal du Bellay to Rome, where he spent three months and gathered materials published

by Marliani in September, 1534, as a *Topographie de Rome*, preceded by a dedicatory letter from Rabelais to the Cardinal du Bellay in which he speaks of travels in Italy. He was in Rome again from July, 1535, to March, 1536, and lost his place in the Lyons hospital in consequence of his absence. He corresponded diligently during this second Italian sojourn with the Bishop of Maillezais on matters of horticulture, politics, and Roman gossip, but chiefly concerning his efforts to secure from the Pope an indulgence to resume the Benedictine dress and to practice medicine, excluding surgery. This indulgence was granted him by Paul III. on January 18, 1536, in view of his "zeal for religion, knowledge of literature, and probity of life and morals," grounds on which Rabelais dwells with much complacency. It was on this visit to Italy that Rabelais procured seeds of the melon artichoke and carnation which he was first to introduce to France and so to England. There seems reason to place at about this time the death of Théodoule Rabelais, "a child of two months," of whom François seems to have been the father. On his return from Italy Rabelais visited Paris and shared in a banquet in honor of the printer and humanist Dolet, who afterwards (1546) suffered death for his freethinking. On May 22, 1537, Rabelais took his doctorate at Montpellier and lectured there later in that year on Hippocrates. In 1540 he was granted a further indulgence by Paul III., passed a brief time with the canons of Saint-Maur-les-Fossés, but soon took up a wandering life again, for we find him in July, 1541, at Turin. A work by him on military art written in Latin about this time was translated into French by Massuau and published in 1542 as *Stratagèmes*. Neither original nor translation exists. His protector, Guillaume du Bellay, Seigneur de Langey and brother of the Cardinal du Bellay, dying in 1543, bequeathed him "fifty livres tournois a year until his heirs shall have provided him or caused him to receive preferment in the Church to the value of 300 livres tournois annually." On September 19, 1545, Francis I. granted Rabelais a permit for the third book (properly the second) of *Pantagruel*, showing that *Gargantua* was then accounted the first and the original *Pantagruel* the second book. Dolet's death in the next year seems to have frightened Rabelais. He took refuge at Metz, where in 1547 we find him employed as a physician by the city. In 1548 Cardinal du Bellay sent for him to come to Rome, where Rabelais wrote a description of the great fête organized by the Cardinal to celebrate the birth of Louis, Duke of Orleans. This was published in 1549 as *La sciomachie et festins faits à Rome*, etc. Soon after Du Bellay's return to France (January 18, 1550) Rabelais was nominated Curé of Meudon, and being assured of royal favor, he published the fourth book of his romance, taking the precaution, however, first to resign (January 9, 1552) his curacies at Meudon and Jambet. The book fell, however, under the censorship of the Parlement. The brief remainder of Rabelais's life is wholly obscure. He probably died in 1553 in Paris (others say Meudon). An early biographer, Colletet, says he was buried in the cemetery of Saint Paul's Parish, Paris. What purported to be a continuation of *Gargantua et Pantagruel* appeared in 1562 separately as *L'He Sonnante*, and in 1567 was incorporated with the

rest as a fifth book. A recension of this fifth book, differing considerably from the others and bearing the date 1549, was discovered in 1900. Some regard it as genuine. Others recall that about that time Rabelais obtained a royal injunction against spurious works issued in his name and think this may be one of them. Parts of it are worthy of him.

In *Gargantua* and *Pantagruel* frank fooling is mingled with keen social satire, political insight, and pedagogic wisdom, but the work is conspicuously lacking in continuity. It may be noted, however, that in the first book, *Gargantua*, will be found, together with the farcical adventures of that giant, the notable deeds of Friar John, and the founding of the Abbey of Thelema, and the quintessence of Rabelaisian social and pedagogical philosophy. The second had for its original descriptive title "Pantagruel, King of the Drunkards, Portrayed According to Life, with His Amazing Deeds and Feats of Prowess." The title of the third, fourth, and fifth books is "Of the Heroic Sayings and Doings of the Good (or Noble) Pantagruel." In both second and third books the central figure is Panurge, an original creation, accomplished, shrewd, but quite without moral character. His debate with himself and his counsel-taking with others as to whether he shall marry, in the third book, is perhaps the most famous passage of the romance. It is finally determined to consult the oracle of the *Dire Bottle*. The voyage in search of this furnishes occasion for the fourth and fifth books. The oracle is 'Trinq.' As nearly as may be Pantagruel is Rabelais. Most of his writing is pure fooling, though always the sport of a philosopher and a scholar, satirizing what he professed to believe, not because he was insincere, but because he saw an essential antinomy in all apprehension of truth—no uncommon attitude of mind during the Renaissance. In him antique reason is opposed to modern faith. He is not an innovator, but a restorer of enlightened paganism, first in that series of Pantagruelists that counts Descartes, Courier, Balzac, and Lemaitre. His very uncleanness of speech is the expression of a lusty animalism in revolt against mediæval asceticism, of a militant faith in nature and instinct, in whose sturdy humor and destructive satire it is to be found the spirit of eighteenth-century ethics and of modern realism. Rabelais does not directly attack the Christian, or even the Roman Catholic faith. He was a freethinker, who clung to the skirts of Catholic faith, a cautious heretic, and no Protestant, a stout defender of free thought in France. Rabelais's influence on the development of fiction was small, but Pantagruel, Panurge, and Friar John are imperishable creations.

The first annotated edition of Rabelais was by Le Duchat and Bernard de la Monnaye (1711). There are subsequent annotated editions by Esmanhart (Paris, 1823-26); Burgaud des Marets and Rathéry (Paris, 1857-58); A. de Montaignon and Louis Lacaud (ib., 1868-73); Marty-Laveaux (4 vols., ib., 1870-81), the best; Pierre Jannet (ib., 1873); Moland (ib., 1881); and Jouart (ib., 1885). There is a very remarkable English translation by Urquhart and Motteux (London 1653-94; often reprinted). Consult the bibliography appended to Marty-Laveaux's study of Rabelais; Petit de Julleville *Histoire de la*

langue et de la littérature française (Paris, 1896-98); and especially Stapfer, *Rabelais, sa personne, son génie, son œuvre* (ib., 1889); Gebhart, *Rabelais, la renaissance et la réforme* (ib., 1895); Henlhard, *Rabelais chirurgien* (ib., 1885); id., *Rabelais, ses voyages en Halle, son œil à Metz* (ib., 1891); and in English, Walter Besant, *Rabelais* (London, 1879); id., *Readings in Rabelais* (ib., 1881).

RABENER, rä'be-nēr, GOTTLIEB WILHELM (1714-71). A German satirist. He was born at Wachau, near Leipzig, went to school in Meissen with Gellert and Gärtner, and after finishing his studies in Leipzig, in 1741 entered the employ of the tax collector. He wrote for the popular periodicals of the day, and of these especially for the *Bremer Beiträge* and Schwabe's *Belustigungen*. These papers are mildly satiric, marked by clearness, purity, and force, yet marred somewhat by the frequent use of 'direct irony,' as Goethe said. They were published at Leipzig (1751-55); with his *Satirische Briefe*, his personal correspondence, and a biography, they were edited by Weisse (1777); other editions followed down to 1840.

RABENHORST, rä'ben-hörst, LUDWIG (1806-81). A German botanist, who contributed greatly to the systematic study of cryptogamous plants. He was born at Treuenbrietzen, Brandenburg, and after studying at Berlin bought a pharmacy at Luckau, where he lived and worked for ten years (1830-40). Then, to devote himself entirely to botany, he removed to Dresden, and afterwards to Meissen. Rabenhorst wrote: *Deutschlands Kryptogamenflora* (1844-53); *Kryptogamenflora von Sachsen, der Oberlausitz, Thüringen und Nordböhmen* (1863-70); *Flora Europæa Algarum Aquæ Dulcis et Submarinæ* (1864-68); and *Mycologia Europæa* (with Gonnemann, 1869-82), as well as some works on general botany. He founded in 1852 the journal *Heidwigia*.

RABIER, rä'byá', ELIE (1846--). A French philosopher and educator, born in Bergerac, and educated there, and in Paris at the Lycée Louis le Grand and at the Ecole Normale Supérieure. He taught philosophy in lycées at Montauban and Tours and in Paris, and then became inspector of secondary schools, a post in which he took a prominent part in educational reforms. He edited Descartes's *Discours de la méthode* (1877; 8th ed. 1899), and wrote an excellent series of text-books of philosophy, *Leçons de philosophie* (1884 sqq.).

RABIES. See HYDROPHOBIA.

RABSHAK'EH (Heb. *Rabshākēh*, Bab.-Ass. *rab-shākē*, chief of the captains). A word which occurs in the Old Testament (II. Kings xviii.-xix., and the parallel passages, Is. xxxvi.-xxxvii.) as the title of the officer sent by Sennacherib with Tartan and Rabsaris (likewise titles of high officials) to demand of Hezekiah the surrender of Jerusalem. The Rabshakeh is represented as delivering his message in Hebrew, in the presence of the people, and when requested to speak Aramaic—at the time the language of diplomatic interchange—so as not to alarm the people by the threats of the Assyrian King, insolently declines to do so. It follows from the choice of the Rabshakeh to convey the message of Sennacherib that he was a high dignitary in the Assyrian army, though not the highest, and

this view is confirmed both by the occurrence of the title in Assyrian historical texts and in legal documents and also in lists of officials (e.g. Rawlinson II., pl. 31, no. 5, 34a). Exactly what position the Rabshakeh occupied is not known, though it is probably not far wrong to regard him as a general staff officer. The old rendering 'chief cup-bearer' is certainly wrong and must be abandoned. Consult Schrader, *Cuneiform Inscriptions and the Old Testament* (Eng. trans., London, 1885-86).

RABUTIN, rá'bu'tán', ROGER, Comte de Bussy-. See BUSSY-RABUTIN.

RACALMUTO, rá'kál-mō'tó. A town in the Province of Girgenti, Sicily, situated on the crest of a hill, 12 miles by rail northeast of Girgenti (Map: Italy, H 10). It has a fourteenth-century castle. There are salt, sulphur, and quicksilver mines, and a trade in wine and oil. Population (commune), in 1901, 15,938.

RACAN, rá'kán', HONORAT DE BŪEIL, Marquis de (1589-1670). A French poet, born at La Roche Racan, Touraine. He was a page to Henry IV. and in that capacity met Malherbe, whose disciple he became. He served in the army for several years, and then retired to his estates. *Les Bergeries*, a dramatic pastoral, appeared in 1625. It is studied from nature and his best production. But he had not the sustained force to write a great work, and he had little education. This becomes apparent in *Les sept psaumes* (1631), *Odes sacrées tirées des psaumes de David* (1651), and *Dernières œuvres et Poésies chrétiennes* (1660), where his limited knowledge of Latin is evident.

RACCONIGI, rák'kō-nē'jé. A town in the Province of Cuneo, Italy, situated on the Maira, 21 miles by rail south of Turin. Its palace, surrounded by a park, was a country residence of Charles Albert. The town has a gymnasium, a technical school, and a large hospital. Silk fabrics, woolen cloths, and shoes are manufactured. Population (commune), in 1881, 9565; in 1901, 9009.

RACCOON (from American Indian *arathcone*, *arrathkune*, raccoon). A small American carnivore (*Procyon lotor*), closely related to the bears. The family (Procyonidae) is American, with the single exception of the Himalayan genus *Ælurus*. (See PANDA.) The raccoon is to be found all over the wooded parts of temperate North America, and most of Mexico, and a second species frequents tropical America. It is about the size of a cat, but more robust in appearance, because of its long fur and the semi-plantigrade feet. The general color is a grizzle, as the grayish hairs are tipped with black; but on the nose and cheeks there are black and white patches, which, with the erect ears, give the countenance a shrewd expression, well justified by the cunning and mischief-loving activity of the little beast. Although it spends much of its time on the ground in search of small animals, insects, and vegetable dainties, it climbs well and makes its home in the hollow of a tall tree, where it sleeps during the day, and hibernates in the colder parts of the country. In the late summer and early fall the raccoon shows a special fondness for ripening corn. At this season also, frogs, crayfish, and wild oysters form a large part of their fare. These they open and scoop out with great dex-

terity. The raccoon, indeed, is as clever with its paws as a monkey. A very singular practice of the raccoon is that of washing everything it eats before putting it into its mouth. Should there be no water at hand, the animal will go through the motions of washing it, rubbing the morsel between its hands until it considers it perfectly clean. It is indeed fond of water in every way, and is a good swimmer.

The hunting of raccoons, which usually is done with dogs, is one of the favorite American sports, especially in the Southern States. This chase is more a matter of sport than profit, although the fur of the raccoon has a considerable value, especially for the making of robes and drivers' overcoats. The hair also is extensively used in Europe, in the manufacture of hats. South America has a similar species of raccoon (*Procyon cancrivorus*), locally called the 'crab-eater,' which is found in all parts of that continent east of the Andes. It takes its name from its great fondness for the land-crabs which abound in South America, and upon which it mainly exists.

Consult: Audubon and Bachman, *Quadrupeds of North America* (New York, 1851); Merriam, *Mammals of the Adirondacks* (New York, 1893); Robinson, *In New England Fields and Woods* (Boston, 1896); Ingersoll, *Wild Neighbors* (New York, 1897); Stone and Cram, *American Animals* (New York, 1902). See Plate of MIXOR CARNIVORES.

RACCOON DOG. A small, short-eared wild dog (*Canis procyonoides*) of Japan and the Chinese coast, which has a curious resemblance in form and color to the raccoon. It haunts the banks of rivers and the seacoast, and feeds at night mainly on fish in winter, and on mice in summer. It lives in burrows, and is said to hibernate, but this assertion needs confirmation. It is not shy, is easily trapped, and its fur and flesh are highly esteemed, especially among the Japanese.

RACCOON OYSTER. See OYSTER.

RACCOON PERCH. The yellow perch. See PERCH.

RACE, CAPE. See CAPE RACE.

RACE-HORSE. See STEAMER DUCK.

RACHEL (Heb. *Rāḥēl*, ewe). A daughter of Laban, the favorite wife of Jacob (Gen. xxxix. 6 sqq., 30), mother of Joseph (ib. xxx. 22 sqq.) and Benjamin (ib. xxxv. 16 sqq.). Jacob served Laban seven years for her, and then, receiving Leah in her stead, was obliged to serve seven years more for Rachel. As Rachel was barren, she gave her husband Bilhah, a servant, for concubine, and thus became the putative mother of Dan and Naphtali (ib. xxx. 1-8). Through 'mandrakes' obtained from Reuben her womb was finally opened (ib. xxx. 14 sqq.). She died in Canaan after giving birth to Benjamin (ib. xxxv. 18). Her tomb is said to have been at Zelzah in the border of Benjamin not far from the sacred tree of Tabor, in the neighborhood of Bethel (I. Sam. x. 2), between Bethel and Migdol Eder, which, according to Micah iv. 8, seems to have been Jerusalem (Gen. xxxv. 16), not far from Ramah (Jer. xxxi. 15), and 'in the way to Ephrath which is Bethlehem' (Gen. xlviii. 7). There must have been a tomb of Rachel in Bethlehem to account for the reference of this pas-

sage to the massacre of infants in Matthew ii. 18. Whether the other passages all refer to the same place or to different tombs cannot easily be determined. Originally the totem of an important clan (Rachel-ewe), the divine ancestress may have been worshiped at more than one tomb, both within the territory of the tribes Joseph and Benjamin and at Bethlehem, which one seems to have belonged to Benjamin (*Bēnē Yamīn*—'Sons of the South'). The Rachel clan itself was probably absorbed in Joseph and Benjamin, though families in Dan and Naphtali may have claimed the same descent. There is a *Kubbet 'Abd el-'Azīz* north of Jerusalem also called *Kubbet Rachel* (tomb of Rachel); the structure at Bethlehem called *Kubbet Rachel* dates from the twelfth century A.D., but may be on the site of an earlier tomb.

RACHEL, *rā'shēl'*, MLE. (1821-58). A celebrated French tragic actress, whose real name was Elisabeth Rachel-Félix. She was born of Jewish parents at an inn in the Swiss village of Mumpf. Her father was a peddler. The family settled for a time at Lyons, where she and her elder sister Sarah used to sing in the streets and cafés. In 1830 they came to Paris. There her singing attracted the attention of Choron, an eminent teacher of music, and he took her as a pupil. Her voice after all proved not very promising, but her dramatic gifts were evident, and she began studying under Saint-Aulaire, the actor. Later she was a pupil in the Conservatoire. In 1837 she secured a position at the Gymnase and made a début which excited no great attention. A few critics, however, perceived her genius, among them Jules Janin, and Mlle. Mars (q.v.) likewise foresaw her future greatness. On June 12, 1838, she made her appearance upon the stage of the Comédie Française, as Camille in Corneille's tragedy of *Horace*. In this rôle and in a series of other impersonations from the classic repertory she achieved great success, and popular admiration of her performances grew to such enthusiasm that for years she was without a rival in the great tragic rôles of Corneille, Racine, and Voltaire. It was in Racine's *Phèdre* that the zenith of her artistic career was reached (1843). Another of her triumphs was in *Adrienne Lecouvreur*, which was written for her by Scribe and Legouvé, but in other modern rôles she was less fortunate. Her relations with her colleagues at the Théâtre Français were by no means always pleasant. Her caprices were without number. In her tours abroad she met with great success, especially in England in 1841 and later, and in Russia in 1852. Her health and popularity in Paris were both failing when in 1855, the year of Adelaide Ristori's first Parisian appearance, Rachel undertook a tour to America with her brother Raphael as manager. She was warmly greeted, though the returns were disappointing, and she soon went back to France in utter physical prostration. A visit to Egypt failed to restore her, and she died of consumption at Canet, near Toulon, January 3, 1858.

Of the details of her private life, which was not exemplary, little need be said. She was constant to her family and helped her sisters who went upon the stage. As an artist, within the limits prescribed by her genius, she was perhaps never equaled. "She does not act—she suffers,"

one said of her. Her *Phèdre* was a portrayal of human agony never to be forgotten.

Matthew Arnold's three sonnets upon her are well known. Consult the *Memoirs of Rachel*, by *Madame de B.*— (Eng. trans., New York, 1858), which are not, however, altogether reliable; Janin, *Rachel et la tragédie* (Paris, 1858); D'Heylli, *Rachel d'après sa correspondance* (Paris, 1882); Kennard, *Rachel* (Boston, 1888); De Mircourt, "Rachel," in *Les contemporains* (Paris, 1854).

RACHITIS, rà-kí'tis. See RICKETS.

RACINE, rà-sèn'. A city and the county-seat of Racine County, Wis., 23 miles south-southeast of Milwaukee and 62 miles north of Chicago, on Lake Michigan, at the mouth of the Root River, and on the Chicago and Northwestern and the Chicago, Milwaukee and Saint Paul railroads (Map: Wisconsin, F 6). It has a pleasant site, some 40 feet above the lake, and is regularly laid out. Among the institutions of the city are Saint Luke's Hospital and the Taylor Orphan Asylum, a public library with more than 7500 volumes, and several other libraries, two of which belong to Racine College (Protestant Episcopal) and Saint Catherine's Academy (Roman Catholic). The post-office, erected at a cost of \$100,000, is one of the finest edifices in the city. Racine possesses a good harbor, and is connected by steamship lines with other lake ports. Its trade is chiefly in farm produce and in the principal manufactured products. As an industrial centre, Racine ranks second among the foremost cities of the State, the output of its various manufactories in the census year 1900 having had an aggregate value of \$12,503,000, and the invested capital having amounted to \$16,753,000. The leading manufactures include agricultural implements, carriages and wagons, foundry and machine-shop products, boots and shoes, leather, trunks and valises, steel springs for cars and carriages, hardware, lumber products, etc. Settled in 1834, Racine was incorporated as a village in 1843, and in 1848 it obtained a city charter. The government, under a revised charter of 1891, is vested in a mayor, elected every two years, and a unicameral council. Of the administrative officers, the fire and police commissioners are appointed by the mayor, and the school board by the mayor with the consent of the council. Population, in 1890, 21,014; in 1900, 29,102.

RACINE, rà'sèn', JEAN (1639-99). The greatest of French tragic poets, born December 21, 1639, at La Ferté-Milon. He received his primary education in Beauvais, at a school affiliated with the Jansenists of Port-Royal; then he passed at fifteen to the more immediate direction of the Port-Royalist teachers at l'École des Granges, where he was taught by the noted Greek scholar Lancelot, and the Latinist Nicole, who was a distinguished moralist, and others skilled in the pedagogy of their time. They left indelible marks, not alone on Racine's mind, but on his character, for the great fact that dominates his whole life is his relation, intellectual and moral, to those solitaries of Port-Royal in whom persisted the Puritan element in the French Church. Sometimes an obedient, sometimes a revolting disciple, he was never indifferent to these influences of his youth. He died in

their fold, and his grave bore the inscription, 'Poet, Recluse of Port-Royal.'

At l'École des Granges and later at the Collège d'Harcourt Racine 'read and annotated all the ancient classics.' He learned by heart long passages from Greek romances and declaimed to astonished friends the choruses of Sophocles, who, with Euripides, remained his dramatic model. He acquired also a puritanic tenacity of mind, and uncompromising uprightness and a reasoned devotion. Yet he had brilliant social gifts, and on his graduation (1658) worldly attractions so prevailed on him that his kindred took alarm. They sent him into a kind of exile at Uzès in Languedoc, where he hoped for a benefice from his uncle, Vicar-General of the diocese. His faults, from a Jansenist point of view, appear to have been intimacy with La Fontaine, Chapelain, other men of letters, and some actors and actresses, and the directing of his talent to dramatic composition and to poems for the Court, especially *La nymphe de la Seine* on the marriage of Louis XIV.

Fifteen months in Languedoc brought Racine no benefice, but he completed his literary education. He read diligently the Greek, Latin, and Italian poets and historians, and the Church Fathers. He returned to Paris (1662) an accomplished scholar, dominated by social and poetic ambition. He was presented to the King, became a fashionable poet, and the intimate of Chapelle, Furetière, Molière, and, above all, of Boileau, who formed in the successful poet a new and fruitful theory of dramatic art. In 1664 he obtained a pension and he was a frequent recipient through life of 'gratifications' from the Court. His earliest play, *La Thébaïde*, on the strife of Eteocles and Polynices, was acted by Molière's company in 1664. His second play, *Alexandre le Grand*, was first performed December 4, 1665, by the comedians of the Palais Royal. December 18th they were astonished to find out that it was being given by a rival company at the Hôtel de Bourgogne. How this came about is unknown, but it ended in a complete breach between Molière and Racine, the latter of whom seems to have been in the wrong, and who presently showed himself as an unfriendly rival to Corneille, and as an unseemly satirist of his old teachers, the Port-Royalists, in a reply to Nicole's *Lettres visionnaires* on the evils of the stage. He wrote also a second reply which Boileau saved him from printing, telling him that it might be a credit to his wit, but was surely none to his heart. He later repented deeply this most discreditable incident in his life. But his irritation at the attitude of his kinsfolk at Port-Royal made his thought more tragically sombre, and while the poet in him was wrestling with the Puritan he wrote *Andromaque* (1667), the first of his seven great plays.

Of Racine's life from 1667 to 1677 we know very little. He lived in close intimacy with at least one actress and produced his only comedy, *Les plaideurs* (1668), and the tragedies *Britannicus* (1669), *Bérénice* (1670), *Bajazet* (1672), *Mithridate* (1673), *Iphigénie* (1674), and *Phèdre* (1677). This last was opposed by a cabal who supported a rival and worthless *Phèdre* by Pradon. Nettled at this or because of a moral dissatisfaction with the result of his theory of dramatic art, Racine withdrew from the stage, made his peace with Port-Royal, and married a worthy woman with more money than culture, and more

good nature than either. Racine's domestic life was happy. He had seven children and a sufficient income from sinecure offices and from the post of royal historiographer, which he shared with Boileau. This involved the duty of accompanying the King to his various 'sieges,' but what Racine wrote was accidentally burned. In 1685 he pronounced in the Academy, of which he had been a member since 1673, a fine eulogy on Corneille, and in 1689 made a kind of return to the stage with *Esther*, written to be acted by the girls at Madame de Maintenon's school at Saint-Cyr. It was a biblical dramatic poem and very successful. *Athalie*, a similar and greater piece (1691), was much less successful. Neither was publicly produced in Racine's lifetime. In his last years he grew ever more devout, wrote four *Cantiques spirituels* and an *Histoire abrégée de Port-Royal*. For this or some other reason he lost Court favor. Tradition says it was for preparing a memoir on the miseries of the people. In March, 1698, he sought to clear himself of complicity in the Jansenist 'heresy' in a long letter to Madame de Maintenon.

A careful examination of Racine's life and letters reveals a puzzling duality, a serious soul and a mobile mind. He was not merely religious; he was credulous and superstitious. He was more than loyal to the King; he was his toy. He was vain, irritable, timid, easily influenced by those he loved or feared. He was gentle and lovable, but the kind of moral goodness that he had was wholly consistent with moral weakness. His mind was keen, supple, strong, with good power of psychic analysis, remarkable delicacy of sentiment, and an exquisite though narrow sense of literary art. The best of him is in his work, a rare combination of wit and feeling, energy and poise, imagination and self-restraint, eloquence and repose.

The production of *Andromaque* makes November 17, 1667, one of the great dates in the history of the French stage. It marked a new conception of the tragedian's art. For Corneille's heroic tragedy is at that moment contrasted with Racine's tragedy of love. Corneille stands for the triumph of will, Racine for the inevitableness of destiny and of passion. This conditions his dramatic form. Since he deals with the universals of human nature, he chooses a conventional environment, whatever least distracts attention and least binds the development and play of passion. With comedy it is different. He puts the scene of *Les plaideurs* in the Paris of his day.

The dominance of passion over will is accepted more readily in women than in men, and Racine's great characters are nearly all women. This is preëminently true of *Phèdre*, *Andromaque*, and *Iphigénie*, his three most popular tragedies. It is true, too, though in a different way, of *Athalie* and *Esther*.

Racine's plays are simple. Each is a problem which the dramatist solves in a way often more consistent with logic than with psychology. Thus the dramatic element is enhanced, for Racine touches only such features in his characters as shall make them stand out clearly and do nothing to hinder the development of his plot. Every person behaves with the utmost decorum; not one of them says anything inelegant or unrefined; there are no visible bloody deeds, no roughness even, and no jesting nor comedy. Herein Racine's men and women constitute an ideal or

rather an unreal society; perhaps it were better to say a society from which such features as did not fit Racine's aesthetic theories are absent. Again, Racine took all his tragic themes from ancient history or legend, but his tragedies are nevertheless of the seventeenth century. Frenchmen in French apparel are called Nero and Achilles. *Iphigénie* is French to the core. Indeed, little remains of the old heroes and heroines, villains, and saints, save their names and the thread of historic tradition. Racine's tragedies teem with anachronisms, but these anachronisms are precisely what quickens the Racinian characters and makes them national or racial. They are not restorations, but vivid adaptations.

Racine's tragedies and his *Plaideurs* are written wholly in Alexandrine verse. In *Athalie* and *Esther* other measures are employed in the choruses. His vocabulary is limited. There are very few allusions to visible nature, to hills, rivers, plants, animals, etc. The whole interest, in a word, is centred in man, and mostly in the aristocracy. The mob, the lowly folk, even middle class people are conspicuously absent. Racine is therefore the poet of the high-born. He has never appealed to the French nation as a whole, but rather to the most cultivated and fastidious classes, who find in him a precise and poetic interpretation of the loftier, more general sides of life.

BIBLIOGRAPHY. Of many editions of Racine the best is Mesnard's (7 vols., Paris, 1863-73). That by Girodet (3 vols., ib., 1801-05) is remarkable for its typography. That of Anatole France is also noteworthy (5 vols., ib., 1874). The first edition is dated 1675-76; the last revision by Racine, 1697. There is an English translation (metrical) by Boswell, in Bohn's Library (London, 1889-91). *Andromaque* was adapted as *The Distressed Mother* by Ambrose Philips in 1712. *Phèdre* was acted in London in English in 1707. For Racine's life we have *Mémoires*, edited by his son Louis (Lausanne, 1747). Consult the popular biographies by Larroumet in *Les grands écrivains français* (Paris, 1898); Deschanel (Paris, 1884); Monceaux ((Paris, 1892); also Stendhal, *Racine et Shakespeare* (ib., 1882); Blaze de Bury, *Racine and the French Classical Drama* (London, 1845); Sainte-Beuve, *Port-Royal*, vol. vi. (4th ed., Paris, 1878); Roy, *Racine; sa vie intime* (ib., 1871), Stapfer, *Racine et Victor Hugo* (ib., 1887); Robert, *La poésie de Racine* (ib., 1890); Deltour, *Les ennemis de Racine* (ib., 1892); De Grouchy, *Documents inédits relatifs à Jean Racine* (ib., 1892); Delfour, *La Bible dans Racine* (ib., 1893). Brunetière, *Études critiques de la littérature française*, vol. i. (Paris, 1880); id., *Histoire et littérature*, vol. ii. (ib., 1884); id., *Les époques du théâtre français* (ib., 1892); and Lemaitre, *Impressions de théâtre*, vols. i., ii., iv. (Paris, 1888 et seq.), contain useful criticism of Racine's dramatic art. The English series of Foreign Classics has a study by Trollope, *Corneille and Racine* (Edinburgh, 1881).

RACK (Goth. *uf-rackjan*, OHG., Ger. *recken*, to stretch; connected with Lat. *regere*, to stretch, rule, Gk. *ὀρέγειν*, *oregein*, Lith. *rūtyti*, Skt. *arj*, to stretch). An obsolete instrument of torture, formerly used for extracting confessions from criminals and suspected persons. It consisted of a large oblong frame of wood, with four beams, slightly raised from the ground, on which the suf-

ferer was stretched and bound. Cords were attached to his ankles and wrists, and gradually strained by means of a lever and pulleys, till—unless the prisoner confessed and was released—dislocation of the limbs ensued. The rack was in use among the Romans in the first and second centuries, and many of the early Christians underwent its tortures. Coke mentions its introduction into the Tower of London by the Duke of Exeter, Constable of the Tower, in 1447, when it came to be called the 'Duke of Exeter's daughter;' its use is mentioned by Hollinshed in 1647, and it became common in the time of Henry VIII. as an implement of torture for prisoners confined in the Tower. The infliction of the punishment of the rack took place during the reign of the Tudor sovereigns by warrant of council, or under the sign manual. In 1628 it was proposed in the Privy Council to put Felton, the murderer of the Duke of Buckingham, to the rack, in order that he might confess as to his accomplices, but the judges resisted the proceeding, as contrary to the law of England. In various European countries the rack was frequently used both by the civil authorities in cases of traitors and conspirators, and by members of the Inquisition to extort a recantation of heresy.

RACK. A liquor. See **ARRACK**.

RACKETS. See **RACQUETS**.

RACKET-TAIL. A name for certain humming-birds (q.v.) two or more of whose tail-feathers are greatly elongated, bare of webs toward their tips, and then suddenly broadly webbed, suggesting the shape of a tennis racket. Several species of extraordinary brilliance inhabit the Andean region, of which the species (*Steganura Underwoodi*) illustrated on the Plate of **HUMMING-BIRDS** is a characteristic example. The name 'puff-leg' is sometimes given to these hummers on account of the mass of loose white feathers about their tarsal joints. Similar tail-feathers occur in other species, as the magnificent *Loddigeria mirabilis* of Northern Peru.

RACK RENT. A rent that is equivalent to the full net annual value of the real property out of which it issues, or approximately so. By statute in England to-day, rack rent is defined to be "not less than two-thirds of the full net annual value of the lands out of which it arises." Rack rent in the ancient sense has probably never been exacted in the United States. See **RENT**.

RACOVIAN CATECHISM. A catechism first printed at Rakow, or Racovia, Poland, in 1605. It was based on the writings of Socinus (q.v.) and presented his doctrines. An English translation was published in London in 1818.

RACQUETS, or RACKETS (Fr. *raquette*, from OF. *rachete, rachette, rasquette, rasquette*, from Sp. *raqueta, raquet*, battledore, from Ar. *rāḥat*, palm of the hand). A modern legitimate descendant of the old game of tennis (q.v.). It is probably of British origin and arose about the beginning of the nineteenth century, being at that time played chiefly in the English debtors' prisons by men who were tennis players, but in their incarceration had to make shift with a less elaborate court. It began as an open-court game, the ball being batted against a single wall so as to rebound within a marked space upon the ground. Other walls were added as the game

developed, and it is now mostly played within a closed court surrounded by four walls and covered with a high roof. The game in America is substantially the same as in Europe, excepting that the courts are somewhat slower and sometimes a trifle smaller, and the balls slightly softer. The game is played by two, or by four, divided into pairs, on a covered court having an asphalted or stone-paved floor space of about 60 feet long by 30 wide (or 80 by 40, for double matches), surrounded by plain plastered walls about 40 feet high at one end and both sides. The other end wall is usually utilized as a gallery for onlookers. On the front wall, on one line, 'the service line' is drawn across eight feet from the floor. Two feet two inches, from the floor on the same wall a board is placed flat across it called 'the play-line or board.' The floor is divided by lines into five spaces, two of which are called 'service boxes.' At the start one player, called the 'hand in,' stands in the service box, and the other, the 'hand out,' in one of the spaces.

PLAN OF RACQUET COURT.

The 'hand in' drops a ball and strikes it so that, without touching either of the side walls, it strikes the front wall, above the service line on the opposite of the centre to that from which he strikes, and rebounds into space. If these conditions are not conformed to, the 'hand out' is not obliged to take the service. If the 'hand in' fails to accomplish the stroke in two attempts, or hits the service board, or roof, or gallery, he loses his service. His opponent is on the watch to hit the ball before it has touched the ground twice, back to the front wall, above the board, and he is at liberty to strike it so that it first

hits the side walls, with penalty. Then the 'hand in' endeavors to return the stroke in the same manner, and thus the game proceeds until a failure to return the ball above the 'service board' counts against the player who fails. The game is fifteen points, scored according to the rules. In the double game each of the opponents serves in turn.

RADAUTZ, rä'douts. A town of Bukowina, Austria, 32 miles south of Czernowitz. Its manufactures include machinery, paper, leather, and wagons. An Imperial stud, with about 1500 horses, is located here. Population, in 1900, 14,343.

RADBERTUS, PASCHASIUS. A Benedictine monk. See PASCHASIUS RADBERTUS.

RAD'CLIFFE. A cotton-manufacturing and coal-mining town in Lancashire, England, on the Irwell, two miles southwest of Bury (Map: England, D 3). It owns a market and maintains water and gas works. Population, in 1901, 25,350.

RADCLIFFE, ANN (1764-1823). An English romancer, born in London, July 9, 1764. Her maiden name was Ward. In her twenty-third year she married William Radcliffe, a student of the law, afterwards editor and proprietor of the *English Chronicle*. The group of romances by which she became famous comprise: *The Castles of Athlin and Dunbayne* (1789); *A Sicilian Romance* (1790, several times published in Italian); *The Romance of the Forest* (1791, translated into French and Italian and dramatized); *The Mysteries of Udolpho* (1794, translated into French by Chastanay); and *The Italian, or the Confessional of the Black Penitents*, badly dramatized by John Boaden, and put on at the Haymarket as the *Italian Monk*, and translated by the Abbé Morellet (1797). After 1797 Mrs. Radcliffe lived in retirement, and there were false rumors that she had gone insane over the horrors conjured up in *Udolpho*. After her death, February 7, 1823, appeared an historical romance, *Gaston de Blondville* (1826). Of interest also is *A Journey Through Holland and Germany* (1795). Mrs. Radcliffe was an exceedingly popular romancer. For *Udolpho* she received £500, and for *The Italian*, £800—unprecedented sums before the advent of *Waverley*. They were also translated into French. Mrs. Radcliffe gave vogue to the so-called Gothic romance founded by Horace Walpole, the motive of which is to awaken wonder and awe at mysteries, to be finally explained away. Having a real passion for deep woods, mountains, storm, and sea, she was able to add a new interest to fiction. Consult the brief memoir prefixed to *Gaston de Blondville* (1826); Scott's introduction to her romances in Ballantyne's *Novelists Library* (London, 1824); Beers, *English Romanticism* (New York, 1898); and see NOVEL.

RADCLIFFE, CHARLES BLAND (1822-89). An English physician, born at Brigg, Lincolnshire, the brother of John Netten Radcliffe (1826-84), the epidemiologist. He studied under a practicing physician at Wortley, and afterwards in Leeds, in Paris, and at the London University, where he graduated in 1851. He was appointed physician to the Westminster Hospital in 1857, and in 1863 was made physician to the National Hospital for the Paralyzed and

Epileptic. He was Gulstonian lecturer in 1860, and Croonian lecturer in 1873, to the Royal College of Physicians of London. His works include: *Proteus, or the Law of Nature* (1850); *The Philosophy of Vital Motion* (1851); *Epilepsy and Other Affections of the Nervous System, etc.* (1854); *Dynamics of Nerve and Muscle* (1871); and *Vital Motion as a Mode of Physical Motion* (1876). With Ranking he edited Ranking's *Abstract of the Medical Sciences* (1845 to 1873).

RADCLIFFE, or RADCLYFFE, JAMES. See DERWENTWATER, third Earl of.

RADCLIFFE, JOHN (1650-1714). A celebrated English physician, and the founder of the Radcliffe Library at Oxford. Born at Wakefield, in Yorkshire, and instructed in Greek and Latin at the grammar school of his native town, at the age of fifteen he was sent to University College, Oxford. In 1672 he took his degree of M.A., applied himself to the study of medicine, and having taken his degree of M.B. in 1675, began to practice as a licentiate at Oxford. He immediately made himself conspicuous by the originality of his ideas. In less than two years his skill had made him famous. In 1682 he took the degree of M.D. In 1684 Radcliffe removed to London, where in less than a year he became the most popular physician of his time. In 1686 the Princess Anne of Denmark made him her physician. After the Revolution he was sent for by King William frequently, and the example of the sovereign was followed by most of the nobility and influential persons about the Court.

In 1694 he was called upon to attend Queen Mary when attacked by the smallpox, in her last illness, as Dr. Radcliffe predicted, before seeing her, merely upon reading the prescriptions of the other physicians in attendance before he was sent for. Being himself ill, he was unable to attend Queen Anne during her last illness, and her death preceded his by a few months. In 1713 he was elected M.P. for Buckingham. Dr. Radcliffe died at Carshalton, and was buried at Oxford in Saint Mary's Church with much ceremony. He died possessed of considerable property, the whole of which he bequeathed to public uses. Thus, to University College he left his estate in Yorkshire, in trust, for the endowment of two traveling fellowships, and the purchase of perpetual advowsons, together with £5000 for the enlargement of the college buildings. He left £40,000 for the erection of a public library in Oxford, since known as the Radcliffe Library, which he endowed with £150 per annum for a librarian, and £100 per annum for the purchase of books. The Radcliffe Observatory at Oxford was erected through his munificence. He also bequeathed a legacy to Saint Bartholomew's Hospital, London.

RADCLIFFE COLLEGE. An institution for the higher education of women at Cambridge, Mass., founded in 1879 by the Society for the Collegiate Instruction of Women. It had no official relations with Harvard University, although popularly known as the Harvard Annex, until 1894, when by act of the General Court of Massachusetts its name was changed to Radcliffe College in honor of Anne Radcliffe, the first woman to give a money endowment to Harvard. It had in 1903 a faculty of 92, almost all of whom were instructors in Harvard University,

and 429 students. The requirements for admission and for the degrees of bachelor of arts and master of arts are identical with those of Harvard College, and the courses of instruction are for the most part the same. In addition, much of the advanced instruction of the university is open to Radcliffe students. The institution had in 1903 a working library of 18,750 volumes and 1100 pamphlets; buildings and grounds valued at \$490,000; and an income of \$93,130. Sixteen scholarships, each sufficient to meet the tuition fee of \$200, are awarded annually.

RADDE, rä'd'de, GUSTAV FERDINAND RICHARD (1831—). A German-Russian naturalist and traveler, born at Danzig. After accompanying the Russian expedition to Southeast Siberia (1855-60) and going with Von Baer on his scientific trip through Southern Russia (1862), he founded at Tiflis the Museum of the Caucasus, of which he became director. In this capacity he traveled through Upper Armenia (1871), Northern Persia (1879), Daghestan (1885 and 1894), Khorasan (1886), and along the eastern coast of the Black Sea (1890). Among his works are: *Reisen im Süden von Ostsibirien* (1862-64); *Vier Vorträge über den Kaukasus* (1874); *Die Chevresuren und ihr Land* (1878); in Russian a description of his voyage with the grand dukes Alexander and Sergeis Mikhailovitch (1892); *Das Ostufer des Pontus* (1894); and *Die Sammlungen des kaukasischen Museums* (1900 et seq.).

RADEBERG, rä'de-bërk. A town in the Kingdom of Saxony, Germany, situated about ten miles northeast of Dresden (Map: Germany, E 3). It has glass works, paper mills, and manufactures of nails, safes, furniture, etc. Population, in 1900, 12,918.

RADECKE, rä'dë-ke, ROBERT (1830—). A German composer. He was born in Dittmannsdorf, in Silesia, and received his musical training in the Conservatory of Leipzig. In 1853 he became musical director of the Court Theatre of that city. He removed to Berlin soon after, played second violin in Laub's quartet, and gave many successful concerts. He was made royal Kapellmeister in 1871, and in 1891 succeeded Haupt as director of the Royal Institute for Church Music. An artist of ability on pianoforte, organ, and violin, Radecke is best known for his compositions, which include two orchestral overtures, *König Johann* and *Am Strande*; the operetta *Die Mönkgüter* (1824); and, above all, for his many songs.

RADEGUN'DIS, SAINT (519-87). The patron saint of Poitiers, in France. She was the daughter of Berthar, a prince of Thuringia. Having been carried as a prisoner to the country of the Franks in the twelfth year of her age by Clotaire I., King of the district whose capital was Soissons, she was educated in the Christian religion, and when she reached a mature age was induced, reluctantly, to become the wife of Clotaire. Her own wish having been to become a nun, her married life was in great measure given up to works of charity and religion. In 544, her husband having murdered her brother, she fled from the palace and retired to the monastery at Noyon. Afterwards she founded a monastery at Poitiers, in which she lived as a simple sister, but which she endowed richly, not only with money and

lands, but also with relics and other sacred objects. It was on the occasion of the translation to her church at Poitiers of a relic of the holy cross that the poet Vexantius Fortunatus composed the celebrated hymn *Vexilla Regis Prodeunt*.

RADETZKY, rä-dëts'kë, JOSEPH WENZEL, Count (1766-1858). An Austrian field-marshal, born in Trzebnitz, Bohemia. In 1784 he became a cadet in an Hungarian cavalry regiment. His first campaign was against the Turks in 1788-89. He fought in the wars of the French Revolution and the Napoleonic wars, attaining the rank of major-general in 1805 and lieutenant-field-marshal in 1809. In that year he fought bravely at Aspern and Wagram. After the conclusion of peace he became chief of the quartermaster-general's staff and took a leading part in the reorganization of the Austrian Army. In 1813-14 and 1815 he was chief of staff of Triure Schwarzenberg. He distinguished himself at Kulm, and was wounded at the battle of Leipzig. In 1831 he commanded in Italy, and in 1836 he became field-marshal. On the outbreak of the insurrection in Lombardy in 1848 Radetzky was driven from Milan after five days of desperate fighting and fell back on Verona. His position was for a time precarious, but having received reinforcements he was enabled to assume the offensive, and inflicted a crushing defeat on the Sardinian King Charles Albert at Custoza, July 25, 1848. A six months' armistice was agreed to, and war was not resumed by the Piedmontese till March, 1849. Radetzky was this time better prepared, and at once invaded Piedmont. He totally routed the enemy at Novara, March 23, 1849. Peace was concluded with Sardinia, and Radetzky besieged Venice, which surrendered after a long siege (August 23d). He was then appointed Governor-General of Lombardy and Venetia, and ruled with absolute authority till his retirement in February, 1857. He died at Milan. There are biographies of Radetzky by Kroner (Vienna, 1891) and Schönhals (Stuttgart, 1858). Consult, also: Troubetzkoi, *Campagnes du comte Radetzky dans le nord de l'Italie en 1848 et 1849* (Leipzig, 1860); Kunz, *Die Feldzüge des Feldmarschalls Radetzky in Oberitalien* (Berlin, 1890).

RADFORD, Mrs. ERNEST (maiden name DOLLY MAITLAND) (1858—). An English writer of verse, born December 3, 1858. In 1891 she won attention with a volume of beautiful lyrics, entitled *A Light Load*. She next published *Songs for Somebody* (1893); *Songs and Verses* (1895); *One Way of Love, an Idyl* (1898); and *Poet's Larder and Other Stories* (1900).

RADFORD, WILLIAM (1808-90). An American naval officer, born at Fincastle, Botetourt County, Va. He entered the navy in 1825, and rose through successive grades to the rank of rear-admiral, which he attained in 1866. He distinguished himself at Mazatlan in 1847 during the Mexican War, and commanded the *Cumberland* in 1861, but was on court-martial duty at Old Point Comfort when that vessel was sunk by the *Merrimac*. He served in both attacks on Fort Fisher in 1864-65, was in command of the *New Ironsides* under Admiral Porter, and in 1869-70 commanded the European squadron. In 1871 he was retired from the service.

RADIANT. See CIRCLE.

RADIANT STAR, ORDER OF THE. An order of Zanzibar, founded by Sultan Bargash ben Said in 1875. It has two classes, of which the first is given only to sovereigns, the second forming an order of merit with four divisions. The decoration is a red cross with five arms edged with white on a green wreath. The circular medallion bears the Sultan's name. The cross is suspended by a wreath from a red ribbon edged with white.

RADIATA (Lat. nom. pl., having rays). The lowest of Cuvier's four great divisions of the animal kingdom. It derived its name from the organs of sense and motion being disposed as rays round a centre, and included (1) the Echinodermata, (2) the Entozoa (or intestinal worms), (3) the Aculephæ (or sea-nettles), (4) the Polyphi, and (5) the Infusoria. See CLASSIFICATION OF ANIMALS.

RADIATION (Lat. *radiatio*, a shining, from *radiare*, to shine, from *radius*, ray). The name given to the quantity of energy carried by ether-waves or sometimes simply the waves themselves. Since wave-motion involves both the vibration and the displacement of the medium carrying the waves, there is always both kinetic and potential energy associated with the advance of a train of waves. A source which is emitting trains of waves is losing energy, and a body which absorbs them gains energy.

Ether-waves may be divided into two classes: irregular pulses, analogous to the disturbances produced in the surface of a pond by dropping into it at irregular intervals a number of stones; and regular trains of waves, analogous to the aerial waves produced by a vibrating tuning fork. It is believed that the radiation called 'Röntgen rays,' or 'X-rays' (q.v.), is of the nature of the former; while the waves emitted by a flame, the sun, etc., are of the latter kind. They should have quite distinct properties, from theoretical considerations. Irregular pulses, if very abrupt, should not be refracted, diffracted, or polarized; their 'rays' should pass in straight lines. Regular periodic trains of waves should obey the ordinary laws of light (q.v.).

Periodic trains of ether-waves are emitted by all portions of matter, owing to the vibrations of the 'atoms;' they are also produced by electric oscillations. The lengths of these waves can be measured by suitable means—by diffraction gratings (q.v.) and by calculation, in the case of those due to the latter cause. Those waves produced by ordinary matter, which have been actually observed, vary in length from 0.000015 cm. to 0.006 cm.; and waves produced by electrical oscillations have been obtained whose lengths were as small as 0.4 cm., although in general they are much longer. When these waves are incident upon portions of matter, they may be partially reflected if the body is large compared with the wave-length; they may be transmitted or pass around it; or they may produce vibrations in the body by resonance, and so be absorbed themselves. Thus long ether-waves produced by electrical oscillations may produce electric oscillations in suitable electrical conductors. (See ELECTRICITY; WIRELESS TELEGRAPHY.)

The shorter ether-waves emitted by material bodies in their natural condition may be absorbed by other material bodies. In this process of absorption the amplitude of the waves dies down, and their energy is gained by the body which absorbs them. This absorbed energy is spent in various ways, depending upon the length of the absorbed waves and the nature of the absorbing body. To measure the energy carried by any train of waves it is necessary to have the absorbing body such that it absorbs all the energy—that is, neither reflects nor transmits the waves—and consumes it in producing rise of temperature. In the case of extremely short waves, chemical action may be produced; the limits of wave-length so far as now known which will do this are from about 0.00007 cm. to 0.000015 cm. Waves whose wave-lengths lie between about 0.00007 cm. and 0.000035 cm. affect the sense of sight of most human beings. In fluorescent bodies the energy due to absorption is spent in emitting other ether-waves.

The radiation from any body is as a rule characteristic of its temperature and the nature of its surface principally; there are, however, many cases when this is not true. Such exceptions are fluorescing and phosphorescing bodies, gases through which an electrical discharge is taking place, bodies such as the salts used in a Welsbach mantle, which are rendered luminescent at quite low temperatures. *The following statements do not apply to these exceptional cases.* Since absorption is due to resonance, it is natural to expect some connection between the radiation emitted from a body and its absorptive properties. It was shown, first by Balfour Stewart and later by Kirchhoff, that the 'emissive power' of any body is identical with its 'absorptive power' at the same temperature. The absorptive power of a body for a train of waves of a definite wave-number is defined as being the fraction of the incident radiation of that wave-number which the body absorbs. A body which absorbs all waves absolutely is called a 'black body.' The emissive power of a body for a train of waves of a definite wave-number is defined as the ratio of the energy radiated by 1 sq. cm. of the surface of the body in the form of waves of the specified wave-number to that emitted by 1 sq. cm. of a 'black body' under the same conditions of temperature and in the same form. This law can be expressed in symbols: let E be the energy emitted by 1 sq. cm. of a 'black body' at a given temperature in the form of waves of a definite wave-number; let a be the absorptive power of any body for waves of this kind; then e , the energy emitted by 1 sq. cm. of this body for these waves, is given by the formula $e = aE$.

Balfour Stewart's law asserts the identity of the emissive and absorptive powers of a body at any one temperature in all respects, wave-number and polarization. This principle is the basis of spectrum analysis. See SPECTROSCOPY.

It is important, therefore, for theoretical reasons to realize as nearly as possible a 'black body' and to study its radiation at different temperatures. This has been done within recent years, notably by Paschen and by Lummer and Pringsheim. It can be shown that the radiation

inside a hollow solid, whose walls are at a uniform temperature, is identical with that which a 'black body' at that temperature would emit (with certain simple limitations); and so, if a narrow slit is made in the walls of this hollow solid, the radiation which escapes can be studied. To absorb and measure the radiation, it is necessary to coat with some 'black' substance a sensitive thermometer or instrument for measuring changes in temperature; for this purpose a bolometer or radio-micrometer or radiometer is covered with lampblack, which is almost 'black' for most waves. In this way the radiation of a 'black' body characteristic of definite temperatures has been studied; and it is possible to express the results in various formulae. One of these is called Stefan's law; it states that the total radiation of a 'black body' whose surface is S sq. em., and whose absolute temperature is T (i.e. $273 + t^{\circ}$ C), can be expressed as proportional to ST^4 . Other laws connect the temperature and the radiation of definite wave-lengths. As the temperature is increased, so is the radiation. If two bodies at different temperatures are put together, the one at the higher temperature emits more energy than it absorbs, while the reverse is true of the other body. In the end their temperature should become equal.

For a full discussion of the radiation of a 'black body,' reference should be made to the papers by Lummer and Wien, *Reports of International Congress of Physics*, vol. ii. (Paris, 1900), and to recent articles by Paschen in *Annalen der Physik*. The original memoirs by Kirchhoff, Stewart, and others are given in Braue, "Radiation and Absorption," *Scientific Memoir Series*, vol. xv. (New York, 1901). See HEAT AND LIGHT.

RADIATION OF HEAT. See HEAT.

RADICAL AXIS. See CIRCLE.

RADICALISM (from *radical*, from Lat. *radicalis*, relating to a root, radical, from *radix*, root; connected with Gk. *ῥάδιξ*, *rhadíx*, root, *ῥάδαμος*, *rhadamnos*, branch, Goth. *waúrts*, root, OHG. *wurz*, Ger. *Wurz*, AS. *wyr*t, Eng. *wort*, weed). In modern history generally, the temper of mind which is most opposed to the conservative, and aims at constant and progressive reform of political institutions. The word was first used of a political party in England about 1819 though a Radical Party, marked off by clear distinctions from the Whigs, may be said to have originated in 1769 with the first concerted movement to reform and control Parliament by pressure from without. Oddly enough, the efforts of the first Radicals were directed not against the Crown or the House of Lords, but against the House of Commons. Radicalism in its origin was a middle-class movement; its active men were a limited class of voters who conceived that their rights were being infringed. Their first popular leader was Wilkes.

A second period extends from 1789 to 1831. The mighty influence of the French Revolution brought up a new class of Jacobinical Radicals. Under Thomas Paine and Godwin, significant changes took place in their attitude. The Crown and the House of Lords were attacked; complaints of oppressive taxation were heard; and the leaders of the school were most of them men who rejected religious creeds. The first quar-

ter of the nineteenth century was a discouraging time for the Radicals, but they were not disheartened. This period witnessed the rise of the most profound and systematic philosophy of radicalism that had yet been formulated. The scientific or philosophical Radicals now came forward, with Bentham and James Mill, with Ricardo and Grote and Joseph Hume. They gained a powerful organ when in 1824 they founded the *Westminster Review*. But there were also practical reformers, and the party was beginning to be recognized as having a definite existence. The working classes now began to take a greater part in the movement, and the first hints of modern socialism were given by Spence and Owen.

The third period opens with the definite agitation for reform of Parliamentary representation, which is part of general English history. While the Radicals lent their support to the movement for the passage of the Reform Bill, they regarded its results with disappointment, and tended to become more and more sharply dissociated from the Whigs who had passed it. The hope of further enfranchisement of the people seemed slight; and the feeling of despair thus engendered gave rise to one of the most important phases in the history of English radicalism, the Chartist movement. (See CHARTISM.) The Anti-Corn Law agitation, though the work of Radicals, especially of their two brilliant leaders, Cobden and Bright, was not an essential part of their campaign. Yet the Manchester school of politicians may be called the dominant type of Radicals from say 1840 to 1885, the connecting link between those of the beginning and end of the century. Though from a despised and persecuted sect, the Radicals, especially under the strong leadership of Chamberlain, succeeded in becoming the controlling force in the Liberal Party, their triumph is not so complete as it appears, and many of the reforms to which strict theoretical Radicals have all along been committed seem as far as ever from accomplishment.

On the Continent there is a strong tide of Radicalism. France has had a strong Radical Party, under one name or another, ever since the outbreak of the Revolution. Its tenets are those of the party wherever it is found—the widest possible liberty for the individual. In addition the French Radicals have been the most persistent opponents of monarchy, and to their efforts the success of the revolutions of 1830 and 1848 may be attributed. To-day they are a strong party. In Germany the rise of the Radicals is of a comparatively recent date. The Socialists, both in Germany and France, must be considered as closely allied to the Radicals. Consult: *The Radical Programme* (London, 1885); Lowell, *Parties and Governments of Continental Europe*, 2d vol. (Boston, 1897); Kent, *The English Radicals* (London, 1899). See POLITICAL PARTIES.

RADICLE, or RADICAL (in chemistry). See CARBON COMPOUNDS.

RADIOACTIVITY. The name given to the property which uranium, thorium, and other bodies to be described presently have of sending out certain radiations spontaneously. Immediately after the discovery of X-rays by Professor Röntgen in 1895 many physicists began investigations in order to see whether phosphorescent bodies in general would not emit rays of the

same character. Among these was Prof. H. Becquerel of Paris. He, in the first months of 1896, made the great discovery that the salts of uranium emitted spontaneously certain radiations which would affect a photographic plate. He also found that these radiations would, like X-rays, discharge electrified bodies, produce phosphorescence, and traverse many bodies which were opaque to ordinary light. The name 'Becquerel rays' was given to these radiations. They were investigated immediately with the greatest care by many others, particularly by E. Rutherford, who was then a student in the laboratory of J. J. Thomson, Cambridge, England; and their properties will be described below. In the search for other substances which would emit radiations similar to those described above, it was discovered, almost simultaneously, by Professor Schmidt and Madame Curie of Paris, in the year 1898, that the salts of thorium emitted rays similar to those of uranium. M. and Mme. Curie began a prolonged investigation of all metals and metalloids, the rare earths, and a great number of rocks and minerals, in the hope of discovering other radioactive bodies, and were rewarded by discovering that pitchblende, which is a mineral containing the oxide of uranium and other substances, was much more active than pure metallic uranium. By a series of chemical separations, they were able to isolate two substances, 'radium' and 'polonium,' which were most intensely radioactive, in some cases several thousand times more so than uranium.

Radium is undoubtedly an element with a definite atomic weight and is found to accompany the barium which is separated from pitchblende. It is not yet proved that polonium is an element, but it is a substance which accompanies the bismuth separated from the pitchblende and is similar to it in its chemical properties. The discovery of these substances was made in 1898; and in 1899 another radioactive substance was discovered by M. Debiere which he called 'actinium,' and which accompanies certain bodies of the iron group contained in pitchblende and seems to be connected with thorium. It has been shown by recent investigators that almost all substances in nature are to a greater or less extent radioactive. Among these may be mentioned the leaves of plants, freshly fallen rain or snow, etc.; and the hypothesis has been advanced that this radioactivity is due to certain radiations emitted by the sun itself and which are connected with the appearance of the aurora borealis and the other phenomena of atmospheric electricity. In the spring of 1903 it was discovered by Prof. J. J. Thomson that the water obtained from deep wells contained a radioactive gas; and beyond a doubt other substances will be found which possess this power of radioactivity.

The properties of the radiations which are obtained from radioactive bodies may be grouped under various heads: chemical, electrical, fluorescent, and physiological. Among the chemical properties it may be sufficient to mention the photographic action of the rays and their power to color glass and porcelain, and in certain cases to produce ozone. The electrical properties of the radiations are the most interesting, as they have led to several most important advances in the theories of matter and electricity. These will be discussed more fully in what follows; but, in

brief, the most obvious electrical effect of the radiations is to make a gas through which they pass a conductor for electricity. In regard to the fluorescent properties nothing need be said except to state that a great number of substances fluoresce under their action. The most important physiological actions so far studied are their power to produce luminosity in the human eye, to cause the same kind of peculiar burn of the skin as do X-rays, and in certain cases to paralyze the nerve centres. It is extremely probable that these radiations have the same therapeutic properties as do X-rays in such diseases as cancer, lupus, etc.

As stated above, these radiations possess the power of penetrating and passing through many substances which are opaque to ordinary light; but it was soon discovered that there were differences in this power which could only be explained by assuming that the radiations were complex in their nature, being made up of two groups, one very easily absorbed, the other extremely penetrating. The attempt was made to see whether either of these groups of radiations could be reflected, refracted, diffracted, or polarized, but it was found that they possessed none of these properties. It was discovered, however, that although in this last respect the radiations were similar to X-rays, they differed from them in being deviated by a magnetic field. This proves that the radiations from radioactive bodies are not disturbances in the ether similar to X-rays or light, but are electrified particles of matter moving at a rapid rate. It was discovered by several observers that the penetrating rays were easily deflected by a magnetic field, and in such a direction as to prove that they were carriers of negative electrical charges. It has been shown that an electrically charged body, if in rapid motion, is equivalent to an electric current, and since an electric current, if free to move in an electric field, is acted upon mechanically by the field, therefore an electrified particle in motion will have the direction of its path changed if subjected to a strong magnetic field, and the direction of the deflection will depend upon whether the particle is charged positively or negatively. It may be shown that there is a mathematical connection between the mass of the moving particle, its electrical charge, its velocity, the strength of the magnetic field, and the amount of the deflection produced.

For obvious reasons, a charged particle in motion will have its direction also changed if it is made to pass through an intense transverse electrical field. It was not, however, until 1902 that it was proved, by Rutherford, that the easily absorbed, non-penetrating radiations were deflected also by a magnetic field, but in such a direction as to prove that they were positively electrified bodies. Thus the former rays are like the cathode rays in an ordinary vacuum tube; the latter, like the so-called canal rays. By means of experiments which need not be described here, it has been shown that although the electrical charges carried by the two kinds of radiations are equal and, so far as is known, identical with the charge carried by a hydrogen ion in ordinary electrolysis, nevertheless, their masses are quite different. The mass of a particle of the α radiations, as the non-penetrating rays are called, is comparable with that of a hydrogen atom; while the mass of a particle of the β radiations,

as the penetrating rays are called, is approximately one-thousandth as great. The velocities with which these particles are emitted are extremely great, but vary within wide limits with the substance emitting them and its condition. The velocity may be as great in certain cases as 2×10^{10} cms. per second, which is approximately as great as the velocity of light. It is interesting to note that Prof. J. J. Thomson has shown from the observations of Kaufmann that the total mass of the β radiations may be accounted for as due to the motion of the charge; because, as explained in the article on MATTER, an electrified particle in motion has a mass greater than that which it would have if it were not charged, and therefore electricity, by itself, in motion has the properties of matter, so far as inertia is concerned.

A most remarkable discovery was made by Rutherford in his investigation of the properties of thorium. He found that there was given off spontaneously by the salts of thorium an emanation which could be blown from one vessel into another, which was radioactive itself, and which had the power of producing radioactivity in the walls of the vessel with which it came in contact. Similar emanations are given off by radium, but so far have not been discovered with uranium or polonium. Rutherford has shown that the emanation has the properties of an inert gas of a comparatively high atomic weight; it can be condensed at the temperature of liquid air and again vaporized; it can diffuse through porous partitions, and it can be occluded. The emanation as it leaves the body which produces it has no electrical properties, but it soon emits β radiations, and therefore becomes positively charged itself. If, therefore, there are any negatively electrified bodies in the neighborhood, the particles of the emanation will settle upon them; and it has been observed, as stated above, that these bodies now become radioactive. Certain chemical changes go on, and there is produced a condition, or better, a substance, which has been called 'excited activity.' This in turn is radioactive; and the radiations or emanations from it produce a secondary excited activity in neighboring bodies. In the case of radium this secondary excited activity produces a tertiary activity; and it is not known where the process stops. Observations made during the summer of 1903 show that in these cases, after these slow changes, a gas appears which beyond a doubt is helium. This, then, is the end-product.

The method by which the radiations from radioactive bodies produce their effects is not yet established, although many facts are now clear. It has been shown that the α radiations produce almost the entire action of the radiation, as might be expected from the fact that, although moving so rapidly and having so large a mass, they are so easily absorbed. The process of making a gas a conductor for electricity, or of 'ionizing' it, as it is called, consists in breaking up its electrically neutral molecules into electrified parts, or 'ions,' which are therefore acted upon by an electric field. This process of dissociation of the gas is brought about in some manner by the motion through the gas and absorption by it of the rapidly moving α and β radiations. The various other actions of the rays, namely, the chemical, physiological,

and other ones, can be accounted for roughly from obvious mechanical principles.

The explanation of the cause of the emission of these radiations by the various radioactive substances is also not yet clear, although a great step has been made in advance by Rutherford and Soddy of McGill University. They have shown that if to a salt of thorium (thorium nitrate, for instance) ammonia be added, a precipitate is formed; and, if this be separated from the solution by filtration, the resulting filtrate, called thorium X, is found to be extremely radioactive, while, on the other hand, the precipitate is at first but slightly radioactive. The thorium X, which can be separated from the filtrate by evaporating the ammonia, is found to lose its radioactivity with time, and to set free the emanation simultaneously; while the precipitate referred to above, which is at first radioactive to only a slight degree, rapidly increases in activity. It is found further that, as the precipitate gains in activity, chemical changes go on of such a nature that, if it be now dissolved in ammonia, it will be seen that thorium X has been formed in the process. This means that starting with the almost inactive thorium, owing to the chemical changes thorium X is formed in it as a definite substance, which may later be separated from it, and that coincident with these chemical changes the α and β radiations are emitted. In short, the radioactivity of thorium, and of the other substances also, is maintained by the continued production of new kinds of matter which have well-defined chemical properties enabling them to be separated from the original substance, and which possess temporary activity. In a similar manner the thorium emanation is formed from the thorium X, and the thorium excited activity from the thorium emanation, etc. The final product, as stated above, and as was first conjectured by Rutherford, is the gas known as helium.

It has been shown that the changes just described do not take place simultaneously, but in the order given, and that the radioactivity of each of the compounds, for instance, thorium X, is connected not with the change in which it was produced, but with that by which the next substance is produced from it. It follows from this that a body which is radioactive must of necessity be undergoing change; and, therefore, it is not possible for any of the new forms of radioactive matter, for instance, thorium X, the emanations, etc., to be identical with any of the known elements. They remain in existence unchanged for but a short time, and the decay of their radioactivity is an indication of their diminishing quantity.

As has been described above, there is a definite series of changes by which thorium produces thorium X, thorium X produces thorium emanation, and so on. This same series of steps holds to a certain extent with the other radiations so far as studied, although the series is in no other case so complete. Radium has been shown to produce a radium emanation, and this to produce an excited activity, and so on; the small amount of radium so far available for investigation has made it impossible to learn whether there is an intermediate product, radium X, between radium and its emanation. Uranium has been shown to produce uranium

X; but an emanation from it has not yet been discovered. Both kinds of radiation, the α and β , are not present to the same extent in all the transformations which occur in these various cases; and in some only the α radiations have been detected and in others only the β radiations. It seems probable, however, that the production of the α radiations goes on quite independently of the β radiations, which is a secondary phenomenon, the α radiations playing by far the most important part in the changes which take place in radioactive matter.

One of the most important questions connected with radioactivity is that of the origin of the energy which is manifested by the expulsion of these rapidly moving particles. The amounts of this energy have been measured approximately, and various theories have been advanced based upon obvious assumptions in regard to the nature of the atom and the motion in it of its parts, which are to a certain degree satisfactory. The atom is thought to consist of a definite space within which are moving many thousand particles negatively charged, and which are identical with the β radiations. If the atom is unstable, it is not difficult to see that some of these particles might be from time to time thrown off, and a consistent theory of matter along these lines has been devised by Professor J. J. Thomson. One of the most interesting evidences of the intense energy furnished by these radioactive bodies is the fact that M. Curie has shown that in certain experiments radium sets free in a continuous manner energy in such a form as to maintain itself at a temperature higher than that of the surrounding bodies, and of such an amount that one gram of radium would raise the temperature of one hundred grams of water one degree Centigrade in an hour. A noteworthy fact is that the radioactive substances uranium, thorium, and radium are of very high atomic weights, standing at the end of their groups of elements in the Periodic Table; and that therefore they may mark a condition in which matter is on the verge of instability under present conditions of pressure and temperature.

For the more detailed statements in regard to the properties of radioactive bodies, reference should be made to articles by Rutherford in the *Philosophical Magazine*, and to a popular article, "Some Recent Advances in Radioactivity," by Professor Soddy, in the *Contemporary Review*, May, 1903.

RADIA/LA/RIA (Neo-Lat. nom. pl., from Lat. *radiolus*, diminutive of *radius*, ray). A group of minute marine animals forming an order of rhizopodous Protozoa (q.v.). About 85 families, including many thousand species, are known, most of them microscopic. They live in the surface water of the ocean and their shells, after death, sink to the bottom and form siliceous deposits, known as radiolarian ooze. (See OOZE.) They are distinguished from all other Protozoa by their complex and generally very beautiful shells, which are composed of silicon, except in a few cases where either the material is a horny substance called 'acanthin,' or the shell is entirely wanting. The radiolarians are further distinguished by the presence of a peculiar, membranous, inner capsule. This is either spherical

and perforated by numerous small openings or it is ovoid with a single large opening. Within it is some clear transparent cytoplasm and the nucleus, while outside is a layer of protoplasm which is covered by a gelatinous envelope, known as the calymna. The skeleton or shell consists of one or more fenestrated spheres: when more than one are present they are concentric. They are connected with each other by radiating rods and spicules which are usually continued outside the outermost sphere as projecting spines, and may be continued inwardly to meet within the centre of the capsule. The variety of form and arrangement is very great and is the cause of the beauty of these animals under the microscope. The pseudopodia are usually very flexible and anastomose freely, but in some cases they are stiff and not inclined to fuse. Contractile vacuoles are not present, but in most radiolarians are very small yellowish spheres, supposed to be parasitic algae; it is possible that these are concerned with the process of excretion. Reproduction takes place either by fission or by spore formation. In the latter case both macrospores and microspores are formed, and it is supposed that one of each must fuse together to give rise to a new individual. Radiolarians play an important part in the economy of the ocean, furnishing food for countless hosts of minute crustaceans and other animals, which in turn supply the fishes. All recent investigations into the biology of the ocean give an important place to this order.

FOSSIL FORMS. Radiolaria are abundant in a fossil state; they have been found in rocks of most of the geological systems, and in many cases they have formed siliceous rocks of considerable thickness. These latter, described from Brittany, England, and New South Wales, recall the radiolarian ooze of the modern ocean bottom. They are among the oldest known organisms, for they are found in quartzites interbedded with Pre-Cambrian gneiss in Brittany. They occur in abundance in phosphate nodules in the lower Cambrian of New Brunswick, Canada, and in Cambrian rocks of other regions. Cherts and jaspers of Ordovician, Silurian, Devonian, and Carboniferous age in Europe, Asia, and Australia have been found to contain them, often in abundance. The Mesozoic and Tertiary flint-bearing deposits, like the chalk of Europe and America, yield them, and the polishing earths known as 'Barbadoes earth' and 'tripoli' owe their abrasive powers to them.

Consult: Haeckel, *Die Radiolarien* (Berlin, 1862-88); id., *Report on the Radiolaria* (*Challenger Reports*, London, 1887); Von Zittel and Eastman, *Text-book of Palaeontology*, vol. i. (New York and London, 1900); Rust, "Beiträge zur Kenntnis der Fossilien Radiolarien," in *Palaeontographica*, vols. xxxi., xxxiv., xxxviii. (Jena, 1885-94).

RADIOLITES, rā'di-ō-lit'ēz (Neo-Lat. nom. pl., from Lat. *radiolus*, little ray). A very peculiar fossil pelecypod of Cretaceous age, allied to Rudistes. See RUDISTÆ.

RADIOMETER (from Lat. *radius*, ray + Gk. μέτρον, *metron*, measure). An instrument invented by Crookes and improved by Pringsheim and E. F. Nichols. It consists essentially of a framework carrying one or more mica vanes supported and free to turn around an axis in an inclosed space from which prac-

tically all the air has been exhausted; one face of each vane is coated with lampblack, while the other is polished. In the radiometer of Crookes there are four such vanes carried on a little framework, not unlike a windmill with four arms; and this being pivoted can revolve around an axis. In the form as used by Nichols

CROOKES RADIOMETER

there are several modifications, the most important of which is that the mica vane can no longer revolve freely, but can simply turn through a small angle. In a space so exhausted as that around the mica vanes, the particles of the gas are few in number comparatively, and their mean free path may be over a centimeter. If, now, ether-waves fall upon the polished surface of the mica, they are reflected and have no action, but if they fall upon the blackened surface they are absorbed, and the temperature of this surface is raised. As the particles

of the gas now impinge on this heated surface they rebound with an increased velocity, and therefore produce an increased reaction against the surface, pushing it backward. If a Crookes radiometer be exposed to a match, or even the hand if sufficiently close, the mica vanes are set revolving at a high speed. If the gas around the vanes was at ordinary pressures, the molecules would be so close that any increased velocity of the rebounding particles would be transmitted almost instantly throughout the whole gas and so be felt on the polished side as well. Thus there would be no resultant force on the vanes.

In the form of instrument used by Nichols it becomes one of the most sensitive thermometers known, and it can measure most accurately the energy of the ether-waves which its vane absorbs.

RADIO-MICROMETER. This is an instrument invented by Vernon Boys to measure the energy carried by ether-waves. It is a combination of a thermopile and a galvanometer with fixed magnets and movable coils. A loop of wire is suspended between the opposite poles of a horseshoe magnet, with its plane parallel to the line joining the poles; the two ends of this loop are prolonged out of the magnetic field and joined by a wire of a different conductor. Only the junction of the two different metals is coated with lampblack (if the waves in question are due to ordinary thermal radiations), and exposed to the radiation, the other junction being shielded. The radiation being absorbed by the lampblack produces a rise of temperature; this causes a thermo-electric current; and thus the loop of wire is turned through an angle which may be measured by ordinary means. If the instrument is to be used for measuring the radiation of waves produced by electrical oscillations, a slightly different plan is adopted at the thermal junction. Consult Preston, *Theory of Heat* (New York, 1894).

RADIOPHONE (from Lat. *radius*, ray + Gk. *φωνή*, *phōnē*, voice, sound). An apparatus for the production of sound by the action of light

upon a selenium cell in circuit with a telephone. Alexander Graham Bell and Sumner Taintor in 1880 discovered that if a rapidly intermitting beam of concentrated sunlight was allowed to fall upon a selenium cell (see **SELENIUM**), the variations in the resistance of the cell would produce variations in the current which, flowing through a telephone in circuit with the cell and a battery, would cause a sound to be emitted corresponding to the original sound which caused vibrations in the beam of light.

RADISH (OF., Fr. *radis*, from Prov. *raditz*, It. *radice*, radish, root, from Lat. *radix*, root). A garden vegetable, *Raphanus sativus*, of the natural order Cruciferae, probably a native of Asia, cultivated in temperate regions for its fleshy roots, which are eaten raw. The plant attains a height of about three feet and bears white or lilac-colored blossoms on a branched flower stalk. There are two main types of radishes. The summer varieties are annuals and the winter perennials. Both types produce turnip or carrot-shaped white or red roots with intermediate forms. Many winter kinds are black. The flesh of all sorts is white. Under favorable conditions the summer varieties, which are most used for forcing, may produce edible roots in three weeks or even less. They are commonly grown between the rows of slower growing crops like lettuce or beets. In beds the seeds are grown in rows about eight inches apart with one or two seeds to the inch. Radishes grow best on a rich sandy loam soil. They are planted for a succession about every ten days throughout the summer. Winter radishes are sown in July or in early August. They are usually larger than summer sorts and have much firmer flesh. They are stored over winter like turnips. Another species of radish (*Raphanus caudatus*) is cultivated as an esculent in Japan, where it is native. The sea-radish (*Raphanus maritimus*) has roots of great pungency. Horseradish (q.v.) is a near relative. See **PLATES OF FLOWERS** and **VEGETABLES**.

RADISH INSECTS. The insects which affect the radish plant in the United States are for the most part the same species which are found on cabbage and turnips. One important insect enemy of the plant is the cabbage-maggot, or radish-maggot (*Phorbia brassicae*), which infests the roots of many oleraceous plants. The maggots puncture the fleshy root of the radish and make channels through it in every direction, safely beyond the reach of any insecticide application. The best remedy consists in proper methods of fertilizing, and a combination of nitrate of soda, ground rock, and muriate of potash is recommended. This fertilizer should be applied soon after the plants are up and when the leaves are about an inch long, at the rate of 500 pounds to the acre, and before or during a rain. If the application be made at this time it seems to reach the maggots just when they are hatching. The adult flies, which are small brown creatures, rather smaller than the house-fly, lay their white and slender eggs in little masses on the surface of the ground near the infested plants. The maggots soon hatch, and the injurious work begins. The species is closely allied to the onion maggot. See **CABBAGE INSECTS**; **ONION INSECTS**.

RADISHTCHEFF, rá-dish'chëf, ALEXANDER NIKOLAEVICH (1749-1802). A Russian author and reformer, born in Moscow of an excellent

family, and after several years as a page, educated with eleven other young Russians at Leipzig University. There he spent four years, in which he was more deeply influenced by French philosophy and the Encyclopædists than by any part of his university curriculum. He returned to Russia in 1771, received a post in the customs administration, and, although he moved in the best society, intellectually, of Petersburg and knew Voroncoff and Kryloff, made little stir until 1790. Then, under the influence of his liberal convictions patterning after Abbé Raynal's *History of the Indies*, with its philanthropic sentiment, and after Sterne's *Sentimental Journey*, he wrote his famous *Journey from Saint Petersburg to Moscow*, which, with all its humor and excessive sentimentality, is a terribly vivid picture of Russian serfdom and contains a frank programme of emancipation, all the more bold for its appearance in the midst of a period of reaction. Catharine sent the author to Ilimsk, in the Government of Irkutsk. He returned to Russia in 1796 under Paul. Nicholas made him a member of the legislative commission in 1801. But recognition came too late; his exile had made him melancholy and half insane, and he committed suicide.

RADIUM (Neo-Lat., from Lat. *radius*, ray). A radioactive substance first obtained from pitchblende by M. and Mme. Curie and M. Bémont in 1888. Radium is considered to be an element and has many interesting properties which are described under *Radioactivity* (q.v.). It maintains its own temperature 1.5° C. above its surroundings, and according to Professor Curie emits heat radiations without combustion or chemical change and without any appreciable decrease in its energy. Its spectrum has been examined by Demarçay and new and characteristic lines obtained which apparently demonstrate that it is an element. The atomic weight is stated at 225, and although it is believed to be a metal, it has been produced as yet only as a chloride or bromide. Radium is forty times as active as uranium, and its discovery and peculiar characteristics have given rise to many interesting physical speculations. It is enormously expensive to prepare, and in 1903 it was said that to produce a kilo of a chemically pure preparation of radium would cost \$6,000,000, and that this quantity would require about 5000 tons of uranium residue at an expense of handling of about \$2000 per ton. See **RADIOACTIVITY**; **OLONIUM**; **URANIUM**.

RADIUS (Lat., rod, staff, spoke, semidiameter, ray). A straight line from the centre to any point on the circumference of a circle (q.v.).

RADIUS OF CURVATURE. See **CURVE**.

RADIUS-VECTOR (Neo-Lat., semidiameter-carrier). The linear coordinate in a system of polar coordinates. See **COORDINATES**.

RADIX (Lat., root). In mathematics, the base of a scale of notation or a system of powers. See **LOGARITHMS**; **SCALES OF NOTATION**.

RADLOFF, rä'tlöf, WILHELM (1837—). A German-Russian traveler and philologist. He was born in Berlin, studied there, at Halle, and at Jena, and in 1858 became instructor at Barnaul in Western Siberia, a position which he held until 1870. After acting (1871-84) as departmental inspector of

Mohammedan schools in Kazan, Radloff was appointed curator of the Asiatic Museum in Saint Petersburg. In 1886 he traveled in the Crimea and in 1887 in Lithuania for research in local dialects. His publications include: *Proben der Volkslitteratur der türkischen Stämme Südsibiriens* (1866-96); *Versuch eines Wörterbuchs der Türkdialekte* (1888 sqq.); *Das Schamanentum und sein Kultus* (1885), two great works in Russian on "Siberian Antiquities" (1888) and the ethnology of the Siberian Turkish peoples (1888); and *Atlas der Altertümer der Mongolei* (1892 sqq.).

RADNORSHIRE. A southern inland county of Wales, Great Britain, bounded on the north by Montgomeryshire and Shropshire, and on the south and southeast by Brecknockshire and Herefordshire (Map: Wales, C 4). Area, 471 square miles. Groups of mountains, of which Radnor forest (2163 feet high) is the loftiest, cover the greater part of the country. The southeastern district is flat, with a gradual slope toward the east. Of the rivers, the chief of which flow southward, the principal is the Wye, which forms the greater part of the southern boundary. The county formerly comprised large tracts of bog and moor land, which are in course of being gradually reclaimed and cultivated. In the east and southeast districts excellent wheat, barley, oats, and potatoes are grown. Capital, Radnor. Population, in 1891, 21,791; in 1901, 23,300.

RADOM, rä'dóm. A government of Russian Poland. Area, 4470 square miles. It is somewhat hilly in the south and level in the north. In the latter part are found also considerable stretches of marshland. The principal river is the Vistula, which forms a considerable part of the boundary. The climate is damp and unhealthy in the marshy districts. Agriculture is the principal industry. Cereals are raised for export. There are a large number of iron works. Population, in 1897, 820,363. Capital, Radom.

RADOM. The capital of the Government of Radom, in Russian Poland, situated on the Mleczna, about 60 miles south of Warsaw (Map: Russia, B 4). It is a well-built town, and has manufactures of machinery and leather. Population, in 1897, 28,750. Radom was the scene of a number of diets in the history of Poland. It was allotted to Austria at the third partition of Poland, and became part of the new Kingdom of Poland in 1815.

RADOWITZ, rä'dô-vits, JOSEPH MARIA VON (1797-1853). A Prussian general and statesman, born at Blankenburg, Brunswick, the son of a nobleman of Hungarian descent. He entered the army in 1812, and was wounded at the battle of Leipzig. He became a teacher in the military school at Cassel and entered the Prussian service in 1823. In 1830 he became chief of the general staff of artillery. In 1836 Radowitz was sent as Prussian military commissioner plenipotentiary to the German Diet at Frankfurt. In 1842 he was named ambassador extraordinary and minister plenipotentiary at the courts of Karlsruhe, Darmstadt, and Nassau; and in 1845 he was raised to the rank of major-general. He exercised a marked influence over Frederick William IV. His lively interest in the contemporary politics of Germany is shown in his writ-

ings, *Gespräche aus der Gegenwart über Staat und Kirche* (1846), and *Deutschland und Friedrich Wilhelm II.* (1848). In the Frankfort Parliament Radowitz was the leader of the ultra-conservatives, but he subsequently modified his views and favored a constitutional monarchy and a united Germany under Prussian leadership. In September, 1850, he became Prussian Minister of Foreign Affairs, but resigned in November on the failure of his anti-Austrian policy, and retired to Erfurt, where he wrote his *Neue Gespräche aus der Gegenwart* (1851). He died at Berlin. Consult Frensdorff, *Joseph von Radowitz* (Leipzig, 1850). His collected works in five volumes were published in Berlin (1852-53).

RADULESCU, ră'dool-les'koo, JOAN HELIADE. See HELIADE-RADULESCU.

RADZIWILL, răd'zė-vil. An old Lithuanian-Polish family, descended from NICHOLAS I. (1366-1446), Palatine of Vilna, who was equally distinguished as warrior and statesman. The most distinguished modern member of the family was MICHAEL JEROME (GERON) (1778-1850). He served as lieutenant in the war of independence under Kosciuszko until 1794, joined Napoleon on his march into Russia (1812), and was made by him brigadier-general. During the Revolution of 1830-31 he was for a short time general-in-chief of the Polish army and after its defeat was transported into Central Russia and detained there until 1836, when he retired to Dresden.

RAE, ră, JOHN (1813-93). An English Arctic explorer, born near Stromers, in the Orkney Islands. He studied medicine at Edinburgh, and in 1833 became resident surgeon at one of the stations of the Hudson's Bay Company, where the greater part of his time was devoted to scientific study. In 1846-47 he made his first Arctic journey, and explored 700 miles of the coast of Committee Bay. In the following year he joined the Government land expedition to search for Sir John Franklin. In 1850 Rae was again sent out by the Government in quest of the lost explorer. During the year consumed by this expedition the party traveled 5380 miles, covering much territory in Wollaston Land and Victoria Land, concerning which nothing had been known, and mapped out 700 miles of new coast line. In 1853 he set out with another party, under the auspices of the Hudson's Bay Company, with the object of completing the survey of the coast line. In Repulse Bay he obtained definite news of Franklin's fate, and upon returning to civilization with the news, found that his party had earned the reward of £10,000 offered for the first accredited information of the lost explorer. In 1858, 1860, and 1864 he took a prominent part in various expeditions in the northern part of the American continent. His activity and endurance bordered upon the marvelous, and he is said to have walked 20,000 miles in the course of his various journeys and explorations. The later years of his life were passed in London, where he held various offices in corporations and institutions concerned with colonial matters. Rae published, in 1850, *Narrative of an Expedition to the Shores of the Arctic Sea in 1846 and 1847*. An account of his work is given in Richardson, *Polar Regions* (London, 1861). Consult, also, the same author's *Arctic Expeditions* (ib., 1852-53).

RAE, JOHN (1845—). An English economist, born in Wick, Scotland, and educated at the

University of Edinburgh. He wrote for English periodicals, made an especial study of the history of economics and of modern economic tendencies, and published *Contemporary Socialism*, a valuable study (1884; 3d ed. 1901); *Eight Hours for Work* (1894); and *Life of Adam Smith* (1895).

RAEBURN, ră'börn, Sir HENRY (1756-1823). A Scottish portrait painter. He was born at Stockbridge, near Edinburgh, March 4, 1756, and at the age of fifteen was apprenticed to a goldsmith at Edinburgh, painting water-color miniatures during his leisure hours. From David Martin, a local portrait painter, he received some inspiration, and learned to adopt a broader treatment in miniatures. Encouraged by his success in this branch of art, he began to fit himself for portrait painting by copying portraits in oil. After contracting a fortunate marriage in 1778, he was enabled to study abroad, to which he was urged by Reynolds, whom he met on a visit to London. After studying for two years at Rome, he returned to Edinburgh, and soon attained great popularity. He was elected president of the Society of Artists in Scotland in 1812, and Royal Academician in 1815. On a visit of George IV. to Edinburgh in 1822 he was knighted, and the following year was appointed the King's limner for Scotland. He died at Edinburgh, July 8, 1823. Raeburn occupies a position in Scottish art similar to that of Reynolds (q.v.) in English. His portraits are strikingly realistic and intense, and are painted in full light. His work has been compared to that of Frans Hals and Velazquez, whom he resembles in this regard and in his facile brush work. The most notable Scotchmen were among his sitters, such as Robertson, Hume, Boswell, Christopher North, Jeffrey, Dugald Stewart, Braxfield, John Erskine, and Sir Walter Scott. There are good examples of his work in the Edinburgh National Gallery, in the National Portrait Gallery, London, and in the Louvre. Consult Andrew William Raeburn, *Life of Sir Henry Raeburn* (London, 1894).

RAFF, răf, JOACHIM (1822-82). A German composer, born at Laehen, Switzerland. He first engaged in scientific studies, but studied music under Mendelssohn, and in 1850 followed Liszt to Weimar. He published *Die Wagnerfrage* (1854), in which he advocated Wagner's theories. In 1856 he went to Wiesbaden, where he gave all his time to composition until 1877, when he was called to the new Conservatory of Music at Frankfort-on-the-Main. Raff was a prolific writer, his compositions numbering over two hundred, including notable examples of nearly every musical form. He was possessed, however, of a facility of invention which poverty frequently drove him to employ to the detriment of his reputation; hence the uneven character of his work. His best work proves him a master of technic, and a composer of high rank. Among his eleven great symphonies are *Im Walde* and *Lenore*, which are universally esteemed. He wrote the operas *König Alfred* and *Dame Kobold*, and many charming songs. He died at Frankfort-on-the-Main.

RAFFAELINO DEL GARBO, răf'fă-ěl-ě'no děl găr'bó (1466-1524). A Florentine painter of the Early Renaissance. He was born in Florence, and studied under Filippino Lippi, whom he

assisted in his work for the Chapel of Minerva at Rome. In his earlier period he was a promising follower of his master, but he was not sufficiently gifted to adopt the High Renaissance, and finally degenerated into a mere craftsman. His chief works are an "Altar-piece" in the gallery of Santa Maria Nuova, Florence (1500); the "Coronation of the Virgin," Louvre; the "Resurrection," Florentine Academy; a "Madonna," Church of Santo Spirito (1505); and two pictures of the "Virgin Enthroned" and "Madonna and Child," in the Berlin Museum. A notable portrait of a "Young Man" is in the Layard Gallery at Venice.

RAFFAELLI, rá'fá'lé', JEAN FRANÇOIS (1850-). A French painter, sculptor, and etcher, born in Paris. He began his career as a singer, then studied art under Gérôme, and first exhibited in 1870. But he did not fully reveal himself until an exhibition of his works held in 1884, for which he wrote a catalogue, *Etude des mouvements de l'art moderne et du beau caractéristique*. Though powerfully influenced by the impressionist movement and by the purely naturalistic school, he was like Degas rather an independent in his own methods. He is especially a student of character, and in his early works deals mostly with low life in the suburbs of Paris, often in winter. The backgrounds are long straight roads, bordered by slender trees, and the typical suburban buildings beneath a melancholy lowering sky. An example of this style is "The Old Convalescents" (1892, Luxembourg). Afterwards his range became wider, and his later works are more happily conceived. Spring takes the place of winter in delicate luminous landscapes, and he paints such pictures as the series of views of Notre Dame, the "White Horse;" the charming portrait of his daughter Germaine (1896); "Young Girl Regarding Herself in a Mirror" (1897); "Portrait of Mlle. Marie Louise" (1898); and "Young Girl with the Cornflower." Other pictures by him are "At Gonon's Foundry" (Lyons Museum); "Old Ragpicker" (Nantes Museum); and the portrait of "Edmond de Goncourt" (Nancy Museum). His medium is generally oil or pastel, and he is the inventor of a new method of using solid oil tubes in painting, which has so far proved successful. His work as a sculptor includes bas-reliefs, portraits, and character studies in plaster and bronze. His drawings were published in the *Revue Illustrée*, and as *Types de Paris*, and he is also an etcher of ability. In 1889 he received a gold medal at the Universal Exposition and the Legion of Honor.

RAFFAELINO, rá'fá-él-lé'nò. The name commonly applied to the Italian painter Raffaello dal Colle (q.v.).

RAFFAELLO, rá'fá-él'lò. See RAPHAEL.

RAFFET, rá'fá', AUGUSTE (1804-60). A French lithographer, born in Paris. He was a pupil of Cabanel, then of Charlet, and afterwards he studied under Gros. His first drawings deal with the army of the Revolution and the First Empire. Each one of these pieces has Napoleon for the central figure, and of these "His grognait et le suivait toujours" and the "Re traite du bataillon sacré" are the best. In 1850 he began his superb series on the siege of Rome. In these the draughtsmanship is remarkable. His

imaginative subjects include "Revue nocturne," "Némésis," and "Patriotes de tous les pays, prenez garde à vous," all strong and effectual pieces. His series of 100 lithographs, called *Voyage dans la Russie méridionale et la Crimée* (1833-49), show his talent in still another direction. He was also a skillful portraitist. Consult: Bry. *Raffet, sa vie et ses œuvres* (Paris, 1874); and Curtis, *Some Masters in Lithography* (New York, 1897).

RAFFIA. See JUPATI PALM.

RAFFLES, rá'f'f'z, THOMAS (1788-1863). An English Congregationalist. He was born in London, was educated at Homerton College (1805-09), and preached in Liverpool with conspicuous success from 1812 to 1862. The cause of education of Nonconformist ministers was much indebted to him, and he wrote several hymns, which have been much used. Consult his biography by his son (London, 1864).

RAFFLES, Sir THOMAS STAMFORD (1781-1826). A British colonial administrator, born at sea off the island of Jamaica, on board the ship commanded by his father. At the age of fourteen he got employment in the East India House as an extra clerk. He soon attracted attention, and in 1805 received an assistant secretaryship in Penang, mastered the Malay language on the voyage out, and in 1807 became secretary and registrar of the Recorder's Court. He visited Malacca and studied its resources and proceeded to Calcutta in 1810, where he came to the notice of Lord Minto, the Governor-General, through his contributions to the Asiatic Society. He accompanied Lord Minto in the following year to Java, which, having been taken from the Dutch, became a British possession under Raffles as Lieutenant-Governor, and for five years he administered the affairs of the island with marked vigor, wisdom, and success. He abolished forced labor, regulated taxation, and remodeled the administration of justice, while retaining the Dutch colonial laws. On the restoration of the island to the Dutch in 1816 he returned to England and published his great work on the *History of Java* in 1817. He was knighted, and by request visited Holland to advise with the King in regard to the policy to be pursued in Java. In 1818 he became Governor of Benakulen in Sumatra, reorganized the colony, abolished slavery, established schools, and explored the interior on foot in company with Dr. Joseph Arnold, discovering, among other things, the great fungus, measuring three feet across and weighing fifteen pounds, which is known by their names, *Rafflesia Arnoldi*. Compelled by ill health to return home, he set sail in 1824, but the ship having caught fire, he lost everything, including his great natural history collection, his manuscripts, drawings, and notes, valued at \$100,000. He reached Plymouth later in the same year, and died suddenly near London. His portrait is in the National Portrait Gallery, London. See his *Memoir* by Lady Raffles, his second wife (London, 1830).

RAFFLESIA. A genus of 8 or 10 species of plants of the small parasitic natural order Rafflesiaceæ, the visible parts of which consist merely of a flower. The species attack *Cissus*, making their appearance at first as hemispherical swellings of the bark of the root, and, after the bark has broken, rising in the form of a cabbage

head while the perianth is covered with imbricated bracts, which are more or less recurved after it has opened. The vegetative part which ramifies in the tissues of the host resembles the mycelium of a fungus. After the flower has expanded, it diffuses a carrion-like smell, which induces flies to deposit their eggs. The largest and first discovered species, *Rafflesia Arnoldi*, was discovered in 1818 in Sumatra by Dr. Arnold, and was sent to Robert Brown by Sir Thomas Stamford Raffles, the British Governor in Sumatra, in honor of whom the genus was named. Its flower measures fully three feet in diameter, is capable of containing almost two gallons of fluid, sometimes weighs fifteen pounds, and is the largest of all known flowers. Other smaller flowered species have been found in the Malay Archipelago and the Philippine Islands.

RAFIN, rá'fán', CATHARINE JOSÉPHINE. The real name of the French actress commonly called Catharine Joséphine Duchesnois (q.v.).

RAFINESQUE, rá'fê-nêsk', CONSTANTINE SMALTZ (1784-1842). An American botanist, of French-German descent, born at Galatz, Constantinople. On his first visit to the United States in 1802 he spent three years in Pennsylvania and Delaware collecting botanical specimens. Afterwards he went to Sicily and was there ten years, during which time he continued to study botany and wrote several scientific works in Italian. He was shipwrecked off the coast of Long Island in 1815, on his way to New York, and lost his collection of manuscripts and books. In 1818 he became professor of botany at Transylvania University, Lexington, Ky. Ultimately he settled in Philadelphia. Though a man of wide learning, his works are marred by his tendency to multiply species and by frequent inaccuracies. They include: *Ichthyologia Ohioensis* (1820); *Annals of Kentucky* (1824); *Atlantic Journal and Friend of Knowledge* (8 numbers, 1832-33); *Medical Flora of the United States* (1828-30); and *The Complete Writings of S. C. Rafinesque on Recent and Fossil Conchology* (1864, edited by Binney and Tryon). Consult Gray, "Botanical Writings of Rafinesque" (*Silliman's Journal*, 1841).

RAFVN, ráfvn, CARL CHRISTIAN (1795-1864). A Danish critic and archaeologist. He was born at Brabeholteberg, in the island of Funen, and educated at the University of Copenhagen, of which he was appointed sub-librarian in 1821. In 1825 he founded the 'Society of Northern Antiquities,' as secretary of which he edited and published many ancient Scandinavian manuscripts, occupying about seventy volumes. Among his numerous important works are a Danish translation of Norse Mythic and Romantic Sagas (3 vols., 2d ed., 1829-30); an edition of Ragnar Lodbrog's death-song, under the title of *Krakumál, seu Epicædium Ragnaris Lodbroci, Regis Danie* (1826); a complete collection of the Norse sagas entitled *Fornaldar-Sögur Nordlanda* (1829-30); and the *Færeyinga-Saga* (1823). His most widely known work was his *Antiquitates Americanae* (1837), followed up by him and Finn Magnussen in their *Historical Monuments of Greenland* (1838-45). Another important work in which Rafn collaborated was the great collection of historical sagas representing events that took place out of Iceland, and entitled *Fornmanna Sögur* (1828 sqq.). He also had a great share in

drawing up and editing the Icelandic manuscripts relating to the history of Russia and other Eastern countries, of which three volumes appeared at Copenhagen in 1850-55, under the title of *Antiquités russes et orientales*.

RAGATZ, rá'gáts, or **RAGAZ**. A tourist resort in the Canton of Saint Gall, Switzerland, 11 miles northwest of Chur. It is attractively situated at the mouth of the Tamina Gorge above the confluence of the turbulent Tamina with the Rhine, and commands a fine view of the Rhine Valley. Its chief features are the Kursaal and gardens, the mineral springs and baths, and Bad Pfifers (q.v.). There is a monument to Schelling in the cemetery. Ragatz attracts annually an average of 50,000 visitors. Permanent population, in 1900, 1862.

RAGGED ROBIN. See LYCHNIS.

RAGGED SCHOOLS. Schools maintained by private philanthropy in various English cities. It is not certainly known who first suggested them, but credit for a successful experiment is due to a poor shoemaker, John Pounds, of Portsmouth, who for twenty years prior to his death, in 1839, gathered poor children about him and taught them as he worked. In 1838 London had a Ragged Sunday School, which later became a free day school. The school at Field Lane was opened in 1843. The first free boarding school was started by Sheriff Watson in Aberdeen in 1841. In 1845 Dr. Robertson opened a similar school in the Vennel, Edinburgh. In 1847 Dr. Guthrie published his well-known *Plea for the Ragged Schools*, which had great influence. The movement spread and in a few years ragged schools were to be found in most of the cities. The further development of the English school system, particularly under the acts of 1870 and 1872, which introduced compulsory school attendance in England and Scotland, merged many of the ragged schools into the public schools. After 1851 the ragged schools received small grants from the general funds and a capitation grant of £2 10s. was allowed by the Privy Council from 1856 to 1859. Consult Cornwallis, *Philosophy of the Ragged Schools* (London, 1851).

RAGGEE (from Hind. rági), *Eleusine coracana*. An Indian grain. See ELEUSINE.

RAGHUVAMŚA, rúgh'vō-vān'sá (Skt., family of Raghu). The title of a celebrated Sanskrit poem by Kalidasa (q.v.). In nineteen cantos it describes the life of Rama (see RAMAYANA) and his forefathers and descendants. The work is one of considerable beauty, especially in its similes, and is characterized by rapidity of movement and poetic charm. The text of the Raghuvamsa has been edited repeatedly. The most important editions are those of Stenzler with a Latin translation (London, 1832), by Pandit with the best native commentary on the poem, that of Malinatha (Bombay, 1869-74), and also by Parab (ib., 1893), by Jvalaprasad with an English translation (ib., 1895), and an English translation by Johnstone (London, 1902).

RAG'LAN, Lord FITZROY JAMES HENRY SOMERSET, first Baron (1788-1855). An English field-marshal, the eighth son of the fifth Duke of Beaufort. He entered the army in 1804 and went to the Peninsula in 1808 as aide-de-camp of Sir Arthur Wellesley (later the Duke of Wellington), whose military secretary he became three

years afterwards. He took part in all the great actions of the Peninsular campaign and gained special distinction at the storming of Badajoz (1812). In 1815 he served under the Duke of Wellington in Belgium, and lost his right arm at Waterloo. From 1815 to 1818 he was secretary of the British Embassy at Paris. He was member of Parliament for Truro in 1818-20 and 1826-29. When Wellington was appointed master of the ordnance in 1819, he again chose Somerset as his secretary; and three years afterwards Somerset accompanied his chief to the Congress of Verona. In 1827 the Duke was appointed commander-in-chief of the British Army and called Somerset to the Horse Guards as his military secretary. This office he held till the death of Wellington in 1852. He was then made master-general of the ordnance, and in October was called to the House of Peers as Baron Raglan of Raglan in Monmouthshire. In 1854 he was appointed, with the rank of general, commander of the English forces despatched to operate against Russia. See CRIMEAN WAR.

RAGNARÖK, rägnä-räk'. In Scandinavian mythology, the end of the world, and the fall of the gods before the combined demon hosts of the world. The word *ragnarök* really means 'judgment of the gods,' but it has been conceived sophistically to mean 'twilight of the gods,' and as the *Götterdämmerung* has formed the basis of the Wagnerian music-drama *Der Ring des Nibelungen*. The fundamental conception of the *ragnarök* is the end of the Golden Age, brought about by the conflict of the two types of Norse gods, known respectively as Æsir and Vanir, and by the Æsir's violation of their oaths. The chief source of these conceptions is the poem of the Elder Edda, called the *Völuspá*, a mixture of heathen and Christian conceptions. The battle between the gods and demons is ushered in with the appearance of the divine war maidens, the Walkyries. Balder, the beautiful god, is dead, through Loki's malignant treachery, and his fate seals the doom of the other gods. The giant watchman Eggther strikes his harp, and in each of the three worlds, that of the giants, the Æsir, and Hel, a cock crows calling the warriors to the battle. The hell-bound Garmé bays aloud; the wolf Fenrir tears his chain. On the earth men are engaged in bloodshed and incest. Floods rise everywhere. The old world tree, the ash Yggdrasil, sways to its roots. Then the god Heimdaler sounds his horn, calling the gods to the fray. In mighty array the demon hosts come marching against the gods from the east, north, and south. Odin engages in combat with Fenrir; Freyr with Surtr; Thor with the serpent Midgard; all the three gods fall in the struggle. The demons are masters of the battle-field. The sun grows black, the earth sinks into the sea, the stars fall from heaven. Vapor and fire rage, the high flame licks the sky. The world and the gods are gone. But from out of the flood rises a new earth which unsown grows grain, and the Æsir come again. Consult Chanépie de la Saussaye, *The Religion of the Teutons* (Boston, 1902).

RAGOZIN, rä-gō-zén, ZÉNAÏDE ALEXÉIEVNA (1835—). A Russian-American author, born in Russia, where she was educated. After several years spent in travel, she emigrated to the United States in 1874. Among her published works are: *The Story of Chaldea* (1886); *The Story of Assyria* (1887); *The Story of Media*,

Babylon, and Persia (1888); *The Story of Vedic India* (1895); all in the "Story of the Nations" series; and five volumes of biography in "Tales of the Heroic Age" series. She translated from the French Anatole Leroy Beaulieu's *The Empire of the Tsars and the Russians*.

RAGTIME. The popular title given to the humorous dance or vocal music of negro origin and characteristics, which has had great vogue since the early nineties of the last century. Theoretically, the music of such compositions is an excessive exaggeration of syncopation. The general lack of instruments other than of percussion, among the different African races, of necessity inclined them to punctuate their melodies with strongly marked pulses or accents. Crude emotional effects are gained by increased noise and abrupt syncopation. The very exaggeration of ragtime proved its strongest appeal to the general public. See NEGRO MELODIES.

RAGUENEAU, rägnó', PAUL (1605-80). A French missionary and explorer, born in Paris, France. He became a Jesuit priest, and in 1636 was sent as a missionary to Canada, where for a time he labored among the Hurons. In 1640 he went among the hostile Iroquois in an unsuccessful attempt to secure the release of some French prisoners. Ten years later, as Father Superior, he was active in gathering the remnant of the Hurons who had escaped the massacres by the Iroquois. In 1657 with another priest and a few lay companions he visited the Onondaga tribe of Iroquois; while among them a plot was formed to murder him, and he escaped with great difficulty. In 1666 he returned to France, where he labored as the agent for the missions in New France. His writings give a good picture of the conditions under which the Jesuits of New France labored, and one of his *Relacions* (that for 1648) contains the first mention of Niagara Falls. He wrote *Vie de la Mère Saint Augustine, religieuse hospitalière de Québec en la Nouvelle France* (Paris, 1672). *Relation de ce qui s'est passé de plus remarquables es missions des Pères de la Compagnie en la Nouvelle France* during the years 1645-52 and 1656-57 (7 vols., Paris, 1647-57), and other works. Consult *The Jesuit Relations and Allied Documents*, edited by Reuben Gold Thwaites (73 vols., Cleveland, Ohio, 1896-1901). Consult, also, Parkman, *The Jesuits of North America* (Boston, 1867, later ed., 1897).

RAGUET, rä-gä', CONDY (1784-1842). An American merchant and political economist. He was born in Philadelphia, studied at the University of Pennsylvania, and having shipped in 1804 as supercargo to Santo Domingo, published upon his return a *Short Account of the Present State of Affairs in St. Domingo*. In 1805 a second voyage resulted in *A Circumstantial Account of the Massacre in St. Domingo*. He took part in the War of 1812, was admitted to the bar in 1820, and from 1822 to 1827 was United States consul at Rio Janeiro. When subsequently made *chargé d'affaires*, he negotiated a treaty with Brazil. He was an exponent of free trade, and wrote on that subject *The Principles of Free Trade* (1835). His other works include *An Inquiry into the Causes of the Present State of the Circulating Medium in the United States* (1815) and *On Currency and Banking* (1839).

RAGULY. A term applied to an irregular line employed in heraldry (q.v.).

RAGUSA, rá-góó'zá (Slav. *Dubrovnik*). A historic town and fortified seaport in the Crown-land of Dalmatia, Austria, situated at the foot of San Sergio, 50 miles south-southeast of Mostar (Map: Austria, F 5). It is a walled city with many towers and intersected by the Corso, once an arm of the sea, and now containing the most interesting features of the town, including the Palazzo Rettorale (fourteenth and fifteenth centuries), the former residence of the rectors of the Republic, the old mint, the custom house, and the cathedral completed in 1713. Among other buildings may be mentioned the Palazzo Comunale, the museum, and the theatre. The harbor is small and unprotected and most of the heavier vessels anchor at Gravosa, about four miles from the town. The chief products are oil, silk, leather, and liqueurs. There is some transit trade with Herzegovina. Population, in 1900, 13,174.

Ragusa is believed to have been founded about the middle of the seventh century, by refugees from Ragusa Vecchia or Old Ragusa (the ancient *Epidaurus*), probably destroyed by the Slavs. Although successively subject to Constantinople, Venice, Hungary, Servia, and Bosnia, Ragusa enjoyed a considerable degree of autonomy and repeatedly fought against every encroachment on its independence. At the close of the Middle Ages it became tributary to Turkey, and under Turkish overlordship rose to the position of one of the principal centres of commerce in Southern Europe. Its territory embraced over 500 square miles. Its institutions were aristocratic. The severe earthquakes during the sixteenth century, and especially that of 1667, when the town lost one-fifth of its inhabitants, put an end to the prosperity of the little Republic. Seized by Napoleon in 1806, it was deprived of its independence in 1808 and awarded to Austria by the Congress of Vienna in 1814. From the fifteenth to the eighteenth century Ragusa was a great seat of South Slavic literature. The most famous of the Ragusan poets was Gundulić (q.v.), who died in 1638. Consult Jackson, *Dalmatia*, vol. ii. (Oxford, 1887).

RAGUSA. A city in the Province of Syracuse, Sicily, situated on a steep ridge, on the right bank of the Ragusa, 15 miles from the sea, and 32 miles by rail west-southwest of Syracuse (Map: Italy, J 11). Around the town ancient tombs have been dug out. The city has a Gothic church, a gymnasium, and a technical school. There are manufactures of silk, cotton, woollens, and furniture, and a trade in wine, oil, cattle, and cheese. Population (commune, including Ragusa Inferiore), in 1881, 30,721; in 1901, 31,922.

RAGUSA, DUKE OF. See MARMONT.

RAHBEK, rá'bék, KNUD LYNE (1760-1830). A Danish poet and author, born in Copenhagen. He was educated at the University of Copenhagen and was appointed professor of aesthetics there in 1790. From 1785 to 1809 he directed the *Minerva*, a literary periodical of great influence, and he also edited *Den Danske Tilskuer* (*The Danish Spectator*) in 1791-1808, and in 1815-22. His own works include numerous editions of the Scandinavian poets, particularly Holberg; the critical *Ludwig Holberg som Lytstspildigter*

(1815-17); *Danske Loesebog* (1700); and, with Nyerup, *Bidrag til den danske Ditekunsts Historie* (1800-28).

RAHL, räl, KARL (1812-65). An Austrian historical and portrait painter, born in Vienna, son of the engraver Karl Heinrich Rahl (1779-1843). First instructed by his father, he entered the Vienna Academy in 1827, won a prize in 1831 with "David in the Cave of Adullam," went to Munich and Stuttgart, where he found a sympathetic adviser in Eberhard Wächter, and after his return to Vienna (1834) painted "Kriemhild Declaring Hagen Siegfried's Murderer" (1835, Vienna Museum). In 1836 he went to Venice where he copied Titian and thence proceeded to Rome, where he lived in congenial intercourse with Koch, Thorwaldsen, Riepenhausen, and Genelli and cultivated an eclecticism which borrowed color and technique from the Venetians and composition from Raphael and Michelangelo. From this Roman sojourn date "Hagen and Volker at Kriemhild's Door" (1836), "Confederation on the Rütli, 1307," and "Charles of Anjou Finding Manfred's Body" (1838, Vienna Museum). He returned to Vienna in 1838, but by the end of 1839 was again in Rome, where he remained until 1847. The works executed in Rome during that period include a huge altar-piece with thirty figures "Saint Joseph of Calasanza" (1841, Piarist Church, Vienna); "Persecution of Christians in the Catacombs of Rome" (1844, Kunsthalle, Hamburg; replica, 1849, National Gallery, Berlin); and "Entry of Manfred into Lucera" (1846, Vienna Museum), besides several genre scenes and various portraits. The year 1848 found him as corrector at the Vienna Academy, which was, however, closed during the revolutionary disturbances, when Rahl took up his abode in Munich, until appointed to a temporary professorship at the Vienna Academy, in 1850. He resigned after one term and opened a private school of painting, which was at once attended by twenty-five of his pupils and many more thereafter. For years underrated and slighted by those in authority, he won at last deserved recognition in 1856 through the patronage of Baron Sina, the Greek banker, who secured his services for the decoration of the Greek church in Vienna, the composition of a grand frieze, representing the "Development of the Sciences in Greece" (1860) for the University of Athens, and whose palace in Vienna he adorned in 1861 with four superb easel paintings of "Episodes from the heroic Age of Greece" and the "Four Elements." The façade of the Heinrichshof he decorated in 1862 with twelve allegorical figures of "The Arts of Peace," and the staircase of the Arsenal in 1863 with the allegories of "War and Strategy," "Fame and Honor," "Courage and Wisdom," and "Unity and Power," having shortly before been appointed professor at the academy. Among more than 400 portraits which he is said to have painted are those of many contemporary celebrities in art, literature, and science. Many admirable designs for future decorative work remained unfinished at his death. Consult: Hotter, *Karl Rahl* (Vienna, 1863); George-Mayer, *Erinnerungen an Karl Rahl* (ib., 1882); Reber, *Geschichte der neueren deutschen Kunst*, ii. (Leipzig, 1884); Bodenstein, in *Allgemeine deutsche Biographie*, xxvii. (ib., 1888); and Pecht, *Deutsche Künst-*

ler des neunzehnten Jahrhunderts, iv. (Nördlingen, 1885).

RAHN, rän, JOHANN RUDOLF (1841—). A Swiss art-historian, born at Zurich. After studying at the universities of Zurich, Bonn, and Berlin and investigating in Italy the art-monuments of the early Christian Era, he established himself as privat-docent in his native city, where he was appointed professor at the university in 1877, and at the Polytechnicum in 1883. His principal works include: *Geschichte der bildenden Künste in der Schweiz von den ältesten Zeiten bis zum Schluss des Mittelalters* (1876); *Kunst- und Wanderstudien aus der Schweiz* (1883); *Schweizer Städte im Mittelalter* (1889); *Die mittelalterlichen Kunstdenkmäler des Kantons Tessin* (1893); and similar treatises on other cantons. In 1879 he became editor of the *Anzeiger für schweizerische Altertumskunde*.

RAHU, rä'hoō (Skt. *Rahu*, the seizer, from *rabh*, Gk. *λαμβάνειν*, *lambainein*, to seize). In Indian mythology, the son of Vipracitti and Simhika, and the demon who is the cause of the eclipses of sun and moon. At the churning of the milk-ocean, Rahu, one of the Daityas or demons, came unnoticed among the gods and obtained a portion of the ambrosia thus produced. His head was cut off by Vishnu; but the nectar had reached his throat and consequently his head had already become immortal. Out of hatred for the sun and moon, who had informed on him, he now pursues them with implacable hatred, seizing them at intervals, and thus causing their eclipses. According to a later form of the legend both the head and the tail of the demon called Ketu ascended to heaven, and there still produce the eclipses of sun and moon either by swallowing them or by making them unclean by his approach. Rahu was accordingly reckoned among the planets which, on account of their wanderings, are regarded as of evil omen. In modern India he is the godling of two low-caste tribes, the Dusadhs and Dhangars, in the eastern districts of the Northwest Provinces, where he is propitiated by the rite of passing through a fire kindled in his honor. Rahu is a post-Vedic demon, his Vedic predecessor as the fiend who eclipses the sun being Svarbanu. In Hindu astronomy Rahu is the moon's ascending, and Ketu is its descending node.

RAHWAY, rä'wā. A city in Union County, New Jersey, 20 miles southwest of New York City; on the Rahway River, and on the Pennsylvania Railroad (Map: New Jersey, D 2.) An attractive suburban city, Rahway is well laid out, and has many handsome residences of business men of the greater cities in the vicinity. There is a public library with 15,000 volumes. As an industrial centre, Rahway is of considerable importance, its establishments including an extensive printing house and manufactories of steel castings, chemicals, felt goods, music boxes, carriages, electrical supplies, lace curtains, and shirts. Population, in 1890, 7105; in 1900, 7935.

RAIBOLINI, ri'bó-le'né, FRANCESCO. See FRANCIA.

RAIFFEISEN, ri'f'zen, FRIEDRICH WILHELM (1818-88). A German economist, founder of the German agrarian loan funds, born at Hamm an der Sieg. In 1835 he entered the army, but was compelled to abandon that profession because of

an affection of the eyes, and entered the civil service. The agricultural crisis of 1846-47, which Raiffeisen believed to be due to the difficulty with which the small landowner secured credit, led him to establish in Heddesdorf and Weyerbusch mutual credit associations, through which the small farmer might obtain loans at a low rate of interest, thereby escaping his former dependence upon usurers. Raiffeisen carried on an extensive propaganda for his idea, organizing numerous mutual credit associations, until in 1866 his health was so shattered by overwork that he was compelled to retire from public service. After he had partially recovered, he founded in 1878 the *Landwirtschaftliches Genossenschaftsblatt*, published at Neuwied. Before his death the agricultural loan associations had become numerous and had proved of the greatest value to the small farmers. Raiffeisen wrote: *Instruktion zur Geschäft und Buchführung der Darlehnskassenvereine* (1869); *Die Darlehnskassenvereine* (1887); *Kurze Anleitung zur Gründung von Darlehnskassenvereinen* (1888).

RAIKES, räks, ROBERT (1735-1811). The founder of Sunday schools. He was born at Gloucester, England, September 14, 1735; succeeded his father as printer and proprietor of the *Gloucester Journal* (1757) and so continued till 1802. He is first heard of in connection with volunteer jail visitation (1768), and called public attention to the pitiable condition of the prisoners. In July, 1780, he opened in Gloucester his first school on Sunday for the instruction of children. Consult his *Life* by Gregory (London, 1877); also Harris, *Robert Raikes, the Man and his Work* (Bristol, 1899). See SUNDAY SCHOOLS.

RAIL (OF. *raale*, *rasle*, Fr. *râle*, rail, rattling in the throat, from OF. *raller*, Fr. *râler*, to rattle in the throat, from MDutch *ratelen*, Ger. *rasseln*, to rattle; connected with Gk. *κραδαίνειν*, *kra-dainein*, to swing; so called from its cry). A bird of the subfamily Rallinae, especially of the genus *Rallus*, related to the coots and gallinules, and more remotely to the cranes. Rails have a slender bill, usually longer than the head, the body of a very compressed form, wings of moderate length, a short tail, long and strong legs, and long toes. The only European species is the common or water rail (*Rallus aquaticus*), which dwells in marshes and the reedy margins of lakes and rivers. It is generally a bird of passage, breeding in the north, and migrating southward on the approach of winter. The bird is about 11½ inches long. The sexes are similar in plumage, olive brown, marked with black above; bluish ash color beneath, with white transverse markings on the belly. The water rail feeds on worms, mollusks, and soft vegetable substances. It is in high esteem for the table.

In the United States six or seven species are known. The Virginia rail (*Rallus Virginianus*) is numerous in many parts of the Eastern States, but not often seen, because of its great shyness. It is rather smaller than the water rail of Europe, but much resembles it in appearance, haunts, and habits, which are those of the rails in general. (See Colored Plate of GAME BIRDS accompanying article GROUSE and also Colored Plate of EGGS OF GAME AND WATER BIRDS.) The king-rail, or fresh-water marsh-hen (*Rallus elegans*) is a much larger bird, inhabiting marshes throughout the Eastern United States, while the clapper-rail,

or salt-water marsh-hen (*Rallus crepitans*), is extremely abundant in the salt-water marshes of the Atlantic Coast. Each of these is about 15 inches long, and both are shot in great numbers for the table, while their eggs are also regarded as a delicacy. The mangrove-hen (*Rallus longirostris*) is a similar species of the West Indies; and a close ally (*Rallus obsoletus*) belongs to California. All these species are much alike in the compressed shape of the body, long bill, and large feet. The prevailing colors are olive, gray, fuscous, cinnamon-brown, black, and white; the sides and under parts are handsomely barred. The name 'rail' is often given to certain American coots, and is universally extended to those rail-like birds of the genus *Porzana* which inhabit drier lands, and in England are called crakes (q.v.). The most abundant and best known of these is the sora, or Carolina rail (*Porzana Carolina*), which is a favorite object of sport, with dogs, in the Southern States. Two other species, the yellow and the black rails, occur in Eastern North America. The latter is rare and remarkable for its diminutive size, dark color, and seclusive habits.

The rails form a highly generalized family, with a numerous fossil ancestry going back to the Eocene. They are distributed throughout the world, and many peculiar forms are or were inhabitants of the East Indian and South Sea islands. Many of these were restricted to one group or even to a single island, and had lost the use of their wings long before they became known to ornithologists; they were thus defenseless and several species have become extinct. Prominent examples are the genus *Notornis* of the New Zealand region, and the strange little wingless rail of Tristan d'Acunha. Consult: Evans, *Birds* (London, 1900); Newton, *Dictionary of Birds* (New York, 1896); and for the American species general works, especially Job, *Among the Water Fowl* (New York, 1902). See FLIGHTLESS BIRDS; EXTINCT ANIMALS; WEKA; and Plate of RAILS, ETC.

RAILROADS. See RAILWAYS.

RAILROAD TELEGRAPHERS, ORDER OF. See RAILWAY BROTHERHOODS.

RAILROAD WORM. A popular name in New England for the apple-maggot, the larva of a trypetid fly (*Trypeta pomonella*), given because it spread along the lines of the railroads. It is a native of the Northern United States and Canada, extending south along the Appalachian Mountains. The larva is a footless maggot, which lives in the pulp of the apple and tunnels it with winding channels, making here and there discolored excavations about the size of a pea. When ready to transform, the maggot leaves the apple, falls to the ground, and beneath the surface enters the pupal state, in which condition it remains until the middle of the following summer, when the perfect fly escapes. The fly is shining black with a rust-red head and legs, and whitish wings with dusky bands. The eggs are inserted into the flesh of the apple and frequently fruit is attacked which has previously been perforated by the codling moth. Thin-skinned summer and fall apples are preferred by it to the winter varieties.

RAILWAY BEETLE. A curious beetle of the family Malacodermidæ and probably of the

tribe Phengodini, the female of which is worm-like or larviform, and which is said to give out a strong red light from the two extremities and a green light from numerous points along the sides of the body, giving it the appearance of a miniature railway train. These beetles occur not infrequently in parts of South America, and the name originated apparently in Paraguay. In the United States very rare representatives of the genera Phengodes and Zarhipis have similar larviform luminous females. Compare LUMINOSITY OF ANIMALS.

RAILWAY BROTHERHOODS. Organizations of railway employees for the protection of their interests and the advancement of their condition in so far as dependent on themselves. The first five organizations described below are commonly referred to in the trade-union world as 'the great railroad brotherhoods'; and they are clearly distinguished from the other trades-unions of the country by unusual conservatism, a highly perfected form of government, and the great emphasis which they place upon the character of their members. While the railway brotherhoods are on an exceptionally friendly footing with the railway managers and have secured written contracts with most of the railroads fixing wages and other conditions of employment, they regard themselves as preëminently protective associations, and each maintains a large protective or strike fund. They also differ from the ordinary American union in the importance which they attach to the feature of mutual insurance. Affiliated with each of the brotherhoods is a Ladies' Auxiliary Society, who together maintain, with assistance from the brotherhoods themselves, a joint home for aged and disabled railroad employees at Highland, Illinois.

The railway brotherhoods are very similar in organization and government. The supreme powers are vested in a biennial national convention. The most striking feature which these brotherhoods have in common, however, is their system of legislative and adjustment boards. (1) The legislative board constitutes the lobby of the railway laborers. Whenever a majority of the divisions of any State or Province so desire, their representatives assemble at the State or Provincial capital and effect a general organization, usually selecting one or two delegates—the chairman and secretary-treasurer—as a permanent legislative committee. A plan has now been devised by which the chairmen of the legislative boards of the several organizations may combine in a Railroad Brotherhoods' Legislative Board, and such boards now exist in several States. (2) The boards of adjustment, also known as protective boards, are charged with the investigation of grievances and the collective bargaining concerning wages and other conditions of employment. In general, each division or local union elects a local grievance committee or board of adjustment; and the chairmen of the local boards on each system of railways constitute a general board of adjustment for that system. Where two or more separate systems are controlled by a single syndicate, the Locomotive Engineers provide for a still higher board or executive committee of adjustment, covering all the roads included in the syndicate. The adjustment system makes it extremely difficult to declare a strike.

RAILS, GALLINULES, AND JACANA

1. CORN CRAKE (*Crex crex*)
2. SORA or CAROLINA RAIL (*Porzana Carolina*).
3. WEKA or FLIGHTLESS RAIL (*Ocydromus australis*).

4. PURPLE GALLINULE (*Porzana Martinica*).
5. JACANA (*Jacana jacana*).
6. AMERICAN COOT (*Fulica Americana*).

The local grievance committee, the general board of adjustment, and the chief executive officer must all attempt to settle the grievance by peaceable negotiations with the railroad officials before a proposal to strike may be considered, and then, in most of the brotherhoods, it must be indorsed by the chief executive, the board of adjustment, and two-thirds of the members who will be involved.

With the exception of the Telegraphers and the International Association of Car Workers, the railroad organizations are not affiliated with the American Federation of Labor, and, notwithstanding the essential similarity of their interests, the frequent attempts to create a general federation of railway employees have signally failed. The United Order of Railway Employees was formed in 1889, but was dissolved in 1891. In 1893 the American Railway Union was organized with the object of bringing all railway employees under a single jurisdiction, but it received its death blow in the Chicago strike of 1894. In 1895 another alliance was formed, in accordance with what is known as the Cedar Rapids plan, between the five railway brotherhoods. This loose alliance was superseded in April, 1898, by a more centralized Federation of American Railway Employees, which in turn was dissolved February 1, 1900, leaving the Cedar Rapids agreement still in force. This agreement provides for united action among the five brotherhoods in settling grievances and conducting strikes.

(1) *The Grand International Brotherhood of Locomotive Engineers*, the oldest and most powerful of the railway unions, was organized August 17, 1863, as the Brotherhood of the Foot-board, and reorganized under the present name one year later. Between the biennial national conventions the supreme powers are centred largely in the grand chief engineer, who is elected by the convention for a term of four years, and receives a salary of \$5000 a year. The brotherhood lays unusual emphasis upon charity and mutual insurance. The local subdivisions in almost every case pay sick and out-of-work benefits; while the international division maintains a charity fund for the payment of pensions to the needy widows and children of deceased members, the expenditures for which average about \$42,000 a year. The insurance system of the brotherhood is conducted by an auxiliary company—*The Locomotive Engineers' Mutual Life and Accident Insurance Association*—which was incorporated under the laws of Ohio, March 3, 1894. From its first organization in 1867 to January, 1903, the insurance department paid out \$12,000,000 at an average cost of about \$16.55 a year per \$1000 of insurance. The mortuary fund at that time contained \$109,309 and the contingent or strike fund more than \$100,000. There were 596 subdivisions in the brotherhood with 42,000 members, of whom about 33,000 belonged to the insurance association. The official journal is the *Brotherhood of Locomotive Engineers' Journal*, published monthly at the headquarters in Cleveland, Ohio.

(2) *The Order of Railway Conductors of America* was organized July 6, 1868, as the Conductors' Brotherhood, adopted the present title in 1878, and in 1890 abandoned the non-protective policy which it had followed for a number of years and under which members were pledged not to participate in any strike. Between the bien-

nial conventions the principal powers are exercised by a salaried grand chief conductor and a board of three trustees. The mutual benefit department is separately conducted and is controlled largely by three insurance commissioners, from whose decisions an appeal lies to a board of directors. Policies of from \$1000 to \$3000 are issued at an average cost per year of about \$16 per \$1000 of insurance. The order is noted for its conservative methods and its elaborate machinery for conciliation and collective bargaining. It maintains, however, a protective fund of \$100,000, and striking members are paid \$50 a month for a period not exceeding three months. Reports covering the biennial period ending December 31, 1902, show 424 divisions, 27,899 members, 24,488 members of the insurance department, and the payment during this period of 604 insurance claims amounting to \$1,206,000. The official journal is *The Railway Conductor*, published monthly at the headquarters in Cedar Rapids, Iowa.

(3) *The Brotherhood of Locomotive Firemen* was organized December 1, 1873, and operated as a fraternal organization until 1877, when it adopted trade-union tactics, absorbed the existing lodges of the aggressive International Firemen's Union and Protective Association, became involved in the railroad strikes of 1877, lost its funds and a large part of its membership, and by 1878 seemed bankrupt and in a hopeless condition. In 1880, however, the strike policy was abandoned and the national officers were changed, with the result that since that year the brotherhood has grown from about 3000 members to 45,112 at the beginning of 1903. The government of the Brotherhood of Firemen does not differ materially from that of the engineers and conductors. Each member is assessed 50 cents quarterly for a protective fund, assessments ceasing when \$250,000 have been accumulated. Members on strike are paid \$25 a month for a period not to exceed three months. The brotherhood maintains a useful and successful employment bureau. The official organ is the *Locomotive Firemen's Magazine*, published monthly at Peoria, Illinois.

(4) *The Brotherhood of Railway Trainmen* was organized September 23, 1883, as the Brotherhood of Railroad Brakemen, and adopted its present name in 1890. It admits conductors, baggage-men, brakemen, flagmen, yard-masters, assistant yard-masters, yard conductors, foremen, and switchmen. In structure and government the brotherhood is about identical with that of the Locomotive Firemen. Active members are assessed \$1 a year for the protective fund until it reaches \$300,000. Members participating in an authorized strike receive \$35 a month during its continuance. Reports covering the biennial period ending December 31, 1902, show 646 subordinate lodges, 54,963 members, 52,591 members of the beneficiary department, and the payment during the two years of 1556 insurance claims amounting to \$1,670,790. The official organ is the *Railroad Trainmen's Journal*, published monthly at the headquarters in Cleveland, Ohio.

(5) *The Order of Railroad Telegraphers* was organized June 9, 1886, and admits telegraphers, linemen, levermen, in connection with the telegraph department and electro-pneumatic or mechanical interlockers. The telegraphers elect no legislative boards; the representation of the local

divisions in the biennial convention varies in accordance with their membership, and the power of the chief executive is somewhat more curtailed than in the other brotherhoods. The mutual benefit department, which was not established until 1898, is governed by an insurance committee as in the Order of Railway Conductors. The protective fund is fixed at \$50,000, for the establishment of which members are taxed \$1 a year. No fixed amount of strike pay is guaranteed. Up to 1902 the order was regarded as the weakest of the large brotherhoods, but from January, 1902, to April, 1903, over 18,000 new members were initiated, making the total membership about 30,000. The official journal is *The Railroad Telegrapher*, published monthly at the headquarters in Saint Louis, Mo.

Among the minor railroad labor organizations the three immediately following closely resemble the great brotherhoods in their conservative policy, emphasis upon mutual insurance, and general form of government.

(6) *The International Brotherhood of Maintenance of Way Employees* was organized as the Brotherhood of Railway Trackmen of America August 15, 1887, operated as a fraternal society until 1898, and adopted its present name in January, 1903. At the latter date the brotherhood comprehended 294 divisions with about 10,000 members. Its official journal is *The Advance Advocate*, published monthly at the headquarters in Saint Louis, Mo.

(7) *The Switchmen's Union of North America*, the successor of the once powerful Switchmen's Mutual Aid Association founded in 1881, was organized in 1897. Its growth and power have been seriously hampered by the Brotherhood of Railroad Trainmen, which also admits switchmen, but at present it seems thriving. In January, 1903, the membership was 14,000. The official journal is the *Journal of the Switchmen's Union*, published monthly at Buffalo, N. Y.

(8) *The Brotherhood of Railway Carmen of America* was organized in December, 1900, and includes all men engaged in building, inspecting, repairing, oiling, and cleaning railway cars in the United States, Canada, and Mexico. This organization has always been weak, and in the last few years has barely maintained an existence.

(9) *The National Railway Clerks' Association of North America* was organized in 1901, and in April, 1903, had 4000 members, organized into 35 local divisions. The *Official Journal of the N. R. C. A.* is issued monthly from the headquarters in Akron, Ohio.

The two organizations immediately following are affiliated with the American Federation of Labor and bear no peculiar resemblance to the other railway brotherhoods.

(10) *The Amalgamated Association of Street Railway Employees* was organized September 15, 1892, and admits any competent street railway employee of good moral character, except managers, superintendents, and foremen. No protective fund is maintained, but a benefit of \$75 is paid upon death or total disability. The official journal is the *Motorman and Conductor*, published monthly at Detroit, Mich.

(11) *The International Association of Car Workers* was organized May 22, 1901, from local lodges affiliated with the American Federation of Labor, and admits all men employed in the

construction and maintenance of passenger, freight, and electric cars. In May, 1903, there were 135 local lodges with a membership of 20,000. The official journal is *The Car Worker*, published monthly at Buffalo, N. Y.

(12) *The United Brotherhood of Railway Employees* was organized in January, 1901, and its membership, which is growing rapidly, is practically confined to Canada and the States west of the Mississippi River. The constitution of the brotherhood is exceedingly complex, and makes provision for local and general benefit departments and boards of adjustment similar to those in the older brotherhoods; but it is strongly opposed to the narrow trade or class organization of the older brotherhoods, and aims to unite in a single industrial organization all classes of railway employees, particularly the lower grades. The brotherhood is affiliated with the American Labor Union, the most prominent exponent in America of the alliance between organized labor and socialism.

RAILWAYS, or RAILROADS. Roads upon which lines of rails are laid to facilitate the movement of vehicles for the carriage of freight and passengers. When employed without qualification the term railway or railroad is generally understood to indicate a road consisting of two parallel lines of rails or of multiples of such units upon which cars are hauled by locomotive steam engines. With the adoption of electric power in place of steam on considerable sections of railway line, steam locomotion has become a less distinctive characteristic of railways than was formerly the case, and the term when unqualified has a less definite meaning than formerly, yet ordinarily a steam railway is understood when the term railway is used by itself. Railways employing other form of motive power are similarly defined as electric railways, cable railways, compressed-air railways, etc., and railways serving especial purposes or distinguished by peculiar characteristics of construction are defined as elevated railways, logging railways, plantation railways, street railways, ship railways, rack railways, etc. A railway may consist of a single line of track with two lines of rails, when it is known as a single-track railway, or it may consist of two, three, or four lines of track, when it is known, respectively, as a double track, three-track, or four-track railway. In a few instances railways have been constructed with a track consisting of a single line of rail. Such roads are known as bicycle railways, mono-rail railways, or by other special names. More frequently railway lines are constructed with tracks consisting of three lines of rails. Rack railways have this form of track, as also do rail-

ways designated to carry both standard-gauge and narrow-gauge cars.

EARLY HISTORY. The development of the steam railway is ordinarily dated from the opening to traffic of the Stockton and Darlington Railway, in England, in 1825. The railway, however, had a history long before this date. Indeed, the Stockton and Darlington Railway, and its immediate successor, the Liverpool and Manchester Railway, were comparatively perfect developments of the art of railway transportation. To understand fully the growth of the steam railway it is, therefore, important to review its early history. This may be roughly divided into two phases, namely, the development of railway track and the evolution of railway motive power. To prevent confusion, each of these lines of growth will be considered separately so far as is practicable, but it will be understood that they progressed simultaneously.

Early in the sixteenth century rails of timber were laid at the collieries near Newcastle-on-Tyne, England, over which by means of bulky carts provided with rollers one horse could draw four or five tons of coal. The first notable improvement of this crude railway consisted in securing these wooden rails by pegs to cross-ties placed two or three feet apart, and in fastening on top of the rails proper, which were about six inches square, strips of hard wood which could be removed when worn and replaced with new strips without disturbing the remainder of the structure. In the year 1735 flat iron bars were substituted to some extent for this upper strip of wood, and in 1767 cast-iron bars were generally substituted for the entire wooden rail. At first these bars were flat and about 4 inches wide, 1¾ inches thick, and 4 or 5 feet long, with holes for the spikes, but after a few years they were made with a ridge along the outside edge to prevent the wheels from leaving the track. Subsequently, the flange was transferred to the inside edge of the rail. In 1789 William Jessup introduced a new form of cast-iron rail in which the depth was greater than the width, which led to the name of edge rail being given to it. These rails were cast with a head 1¾ inches wide carried by a thin web deeper at the middle of the rail than at the ends. At first these rails were bolted or pinned directly to the ties, but soon afterwards they were arranged to be supported by cast-iron pedestals or chairs spiked to the ties and having a slot at the top in which the web of the rail was set and secured by a wedge. The rails were made without flanges and instead flanges were placed on the wheels. Owing to the short lengths in which these rails had to be cast, the joints were numerous, a very important objection in railway track, and besides this the material was too brittle to carry safely heavy loads at high speed. The development of the iron industry partly remedied these faults about 1820 by furnishing malleable or wrought iron from which tough rails could be rolled up to lengths of 15 feet. At the end of the first quarter of the nineteenth century, therefore, the standard railway track is found to have consisted of wrought-iron edge rails about 15 feet long, fastened by keys into cast-iron chairs, which were in turn bolted down to stone blocks or wooden sills, spaced about three feet apart. The gauge of the track, that is the distance apart of the rails measured between the inner edge of their heads, was 4 feet 8½ inches, which ulti-

mately became the standard gauge of railway track in England and America. It will be observed that the essential characteristics of the modern steam railway track had been established by 1825, and that it only remained for future knowledge and experience to develop and perfect these features.

The great advance of the wrought-iron edge rail over previous forms of rails gave the first strong impetus to the development of a means of motive power for railways which would be superior to haulage by horses. The possibility of using steam locomotives at once suggested itself. Steam carriages for operation on common roads had been constructed long previous to 1825. (See **AUTOMOBILE**; **LOCOMOTIVE**.) As early as 1804 Richard Trevithick had built a locomotive engine, which at its first trial upon the Merthyr and Tydvil Railway, in Wales, had hauled wagons containing ten tons of coal at the rate of five miles per hour. In 1812 locomotives were used by Blenkinsop to haul coal between the Middleton collieries and Leeds, and also by Blackett at Wylam. None of these locomotives were satisfactory. In 1814 George Stephenson built his first engine and put it in operation on the Killingworth Railway, where it hauled a load of 35 tons at the rate of four miles per hour on a grade of 1 in 450. Stephenson continued to build locomotives, each of them an improvement over its predecessor, and had them working regularly on the Killingworth Railway, although they did not supersede the work of horses. The next step in advance in the use of the locomotive was made on the historic Stockton and Darlington Railway, the construction of which marked the advent of a new era in railway transportation. Before passing from the early history of railways to this new era it will be interesting to summarize briefly the status of railway transportation at the time. In 1825 the existing railways of Great Britain were 28 in number, ranging in length from 4 to 35 miles, and amounting in the aggregate to about 400 miles. These roads were used almost exclusively for the transportation of mineral products. With the few exceptions previously noted, the universal motive power employed was haulage by horses.

PERIOD OF DEVELOPMENT. The Stockton and Darlington Railway, 25 miles long, was opened for traffic in 1825, the line having been constructed under the direction of George Stephenson, as chief engineer. Considering Stephenson's previous work with steam locomotives on the Killingworth Railway, it was not surprising that he should attempt to use similar motive power on the new line. His success in the attempt was considerable. On the opening of the road the Stephenson engine hauled a train composed of 22 wagons filled with passengers and 12 wagons loaded with coal, making an aggregate weight of about 90 tons, at an average speed of five miles per hour and a maximum speed of 12 miles per hour. Notwithstanding the flattering showing made by the locomotive engine in this trial trip, that form of motive power was employed only to a small extent in the immediate future operation of the railway. It could not compete in economy with haulage by horses, and for some time all passengers and mixed freight were so hauled, the locomotive being used only to handle a portion of the coal traffic. The important rôle played by the Stockton and Darlington Railway,

therefore, consisted less in any advance in the mechanical features of railway transportation than in establishing the possibility of the railway as a common carrier of passengers and freight. Railway transportation in the modern meaning of the term began, thus, with the Stockton and Darlington Railway.

The success of the Stockton and Darlington Railway revived another railway enterprise which was destined to accomplish more in some respects for railway engineering than did the earlier road. This enterprise was the project for a railway line between Liverpool and Manchester, a distance of 30 miles. Construction was begun upon the road in 1826, with George Stephenson as chief engineer. Considerable difference of opinion existed as to the best method of operating the road when completed. Stationary engines had many advocates, including some of the most noted engineers of the day; others were in favor of horse power aided by stationary engines at the steep inclines, but few had any faith in locomotives, and Stephenson stood practically alone in openly advocating their use. His persistent earnestness, however, influenced the board of directors to offer a prize of £500 for the best locomotive engine which in a certain day should be produced on the railway and perform certain specified duties in the most satisfactory manner. The date of the test was October 1, 1829, and on this date four locomotives appeared to compete. One of these was the *Rocket*, built by Stephenson, and another was the *Novelty*, built by the Swedish engineer John Ericsson, afterwards famous as the designer of the iron-clad *Monitor*. The trials of these locomotives lasted until October 14th, when the prize was awarded to Stephenson's locomotive, the *Rocket*, which undoubtedly ranks as the first high-speed locomotive of the modern type. (See LOCOMOTIVE for description.) The success of the *Rocket* determined the motive power for the Liverpool and Manchester Railway, and incidentally for railways throughout the world. On September 15, 1830, the Liverpool and Manchester Railway was opened for traffic and on December 4th of the same year the locomotive *Planet* hauled the first load of freight, consisting of 18 wagon loads of cotton, 200 barrels of flour, 63 sacks of oatmeal, and 34 sacks of malt, from Liverpool to Manchester in two hours and thirty-nine minutes. As the model railway of its time the track construction of the Liverpool and Manchester Railway deserves some mention. Upon the graded surface was placed a layer of broken stone two feet deep. Stone blocks two feet square were set three feet apart and upon them and upon the wooden cross-ties used on embankments were fastened cast-iron chairs in which the rails were secured by wedges. The rails were of wrought iron 15 feet long and were rolled with the web deeper at the middle than at the ends. They weighed 35 pounds per lineal yard. The locomotive used has already been mentioned. The passenger cars resembled closely the familiar stage coach, while the freight cars consisted simply of a platform about 10 feet long, with sides from 4 inches to 10 inches high, mounted on four wheels.

In addition to establishing the practicability of the steam railway as a means of transportation for passengers and freight, the Liverpool and Manchester Railway proved the commercial value

of such thoroughfares so satisfactorily that projects for railway lines sprang up all over the world. In Great Britain in 1840, ten years after the opening of the Liverpool and Manchester Railway, there were 1331 miles of railway. These figures had increased to 6635 miles in 1850, to 10,410 miles in 1860, to 15,310 miles in 1870, to 17,935 miles in 1880, to 20,873 miles in 1890, and to 21,855 in 1890. Chronologically Austria-Hungary of the European countries ranks second to Great Britain in the construction of railways. The Austrian railway from Budweis to Lintz, 80 miles, was begun in 1825 and 40 miles were completed in 1828; it was operated by horse-power. In France the first railway, from Saint Etienne to Andrézieux, 13 miles, was also completed in 1828. The first steam railway in Germany, that between Nuremberg and Fürth, 4½ miles, was opened in 1835. To trace the development of the railway systems of these and other foreign countries in detail would exceed the limits of this article, and it must be sufficient to state the year in which the first important railway line was opened for traffic in each, as follows: Belgium, 1835; Germany, 1837; Russia, 1838; Netherlands, 1839; Italy, 1839; Switzerland, 1844; Denmark 1844; Canada, 1847; Spain, 1848; Mexico, 1850; Sweden, 1851; Peru, 1851; Chile, 1852; India, 1853; Norway, 1853; Brazil, 1854; Portugal, 1854; Australia, 1855; Egypt, 1856; Turkey, 1860; Paraguay, 1863; Argentine Republic, 1864; Venezuela, 1866; Uruguay, 1869; Greece, 1869; Colombia, 1880. The articles relating to these countries give further details concerning the history of railway development in them and the latest available statistics of mileage are presented in the accompanying Table I. It will be observed from these figures that nearly one-half the total railway mileage of the world is credited to the United States, and for that reason the history of the development of the railways of the United States has been allotted a paragraph by itself.

Common report has it that the first railway line in the United States was a short stretch of track laid by Silas Whitney on Beacon Street, in Boston, Mass., in 1807; the first line of which there is undisputable record was one three-quarters of a mile long constructed by Thomas Deiper at his stone quarry in Delaware County, Pa., in 1809. This was followed by several tram roads of similar character, the most important of which was one from Quincy to Newport, Mass., three miles long, and one at Mauch Chunk, Pa., nine miles long, both built in 1827. These roads had a track consisting of an iron strap on wooden rails, supported by stone blocks or wooden sills, and were operated by horses. The first attempt made in the United States to use locomotive engines, otherwise than for mere experiment, was made on the railway from Carbondale to Honesdale, Pa., 16 miles, built by the Delaware and Hudson Canal Company. Under instructions from this company its chief engineer, Horatio Allen, had ordered the building of these locomotives in England, and one of them, called the *Stourbridge Lion*, was placed upon the road in August, 1829, by Mr. Allen, who personally ran the engine during its first trip. In 1830 construction was begun on the South Carolina Railroad, with Mr. Allen as chief engineer, and upon his recommendation and by his advice the road was designed and built to be operated by steam loco-

motives. This was the first railway in America built with the purpose from the beginning of using steam locomotives, and the engine ordered

road was built and put in operation in 1831. The Baltimore and Ohio Railroad, commenced in 1828 and completed from Baltimore to Ellicott's Mills, Md., 15 miles, in 1830, came next in the

use of steam locomotives. Indeed, in 1830 a small engine was built by Peter Cooper and made experimental trips on this road, but the first locomotive to be put in actual operation was installed in 1831. In 1831 the *De Witt Clinton*, a locomotive built by the West Point Foundry, was put into service on the Hudson and Mohawk

Railroad. The next railway to mark a step in the development of the railway system of the United States was the Camden and Amboy Railroad, begun in 1831 and completed from Bordentown to South Amboy, N. J., 34 miles, in 1832. The president of this road, Col. Robert L. Stevens, conceived the idea that an all-iron rail would be preferable to the iron-strapped wooden rails

employed on all previous American roads. There was no rolling mill in America capable of rolling such rails, however, and Mr. Stevens went to England to secure them. His request of the English ironmasters was for a rail having a head similar to that then in use upon the principal British roads, but with a wide flat base to the web, which he proposed to secure to the supporting blocks or sills by hook-headed spikes. Considerable difficulty was experienced in getting this request fulfilled, but in May, 1831, the first 500 rails, 15 feet long and weighing 36 pounds per yard, reached Philadelphia, and were placed in the track, thus recording the first use of the flanged T-rail, which has since become universal in America and is extensively employed abroad. It is important to note here that the flanged T-rail was reinvented in England in 1836 by Mr. Charles B. Vignoles, and that rails of this form are known abroad as Vignoles rails. Mr. Stevens also invented the fish plates and the hook-headed spike.

RAILWAY SURVEYS. The surveying operations requisite to and preceding the construction of a railway are in general a reconnaissance, a preliminary survey, and a locating survey or location. The reconnaissance is a general and somewhat hasty examination of the country through which the proposed road is to pass for the pur-

pose of noting its more prominent features and acquiring a general knowledge of its topography with reference to the selection of a suitable route. A preliminary survey consists of an instrumental examination of the country along the several available routes for the purpose of obtaining such details of distances, elevations, and topography as may be necessary to prepare a map and profile of each, make an approximate estimate of the cost of the road, and furnish the data from which definitely to locate the line. The locating survey consists specifically in establishing the centre line of the road on the ground in the position which it is finally to occupy. Defined more broadly, the location consists first in choosing the best route from the several which are available, and second in selecting for the chosen route the best combination of grades and curves. In determining the best combination of grades and curves for the route chosen the engineer has to take into account both the cost of construction and the cost of operation. On one hand he has the annual interest upon the original cost, and on the other the annual expense of operating the road. But the best combination of grades and curves is that which will render the sum of these two a minimum. To select the best line from several available lines, the engineer determines the most economical combinations of grades and curves for each one, calculates the interest on the entire cost of constructing the line with this combination and also the annual expense of operating the line, and takes the sum of the two amounts. That route is best in respect to which this sum is the least. In this last statement it is assumed that so far as their ability to command traffic is concerned all of the available routes are on a parity. This is not always the case. Sometimes one route is superior to any of the others in its ability to command traffic while being inferior in its ability to present the most economical combination of grades and curves. In such a case it often becomes the duty of the engineer to select the more expensive route for the sake of securing the greater amount of available traffic. It is plain upon very little thought that to answer each of these broad general questions a multitude of minor factors have to be carefully integrated, and that altogether the location of a railway is a task which, if it be well performed, calls for skill, experience, and good judgment on the part of the engineer. Beyond the statement of this fact it is impossible to proceed within the limits of the space available in this article, but the reader who wishes to study the problem of railway location in detail will find it presented at great length in Wellington, *Economic Theory of Railway Location* (New York, 1900).

When the engineer has chosen his route and has selected a combination of grades and curves for this route his next task is to establish its centre line on the ground with all the grades and curves properly indicated. In plan the centre line consists of a combination of straight lines or tangents and of curves. The curves may be simple curves, that is, plain circular curves; or compound, that is, consisting of two or more circular arcs of different radii; or reverse curves, that is, two simple curves so joined as to form a curve like a flat letter S. Curves are further designated by their degrees of curvature. The degree of a curve is determined by the angle at

the centre subtended by a chord 100 feet long. For example, if on any curve a chord 100 feet long subtends an angle of 5° at the centre, that curve is known as a five-degree curve. In profile the centre line is composed of a combination of level or horizontal lines and of inclined lines or grades ascending or descending from the horizontal. Grades are designated either by stating the number of feet of rise or fall in a horizontal length of line of 100 feet or of one mile. For example, a grade having a rise of one foot in a horizontal length of line of 100 feet is known as a 1 per cent. grade. The same grade defined in terms of feet rise per mile of length would be known as a grade of 52.8 feet per mile. When two grade lines meet or when a grade line and a level meet the junction is marked by an angle more or less abrupt. This angle is always replaced by a vertical curve which is convex upward at a summit and concave at a valley.

ROADBED CONSTRUCTION. The first task in the building of a railway is the construction of the roadbed or permanent way. In its broadest meaning the permanent way of a railway comprises all structure upon which track is laid, but the term is often given a more limited application which excludes culverts, trestles, viaducts, bridges, etc.; the broader application of the term will be chosen here. The actual work of construction of the roadbed of a railway begins with the clearing of the right of way. This right of way is a strip of land usually 100 feet wide, or 50 feet each side of the centre line of the road, and the clearing from it of all obstructions is obviously necessary before the work of actual construction can be begun. The amount of clearing required varies according to the natural conditions; on an open prairie section it is merely nominal, but in thickly wooded country, where trees have to be felled and their stumps pulled up, it forms quite an item in the expense of construction. As soon as the right of way is cleared, the work of excavation and embankment construction is begun. In locating the road the engineer has settled upon certain stretches and grades which are right lines and which define the top surface of the roadbed. The lines of these levels and grades in some places cut the natural surface of the ground and in other places they lie above the ground surface so that the roadbed has to be filled in. So far as he can do so without sacrificing more important things, the engineer endeavors to make the adjacent cuts and fills balance each other; that is, he tries to arrange the grades so that the material excavated from the cuts will be sufficient in quantity to construct the adjacent fills or embankments. When this desirable end cannot be accomplished the extra earth necessary for the embankments is secured by excavating pits called burrow pits at points convenient to the embankment to be built. Sometimes also it is preferable to take the material from burrow pits even where the amount of cuttings is more than enough to form the fills, since it is less expensive to do this than to haul the material excavated from the cuts to the points where it is required for embankment construction. A cut is simply a trench whose bottom is at the plane of the grade line and somewhat wider than the required roadbed, and whose sides slope upward and away from the track to the ground surface at greater or less angles, determined by the slope at which

the material will stand without sliding. The natural slope of different materials runs from a nearly vertical plane in firm rock to planes as flat as one foot rise in a horizontal distance of four feet, or technically defined, a slope of one on four. Slopes of 1 on $1\frac{1}{2}$ or 1 on 2 are perhaps the most common. Evidently the width of the cut at its top will depend upon its depth and the slope of the sides; it may easily reach 100 feet. When it exceeds this width it becomes necessary for the engineer to figure upon the desirability of sustaining the sides of the cut by retaining walls (see **RETAINING WALL**), or perhaps to consider the substitution of a tunnel for an open cut. Cuts are always made with a bottom width enough wider than the roadbed to allow a ditch to be built at each side to carry away the water from rain or melted snow which runs down or seeps through the side slopes.

The excavation of cuts is accomplished by any of the ordinary means of earth and rock excavation. For earth excavation the steam shovel (q.v.) is the tool most commonly employed. A fill may be described as the reverse of a cut; in fact, were it possible to take out a cut in a single solid piece and to deposit this piece on the ground bottom side up, it would serve as a fill. The manner of constructing a fill is to deposit the material from cuts and burrow pits along the line until an embankment is formed whose top is at grade and somewhat wider than the required roadbed and whose sides slope downward and outward at angles depending upon the natural shape of the material. Care is taken to make the embankments solid, since they must carry heavy trains, and to construct them so that the water falling on them will drain away as soon as possible. Usually there is not much attempt to use selected material, except for the upper section on top of which the track ballast will come. Fills, and, more particularly, deep fills, are often constructed by building a rough timber trestle onto which the material cars are run and their contents dumped until the trestle is entirely buried in an embankment of earth. Often also a trestle is at first built to carry the trains with the intention of filling it in afterwards. This hastens the construction and cheapens the first cost of the road, thus allowing the owners to begin operations and to earn money while the final embankment awaits some convenient time for its construction. The method of constructing embankments by filling in trestles is often resorted to in order to carry the roadbed across morasses of swampy ground.

It often happens that the problem of carrying an embankment across a morass is one of the most difficult which falls to the lot of the railway engineer. Where streams have to be crossed it is necessary to provide openings in the embankment for their passage. For small streams these openings are provided by means of culverts (see **CULVERT**) and in the case of large streams bridges are built. (See **BRIDGE**.) Bridges or viaducts are also employed to carry the road across gorges and deep valleys. Where the contrary condition exists and the engineer is called upon to carry his line over ridges or mountains where an open cut is not possible, because of its size and cost, and a direct climb is not practicable, because of the steep grades, he either resorts to the construction of a tunnel or of a switchback. The conditions which call for a

tunnel and the methods of constructing such works are discussed in the article on TUNNELS.

A *switchback* is a line which zigzags back and forth along the side of a mountain and thus gradually climbs to the summit level at which a direct crossing is possible. These structures are expensive to operate, because of their length and steep grades, and railway managers usually substitute tunnels for them as soon as the finances of the road and the amount of its traffic will warrant so costly an undertaking. Another method of overcoming steep mountain grades is to use a rack railway or a cable incline railway, and these special forms of road are described in succeeding paragraphs.

TRACK CONSTRUCTION. The width of the roadbed at the top is from 26 to 32 feet for double track and from 14 to 18 feet for single track on embankment. In cuts the width of roadbed exclusive of ditches is from 23 to 33 feet for double track and from 18 to 22 feet for single track. The surface of the roadbed at subgrade is almost invariably crowned at the middle so as to drain off water to the sides. On the top of this crowned surface is constructed the track. This consists of the ballast, the ties, the rails, and their accessories. Ballast is used for four principal purposes: (1) to distribute the load over the roadbed; (2) to form a support for the ties; (3) to provide efficient drainage under and

other woods. White oak is considered the best wood for railway ties, and ties of this wood have a life of about eight years. Ties are generally from 7 to 10 inches wide, 6 inches thick, and 8 to 9 feet long, and they are spaced from 18 inches to 2 feet apart in the track. An immense amount of timber is consumed annually for railway ties, as a brief estimate will demonstrate. Assuming that 2500 ties per mile of track are employed on the average, then the 250,000 miles of railway track in the United States require 625,000,000 ties. The annual consumption is about 76,000,000 ties for renewals and 14,000,000 ties for new construction, a total of 90,000,000 ties or nearly 300,000,000 cubic feet of timber. In view of these figures, it is not surprising that railway managers are finding greater difficulty each year in securing ties, and that they should be resorting to measures which will cut down the consumption.

TIE PLATE.

One of these measures is to plant trees, but the one most commonly sought is to treat the ties used by some of the various methods for preventing or rather for delaying the natural decay. Another resort for prolonging the life of ties is to use *tie plates*, which are plates of iron inserted between the top of the tie and the bottom of the rail so as to distribute the load over a larger area and thus reduce the tendency of the rail to cut into the top of the tie. By many engineers

TYPICAL SECTIONS OF RAILWAY ROADBED AND TRACKS.

around the ties; and (4) to allow of surfacing and arranging the track without disturbing the roadbed. At this point it is a matter of some interest to note that the term ballast originated in England when gravel ballast was taken from ships for building tramroads. The materials most generally used for ballast are broken stone, furnace slag, burnt clay, gravel, sand, cinders, and earth, but other materials, as shells and chert, are often used locally. These materials rank in merit about in the order named, but the gravel is the material most used in America and after this comes broken stone. The ballast is usually level with the tops of the ties and about one foot thick, and it is usually shouldered out beyond their ends.

Ties, or *cross-ties*, as they are often termed, are the transverse wooden sections to which the rails are attached. As stated above, they are imbedded in the ballast. Wood is the almost universal material for ties in the United States, but in other countries metal ties are quite extensively employed. About 55 per cent. of all the ties in the United States are of oak and 22 per cent. are of pine. The remaining 33 per cent. is divided between cedar, chestnut, hemlock, cypress, and

it is thought that the ultimate solution of the problem will be the substitution of metal ties. An endless number of forms of metal ties have been tried, but only a few of them have proved successful, although these successful forms have given excellent results in many instances. In Europe, India, Africa, South America, and Mexico, metal ties are extensively used.

Rails are now universally made of steel and are of the flanged T-section invented by Col. R. L.

STEEL CROSS-TIE.

Stevens in 1830. This statement is wholly true of American practice and is generally true of foreign practice. Practically the only exception to the flanged T-section is the so-called bull-headed rail used in England. This rail has the

familiar flanged base of the American rail replaced by another head, the object of this design being to enable the rail to be reversed when one head has become worn. These bull-headed rails cannot of course be spiked to the ties, and they therefore require cast-iron chairs for their support. Formerly in America nearly every road used a form of rail peculiar to itself, which differed somewhat in minor dimensions and details from the rails employed by other

roads. Recently, however, practice has settled down to the use of a very few standard sections. In America the so-called Am. Soc. C. E. section recommended in 1893 by a special committee appointed by the American Society of Civil Engineers (q.v.) is the one which is most generally used; in Europe the section invented by Mr. Sandberg is chiefly employed. The ordinary length of rails is 30 feet, but rails 33 feet, 45 feet, and 60 feet long are used to some extent. The weight of rails per linear yard varies from 65 pounds, which is the least weight economical for ordinary service, to 100 pounds, which is the heaviest rail actually in use in the United States. Generally for ordinary traffic on roads with easy curves and moderate grades a 70-pound or 75-pound rail is used; for heavy and fast traffic and for sharp curves and steep grades the weights used run from 80 pounds to 85 pounds, 90 pounds, 95 pounds, and 100 pounds. An 80-pound rail of the Am. Soc. C. E. section is 7 3/8 inches high, with a head 2 1/2 inches wide and 1 1/2 inches deep, a web 35/64 inches thick and 5 inches

STANDARD AM. SOC. C. E. 80-LB. RAIL.

deep, and a base 5 inches wide. Of the total weight, 42 per cent. is in the head, 21 per cent. in the web, and 37 per cent. in the base.

Until 1855 all rails were made of wrought iron, but in that year steel rails were rolled in England, and were laid in track. Steel rails were rolled experimentally in the United States in 1865 and in 1867 they were being rolled to supply orders from the railways. The substitution of steel for iron for railway rails was one of the benefits wrought by the invention of the Bessemer process of steel-making. (See IRON AND STEEL.) The Bessemer process was introduced and developed in America largely through the efforts of A. L. Holley (q.v.). It has been claimed with substantial justness that no other invention did so much to encourage the development of the heavy-traffic, high-speed American railway as did this epoch-making discovery of Bessemer. In America and England rails are now generally spaced 4 feet 8 1/2 inches apart, this spacing being known as the standard gauge. Various other gauges are employed in other countries, the meter gauge, 39.37 inches, being common in

South American countries and Japan, a 5 foot 6 inch gauge being used in India, and a 5 foot 3 inch gauge being used in Ireland. A narrower gauge than the meter gauge has been employed on some railways. The Great Western Railway in England was originally constructed with a 7 foot gauge, and it was not until 1892 that it was converted to a standard-gauge road. A 6-foot gauge was introduced on the Erie Railway and retained long after the standard gauge had become general in the United States. As

time passes, however, the 4 foot 8 1/2 inch gauge is becoming more common all over the world. The method of fastening rails to the ties varies. In America hook-headed spikes are almost universally used; the bull-headed rail used in England is wedged into cast-iron chairs which are bolted to the ties; in Europe considerable use is made of bolts; and when steel ties are employed various forms of clamping devices tightened by means of bolts or wedges are used. To allow for expansion, rails are usually laid with a little space between the ends of succeeding rails. The space allowed varies on different roads and with the temperature at the time the rail is laid, but it is seldom more than three-eighths of an inch for the coldest weather and from this distance it gradually decreases to nothing at the maximum prevailing heat for the climate which the road has to endure.

SPIKES FOR FASTENING RAIL TO CROSS-TIE.

The ends of succeeding rails are clamped together by various devices going under the general name of rail joints. The simplest form of rail joint is the fish plate, and the most common form is the angle bar. (See FISH PLATE.) The joint remains the weakest point of the rail despite all the efforts which have been made to remedy this

weakness. It may be noted in passing that these efforts are responsible for the numerous forms of patented rail joints which are on the market, several of which have met with substantial success. Rail joints are defined as *suspended* when the opening between the rail ends comes over the space between the adjacent ties, and as *supported* joints when this opening comes over the

ANGLE-BAR RAIL JOINT.

weakness. It may be noted in passing that these efforts are responsible for the numerous forms of patented rail joints which are on the market, several of which have met with substantial success. Rail joints are defined as *suspended* when the opening between the rail ends comes over the space between the adjacent ties, and as *supported* joints when this opening comes over the

centre of a tie. Suspended joints are by far the most common in the United States. Rails are said to be laid with *square* joints when the joints of the two lines of rails are opposite each other, and they are said to be laid with *broken* joints

RAIL BRACE FOR HOLDING RAILS ON CURVES.

when the joints in one line of rails come opposite the centre portion of the rails in the other line. Broken joints are the more common in the United States. On curves the gauge of the rails is usually slightly increased, with the idea of preventing the flanges of the car wheels from

and on sharp curves braces of stamped or cast steel or iron are spiked to the tie and brace against the side of the rail. These braces are called rail braces. In many places rails develop a tendency to creep or travel along the track, due to the various forces acting upon them. The direction of this creeping may be either up or down grade, with or against the traffic, and to prevent it check plates or creeper plates are sometimes employed, which are bolted to the rail and spiked to the tie. Special forms of track construction are required at switches.

The switch is a device by which a train is directed from one track to another. An essential part of a switch is a frog. (See FROG.) On bridges and trestles the track construction also varies somewhat from that on embankments and in cuts. Sometimes the floors of bridges are made solid and carry ballast on which the ties and rails are supported in the usual manner, but more commonly the ties are laid on the

CATTLE GUARD WITH METAL SURFACE.

binding when rounding curves, and the outer rail of the curve is elevated above the level of the inner rail to counteract the tendency of the running cars through centrifugal force to continue in a straight line when passing a curve.

bridge stringers and carry the rails without any ballast. An essential part of railway track on bridges is a wooden or metal rail laid parallel to each of the track rails and a little distance away from them. The object of the guard rails is to restrain the free movement of derailed cars and prevent them from running off the bridge. In thickly settled districts the railway right of way is usually fenced in with fences of timber or wire, or, where a nice appearance is particularly desired, with hedges and walls of stone bearing ornamental iron railings. At grade crossings of highways and in a few other places at which cattle are liable to stray onto the track cattle guards are employed. These are of two kinds, known as *pit guards* and *surface guards*. A pit guard, as its name implies, is a wide deep pit underneath the rails which cattle will shun for obvious reasons. A surface guard is made up of sharp edged or toothed slats of wood or metal which depend for their efficiency upon the fact that in treading upon them the animal

PLAN OF FREIGHT YARD ON ERIE R.R., PORT JERVIS, N. Y.

The amount of this elevation is greater the sharper the curve is. This same centrifugal force of the car tends to push the outer rails of curves in an outward direction or away from the inner rail, and to prevent this the outside rails on flat curves have a double set of outside spikes,

hurts its feet and withdraws from the attempted crossing.

Sidings and yards are special developments of the track system for special purposes. Sidings are provided to enable trains to pass on single-track roads and to relieve traffic on double track.

Yards are aggregations of tracks at terminals and other points which are provided for the storage and handling of cars which accumulate at those points. Various arrangements of yard tracks are employed, each arrangement being adopted to serve certain purposes and to meet certain conditions of traffic and of form and area of yard space. At the ends of stub tracks a bumping post (q.v.) is a necessary structure to prevent the cars from running off the end of the track. Another essential structure is a turntable for turning locomotives and sometimes cars. Track scales are an important item in railway-yard equipment. They resemble very closely the familiar platform scale used for weighing hay, coal, etc., in wagons, but are much larger and stronger so as to accommodate heavily loaded cars. To facilitate the handling of locomotives ash pits are provided into which the engines may dump their grates when necessary, and also water tanks, as are shown in the illustration. Station platforms are also usually classed as a part of the track construction.

So far reference has been made only to track construction, but track maintenance is quite as important an item. The work of maintaining the track of railways in good order costs in America all the way from \$500 to \$1500 per mile, and is from 8 to 20 per cent. of the total operating expenses. The number of employees engaged in track work by American railways averages about 150 per 100 miles of line.

BUILDINGS. Railway operations require the use of buildings in vast numbers. Of these passenger stations and freight depots are among the most important because of their number and cost. Passenger stations vary in size and character from small combination depots used at local stations of minor importance to large terminal stations of masonry and steel, and often of almost monumental magnificence. A combination depot is one in which both the freight and the passenger business is carried on under one roof. For the freight business a freight room is required, with platform space along a wagon road for transferring freight to and from wagons; and also the necessary facilities for handling freight to and from cars in freight trains or cars standing at the depot. The passenger business is served by the introduction of waiting rooms. Generally the structure is a one-story frame building sheathed with boards and roofed with shingles. Flag stations are stations of minor importance at which only a limited number of trains stop, usually upon being signaled by flag. The buildings at such stations range in importance from a single roofed platform to a combination depot.

Where the volume of traffic is sufficient the freight and passenger buildings are separated. Passenger stations in these cases may be divided into local stations and terminal stations. The distinction between the two is that in terminal side stations the tracks, or a number of them at least, terminate at the station, while in large first-class local passenger stations the tracks pass by the buildings. Local stations vary greatly in size, character, and cost, many of them in large towns and cities being elaborate stone and steel structures, but the largest of them seldom equal in size the largest terminal stations. Terminal passenger stations are those erected

for the accommodation of the passenger service at large passenger terminals of railways. Frequently several railways entering a town unite and use conjointly a so-called 'union depot.' It follows, therefore, that terminal passenger stations are located in large cities and towns, or at ferry terminals or at important junction points of several railways. These stations possess all the accommodations provided for large local stations, but in more capacious and luxurious forms

Half Elevation. Half Section.

Part Plan of Foundations. Part Plan of Substructure.

RAILWAY WATER TANK FOR SUPPLYING LOCOMOTIVES.

and in addition many others, such as hotels, bars, cab, and carriage stands, parlors and reception rooms, rooms for gatemen, porters, police, watchmen, doctor's office, etc. Terminal stations are denominated side stations when the building is situated at one side of the tracks and head stations when the building extends across the dead ends of the tracks. Usually the tracks enter the station in pairs with a platform between each pair of tracks. These tracks and platforms are commonly roofed over in terminal stations. Train-shed roofs are sometimes made up of large steel arches spanning the tracks without intermediate supports, and sometimes they consist of two or more spans of steel roof trusses carried by side walls and intermediate columns.

Except at combination depots and flag stations special buildings are provided for handling the

freight traffic. Freight houses are of two kinds, commonly defined as terminal freight houses and local freight houses. The former are large separate buildings at important terminals, and the latter are usually small structures at intermediate stations along the line. Local freight houses are usually single-story frame structures having high platforms on one or all sides. If the tracks are only on one side of the building it is designated a side freight house, but if there are tracks on both sides it is designated as an island freight house. Terminal freight houses differ from local freight houses in their greater size, in their more substantial construction of brick and steel, and in their arrangement for handling incoming freight, outgoing freight, different classes of freight, etc., in separate departments, and in having the storage space separate from the spaces devoted to the handling of transient freight. Terminal stations located on the water front must also have provisions for transshipping freight to and from vessels. Railway shops are located at one or more places on a railway at which locomotives and cars are repaired and built, and where all the manufacturing work of the railway is done. Such shops resemble large manufacturing establishments elsewhere in their construction, arrangement, equipment with wood and metal working machines, etc., suitable for the work to be performed. Among the various other railway buildings are: Roundhouses for the shelter, cleaning, and minor repairing of locomotives between trips; car sheds and car-cleaning yards, for the shelter and cleaning of cars between trips; ice houses, for storing the ice used in passenger and dining cars and for refrigerator cars; sand houses, for drying, cleaning, and storing the sand supplied to locomotives; oil-storage houses, for storing the lubricating and lamp oil; coaling stations, for storing and delivering coal to locomotives; watchmen's shanties; section-houses; snow sheds and protection sheds for landslides; dwelling houses for employees, and sleeping quarters, reading rooms and club houses for employees. Some notion of the enormous expenditure in buildings required by railways is furnished by the statement of the Interstate Commerce Commission that for the year ending June 30, 1900, the cost of repairs and renewals of buildings on the railways of the United States was \$22,770,906, or about 2½ per cent. of the total operating expenses.

CARS. Railway cars of so many varieties are now in use that a description of the different kinds would be beyond the scope of this article. The list would include upward of 40 distinct patterns of cars, each of which is adapted to a special use. The early passenger cars differed but little from stage coaches, and the first step in the evolution of the modern car was made by joining several of these coach bodies into a single car. In the United States bogie trucks were next placed under each end of the cars, permitting them to be made of much greater length, after which the compartments were discarded for the present continuous car bodies, although in England and in most of the countries of Continental Europe the compartment system has been retained, each car being divided into three or four independent sections. Most of the improvements following these changes have been in the direc-

tion of additional safety devices and luxuries. The first attempt to furnish sleeping cars was on the Cumberland Valley Railroad in 1836. A compartment car of four sections was used, each section containing a lower, middle, and upper berth, but this, as well as a few other experiments in providing sleeping accommodations, was too crude to prove attractive. In 1864 the first Pullman sleeping car was introduced, and some time afterwards was put into service on the Chicago and Alton road. This car, called the *Pioneer*, was a foot wider and two and a half feet higher than any in use at that time, and before it could run over the line several bridges and all the station platforms had to be altered. Parlor cars and dining cars soon followed, and in 1886 the vestibuled cars completed the list of luxuries in railway travel. The car-building industry in this country is a vast one, as is well indicated by the fact that in 1900 a total of 124,106 cars were built, not including those built by the railway companies at their own shops. The total number of cars in service in the United States on June 30, 1900, was 1,450,838, of which 1,365,531 were freight cars.

A notable increase in the size and capacity of cars has signalized recent car construction. In 1875 the normal capacity of freight cars in the United States was from 20,000 pounds to 25,000 pounds. In 1885 this normal capacity had grown to 40,000 pounds and 50,000 pounds, and in that year cars of 60,000 pounds capacity had begun to be built. Few cars of less than 60,000 pounds capacity are now used for general freight service, and there is a decided tendency to increase the capacity to 70,000 pounds and 80,000 pounds. For special coal and ore traffic steel cars of 100,000 pounds and 110,000 pounds capacity are quite generally used. The steel car is a decidedly modern innovation and one which has been received in America with much favor. The principal advantages argued in favor of steel cars of 50 to 60 tons capacity are their great capacity in proportion to their weight and their superior strength and durability over modern cars. In addition to all-steel cars, cars with steel under frames and wooden superstructure are considerably used.

In Europe the passenger cars used are generally smaller and of lighter construction than those in America, but during recent years the tendency has been to employ cars of larger size than formerly, although such great dimensions as are common in America have not yet been attained. The smaller cars are from 26 to 34 feet long and are usually mounted on six wheels; the larger cars reach a length of nearly 60 feet and are mounted on trucks after the American fashion. The smaller American passenger cars are usually 50 feet long, while the large sleeping and dining cars frequently have a length of 80 feet or even 90 feet. European freight cars are veritable pygmies as compared with those used for the same service in America, they being from 12 feet to 18 feet long, mounted on four wheels and having a capacity of from 5½ to 9 tons.

SAFETY APPLIANCES. Safety appliances for railways have been of growing importance in proportion to the increase of the weight and speed of trains; at the same time, very few of these appliances are used solely with a view to safety, most of them having some

mechanical function to fulfill apart from the promotion of safety. Signals are one of the most important items of this class, and serve to keep the trains a certain distance apart, as well as to inform the engine runners of the condition of the tracks at switches, crossings, etc. The semaphore is the standard signal in both the United States and England. These are arranged to give three indications, according to the positions and colors of their blades in the daytime and the colors of their lanterns at night. The semaphore consists of a vertical post, to which a blade about two feet in length is pivoted near one of its ends, so as to hang either vertical at right angles to the post or midway between these positions. The short end of this blade behind the pivot carries a disk of colored glass, either red or green, which falls in front of a lantern when the blade is moved. For a clear track the blade hangs at an angle of about 30 degrees from the post and the lantern shows white. For danger a red blade stands horizontal, showing a red light, and for caution a green blade and a green light are shown. The signals and switches are worked from the same station by means of levers, which are provided with interlocking devices, so that only the proper signal corresponding to the position of the switch can be given. The interlocking system is a very ingenious arrangement, by means of which the movements of a number of levers are interdependent, so that it is mechanically impossible for the signalman to move them except in their prearranged order. In approaching a switch there are two signals, the farther one indicating caution, and the home signal danger, if the switch is not locked in position so that the line is clear. The switch lever is the only one which can be moved, and its movement releases the lever of the caution signal. Moving the latter locks the switch lever and releases the danger-signal lever, which, being thrown, locks the caution-signal lever and indicates that the way is clear. The levers can only be moved now in the reverse order, so that in throwing the switch the signals show danger first. In cases where the signals are too far from the signal tower to be seen and a break in the connection occurs, the signal falls by gravity to the danger position. This system of interlocking is capable of broad expansion, as one lever may be made to lock any one or more of the assembled levers in a signal tower.

In a refinement of the above system the manual labor of throwing the levers is replaced by the use of compressed air. The valves which control the various signals and switches are operated by electricity and controlled by small switches, which interlock in the same way as the levers described. A model of the track and signals is placed over the switchboard, and any changes made are reproduced on the model. As with the interlocking system, a signal could not be given which would lead to an accident; such could only occur by the failure to see or obey the signals. In case of fogs, a torpedo is frequently placed on the track, which makes a loud report when the wheels of a locomotive pass over it. In connection with the interlocking system, the detector-bar for switches is important, its function being to prevent the throwing of a switch while a train is passing over it. This is accomplished by means of a bar placed parallel to the rail, and which is moved by the same mechanism

which locks the switch. The movement of this bar raises it above the level of the rail, so the switch cannot be unlocked as long as there are any wheels on the rail which prevent the detector-bar from being raised. Another railway safety appliance is the system of signals which is used to maintain a minimum distance between the trains on the same track. The block system is used for this to some extent in the United States, and is almost general in England. See BLOCK SIGNAL SYSTEMS.

Brakes are the most essential safety devices for railway trains, and certain general principles are now recognized as necessary, which are to be found in almost all brake mechanism in use all over the world. They must be quick-acting, must be applied to every pair of wheels in a train, and must be applied simultaneously and controlled from a single point, generally at the locomotive. Air brakes, vacuum brakes, and several electrically controlled brakes fulfill these conditions, the Westinghouse automatic air brake, however, being the standard in this as well as most other countries. See AIR BRAKE.

In addition to the signaling and braking appliances mentioned, a number of minor devices of great value in promoting safety have been introduced. Automatic couplers are important

AUTOMATIC CAR COUPLER.

among these, and they are now demanded by law in the United States. A standard form has been adopted by the Master Car-Builders' Association, to which the various manufacturing companies comply, so that any of the different makes will work together. Their use is now general on all cars.

Grade crossings of highways at important points are gradually being abolished, as the percentage of people killed at these points is much greater than that of passenger fatalities. One device used at grade crossings is the well-known arm gate, operated by a flagman, or by compressed air, when several gates near together are used. Another method for crossings where the travel is infrequent is to provide an electric bell at the signal post, which is put in operation by the car wheels, and continues to ring for several minutes before the passing of a train. A considerable number of other appliances are in general use for promoting safety on railways, which would require too much space to describe.

RAILWAY MANAGEMENT. Railway management in the United States is primarily under the control of the directors of the railway companies, who are elected by the stockholders. A president is the chief executive officer of a railway, and the other officers are generally one or more vice-presidents, a treasurer and secretary, and a general manager. The treasurer has charge of all moneys collected and disbursed, and is responsible directly to the president, who is assisted in certain duties by the vice-president. The duties of the general manager extend to every department of the service, all of which are under his control. A superintendent is at the head of each department, who is responsible for every detail

of the work in every division and subdivision of his department, and each sub-department is in turn under the control of a single head, and so on down to the end of the scale. In this way the lines of responsibility of each employee, from the car-cleaner up to the president, are clearly defined. The heads of the principal departments directly in charge of the general manager are the superintendent of roadway, the superintendent of machinery, and the superintendent of transportation. The controller, the traffic manager, and the car accountant are also classed in the same rank. The subdivisions of these departments are too numerous to trace in detail. The superintendent of roadway is responsible for the maintenance of all the construction work of the railway, including the track, trestles, bridges, buildings, etc., each of which departments is assigned to supervisors, whose work covers a certain allotted territory. Each supervisor divides his territory into sections which are in charge of a resident section master, who employs a section gang. Track walkers from these gangs patrol their entire section several times a day and report any needed repairs, which are attended to by the section men. The superintendent of machinery attends to the provision and maintenance of all the rolling stock. The locomotives are in charge of a master mechanic, who keeps a record of the performance of each of them, and the cars are under the care of a master car-builder, who attends to the manufacture, repairing, and inspection of all the company's cars. The superintendent of transportation is in charge of the movements of all the trains on the road and all employees connected with the train service, including telegraphic operators, train dispatchers, conductors, etc. In addition to arranging the regular time schedule, he provides for the extra trains ordered by the traffic manager. A graphical representation of the regular trains is used, from which the relative positions of the trains on the road at any time during the day can be seen at once if the runs are made on time. From this diagram the opportunities for sending out extra trains are determined, and any chances of collisions become apparent and can be guarded against.

The traffic manager's department is divided into two principal branches—the passenger traffic and the freight traffic—each in charge of a general agent. In this department the rates and tolls are made, and the advertising, soliciting of business, etc., carried on. The duties of the car accountant are keeping a record of all cars on the road, which is made up from the conductors' reports, and notifying the owners of the number and movements of other companies' cars on his road. This is made necessary from the custom of sending through freight cars over different roads without unloading, and in this way they are often scattered widely over the country. There are two other departments, less intimately connected with the management of the roads than those mentioned above. These are the purchasing and the legal departments. The controller's department, where the accounts and statistics are kept, completes the general outline of the organization of a railway.

RAILWAY TRAFFIC. Passenger service on steam railways was inaugurated on October 10, 1825, on the Stockton and Darlington road with a passenger car called the *Experiment*, which car-

ried inside and outside about 25 passengers. The distance run was 12 miles, and the fare was one shilling, each passenger being allowed 14 pounds of baggage. In America by the end of the year 1831 there were several railways in operation or in course of construction, but for fifteen or twenty years the railway travel was extremely uncomfortable, although it was a vast improvement over the stage coaches previously used. The car ceilings were low and without ventilation, the stoves at either end of the cars had no effect on the temperature at the middle seats, and in the absence of spark arresters the cars were filled with cinders. Tallow candles were used at this period, which contributed more to the odor than to the illumination of the cars, and the roughness of the track and jolting of the train made conversation almost impossible. The flat rails used at first were the cause of numerous accidents. Their ends were cut at an angle to form lap joints, and the pointed ends were occasionally caught by the wheels and driven up through the car floor, impaling the passengers sitting directly over them. Through tickets were unknown, and at the end of each short, independent railway, into which the long routes were at first divided, the passenger was obliged to purchase a new ticket, change cars, and transfer his own baggage. These conditions prevailed generally on American railways, as well as on all others, for a number of years, and it was not until 1860 and after that the most important railway improvements were adopted. Automatic brakes and automatic couplers, as well as spring buffers, were the most noticeable of the early improvements introduced. These devices overcame the jerking and jarring of the cars both when in motion and when starting and stopping. The bell-cord passing through the cars and communicating with the engineer, or with the air-brake mechanism, is a safety device peculiar to this country, and is still generally omitted in Europe for fear that false signals may be given.

The use of sleeping cars and parlor cars introduced an element of comfort in railway travel which was of great importance in this country, on account of the distances traversed. The buffet car was afterwards provided to avoid delays at meal stations. This was merely a modified sleeping car with a kitchen at one end and portable tables, which could be fixed in each section. Dining cars, introduced shortly afterwards, led to the development of vested trains, as, in order to reach the dining car, the rule forbidding passengers to cross the platforms when the cars were in motion was then broken at the invitation of the railway companies. Vestibuled express trains are now in general use, on which sleepers, parlor cars, a dining car, a smoking saloon, library, bath-room, barber shop, and writing-room are provided. The checking of baggage is regarded in this country as one of the most indispensable features of railway travel, as by this system through checks over any number of connecting railways may be issued, so that baggage is transferred from the passenger's residence to any specified address in the country without devolving any responsibility upon the owner. This system operates so perfectly that the loss of baggage is almost unknown, and its detention is of rare occurrence. The usual allowance of 100 pounds of baggage per passenger is merely nominal on most roads, as charges are

rarely made except where the excess is several times the specified weight. In connection with through checks, coupon tickets are issued for trips covering several different roads, which are sold by either of the companies whose lines are traversed. This requires an agreement between the different roads for the mutual accounting for the tickets sold. The average rate per mile for railroad fares in the United States is approximately the same as in Europe, and to make a comparison the different classes of travel must be considered. In Europe the rates of fare are graded into three classes—first, second, and third. The first-class travel is very small, and the fares are comparatively high; by far the largest proportion of travel is on the third class. In the United States the first class comprises most of the railroad travel, the second and third classed together amounting to only 1 per cent. of the whole.

The speed of passenger trains is being steadily increased, and recent years have shown some remarkable records of train speeds both in America and abroad. A more important development than these occasional record runs, however, has been the increase in the average speed of trains. Many railways to-day maintain a schedule speed of 50 miles per hour in their express train service, and in some instances regular trains average 60 miles per hour. Where an average speed of 60 miles an hour is demanded by the time-table, the speed during a part of the run often reaches 75 and even 85 miles per hour. Much higher speeds than this have been exceptionally attained for short distances. As the result of these developments the schedule time between important cities has been greatly reduced. In the United States between four and five thousand passengers are killed and injured each year by railway accidents. These figures seem large until the enormous number of passengers carried safely to one injured is calculated. According to the report of the Interstate Commerce Commission, 2,316,648 passengers were carried safely in 1900 to one passenger killed, and 139,740 passengers were carried safely to one injured. In England in 1900 the proportion was one passenger killed in 8,461,309, and one injured in 470,848. On the Continent of Europe in many cases an even better record is maintained.

The railways of Europe are largely under Government control, growing out of the policy of subsidizing them, or in some cases of building the lines outright, or of guaranteeing a monopoly of traffic by the State. In France most of the railways are either owned entirely or to a very large extent by the Government, and are held by the companies operating them on leases. In this way almost all the railways in the country will ultimately revert to the possession of the Government. Railway service in England is in some respects different from that of any other country, and its evolution from stage-coach travel is still suggested by its nomenclature. The cars are called carriages, the engineers drivers, and the conductors guards. The absence of grade crossings and sharp curves and the substantial character of the construction work make the English roadbeds superior to most others. Safety in travel is greatly promoted by these conditions, but in other respects the passenger service is, from an American standpoint, much inferior to

that in this country, although vast improvements have taken place both in England and on the Continent within recent years.

Freight service constitutes the greater part of the business of most railways, and is the most important source of their income. Of the entire revenue of the railways, about 70 per cent. is derived from freight traffic, 25 per cent. from passenger service, and 5 per cent. from mail and other minor services. The movement of freight by the early railways was very slow and much more expensive than it is now, largely owing to the transfers made between the cars of different companies, each of which used its own rolling stock exclusively. With the increase of freight traffic the custom has grown to allow freight cars to run from the point of shipment over any number of railways to their destination without transfer, and the greater part of the freight business in the United States is now done in this way. The cars of each company become considerably scattered over the lines of other companies, and every road does more or less business with other companies' cars, for which a mileage is paid to the owners of the cars. The through freight service of the country is very much improved by avoiding transfers, but at the same time keeping account of the whereabouts of its cars and reducing its mileage balance by as little use as possible of foreign cars are often troublesome problems for a railway. The car accountant's department keeps records of the movement of cars, which are made up from the reports of the train conductors and from agents placed at each railway junction. These records are quite complete, and are of additional use in checking the reports of foreign roads and adjusting the mileage charges. Cars are supposed to be promptly returned to their home roads with loads in that direction only, but it happens frequently that when short of cars freight agents will use any car at hand, without regard to its home direction. From this practice it sometimes results that a car will not reach home for months or even over a year from the time it left its own road. At the receiving station freight is loaded into the cars, as far as possible allowing to certain cars goods marked to the same destination. The number and destination of each car is given to the dispatcher, who makes up the trains from these memoranda. The conductor takes the memoranda of each car, called running slips, and these slips are transferred from road to road with the car until it reaches its destination. At each railway junction a record of the cars in every train is made. For through freight several fast freight lines have been organized under a separate management to operate between certain points over several roads. Some of these are simply formed by the cooperation of several roads, each of which assigns a certain number of cars to the line, which is placed in control of a general manager. Other fast freight lines are independent of the railways, which simply charge mileage for the cars carried over their lines.

A number of special classes of freight require special cars for their transportation, and these are sometimes owned by the shippers or by fast freight lines, as well as by the railway companies. Live-stock cars for cattle, refrigerator cars for dressed meat and other provisions, heater cars for fruit, etc., are in extensive use,

as well as many other special cars adapted to the needs of perishable freight. An hourly record is kept of the movements of the latter cars from the time they leave the consignor until they are delivered to the consignee. For every freight car moved a way bill is issued, which gives the number and owner of the car, a description of its contents, with the weight and address of every package, the names of the consignors and consignees, the starting-point and destination, charges, and every detail in regard to routes and the proportions of charges due the different carriers. Duplicates of these way bills go to the auditor's department, and from these the whole record of the freight business is made, and they are afterwards put on file for reference in case of claims. The average freight charges in this country are the cheapest in the world, yet the question of rates is the most troublesome one with which railway companies have to contend. The relative rates between different roads and different points rather than the actual charges for freight involve problems which railroad pools, traffic associations, and legislators have not been as yet entirely successful in solving. The subject is too broad to be discussed here, but two of the most important troubles in fixing rates lie in the discriminations in favor of large shippers and the reduction of through rates below those of intermediate points. Both of these practices, while apparently unfair to the public, are to some extent reasonable, as the same discrimination between large and small consumers is seen in the wholesale and retail prices in all businesses, and on some through lines, especially those in competition with water routes, the traffic must either be secured by special reduced rates between such points or be lost to the railways. Competition between railways is apparently less desirable than it is in the case of other kinds of trade, as the localities where it exists are alone benefited, and the business at other places is threatened. Railways serving a certain territory find it necessary to cooperate in fixing joint rates, and the concessions in charges which are mutually agreed upon between competing lines practically effect the same division of the traffic between them which was secured by the railway pools.

In making the rates, all articles of commerce are divided into several classes, and a certain standard rate per hundred pounds of each class is fixed between two important points, as New York and Chicago. Every other city reached by the same line is figured at its agreed proportion of the standard rates. For example: From New York to Pittsburg would be figured at 60 per cent. of the standard rate between New York and Chicago, and any change in the standard would affect all other places proportionately.

Mail service is a very important department of most railways from a public standpoint, although one which yields a comparatively small revenue to the railways in proportion to the service demanded. The present system of railway mail service was not suggested until 1862, and was not put into effect on a comprehensive scale until two years later, under the superintendence of Col. G. B. Armstrong. It was not, however, until about 1875 that special fast mail trains on which mail was sorted and distributed along the routes were put in operation. Special cars are provided for this service, which are fit-

ted up with tables, pouches, and racks, and a 'mail catcher,' which picks up mail pouches from posts at stations where the train does not stop.

In 1900-1901 there were 9182 clerks employed in railway mail service in the United States, working in crews on 783,358 miles of railway. This number includes the clerks employed on steamboat lines (33,970 miles in length) and electric and cable cars. Considerable of the mail carried by the railways is charged at freight rates, according to its weight, and the largest proportional earnings from this source are made by the railway companies which carry too little mail to warrant running high speed trains without extra remuneration. Considering the requirements of the mail service, which are met by the railway companies, the advantage of this traffic as a source of profit to them is doubtful. The time in transit for mail from New York to San Francisco, Cal., a distance of 3250 miles, is indicated by the Official Postal Guide as 106 hours; from New York to Chicago, 900 miles, 23 hours; New York to Buffalo, 410 miles, 9½ hours, and New York to Albany, 142 miles, 3½ hours.

RAILWAY CAPITALIZATION. Much of the financial difficulty under which a good many American railways have labored has been the direct outgrowth of speculation, in which the properties have frequently been practically wrecked merely to effect deals in the stock market, and roads which have been the subject of these operations are generally overcapitalized or mortgaged to such an extent that the earnings which would be sufficient to provide reasonable dividends on the actual value of the property are frequently too small to pay the interest on its bonds. The amount of railway stock which has been issued without consideration of money or value is unquestionably very large, although no approximation to the real sum is possible of being estimated. Occasionally such stock is issued pro rata to the stockholders of a very profitable road to make the rate of dividends less prominent, which might otherwise invite restrictive legislation. More frequently the object of issuing watered stock is to keep the control of the railway by means of the apparent investment it represents, or to balance some difference in cases of reorganization. The bonds represent very closely the amount of the debt actually paid in. The stockholders, as owners of the road, have the entire control of the property, and the bondholders have no voice in the management so long as their interest is paid. This condition, corresponding to that of the owners and mortgagees of real estate, is entirely reasonable as long as the actual investments in stock and bonds maintain normal proportions, for the reason that the stockholders assume all the risk, while the bondholders are practically secured. In some cases, however, the amount of money supplied by the stockholders is merely nominal, and the road is bonded for all or more than its value. This can only occur where the stock is most all 'water,' and its result is to put the management of the road in hands of parties having but little financial or other interest in it except for the opportunity it affords for speculating with the money of the bondholders. The abuses which have grown out of railway transactions under such circumstances constitute shameful chapters

in the history of a number of roads, such as the Erie, Wabash, Union Pacific, and others.

What are known as the Erie wars in 1868 illustrated the worst evils of this class. Two or three operators bought within a few weeks options on a large amount of Erie stock for the sum of \$72,000, and obtained possession of sufficient proxies to elect one of their own representatives as president of the road. After thus obtaining control of the property, the railway was charged at once with the \$72,000 spent in acquiring it, and the speculators then commenced selling the stock for a fall. This was eagerly purchased by the Erie's rivals, the owners of the New York Central road, and, instead of a fall, the price of Erie stock rose from 68 to about 80. As this threatened to ruin the Erie operators, they issued \$5,000,000 worth of fraudulent stock, which was sold at 80, and on its discovery the speculators for a fall realized an enormous profit in addition to the \$4,000,000 proceeds from the sale of fraudulent stock. In the legal proceedings which followed large sums of money were spent in buying up elections, legislatures, and judges, all of which were charged to the Erie road, and at the end of two or three years, when the ring lost its control, the indebtedness of the Erie had been increased by about \$65,000,000, which prevented its stock from paying a dividend for twenty years.

A certain amount of hostile feeling has always existed between the public and the railways, which fortunately is diminishing with the better understanding of the questions in dispute. Practically the whole difference hinged on the matter of rates, and both sides have been at fault in treating this subject. The railways have at times made very unjust discriminations between different persons and different localities, and, on the other hand, the public in attempting to correct these abuses have passed laws which have been equally unjust to the railways. The problem of rates is an exceedingly difficult one to legislate upon, as no fixed rule can be justly applied in every case as to the proportional charges for different distances. A large proportion of the transportation of this country falls within the jurisdiction of the Interstate Commerce Law, which in respect to rates leaves considerable discretionary power in the hands of the Commission. See INTERSTATE COMMERCE ACT.

ELEVATED RAILWAYS. Elevated railways is the name given to railways which run along a line of streets on girders supported on iron pillars erected on the street surface. The first elevated railway was a short line built in New York City in 1867, but the successful operation of such lines did not take place until 1872, when the New York Elevated Railroad Company began running trains on a line from Battery Park along Greenwich Street and Ninth Avenue to Thirtieth Street. From this time on the growth of the elevated railway system of New York was rapid, and succeeding years saw lines built in Brooklyn, Chicago, and Boston. Liverpool, Berlin, and Paris are among the foreign cities which possess elevated railway lines. The modern construction of elevated railways in America consists of steel pillars or columns erected along each curb line about 60 feet apart. The tops of these columns are connected across the street by plate girders (see BRIDGES), and these girders carry others generally one

under each track rail, reaching from one pair of columns to the next longitudinally of the street. The railway track is laid on these longitudinal girders, and consists of cross-ties with rails spiked to them in the usual manner. The stations are carried on elevated platforms level with the railway, and access and egress is had by means of stairways and elevators. On the Barmen-Elberfeld Railway, operated by electricity, the cars are suspended from the elevated structure. The principal elevated railway in Berlin is a viaduct of masonry, presenting fine architectural features.

MOUNTAIN RAILWAYS. The term mountain railway is applied to lines whose grades are too steep to be operated by locomotives, depending upon adhesion only for their drawing power, and which, therefore, necessitate the use of some special system of securing greater traction power. Several such systems are employed. The two principal ones are the Fell system, with a central, elevated, double-headed rail laid sideways, which is gripped by horizontal wheels on each side, which greatly augment the adhesion, and the system with central racks in which vertical cog-wheels work, whereby the adhesion of the ordinary driving wheels is greatly assisted in drawing a train up the incline, and the descent of the train is kept under control. This latter system embraces the Riggenbach, Abt, and other systems. In tourist lines ascending the steep sides of mountains for the sake of the views, a cog-wheel working in a central track is generally used as the sole means of propulsion up the inclines. Lastly, where the ascent is steep, straight, and fairly short, a cable is employed for hauling up the vehicles, resembling in principle the inclines worked by ropes in mines, a system which has also occasionally been adopted for the steep inclines on ordinary railways.

The central-rail system was first adopted for crossing the Mont Cenis Pass by a railway laid mainly along the road between Saint-Michel and Susa, a distance of 48 miles, having a gauge of 3 feet $7\frac{3}{8}$ inches and surmounting a difference of level of 5300 feet between Susa and the summit, with a total variation in level between its termini of about 9900 feet. The ruling gradient was 1 in 12, the average gradient about 1 in 17, and the central rail, raised $7\frac{1}{2}$ inches above the ordinary rail-level, was laid along all gradients exceeding 1 in 25; while the minimum radius

CENTRAL-RAIL SYSTEM FOR MOUNTAIN RAILWAYS.

for the curves was 2 chains. The greatest train load carried over the Mont Cenis Fell Railway was 36 tons, and the heaviest locomotives employed on it weighed 26 tons. In this system the grip of the horizontal wheel on the central rail not merely secures sufficient adhesion to mount steep inclines, but also serves as a very effective brake in the descent, and keeps the locomotive firmly on the line in going around sharp curves.

The Rimutaka incline, on the Wellington and Featherstone Railway in New Zealand, with a

gradient of 1 in 15 for $2\frac{1}{2}$ miles, and a total rise of 869 feet, opened about 1879, having a gauge, like the rest of the railway, of 3 feet 6 inches, and curves of 5 chains radius, was laid with a central rail, and the traffic on the incline has been worked continuously by a locomotive with horizontal wheels gripping the central rail. Each engine, weighing about 36 tons, can draw a maximum train load of 70 tons up the incline; and in order to avoid an undue strain on the draw-bars, the three engines employed for taking up a heavy train are so distributed between the carriages as to enable each to draw its own load. The system has proved safe and satisfactory, and well adapted for running around sharp curves; while the saving in cost of construction by adopting the incline on this particular railway, instead of a more circuitous course, to obtain flatter gradients, readily surmounted by ordinary locomotives, was estimated at £100,000.

A solid central rack was introduced for the first time in 1847 on an incline of the Madison and Indianapolis Railway near Madison, Ind. It was $1\frac{1}{3}$ miles long, with gradients of 1 in $16\frac{1}{2}$ to 1 in 17. The rack railway, however, which was the precursor of the numerous Swiss mountain railways for tourists, was the line, three miles in length, constructed up to the top of Mount Washington in New Hampshire in 1866-69, rising altogether to a height of 3600 feet, with ruling gradient of 1 in 3. The rack in this case was formed in lengths of 10 feet, with two parallel angle-irons, 4 inches apart, connected by a series of round wrought-iron bars constituting the teeth of the rack, which resembles a ladder laid on the ground. The locomotives, provided with a central cog-wheel working in the ladder-rack, push the vehicles up the mountain at a rate of about three miles an hour. The first rack railway carried out in Europe up a mountain slope was the Vitznau-Rigi Railway, constructed from Vitznau, on the Lake of Lucerne, to the summit of the Rigi in 1869-73, rising 4472 feet in its course of $4\frac{1}{3}$ miles, with a ruling gradient of 1 in 4 for about a third of its length, and never less than 1 in 6, except at the stations. The locomotive on these mountain lines is always placed below the carriages, so as to push them up the inclines and control their descent, the speed of the trains on the Rigi line being limited to between three and four miles an hour.

The driving cog-wheel and the other cog-wheels fitted to the locomotive and carriages are furnished with powerful brakes, which, when applied, keep the cogs firmly engaged in the rack, so as to arrest the descent of the train; and an air brake acting on the piston of the locomotive serves to regulate the downward speed. Strong hooks attached under the locomotive and carriages encircle the top flange of each side-piece of the rack, and thus secure the train from leaving the rails or being blown over by the wind.

A steel rack rail with teeth on each side, in which horizontal cog-wheels work, was adopted for surmounting the exceptionally steep inclines of the Pilatus Railway, averaging 1 in 2.8, and attaining 1 in 2.08 in some places, preliminary trials having proved that the ladder-rack was unsuitable for such gradients. This railway opened in 1889, starts from Alpnach on the Lake of Lucerne, and rises 5363 feet in its length of

$2\frac{3}{4}$ miles. The driving cog-wheels are actuated by spur gearing, and the two pairs of cog-wheels are controlled by hand brakes, which suffice to regulate the descent of the train or to stop it if necessary. An air brake acting on the pistons of the locomotive furnishes additional control of the train on its descending journey; and if at any time the speed in descending becomes more than three miles an hour, a reserve automatic brake comes into action.

Another form of rack consists in cutting the edge of a flat steel bar, so as to provide a uniform row of teeth on its upper side, and the strength of the rack can be increased for steeper gradients by increasing the thickness or the number of the bars. The rack is thus formed by a series of solid bars, with teeth shaped to the most convenient form for the working of the cog-wheel in them. This simple form of rack, consisting of successive lengths of single bars joined at their ends and laid in the centre of the track, has been employed on the flatter gradients of several rack railways, where the Abt system of two or more such bars, laid so that their teeth are not in line across the track, is resorted to on the steeper parts of the lines.

The Sant' Ellero-Saltino Railway, the first purely rack railway built in Italy, was constructed in 1892. This railway rises 2765 feet in a length of five miles, and it is laid to meter gauge, with a ruling gradient of 1 to 4.55. The rack on gradients not exceeding 1 in $8\frac{1}{2}$, consists of two steel angle bars riveted together, 4 to 6 feet long, with teeth formed in them; but for steeper gradients up to the maximum of 1 in 4.55, two flat steel bars are introduced between the angle bars, increasing the thickness of the teeth and the rigidity of the rack, which latter can be still further augmented by introducing a distance piece between the angle bars, so as to form two or three parallel racks with a small interval between them, in which the cog-wheel works with a widened bearing. This Telfener rack is simpler in construction and cheaper than the Riggenbach and Abt racks; but it does not possess the special advantage of the Abt rack, of thoroughly engaging two or three successive teeth of the cog-wheel at the same time. The speed of the trains ranges from $5\frac{1}{2}$ to $4\frac{1}{2}$ miles an hour, according to the gradients, and averages 5 miles an hour.

A more complicated form of single rack, resembling a flat-bottomed rail in its low portion, and widened out considerably for the teeth at

TRACK CONSTRUCTION OF STRUB RACK RAILWAY.

the top, called the Strub system, after its designer, has been recently introduced on the Jungfrau Railway, which is laid to the meter gauge, and was opened in 1899, the motive power being electricity generated by waterfalls on the mountain. This line rises 6657 feet in a length

of 7.3-5 miles, with gradients ranging from 1 in 14½ up to 1 in 5; and the upper 6.1-5 miles are to be in tunnel, while the final ascent to the summit is to be effected by a vertical lift of 241 feet. The central rack rails, 11½ feet long, are joined together at their ends by fish-plates, like ordinary flat-bottomed rails. A brake is provided, which encircles and grips the widened-out head of the rack.

The Abt system consists essentially of two or three steel rack bars, from 11-16 inch to 1 13-16 inches thick, and 2 to 4½ inches deep, placed nearly two inches apart, and so arranged that the teeth are not opposite each other, but as it were break joints, causing the cog-wheels to engage in a tooth in front on one rack before leaving the tooth behind on the adjacent rack, which renders the motion smoother, and increases the security of the trains in descending, besides proportioning the strength of the rack to the steepness of the gradient by the addition of one or two bars. The Generoso railway in Italy and the Rothorn railway in Switzerland, 5.2-3 miles and 4.4-5 miles long, rising 4326 feet and 5515 feet, with ruling gradients of 1 in 4.55 and 1 in 5, and constructed in 1889-90 and 1891, respectively, are laid to a gauge of 2 feet 7½ inches with cast-steel sleepers, and provided with a double Abt rack, in which cog-wheels on the driving axles work. The system has also been extended to mountain lines in several other countries, as, for instance, the Manitou and Pike's Peak Railway in Colorado, of standard gauge, rising 7552 feet in a length of 8¾ miles, with a maximum gradient of 1 in 4.

TRACK CONSTRUCTION OF ABT RACK RAILWAY.

Instances of the application of electricity as the motive power on mountain railways laid with the Abt rack, where water-power is readily available for generating the electrical current, are furnished by the Mont Salève Railway near Geneva, and the Gornergrat Railway ascending from Zermatt. These railways, constructed in 1891 and 1896-98, respectively, have lengths of 5.3-5 miles and 5.4-5 miles, with rises of 2363 feet and 4600 feet, and are laid to the meter gauge, with gradients of 1 in 4 and 1 in 5, and a double line of rack. In all these rack railways, special care is always taken to anchor the track firmly down into the solid ground, so as to prevent its creeping gradually downhill under the pressure of the cog-wheels on the rack.

ELECTRIC RAILWAYS and STREET RAILWAYS will be found treated under their own heads.

RAILWAY TRAINMEN, BROTHERHOOD OF. See RAILWAY BROTHERHOODS.

RAIMONDI, RAIMONDI, ANTONIO (1826-90). An Italian geographer and naturalist, born in Milan. In 1850 he went to Peru, and was professor of botany in the University of Lima from 1862 to 1871. During this time he explored the country and gathered material for his proposed exhaustive work on the geography, botany, zoology, and ethnology of Peru. Three volumes on geography were published (1874-76-80) and called *El Perú*, but a part of the work was destroyed when Lima was captured in the Chilean War, and Raimondi died before completing it. His manuscripts became the property of the Lima Geographical Society.

RAIMONDI, MARCANTONIO (?-c.1534). The chief Italian line engraver of the Renaissance. The year of his birth is unknown, but he was a native of Bologna, where he studied engraving under Francia, devoting himself at first to niello. At the beginning of the fifteenth century we find him executing line engravings after the paintings of Francia, but also after his own designs. Even in these early prints the influence of the German engravers, like Schongauer, is evident, particularly in the landscape backgrounds. Greatly impressed by Dürer's engravings, he copied about eighty of his woodcuts and copper plates in line engraving, even counterfeiting Dürer's signature. He thus pirated without acknowledgment the entire *Life of the Virgin* and the *Little Passion*. The generally accepted account, derived from Vasari, of how Dürer obtained redress from the Venetian Government is improbable, since the first series was not published until after Dürer's visit to Venice in 1506.

Until 1510 Raimondi resided at Bologna, with occasional visits to Venice, but in that year he seems to have been at Florence, since it was the date of his celebrated engraving, "Les grimpeurs," after Michelangelo's cartoon, the "Battle of Anghiari," the background of which was taken from Lucas van Leyden. He was then probably on the road to Rome, where he henceforth devoted himself to the reproduction of the works of Raphael. The latter even sketched designs for him, and himself added the finishing touches to the plates. Marcantonio carried out these designs with great vigor and charm, rendering, as no other has done, the forms of Raphael, not only in line, but in spirit. Among the best of his works executed after Raphael were: the "Murder of the Innocents;" "Quos Ego" (Neptune riding on a shell); "Lucretia;" the "Judgment of Paris;" "Adam and Eve;" etc. After Raphael's death he engraved after Giulio Romano, notably a "Bacchus and Ariadne;" and after the antique, which he was largely instrumental in popularizing. His engraving of Giulio's illustrations of Ariano's *Sonnetti lussuriosi* caused his imprisonment by Clement VII., and he was ruined by the sack of Rome in 1527, when he was held

for ransom by the Spaniards at an exorbitant sum. He returned to Bologna, where he died not later than 1534. The chief pupils of his school at Rome were Agostino Veneziano and Marco Dente di Ravenna. Consult Delaborde, *Marc-Antoine Raimondi* (Paris, 1887).

RAIMUND, rí'munt, FERDINAND (1790-1836). An Austrian actor and playwright, born in Vienna. After playing on provincial stages in Hungary, he secured an engagement in Vienna at the Josephstädter Theatre in 1813, and in 1817 at the Leopoldstädter Theatre, where he soon became the most popular exponent of local comedy, and which he managed as director in 1828-30. In the meanwhile he had come before the public as a popular dramatist with *Der Barometermacher auf der Zauberinsel* (1823); *Der Diamant des Geisterkönigs* (1824); *Der Bauer als Millionär* (1826); *Alpenkönig und Menschenfeind* (1828); and others which, after severing his connection with the Leopoldstädter Theatre, he mounted on the stages of Munich, Hamburg, and Berlin, appearing himself in them in a starring capacity. His last and best play was *Der Verschrender* (1833), which is still popular on the German stage. In a fit of hypochondria Raimund attempted his life with a pistol and died within a week on his little estate of Gutenstein. He was a genuine poet in the popular vein, who dwelt with affectionate sympathy upon the life of the people, and weaved its joys and sorrows into the fabric of fantastic dramas of peculiar charm. Their pathos and humor are alike telling. His life was made the subject of a novel by Otto Ilorn (Bäuerle) and of several dramatic productions. By the Raimund Dramatic Club, founded in Vienna in 1890, the Raimund Theatre was established there in 1893.

RAIMUND, Golo. The pseudonym of the German novelist Bertha Frederick (q.v.).

RAIN (AS. *regn*, *rēn*, Goth. *riḡn*, OHG. *regan*, Ger. *Regen*, rain; connected with Lat. *rigare*, Gk. *βρέχειν*, *brechein*, to wet). Drops of water formed in the atmosphere by the condensation of its aqueous vapor and falling rapidly by virtue of their weight: the very small drops that fall slowly are spoken of as mist, cloud, or fog. The largest drops of rain that have been measured are as much as 0.25 to 0.30 inch in diameter and fall at the rate of from 15 to 25 feet per second. The smallest drops that are likely to be spoken of as rain are about one-twentieth of an inch in diameter and fall at the rate of about five feet per second. As rain water is condensed vapor that had previously been evaporated from distant water surfaces, therefore, in accordance with the laws of evaporation, it would be chemically pure water were it not for a small percentage of foreign substance which it gathers to itself from the atmosphere. Rain water washes down out of the air dust, soot, pollen, spores of fungi, and many other solid substances. Ordinary rain water contains an appreciable percentage of dissolved oxygen, nitrogen, ammonia, and carbonic acid gas, and in special cases it is found to contain nitric acid, sulphuric acid, and other components of the impure air of cities. The acid and alkaline impurities generally increase the power of the rain water to dissolve the mineral constituents of the earth's crust; the gases make it possible for plants and animals to live in rivers and ponds, which would be impossible if the water were

chemically pure. Rain water only becomes wholesome potable water for man's use after it has been thoroughly filtered through the earth, whence it issues as springs of pure water.

Up to the middle of the nineteenth century rain was supposed to be naturally formed by the mixture of cold and warm masses of moist air, but the publication of Espy's *Philosophy of Storms* (Boston, 1842), and his life-long contention that cloud and rain are not due to cooling by mixture or by radiation, but are a consequence of the cooling of the atmosphere by virtue of the work done in expansion, supported as he was by Professor Joseph Henry, Sir William Thomson (Lord Kelvin), and other physicists, finally led meteorologists to study the great thermodynamic problems of the atmosphere. When air is forcibly compressed, the work done by compression is represented by the increase in temperature of the confined air; *vice versa* when the air expands by diminution of pressure, the work done in expansion is represented by the heat abstracted from the expanding air, which therefore experiences a corresponding cooling. The laws of convective equilibrium governing the temperature and the volume of a unit mass of rising air were first expressed in the exact language of mathematical physics by Sir William Thomson in 1861. Graphic methods of treating the complex meteorological problems were devised by Hertz in 1884, and improved by Von Bezold in 1888 and Neuhoff in 1900. The analytical treatment of the subject is given by F. H. Bigelow with convenient tables in his report of 1900 *On the International Observations of Clouds*. When warm moist air ascends from near the earth's surface it cools by expansion; if no heat is added or subtracted, it is said to cool adiabatically, and does so at the rate of about one degree Centigrade per 99 meters of ascent, or one degree Fahrenheit for 185 feet, until it reaches an altitude at which its temperature is the same as the temperature of the dew point of the original air. At and above this elevation cloud is formed as the air ascends. If the rise continues until the air has cooled to the temperature of freezing point of water, then the watery cloud particles begin to change to ice, giving out a little of their latent heat as they do so. When in the course of its further ascent all the cloud particles have become ice, then any additional rise will be accompanied by the formation of snow crystals. This latter condition would continue to exist throughout the further ascent of the air were it not that in these higher regions the formation of snow is very slight. If the sun is shining upon the clouds, the process ceases to be adiabatic, and the particles of water or ice may be immediately evaporated back into vapor. Owing to the resistance of the air, the cloud particles fall very slowly to the ground, or may, in fact, be upheld indefinitely by a gentle ascending current. But if numerous small particles combine together into drops of water, the latter may fall rapidly to the ground as rain. The above paragraph correctly explains the formation of cloud by cooling due to expansion, but nothing is as yet known satisfactorily as to the process by which large raindrops are formed from the minute cloud particles.

Among the several plausible hypotheses are the following: (a) That the cloud particles are

jostled together by currents of air, or that the larger ones fall fast enough to overtake the smaller ones, so that in either case larger particles are formed which, as they descend, grow by the accretion of small particles that lie in their path. (b) That some of the smaller particles are positively and others negatively electrified, and consequently by attraction are made to coalesce. (c) That some particles, being larger than others, have different surface tensions, and that the larger ones are thereby enabled to grow at the expense of the smaller ones. (d) That the original cloud particles consist of vapor that has condensed upon particles of dust or foreign substances in the air, and that this condensation takes place more readily upon some nuclei than others, as is known to be the case from the observations of Wilson, Aitken, Barus, and others. (e) That the atmosphere within a cloud, being saturated, has no remaining nuclei upon which condensation can take place, and as the air continues to rise and cool it comes to a state of supersaturation and intense molecular strain, which is finally relieved by a violent condensation upon groups of cloudy particles already existing; this violent condensation takes place in such a way as to sweep many of the smaller cloud particles together into one large drop: C. T. R. Wilson has shown that these larger drops can only be formed when the air in the dustless cloud has been expanded and cooled at least one-third more than is required for ordinary dusty air. (f) Wilson has lately shown the plausibility of a slight modification of the preceding method; he finds that dustless air virtually acquires new nuclei on which condensation takes place when a beam of ultra-violet light or of the Roentgen rays, the radiation from cranium, or even ordinary sunlight, passes through the moist air, that in fact such nuclei are being formed in it all the time.

Professor J. J. Thomson's observations on the formations of 'ions'—namely, the breaking away from a molecule of some one of its integral components which he calls 'corpuscles'—suggest that the atmospheric 'ions' thus formed are active in producing cloudy condensation, and that the negative 'ions' attract moisture to themselves more readily than the positive, therefore they grow to be larger drops, and descending to the earth with their negative charges, give it negative electricity, while the atmosphere is left essentially positive.

GEOGRAPHICAL DISTRIBUTION OF RAIN. As all animal and vegetable life on the earth's surface depends more or less directly upon the quantity of rainfall and its distribution throughout the months of the year, therefore the geographical and seasonal distribution of rain claims our first attention. From the preceding section it is seen readily that the distribution of rain over the earth's surface must depend upon the influences that force air to ascend rapidly. Thus on warm clear days, when the surface of the ground or water is highly heated, the lower stratum of air acquires a decided upward motion by reason of its buoyancy. Masses of hot air are rising while the cooler air near by is descending. Thunder storms are usually formed in this way, and nearly every station in the torrid and temperate zones has a preponderance of local rains in the afternoon. Whenever an ocean

breeze or a monsoon wind rises high enough on a mountain side it gives rise to cloud and rain, so that the ocean winds bring more rain than the land breezes. The finest illustrations of this principle are seen in the rains of the southwest monsoon in India, in the rains that fall with southwest winds on the coast of Europe, or in the southerly winds with rain on the Gulf coasts of the United States. Again, when a moist warm wind meets a cold dry wind, the latter generally flows under and lifts up the former, because of the greater density of the cold air compared with the warm. Therefore above the cold air is formed a layer of cloud and oftentimes of rain due to the rapid elevation of the warm air. Illustrations of this are to be found on the southeast and southwest sides of the areas of low pressure that pass eastward over the United States throughout the year, and especially in the winter season. From the preceding it follows (1) that every rising slope, whether of mountain ranges or interior plains, should, other things being equal, show a greater rainfall as we proceed up the slope, and this distribution of rainfall with altitude has been found to agree with observations in Great Britain, Germany, India, the East Indies, and the United States; (2) considering the world at large, the heavier rainfalls should occur in regions where warm moist winds steadily impinge upon the mountain slopes. The above principles are exemplified in the rainfall charts contained in Bartholomew's *Physical Atlas* (London, 1899), and especially in the twenty-six maps showing the monthly and annual distribution of the rainfall on the land surface throughout the globe compiled by A. J. Herbertson and published by the Royal Geographical Society of London in 1900. Herbertson's charts of annual rainfall on the land surfaces are reproduced herewith.

SEASONAL DISTRIBUTION OF RAIN. This is in many respects more important than the total annual quantity. It is the combination of rainfall, temperature, and sunshine that determines the character of the vegetation in each part of the globe. In the Northern Hemisphere some stations have a large rainfall in June and July, when the sun is nearly overhead; but other stations have the minimum rainfall at this season. In the tropics most stations have two minima and two maxima of rainfall during the year. In the Southern Hemisphere, where the sun has its maximum power in December or January, even greater diversities appear. The growth of the perennial vegetation, and especially the annual plants and the important crops, is entirely controlled by these relations of sunshine and rain. In regions where the rainfall is insufficient to perfect the important grain crops, recourse must be had to irrigation, the success of which again depends upon the annual distribution of snow and rain.

Various types of rain prevail over the ocean as well as over the land, although, unfortunately, we have but very few measurements of the actual rainfall at sea, and must, therefore, speak only of the frequency of the rain. Thus on the Atlantic and Pacific oceans, under or near the equator, is a rainy belt, where the pressure is always low, the winds exceedingly light, variable or calm; here the sun almost invariably rises in a clear sky, but about midday clouds begin to gather, and in a short time the whole

face of the sky is covered with dark clouds which pour down prodigious quantities of rain. Toward evening the clouds disappear; the sun sets in a clear sky, and the nights are serene and fine. In latitudes 25° N. to 35° N. on both Atlantic and Pacific there is a region of northeast trade winds in which the rainfall is comparatively light and occurs equally in all parts of the earth.

The details of the distribution of rainfall in the United States are given by Professor A. J. Henry in his "Rainfall of the United States," *Weather Bureau Bulletin D, 1897*, and especially in the article, "Rainfall and Charts of Rainfall," in the *Monthly Weather Review* for April, 1902 (Washington, D. C.).

RAIN-BIRD. Any bird popularly believed to foretell rain. Many of these birds are cuckoos. Both of the North American species have this reputation, as also have the black nuth of Mexico and southward, which are frequently called 'rain-crows.' In the middle western portion of the United States the bird commonly called 'rain-crow' is the yellow-billed cuckoo. The East Indian cuckoos, called 'koels' (q.v.), have the same reputation, and are commonly known in India and the Malay countries as 'rain-birds' and 'foretellers.' To what extent this repute is justified is a question admitting of discussion. Birds, as well as other animals, are no doubt sensitive to changes in the temperature and humidity of the air, and some may be quick to recognize that certain of these changes portend disagreeable weather. The immediate effect or their anticipations may lead them to make outcries indicative of discomfort or alarm. A great variety of information and folk-sayings on this subject is given in Dunwoody's "Weather Proverbs," *Signal Service Notes, No. ix.* (War Department, Washington, 1883). For Oriental superstitions, see *Ibis* (London, 1879).

RAINBOW (A.S. *Regnboga, rēnboga*; OHG. *regan-bogo*; Ger. *Regenbogen*, from *Regen*, rain, and *boga*, bow). The term applied to the arc of prismatic colors which at times is seen when the sun or moon is shining while it is raining. It always is seen in the part of the heavens opposite to the sun, and is high when the sun is low, and low, near the horizon, when the sun is high. It is a short arc, or a complete one, resting on the earth at each end, according to the extent of the rain. Sometimes a second concentric bow is seen with the colors reversed. Both are due to the reflection and refraction of the rays of the sun in the drops of rain.

If the parallel lines S, Fig. 1, represent rays coming from the sun and falling upon the drop of water, the centre of which is O, it is possible to determine the path of each ray by applying the simple law of refraction. For example: the ray SB will be refracted to A, reflected to C, and finally refracted out to T. The parts of the ray which are reflected out at B, refracted out at A, or reflected in at C, need not be considered, as they do not contribute to the phenomenon. It may be shown that when the arcs BA and AC are equal, then the angle between SB and CT is greater than for any other case. In other words, when the ray passes through the drop symmetrically, the final direction of the ray is at the greatest angle with the original direction, and also that a greater proportion of the total light falling on the drop is sent out

in this direction than in any other. The light which falls farther out on the drop than B is mostly reflected off the drop, and that which falls nearer than B enters the drop, but

FIG. 1.

mostly passes out at the back at A. Inasmuch as the index of refraction is different for the different colored lights, it follows that the angle between SB and CT must be different for the different colors, less for violet than for red. An eye at T, Fig. 2, looking toward the drop, would see considerable of the light coming in the direction CT, but an eye at E₁ would only see a little light corresponding to the ray SB₂A₂C₂T₂, and an eye at E₂ would see no light from that drop. If we imagine the whole of Fig. 2 revolved upon the line TS' as an axis, then

FIG. 2.

the ray SB becomes a cylindrical shell of rays, the drop becomes a circular arc of drops, and the ray CT becomes a conical shell of rays, which, seen by the eye at T, appears as a ring of light against the clouds as a background, having an angular radius equal to CTS'. If the red rays are considered this radius would be about $42^{\circ} 22'$, and for the violet rays $40^{\circ} 35'$, and for the intervening colors it would have corresponding values. Thus the ring of violet would appear the smallest and the red the largest, with the

other colors ranged between. Of course, a particular drop is only in the right position to contribute to this ring of light for a small fraction of a second, but others take its place. Moreover, the apparent diameter of the sun causes a widening of the line of light to a band, and these bands of different colors overlap and blend. The bow formed as above described is called the 'primary bow' and is much brighter than the 'secondary bow,' which is formed as

FIG. 3.

follows: By a line of reasoning entirely analogous to that given above, it may be shown that light falling upon the opposite half of the drop, as shown in Fig. 3, may undergo two reflections in the drop and emerge in the direction DT. Again, when the path is symmetrical in the drop, the angle between SB and DT is now smaller than for any other case, but larger for violet than for red, and in all cases larger than the angle between SB and CT in the primary bow. Applying a similar consideration to Fig. 4, and considering it revolved upon the line

FIG. 4.

TS' as an axis, it will be seen that colored bands of light will be seen by the eye at T of an angular diameter greater than any in the primary bow, and with the violet having the largest and the red the smallest diameter. The angular radius of the red is about 50° 24' and of the violet 53° 22'. The values of the diameters

were calculated by Airy and experimentally verified by Miller. When the conditions are very favorable other fainter bows may be seen inside the primary and outside the secondary bow. These correspond to a still more complex combination of reflections and refractions of the rays in the drops. A lunar rainbow differs from a solar bow only in the intensity of the light and consequent paleness of the colors.

RAINBOW FALLS. A cataract in the State of Washington. See CHELAN, LAKE.

RAINBOW TROUT. The trout of the coast ranges of the Pacific Coast, from central California northward to Puget Sound, which takes its name (*Salmo irideus*) from the large, brilliant spots scattered over its bluish-silvery body. See TROUT; and Plate of TROUT AND GRAYLING.

RAIN CROW. See ANI; and Plate of CUCKOO.

RAIN GAUGE. An apparatus to catch the rain and measure its equivalent depth on the ground at any place. The simplest rain gauge consists of a vertical cylinder, into which one may dip a graduated stick and read off the depth of the collected water. Such an instrument is furnished by the United States Weather Bureau to its voluntary observers, and is illustrated in the accompanying figure. Other gauges consist essentially of funnels to catch the water, glass bottles to hold it, and slender graduated glass tubes by which to make minute

SIMPLE RAIN GAUGE, U.S. WEATHER BUREAU PATTERN.

measurements. Self-registering gauges are now made so economically that they are always to be recommended: those of the simplest pattern employ a tipping bucket, divided into two equal compartments, and tipping to the right and left alternately, according as the right or left compartment is filled. Each tip corresponds to a definite depth, such as a hundredth of an inch. Another favorite form consists essentially of a weighing machine, and every ounce of rain, or the equivalent depth, is properly recorded on a sheet of paper moved by clockwork. Both forms, as perfected by Professor C. F. Marvin, are used by the United States Weather Bureau.

It has long been known (since Heberden, 1776) that perfectly reliable gauges collect less rain the greater their height above ground, and it is now satisfactorily demonstrated that this is entirely due to the fact that the gauge causes eddies of wind around and even within its

mouth. These eddies carry away the smaller particles of rain or snow to a greater or less extent. On the average of all records that have been made in Europe and America and in all kinds of rain, the deficit of rain recorded by the gauge has been found to increase in proportion to the square root of the altitude above ground. Consequently the correct rainfall can be approximately determined if the observer notes the difference between the catches of two or more similar gauges set at different altitudes above the ground.

In 1855 Joseph Henry, in 1875 F. E. Nipher, and in 1886 Wild and Boernstein described appliances that largely annul the error due to the wind. Henry surrounded his gauge with a thin broad rim near the top, either horizontal or sloping downward; Nipher surrounded it with an umbelliform structure of wire gauze; Wild surrounded it with a closed board fence, but Boernstein placed a simple open board fence at a distance of about two feet around the gauge. When a gauge is set up within a shallow saucer-like depression in the ground, so that the mouth of the gauge is level with the earth beyond the edges of the pit, or when it is placed on the flat roof of a building and protected on all sides by a high balustrade, good measurements are also obtained. Most elaborate investigations into the peculiarities of rain gauges are published in the annual volumes of Symons's *British Rainfall*. For other special studies, see the works of Eastman, United States Naval Observatory; Hellmann, Berlin, 1890; Abbe, Washington, 1887 and 1892; Boernstein, Saint Petersburg, 1890; E. Berg, Saint Petersburg, 1895.

RAINIER, rā'nēr, MOUNT, or MOUNT TACOMA. One of the highest peaks of the United States, exceeded south of Alaska only by Mount Whitney. It is a regular volcanic cone rising from the Cascade Range in the southwestern part of the State of Washington to a height of 10,000 feet above its immediate surroundings and 14,526 feet above the sea (Map: Washington, C 2). Although its crater still emits sulphurous fumes, it is to be regarded as extinct, since the deeply eroded slopes of the mountain show that the last eruption must have occurred at a remote period. The lower slopes are densely forested, but the higher portion carries a series of fourteen glaciers, the largest in the United States south of Alaska. The ascent of the mountain is difficult.

RAINOLDS, rēn'olz, or **REYNOLDS**, JOHN (1549-1607). An English biblical scholar. He was born at Pinhoe, near Exeter. He graduated B.A. at Corpus Christi College, Oxford, in 1568, and became tutor to Richard Hooker. He was afterwards Greek teacher (1572-78). He took a prominent part in university affairs at Oxford and distinguished himself as a zealous Protestant. In 1593 he was made Dean of Lincoln, with the expectation that he should later exchange offices with Dr. William Cole, president of Corpus Christi. This arrangement was carried out in 1598, and the college prospered greatly under his management. Rainolds's greatest distinction is the part he took in the Hampton Court Conference (q.v.) and his connection with the translation of the Bible. It was he who urged the necessity of the latter work upon the King, and he occupied a prominent position among the translators; his com-

pany was that to which the prophets were assigned. Rainolds's writings were numerous, many of them, however, not being published till after his death.

RAINS, rānz, GEORGE WASHINGTON (1817-98). An American soldier and chemist, born in North Carolina. He graduated in 1842 at the United States Military Academy, and was an instructor there in 1844-46. He served in the Mexican War, was brevetted major for gallant conduct, and in 1849-50 fought against the Seminoles. Promoted in 1856 to be captain, he resigned in the same year and in 1861 entered the Confederate Army as colonel. He erected the Confederate powder-mill at Augusta, Ga., and was promoted to be brigadier-general. From 1867 he was professor of chemistry and pharmacy in the University of Georgia, and until 1884 was dean of the faculty. He published *Steam Portable Engines* (1860); *Rudimentary Course of Analytical and Applied Chemistry* (1872); and *Chemical Qualitative Analysis* (1879).

RAINS'FORD, WILLIAM STEPHEN (1850—). An American clergyman of the Protestant Episcopal Church. He was born at Dublin, Ireland, October 30, 1850. He took his degree at Saint John's College, Cambridge, in 1872, and was curate of Saint Giles's Church, Norwich, 1872-76. He was very successful as an evangelist, and came to the United States in 1876 to take part in gospel-tent meetings in New York. Subsequently he conducted evangelistic services in other cities of the United States, in London, and Canada. From 1878 to 1882 he was at the Cathedral of Saint James, Toronto. In 1883 he became rector of Saint George's Church, New York. He published a volume of sermons (1887); *Good Friday Meditations* (1901); *The Reasonableness of Faith and Other Addresses* (1902).

RAINY, rā'mi, ROBERT (1826—). A Scottish divine and scholar, born at Glasgow, January 1, 1826. Educated at Glasgow University and at New College, Edinburgh, he became minister of the Free Church at Huntly in Aberdeenshire (1851-54) and of the Free High Church in Edinburgh (1854-62). After serving for twelve years as professor of Church history, he was elected principal of New College (1874). In 1900 he was made moderator of the United Free Church Assembly. Among his publications are: *Three Lectures on the Church of Scotland* (1872; often reprinted); *Development of Christian Doctrine* (1874); *The Bible and Criticism* (1878); *The Epistle to the Philippians* (1892); and *Presbyterianism, a Form of Church Life and Doctrine* (1894).

RAINY LAKE. A lake forming part of the boundary line between Canada and the State of Minnesota, and situated 160 miles west of Lake Superior (Map: Ontario, K 8). It is a very picturesque sheet of water, nearly 50 miles long and five miles in average breadth. Its surplus waters are drained into the Lake of the Woods (q.v.) by the Rainy River, which is about 100 miles in length, and the banks of which are covered with pine-forests.

RAI SANYO, rī sän'yō (1780-1833). A Japanese author and historian, who, in 1827, after sifting 650 native books in twenty years of continuous labor, published in 22 volumes his great work, the *Nihon-Guashii*. It is written in Chinese and tells the story of the domination of

the Empire by the military class, from the twelfth century onward, picturing the rise of those military clans, the Taira and Minamoto, that usurped the power of the Mikado, and ending with the establishment of the Tokugawa shogunate in the early part of the seventeenth century. In his other work, the *Nihon Siki*, also in Chinese, published posthumously, Rai sketches in 16 volumes the history of Japan from B.C. 660 to 1596, discussing the character and conduct of each sovereign in turn. The effect of these writings was to educate the Japanese Samurai (q.v.) into a bitter hatred of the Shogun, and to set forward the revolution of 1868. The name of Rai Sanyo is cut upon the front of the Boston Public Library as one of the great names in the world's literature. Five books of the *Nihon-Guishi* were later translated into English in 1872 by Satow (q.v.), British Minister to Japan, and afterwards Minister to China. Consult: Chamberlain, *Things Japanese* (London and New York, 1891); and Aston, *History of Japanese Literature* (London, and New York, 1901).

RAISINS (OF. *raisin*, *reisin*, Fr. *raisin*, It. *racemo*, grape, dried grape, cluster of grapes, from Lat. *racemus*, cluster of grapes; connected with Gk. *ράξ*, *rhax*, berry). The dried fruit of the grape. Raisin grapes are usually the product of warm climates and contain from 28 to 30 per cent. of sugar. They are for the most part dried in the sun, and as this requires several weeks of practically rainless weather, the areas of commercial culture are limited to a few countries about the Mediterranean Sea and in the Western Hemisphere to Southern California and Chile. The principal and most valuable class of raisins is the Muscatel or Muscat from Malaga and Valencia in Spain, and from California. The seedless raisins of commerce are largely the product of the sultana grapes. The Thompson seedless, which is a promising seedless raisin grape in California, produces raisins a little larger than the sultana. The smallest raisins come from the small currant grape, originally from Corinth. The small black currant of Zante belongs to this class. (See CURRANT.) In the sun curing of standard raisins in California the bunches of grapes are picked by the stems, and all imperfect berries, dirt, etc., having been removed, laid in trays slightly raised so as to incline toward the sun. When about two-thirds dry, which will be at the end of six to eight days, they are turned by placing an empty tray over the filled one and inverting both. The upper or original tray is then removed and the grapes exposed four or five days longer for further drying. At the end of this time the grapes are stored and put through a sweating process of from fifteen to twenty days, when they are ready for packing. Sometimes the drying is done entirely in drying houses. In the Mediterranean districts the stems of the ripened bunches are sometimes partially cut and the sun drying begun on the vines. Another method of curing is to dip the bunches into a hot solution of potash lye, to which has been added a little salt and olive oil. This method is practiced much more in Europe and Asia Minor than in California. Some of the best raisins of commerce are thus treated. The raisin industry in California has developed rapidly, and in 1900 about 40,000 acres were devoted to this

crop. Consult Eisen, *The Raisin Industry* (San Francisco, 1890).

RAJA, rā'ja (Skt. *rājan*, king). Originally a title of those princes of Hindu race who, whether independent or not, governed a territory. It subsequently became a title given by the native governments, and in later times by the British Government, to Hindus of rank, and it is now not uncommonly assumed by zemindars or land-holders. The native princes now frequently assume the title of *mahārāja*, or great king. According to the ancient social system of India, the raja belonged to the kshatriya or military caste (see CASTE), although the title is now also given to or assumed by members of inferior castes. Consult: Foy, *Die königliche Gewalt nach den altindischen Rechtsbüchern* (Leipzig, 1895); Jolly, *Recht und Sitte* (Strassburg, 1896).

RAJĀŚEKHARA, rā'jā-shā'k'hà-rā (c.900 A.D.). A Sanskrit dramatist. He seems to have been born in the Dekkan, doubtless in the region about Vidarbha and Kuntala, whence he came to the Court of Mahendrapala, King of Kanauj. He was a Brahman, and his wife, Avantisundari, was a Rajput princess. Four plays are ascribed to Rajasekhara. The first is a drama in four acts, entirely in Prakrit (q.v.), entitled *Karpūramānjari*, or Camphor-Cluster. It was edited by Vamanacarya (Benares, 1872), and, together with the *Bālabhārata*, by Durgaprasad and Parab (Bombay, 1887), and with an admirable English translation, glossary, and account of the author by Konow and Lanman (Cambridge, Mass., 1901). The second drama is the *Viddhasālabhaijīkā*, or Broken Statue, also in four acts, which much resembles in plot the *Karpūramānjari*. It has been edited by Vamanacarya (Benares, 1871), by Vidyasagara (Calcutta, 1873; 2d ed., ib. 1883), and by Arte (Bombay, 1886). The remaining plays are based on the two great epics of India, the *Rāmāyana* (q.v.) and the *Mahābhārata* (q.v.). Of these dramas the *Bālarāmāyana*, in ten acts, is the more important. It was edited by Sastri (Benares, 1869) and by Vidyasagara (Calcutta, 1884). The last play, the *Bālabhārata* or *Pracandapāndava*, in only two acts, seems to be incomplete. It has been edited by Capeller (Strassburg, 1885). Consult Apte, *Rājasekhara, His Life and Writings* (Bombay, 1886).

RĀJĀTARĀNGINĪ, rā'jā-tā-rān'gè-nè (Skt., river of Kings). A work of the Kashmirian poet and historian Kalhana. In eight cantos with a total of about 8000 verses it tells the histories of the various dynasties which ruled Kashmir from the earliest (mythic) period down to the time of the author. Kalhana describes himself as the son of Campaka, the minister of the famous King Harsha, who ruled from 1029 to 1101. The history was written between 1148 and 1150 under the reign of Sinhadeva. Kalhana's chronicle is practically the sole extant work of a truly historical character in the entire range of Indian literature. He reports that he studied eleven historical works, but not content with that, he examined old documents, grants, proclamations, laws, and sacred books. He is especially well acquainted with the great epic, the *Mahābhārata* (q.v.), which he cites frequently. Above all he has the gift of character portrayal. The historians whom Kalhana mentions as his predecessors are all lost, so that the *Rajatarangini*

is the chief and direct source of information on the ancient history of Kashmir. The first three cantos, which deal with the two first dynasties, are almost wholly legendary. Kashmir was always closely connected with the Hindu kingdoms to the south, so that Kalhana's work is important authority for the history of India as a whole. Incidentally the *Rajatarangini* throws much light on the social, political, and religious conditions of India of the twelfth century. Stein published a critical edition of the text at Bombay in 1892, and a translation in two volumes, with an introduction, commentary, and appendices, at Westminster in 1900.

RAJENDRALALA MITRA, rā-jēn'drā-lā'li mē'trā,-RAJA (1824-91). An Indian Orientalist, born near Calcutta. He early devoted himself to historical and philological research, became librarian of the Bengal Asiatic Society in 1846, its vice-president (1861-85), and its president in 1885. To the *Journal* of the society he contributed many valuable papers. But he was better known for his *Antiquities of Orissa* (1875); *Buddha Gayā* (1878); *Indo-Aryans* (1881); and the *Sanskrit Buddhist Literature of Nepal* (1882), in which he showed especial skill in deducing history from artistic and architectural remains.

RAJKOT, rāj'kōt'. A town and railway station, capital of a Gujarat native State of the same name, on the Kathiawar Peninsula, Bombay, India, 110 miles west of Cambay. It has several educational institutions, including a Rajkumar college for native princes; and there is a bridge of some merit spanning the Aji River. A military cantonment is located here. Population, with cantonment, in 1891, 29,247; in 1901, 36,151.

RAJNA, rī'nā, Pio (1847-). An Italian philologist, born at Sondrio, and educated at Pisa. He taught in *licei* at Modena and Milan, and in 1883 became professor of Romance philology at the Florence School for Higher Studies. He published *Ricerche intorno ai Reali di Francia* (1872); *Le fonti dell' Orlando Furioso* (1876); *Le origini dell' epopea francese* (1884, winning the Diez Prize); and critical editions of Dante's *De Vulgari Eloquentia* (1896 and 1897, under the supervision of the Società Dantesca Italiana).

RAJON, rā'zhōn', PAUL ADOLPHE (1844-88). A French etcher, born in Dijon. He was a pupil at the Ecole des Beaux-Arts, and of Pils. He executed a large number of etchings from pictures in a careful and sympathetic manner. They include the notable portraits of J. S. Mill, Tennyson, Joachim, and Mrs. Anderson Rose, after Watts; Darwin, after Oulless; and the Emperor Claudius, after Alma-Tadema. He received medals at the Salons of 1869, 1870, and 1873. Consult Stephens, *Twelve Etchings by P. A. Rajon*, with a memoir (1889).

RAJPUTANA, rāj'pūt-tā'nā. A division of British India consisting wholly of native States with the exception of the small enclave of Ajmere-Merwara (q.v.), which is under British administration (Map: India, B 3). The division is bounded on the north by the Punjab, on the east by the United Provinces of Agra and Oudh, on the southeast by the Central India Agency, and on the southwest and west by Bombay. Its total area is 127,541 square miles, or twice the size

of New England. Rajputana is divided into two distinct physical divisions by the Aravalli Range, which crosses it from southwest to northeast. The northwestern and much the larger part consists of sandy and arid wastes. It includes the Tar, or Great Desert of Northern India. The southeastern portion is much more elevated and watered by numerous streams flowing chiefly to the Jumna, the largest being the Chambal, or Chumbul. It contains large fertile tracts, but consists principally of rugged and rocky country covered with jungle. The climate in the main portion is very hot and dry, and the rainfall scanty and irregular.

Agriculture, including herding, is the principal occupation. Pulse, cereals, cotton, and other fibres are grown. The status of agriculture varies greatly with varying climatic conditions. The scant rainfall over the larger portion of the region renders the industry precarious, and there is liability to famines. Some commerce is carried on with the surrounding regions. A railroad traverses Rajputana from northeast to southwest. Branch lines have been constructed by the agencies of Bikanir, Jodhpur, and Udaipur. The total population in 1901 was 9,723,301, the famines having caused a decrease of 2,267,203 during the preceding decade. The population is composed mainly of Hindus, of whom there were 8,090,269 in 1901. The Mohammedans numbered 924,656; the Animisties, 360,543; Jains, 342,595. The Christian religion has probably made less progress here than in any other portion of India, there having been in 1901 only 2840 Christians. Among the principal Rajput States are Bikanir, Jodhpur, Jaipur, Alwar, Bhartpur, Jaisalmer, Udaipur, and Kotah. The most important city is Jaipur. Each of the 19 States which compose Rajputana has an autonomous government under its own chief. While the Rajput clans represent a very small minority of the population, the chiefs of sixteen of the States are of that tribe. The chiefs in two of the other States are Jats, and the head of the third is a Mohammedan. The whole is under British suzerainty.

RAJPUTS, rāj'poots' (Hind. *Rājput*, from Skt. *rājanputra*, prince, from *rājan*, king + *putra*, son). The Rajputs, from whom Rajputana, in North-Central India, has received its name, number some 11,000,000. The name is an honorary one applied to a congeries of tribes and castes of diverse origin and customs. The Rajputs were originally the feudal conquerors of Western Hindustan. Despite their claim to be descendants of the ancient Hindu Kshatriya caste (see CASTE), it is doubtful whether their Brahmanism is not like other of their mental and physical qualities, a transferred character. The chief seat of the Rajputs is Rajputana, but they are also numerous in Gujarat, and were formerly powerful in Lower Sindh. Consult Crooke, *Tribes and Castes of the Northwest Provinces and Oudh* (Calcutta, 1896).

RAJSHAHĪ, rāj-shā'hé. A division of Bengal, British India, having an area of 17,356 square miles. It is divided into seven districts: Rajshahi, Dinajpur, Jalpaiguri, Darjiling, Rangpur, Bogra. Pabna. Population, in 1891, 7,726,701; in 1901, 8,489,788.

RAKE'S PROGRESS, THE. A series of eight paintings by Hogarth (1735), now in the

Soane Museum. They depict the career of a dissolute man of fashion of that day. They are entitled: (1) "The Heir and His Property;" (2) "Surrounded by Artists;" (3) "Tavern Scene;" (4) "Arrest for Debt;" (5) "Marriage;" (6) "Gaming;" (7) "Prison;" (8) "Madhouse."

RÁKÓCZY, rá'kō-tsi. A distinguished Transylvanian family, who played an important part in the affairs of Hungary during the seventeenth and eighteenth centuries. GEORGE I. RÁKÓCZY (1591-1648) became Prince of Transylvania in 1631. He married the heiress of the Báthory family, thereby acquiring immense riches. In alliance with the Swedes and the French he invaded Hungary in 1644 and succeeded in extorting new guarantees for Hungarian liberties in the Peace of Linz (1645). A great-grandson of GEORGE I. was FRANCIS II., Prince of Transylvania, born in 1676. His father, FRANCIS I., was elected Prince of Transylvania, but never assumed the office, and died soon after his son's birth. FRANCIS II. was a Protestant, married a princess of Hesse, and in 1701 was imprisoned on an accusation of conspiracy to incite rebellion, but he escaped to Poland, and headed an insurrection in Hungary against Leopold I. (1703), at the time when that prince was engaged in the War of the Spanish Succession. He soon gained possession of Hungary and Transylvania, his operations being facilitated by subsidies obtained by Louis XIV. In 1705 the insurgent parts of Hungary united themselves in a confederation, and placed Rákóczy at the head. He had previously been chosen Prince of Transylvania. In 1708 he was defeated by the Austrians; dissensions sprang up in the confederation, and during his absence in Poland (1711) a treaty of peace was negotiated between Austria and the confederation at Szatmár. This treaty Francis Rákóczy never acceded to. He lived in exile in France and Turkey, and died at Rodosto, on the Sea of Marmora, April 8, 1735. Consult his *Mémoires, sur les révolutions de Hongrie* (The Hague, 1739).

RÁKÓCZY MARCH. A military air by an unknown composer, popularized by the army of Francis Rákóczy II. of Transylvania. The Hungarians adopted it as their national march, and, like the "Marseillaise" in France, it has been placed under the ban of the Austrian Government at various periods of political excitement. The air most generally known in Germany and elsewhere out of Hungary as the Rákóczy March, which is introduced by Berlioz in his *Damnation de Faust*, is a weak paraphrase of the original version of Rucziska.

RÁKOSI, rá'kō-sé, JENÖ (1842—). An Hungarian author, born at Acsád, Eisenburg County, and largely self-educated. At twenty-one he went to Budapest, became a contributor to the *Napló* when that journal was under the charge of Kemény, and in 1866 scored a great success with his comedy, *Esop*. From 1875 to 1881 he was manager of the Hungarian popular theatre in Budapest and then founded the *Budapesti Hirlap*, a radical paper. His success with *Esop* made him a leader of the younger literary circle. Among his later works are the tragedy *Andrew and Joanna*, dealing with the murder of Andrew of Anjou by Joanna, I. of Naples (1885); a study of the nature of tragedy (1886); a very realistic and Zolaesque drama entitled *Magda-*

lene; The Greatest Fool, a novel; some dramas, comedies, and farces; and a comediotta, *Ida*, which was played in Dresden. His brother VICTOR (1860—) is a popular humorist.

RAKSHASA, rük'há-sá (Skt. *rakṣas*, *rakṣasa*, demon, probably from *rakṣ*, to injure, hardly from *rakṣ*, to protect, ward off). In Hindu mythology, the name of the principal class of demons. The Rakshasas play an important part in the religion of India from the Vedic period to the present time. They may assume various shapes at will, as of dogs, vultures, owls, and other ill-omened creatures, or of human beings. When they assume human form, they are occasionally beautiful, especially as women, but more often they are hideously malformed, with three heads, five feet, monstrous bellies, projecting teeth, crooked thighs, or with feet turned backward. Their special object of maleficence next to children is sacrificial worship, although they ever lurk to destroy the pious, especially by entering his body together with his food. The post-Vedic texts abound in tales of these demons, who there assume the vampire type. They are essentially nocturnal fiends, devourers of corpses, and haunters of graveyards. Among themselves the Rakshasas have kingdoms and enormous wealth which they bestow generously on those who win their favor. They are, therefore, regarded as the attendants of Kubera. They are constantly at war with the gods, but are routed by Vishnu (q.v.). Like many devils, they are extremely stupid, and may easily be cheated by their intended victims. The origin of these demons is uncertain. Some texts say they were either created by Brahma to guard the waters, or were born from his foot, while other accounts call them the children of Pulastya, or of Rakshas, son of Kasyapa. Consult: Muir, *Original Sanskrit Texts* (London, 1868-74); Crooke, *Popular Religion and Folk-Lore of Northern India* (2d ed., ib., 1896); Macdonell, *Vedic Mythology* (Strassburg, 1897); Wilkins, *Hindu Mythology* (London, 1900).

RALE, or **RASLE**, ráI, SÉBASTIEN (1657-1724). A Jesuit missionary in North America. He was born in Franche-Comté, became a Jesuit novice at Dôle in 1675, was an instructor from 1677 to 1684 at Carpentras and Nîmes, and in 1689 went to Canada as a missionary. He was stationed for two years at the Abenaki mission of Saint Francis, near the mouth of the Chaudière, afterwards spent two years among the Illinois Indians, and from 1694 until his death was stationed among the Norridgewocks, near the present Norridgewock, Maine. He learned the Abenaki language, acquired great influence over the Indians, and was believed by the English, apparently with good reason, to have been the instigator of the Indian attacks upon the English in this region, which resulted in the so-called Dummer's War (q.v.). In 1705 a party of English settlers attacked and burned the church which had been built by Rale; in 1722 another party pillaged Rale's cabin and burned the church, which had been rebuilt; and in August, 1724, a third party surprised the town, killed several Indians, and shot Rale. Among Rale's papers which were carried off by the English was his dictionary of the Abenaki language, upon which he had been engaged for thirty years. This is preserved in the library of Harvard University, and was pub-

lished by John Pickering in the *American Academy of Arts and Sciences Memoirs*, New Series, vol. i. (Cambridge, 1833). A number of Rale's letters are given in Thwaites (ed.), *Jesuit Relations* (Cleveland, 1903). Consult: Francis, "Life of Rale," in *Sparks's American Biography*, New Series, vol. vii.; Parkman, *A Half Century of Conflict* (Boston, 1892); Baxter, *The Pioneers of New France in New England* (1894); and, for a defense of Rale, Shea, *The Catholic Church in Colonial Days* (1886); and an article in the *United States Catholic Intelligencer*, vol. viii. (1831).

RALEGH, or RALEIGH' rā'li, CAREW (1605-66). An English politician, the second son of Sir Walter Raleigh. He was born in London, in 1604, and was educated at Oxford University. In 1635 he was appointed a gentleman of the privy chamber to Charles I. From 1648 to 1653 he was member of Parliament for Haslemere, and also sat in the Rump Parliament. After the Restoration he received the appointment of Governor of the Island of Jersey. He was killed in 1666. He was the author of a vindication of his father, entitled *A Brief Relation of Sir Walter Raleigh's Troubles*, which was published in 1669.

RALEGH, or RALEIGH, Sir WALTER (c.1552-1618). An English courtier, navigator, and explorer. He was the son of Walter Raleigh of Fardell, near Plymouth, in Devonshire, and studied for a time at Oxford. In 1569 he was in the Huguenot army at the battle of Jarnac, and he seems to have spent some five years in France. In 1577 he was among the hangers-on at Court, and in 1578 he sailed with a small fleet belonging to his half-brother, Sir Humphrey Gilbert, upon an alleged 'voyage of discovery,' though the capture of Spanish galleons was probably the real object in view. During 1580-81 Raleigh was a captain in the Irish service, and was a member of a commission for governing Munster. Upon his arrival at Court with Irish dispatches in December, 1581, his handsome presence and address attracted the attention of Queen Elizabeth. Within a few years he had received appointments and grants which placed him among the most wealthy courtiers. As vice-admiral of the western counties of England, he was in constant touch with the buccaneering expeditions against Spain, which sailed under pretended commissions from the Prince of Condé or William of Orange. He invested heavily in Sir Humphrey Gilbert's unfortunate expedition to Newfoundland in 1583 and after the latter's death applied to the Queen for a continuation of his patent. The privileges obtained entitled him to fit out expeditions for a period of six years and to take possession of unknown lands, in the name of the Queen. In 1584 Raleigh sent Amadas and Barlow to find a place for a settlement. As the Queen refused to allow Raleigh to leave England, he fitted out an expedition consisting of seven ships which sailed in 1585 under the escort of his cousin, Sir Richard Grenville, and planted a settlement on Roanoke Island, on the Carolina coast, with Ralph Lane (q.v.) as Governor. In June, 1586, however, the settlement was abandoned. Grenville left a new party of colonists, which was reinforced by settlers from England in the year following under John White, but ships sent out by

Raleigh failed to reach the colony, and when, in 1590, a relief expedition finally arrived at Roanoke all trace of the settlement had disappeared. Although the colony was a failure, the enterprise resulted in the introduction of the potato and of tobacco into England.

During 1587 and 1588, when Spanish invasion was threatened, Raleigh was one of a commission to draw up a plan for the defense of the country, and performed important services in levying and forming the militia in the west of England. It is not probable that he took any part in the actions against the Armada. Raleigh was not, as is frequently stated, with Drake in the Portugal expedition, in 1589; but at that time was in Ireland, where his friendship with the poet Spenser was formed. In 1591 he was made second in command of an expedition under Lord Thomas Howard to intercept the Spanish plate fleet. Again the Queen refused to let him leave England, and his place was taken by Sir Richard Grenville. In 1592 another expedition was equipped. Raleigh had obtained permission to command in person, but was, at the last moment, recalled and imprisoned in the Tower, because of an intrigue with a maid of honor, Elizabeth Throgmorton, which had become known to the Queen. There he remained from July to September, when the expedition returned. Raleigh was permitted to marry, although forbidden to come to Court. In 1593 he sat in Parliament as member for Cornwall. In 1594 he sent out an expedition in search of El Dorado (q.v.), which he conceived to be situated in the interior of South America, upon the Orinoco, in the country then designated as Guayana, or Guiana. The effort was unsuccessful, and Raleigh determined to go himself. He fitted out five ships—chiefly at his own expense—and obtained a commission from the Queen to wage war against the Spaniards. He penetrated into the interior, going up the Orinoco a distance of more than 400 miles, but was obliged to return for supplies. Upon reaching England he published his *Discoverie of Guiana* (1596). He brought back quartz containing gold, and the first mahogany seen in England. An expedition was sent against Cadiz in 1596 in which Raleigh distinguished himself by gallantry in action. In 1597 he was one of the commanders of a fleet sent to the Azores to intercept the Spanish treasure-ships. Many valuable prizes were secured. The next few years were passed in administrative duties, as member of Parliament, and as Governor of Jersey.

For many years Raleigh had active and powerful enemies at Court, and although even Essex, Howard, and Cecil could not permanently discredit him in the eyes of Queen Elizabeth, he met with nothing but ill treatment at the hands of James I. His posts and grants of monopoly were withdrawn, and a few months after the King's accession (1603) he was sent to the Tower on the charge of being privy to the plots contrived against the King's person by Lord Cobham and the Spanish agent, Count Aremberg. He was condemned under the harsh procedure of *lesa majestas* trials, for failing to produce conspicuous proofs of innocence. A reprieve was granted, and his personal property restored, but he still remained a prisoner in the Tower until his petition to be allowed to lead another expedition to the Orinoco was granted, in 1616. The

Spanish Ambassador protested, and Raleigh was ordered not to engage in any hostilities against the Spaniards, on penalty of his life. He sailed on June 17, 1617, and encountered an unbroken series of misfortunes. During the voyage the Spanish settlement of San Tomas was attacked and destroyed. Upon his return to England he was at once arrested, and after some deliberation was executed, by virtue of the former sentence, on October 29, 1618. During his long imprisonment in the Tower he wrote the *History of the World*, one of the monuments of Elizabethan literature. He also wrote treatises on religious and philosophical subjects, and several poems of merit. The chief lives of Raleigh are those by William Stebbing (1891), Edmund Gosse (1886), and Edward Edwards (1868), who also published Raleigh's letters.

RALEIGH, rā'li. A city, the county-seat of Wake County, and the capital of North Carolina, 148 miles north-northwest of Wilmington; on the Southern and the Seaboard Air Line railroads (Map: North Carolina, D 2). It is situated at an elevation of about 320 feet, and has a number of fine buildings, the State Capitol occupying a prominent site in a small square near the centre of the city. Other noteworthy structures are the post-office, the Governor's mansion, State Insane Asylum, State Institution for the Blind with separate departments for white and colored, the State Penitentiary, and the State Geological Museum. Raleigh is noted for its educational institutions, which include the State College of Agriculture and Mechanic Arts, opened in 1889, Peace Institute (Presbyterian), Saint Mary's School (Protestant Episcopal), Raleigh Male Academy, and the Baptist Female University; and for colored students, Shaw University (Baptist), opened in 1865, and Saint Augustine's Normal School and Collegiate Institute (Protestant Episcopal). Among the libraries in the city are the Olivia Raney (public), with 6000 volumes; the State, having 35,000 volumes; and the Supreme Court, with more than 13,000 volumes. Pullen Park, and the Confederate and National cemeteries, the latter having 1207 graves, 572 of unknown dead, are also of interest.

Raleigh is a large cotton and tobacco market, and industrially is of considerable importance, its manufactures in the census year of 1900 representing an invested capital of \$1,611,000, and having products valued at \$2,204,000. The principal establishments include cotton mills, car and wheel works, phosphate works, foundries and machine shops, cottonseed-oil mills, flouring mills, wood-working mills, etc. The government is administered under a charter of 1899, which provides for a mayor, elected biennially, and a unicameral council that controls elections of subordinate officials, excepting the tax collector and city clerk, who are chosen by popular vote. Population, in 1890, 12,678; in 1900, 13,643. The site of Raleigh was selected as a location of the permanent capital of the State in 1792, and in the same year the city was laid out and named in honor of Sir Walter Raleigh. In 1794 the Legislature met here for the first time, and by acts of 1795 and 1803 Raleigh was incorporated. General Sherman occupied the city during a part of 1865. Consult Battle, *The Early History of Raleigh* (Raleigh, 1893).

RALEIGH, ALEXANDER (1817-80). An English Congregational minister. He was born in Scotland; educated at the Lancashire Independent College, Manchester; and after holding charges at different places became a pastor in London (1858), and so continued till his death. He was highly honored by his brethren, being chairman of the Congregational Union of England and Wales in 1868 and 1879, and their representative at the National Council of the American Congregational Churches (1865). He published numerous sermons and expositions, noted for their spiritual fervor and elevated diction. Consult his *Life* by his wife (London, 1881).

RALEIGH, Sir WALTER. See RALEGH.

RAL'LENTAN'DO (It., slackening). A musical term, abbreviated *rallent.*, or *rall.*, indicating a gradual relaxing or diminution of time.

RALPH, JAMES (c.1698-1762). An American poet and pamphleteer, born in Philadelphia, Pa. He became an intimate friend of Benjamin Franklin, whom he accompanied to London in 1725. There he tried to support himself by writing, but with little success. Pope satirized his poem *Night* (1728) in the *Dunciad*. Afterwards Ralph attached himself to the Prince of Wales, and used his pen to assist his friends the Whigs in every possible way. When George III. ascended the throne, he was given a pension. His works include: *Zeuma* (1729), a poem; *The Groans of Germany* (1734), a political pamphlet; *The Use and Abuse of Parliaments* (1744); *History of England During the Reigns of King William, Queen Anne, and George I.* (1744); and some poems, essays, and plays.

RALPH, JULIAN (1853-1903). An American author and journalist, born in New York City. He joined the staff of the *New York Daily Graphic* in 1875, but within a year he left it and was on the staff of the *New York Sun* until 1895, gaining a world-wide reputation as a correspondent. In 1896 he became London correspondent for the *New York Journal*, was with the Turkish armies during the Græco-Turkish War in 1897, and in 1899 went to South Africa as war correspondent for the *London Daily Mail*. Besides numerous magazine articles, his publications include: *Dutchman or German* (1889); *On Canada's Frontier* (1892); *Chicago and the World's Fair* (1893); *Our Great West* (1893); *People We Pass* (1895); *Dixie* (1896); *Alone in China* (1898); *A Prince in Georgia* (1899); *Toward Pretoria* (1900); *An American with Lord Roberts* (1901); *War's Brighter Side* (1901); and *The Millionairess* (1902), a novel.

RALPH ROISTER DOISTER. A comedy by Nicholas Udall, probably written between 1534 and 1541 for the Christmas entertainment at Eton, of which Udall at that time was headmaster. It was printed anonymously in 1566, the only copy of that edition being now in Eton Library, and Collier was the first to connect Udall's name with it about 1820. It is noteworthy as the first English comedy. Its humorous and life-like characters far surpassing the wooden figures of the Moralities and even the personages of Heywood's farces. Ralph Roister Doister, a hare-brained, vain, boastful fellow, is egged on in his courtship of Dame Custance, a rich London

city wife, by Merrygreek, who maliciously enjoys the diversion of a fool in love. Though she does not intend to accept Ralph, his pursuit makes trouble between Custance and her betrothed, Gawin Goodluck. The fool's chagrin is soothed by Merrygreek by flattering his vain delusion that the lovers fear him, and all ends well.

RALSTON, rā'l'ston, WILLIAM RALSTON SHEDDEN- (1828-89). An English Russian scholar, and the son of W. P. Ralston Shedden, who, after making a fortune in India, returned to England. He was prepared by a private tutor for Trinity College, Cambridge, where he graduated B.A. in 1850. Though subsequently called to the bar, he never practiced. To free himself from the odium attached to a prolonged lawsuit, begun by his father and continued by his sister, for the Ralston estates in Ayrshire, he added the name of Ralston to Shedden. Entering the printed-book department of the British Museum (1853), he rose rapidly. He learned Russian and traveled extensively in Russia, forming a close friendship with Turgenieff. Owing to ill health, he resigned his post in the British Museum after serving for twenty-two years. He contributed largely to the *Athenæum*, the *Saturday Review*, and other periodicals, and published *Krilloff and His Pables* (1868); a translation of Turgenieff's *Liza* (1869); *Songs of the Russian People* (1872); and *Early Russian History* (1874).

RAM (AS. *ram*, *ramm*, Ger. *Ramme*, battering-ram, OHG. *ram*, *rammo*, Ger. *Ramm*, male sheep), MARINE. It was evident to the ancients that a ship, if given a sufficient rate of speed, could deal the enemy's vessel a more disastrous blow than could any weapon then known, so that the use of the ram is as ancient as maritime war. The oar-propelled galley furnished requisite speed and control for ramming, and to further the efficacy of the craft of this sort they were furnished with beaks. The short ranges at which ancient weapons were dangerous were favorable to the use of the ram, and most of the celebrated actions of the galley were decided by it. But the advent of gunpowder rapidly effected a change. With the introduction of sail propulsion ramming was nearly given over, but when steam came to the front it reappeared in a form which soon reached its highest development. The ram, however, has never accomplished much except under special conditions, and it is now regarded as a very subordinate weapon in naval warfare. W. Laird Clowes has carefully tabulated all the cases of ramming or attempted ramming which have taken place in modern naval warfare, and he finds that: (a) when both vessels have had plenty of sea room and were able to steer not one of the thirty-two attempts to ram were wholly successful—indeed, the ships attempting to ram received slightly the gravest injuries; (b) where the ramming took place in waters which were too contracted to admit of free manœuvring (32 cases also), 28 per cent. of the vessels attacked by ramming were sunk, as were 3 per cent. of the attacking ships, while the percentages of the attacked vessels which were seriously injured was about double that of the ships attempting to ram. The torpedo and the greatly enhanced gun power of recently built ships both serve to weaken the influence of the ram upon naval operations, leaving its probable

effective use confined to unusual and special conditions.

It is difficult to determine who first suggested ramming by steam vessels. One of the earliest designs is that of Capt. Samuel Barron of the United States Navy, which was made in 1827 and a model of which is preserved at the Naval Academy, Annapolis. At this time, however, there was but one steam man-of-war in existence, and it was not until the Civil War broke out that attention was seriously attracted to the importance of ramming. The *Merrimac* was fitted with a ram with which she sank the *Cumberland*, and the *Monitor* was designed to use her sharp bow for ramming if opportunity offered. After the sinking of the *Cumberland* many war vessels were supplied with rams, and at present nearly all fighting ships are so fitted, but it is not expected that the use of the ram will be other than exceptional.

The marine ram as a special vessel designed to use its beak as its principal weapon of offense appears to have had few advocates after the time of Captain Barron's ram in 1827 until late in the Civil War. Admiral Ammen of the United States Navy was a strong advocate of the purely ram type of vessel, and one of his designs was embodied in the U. S. S. *Katahdin*. About 1880 the British built the torpedo ram *Polyphemus*, which is like the *Katahdin* in many respects. No other large ram vessels have been built which are not also well armed with guns.

Among naval officers the use of the ram is now regarded as the last resort—a weak ship endeavors to sacrifice herself in destroying a more powerful one; a ship whose battery is disabled attempts to destroy a still powerful enemy; or a ship which refuses to surrender is given the *coup-de-grâce*. In all this, however, the danger of the torpedo is to be faced, and that is commonly regarded as more to be feared than the ram.

BIBLIOGRAPHY. For further information, consult: "The Ram in Action and Accident," by W. Laird Clowes (*Proceedings of the United States Naval Institute*, whole No. 69, Annapolis, 1894); Elliot, *The Ram* (London, 1884); Bennett, *The Monitor and the Navy Under Steam* (Boston and New York, 1900); *Proceedings of the United States Naval Institute* (various articles); *Journal of the Royal United Service Institution*, particularly 1875, but also various later volumes, (London); Noel, *The Gun, Ram, and Torpedo* (Portsmouth, Eng., 1888).

RĀMA, rā'mā. In Hindu mythology, the name of the sixth, seventh, and eighth incarnations of Vishnu (q.v.), Parasurama, Ramacandra, and Balarama. Of these the Ramacandra avatar (see AVATAR) is by far the most famous, as Rama is here the hero of the Sanskrit epic of the *Rāmāyana* (q.v.).

RAMA, or MELCHORA. An interesting tribe formerly upon the Rama River on the Caribbean coast of Southern Nicaragua, and now gathered upon a small island in Bluefield lagoon. They are a detached tribe of the Changuinan or Dorasquean stock of the Isthmus of Panama. They are kept under subjection by the dominant Mosquito (q.v.), and are now on the verge of extinction, having numbered only about 250 persons in 1891, all Christianized by Moravian missionaries, and described as being of fine physique and great strength.

RAMADAN, rā'mā-dān' (Ar. *Ramaḍān*, from *ramiḍa*, to be burning hot). The ninth month in the Mohammedan year. Mohammed is said to have had his first revelation in Ramadan, and every Moslem is therefore enjoined to keep a strict fast during this month from dawn to sunset of every day, and to abstain from eating, drinking, smoking, bathing, smelling perfumes, and other bodily enjoyments. During the night, however, the most necessary wants may be satisfied, and this permission leads to nightly indulgences in all sorts of enjoyments. As the Mohammedan year is a lunar one, the months rotate through the different seasons, and the fast of Ramadan becomes a severe affliction upon the faithful when the month happens to fall in the hot days of the summer. The sick, travelers, and soldiers in time of war are temporarily released from this duty, though it must subsequently be performed during an equal number of days. Nursing and pregnant women, and those to whom it might prove really injurious, are exempted from fasting. During this month twenty additional prayers are said after the night prayer. Very pious believers seclude themselves and devote their time to the reading of the Koran. The fast is followed by the feast of Beiram (q.v.). In establishing this fast Mohammed seems to have been guided by the Christian institution of Lent, which in the early Church varied in length from four to six weeks. The principal passages treating of the fast of Ramadan are found in the Koran, sura ii. 179-184. Consult: Wellhausen, *Reste arabischen Heidentums* (Berlin, 1897); D'Herbelot, *Bibliothèque orientale* (Paris, 1781); and the commentaries on the Koran.

RAMAKA, rā-mā'kā. Another name for the Egyptian princess Hatasu (q.v.).

RAMAKRISHNA, rā'mā-krīsh'nā (1833-86). A celebrated Hindu yogi or ascetic. He was born at Kamarpukur, near Jahanabad, in Bengal, and was the youngest son of a poor Brahmanic family. At sixteen years of age he attended the school of his eldest brother, Ramkumar Chattopadhyaya, at Calcutta, and followed him when he was appointed priest to the temple of the goddess Kali, founded in 1853 at Dakshinesvara. He became a devotee of Kali, and began a course of twelve years of asceticism. The fame of his humility, sanctity, and wonderful teachings spread, and crowds of people of all classes, including Keshub Chunder Sen, fell under his spell. His conduct was characterized by great tenderness and humility, and his teachings were distinguished by simplicity and purity of language. Consult Müller, *Ramakrishna, His Life and Sayings* (New York, 1899).

RĀMĀYANA, rā-mā'yā-nā (Skt., story of Rama). The second of the two great epic poems of mediæval India. It is in the main the work of a single author, Valmiki. Herein lies the important distinction between it and the *Mahābhārata* (q.v.). Though all its parts are not from the same hand, and though it is not entirely free from digressions or episodes, the poem tells a connected story of great interest in epic diction of the highest order; it ranks with the great epics of the world, and is even to this day the favorite poem of the Hindus.

The central figures in the epic are Rama and his devoted wife, Sita; the main event, the con-

quest of Lanka (probably Ceylon). Daśaratha, the mighty King of Oudh (*Ayōdhya*), having grown old, announces in open assembly that he has decided to consecrate his oldest son, Rama, as his successor, and Rama is accordingly acclaimed joyously. But the intriguing second Queen of Daśaratha, Kaikeyi by name, induces her husband to change his resolution in favor of her son Bharata and to banish Rama for fourteen years. Rama accepts his fate with great dignity, and retires with Sita to the forest Dandaka. When King Daśaratha dies, his son Bharata is called to the succession, but he refuses to usurp Rama's throne, and seeks him out in the wilderness in order to conduct him back to the throne in his capital city. Rama in his turn refuses to cross his father's decision; he removes his gold-embroidered shoes, and presents them to Bharata as an outer token of his resignation of the throne. But Bharata on returning places Rama's shoes upon the throne and holds over them the yellow parasol, the sign of royalty; he himself stands by and acts as the King's plenipotentiary. Now Rama continues in the wilderness, and makes it his mission to fight the demons who molest the ascetics of the forest in their holy practices. Ravana, the king of the demons, who lives in Lanka, plans revenge. One of his demons, in the guise of a golden gazelle, places himself in sight of Sita, who, eager to possess it, sends Rama to hunt it. During his absence Ravana, in the garb of an ascetic, is admitted to Rama's dwelling, and kidnaps Sita. On returning Rama gives himself over to despair, until a mysterious voice tells him the way to overcome his enemies and to rescue Sita. He allies himself with Hanuman (q.v.) and Sugriva, kings of the monkeys. Hanuman succeeds in finding Sita in Lanka, and the monkeys build a wonderful bridge from the mainland. Rama leads his army across, slays Ravana, and is reunited with Sita. They return home, and Rama, conjointly with Bharata, rules his happy people, so that the golden age has again come upon the earth.

The Ramayana consists of seven books in about 24,000 verses. Notwithstanding the essential unity of the entire epic, the first and last books are in a certain sense secondary. The first deals with Rama's youth up to his marriage with Sita; the last with Rama's life from his restoration to his death. In these Rama is apotheosized and identified with the god Vishnu (q.v.) as one of his incarnations. The main body of the epic (books ii.-vi.) deals with Rama as a national hero, the embodiment especially of the ethical ideals of the people. But the Rama-Sita story itself, notwithstanding that it presents itself outwardly as an heroic legend, is justly under the suspicion of containing one or more mythic roots, though the exact formulation and explanation of them is perplexing. In the Veda Sita (q.v.) is the personified furrow of the plowed field, the beautiful wife of Indra or Parjanya. Hence Rama has been identified with Indra (q.v.), the slayer of demons, especially of the demon Vritra. In the epos Ravana is supposed to have taken the place of Vritra. According to another interpretation, the legend is a mixture of culture and nature myth, typifying the spread southward toward Ceylon of Brahmanical civilization. The demons who disturb the ascetics in their holy practices are the barbarous tribes

who oppose Aryan culture. In any case, these mythical and other motives cannot have served as more than mere suggestions for the great story.

The Ramayana exists in three recensions which differ from one another in their reading, in the order of their verses, and in having each more or less lengthy passages that are wanting in the others. The best known and most popular of these is also the most original version of the poem. Its home is in the northwest and south of India; it has been edited a number of times in India, and is most accessible in the second Bombay edition of 1888. The second recension is at home in Bengal; it has been edited by the Italian scholar Gaspare Gorressio, who added to his edition a somewhat free Italian translation in poetical prose (Paris, 1843-70). The third recension apparently at home in the west of India is as yet unpublished, but is accessible in manuscripts at Berlin and Bonn. The poetic translation of the Anglo-Indian scholar Griffith in five volumes (Benares (1870-75) is based upon the first recension. Consult: Weber, *Ueber das Rāmāyana* (Berlin, 1870); Jacobi, *Das Rāmāyana* (Bonn, 1893); Ludwig, *Ueber das Rāmāyana und die Beziehungen desselben zum Mahābhārata* (Prague, 1894).

RAMBAUD, rān'bō', ALFRED NICOLAS (1842-). A French historian, born at Besançon. He was a pupil of the Ecole Normale, and after receiving his degree in 1870 traveled in Russia, and taught history at Caen and Nancy (1871-79). He was chief of a department in the Ministry of Public Instruction in Ferry's Cabinet in 1879-81, and held the portfolio of Public Instruction in the Méline Cabinet in 1896-98. He became professor of contemporary history at the Sorbonne in 1883, and was elected to the Academy of Moral Sciences in 1897. His works include: *La domination française en Allemagne. Les Français sur le Rhin 1792-1800* (1873); *La Russie épique* (1876); *Histoire de la Russie* (1878, translated by Lang as *A History of Russia*, 1879); *Histoire de la civilisation française* (1887); *Histoire de la civilisation contemporaine en France and Histoire de la Revolution française, 1789-1799* (1895). With Lavisse he directed the publication of the *Histoire générale du IVme siècle à nos jours* (1893-96).

RAMBAUT, ARTHUR ALCOCK (1859-). An English astronomer, born in Waterford and educated at Trinity College, Dublin. He was assistant in astronomy there from 1882 to 1892, when he became royal astronomer of Ireland; and in 1897 he was appointed Radcliffe observer at Oxford. His valuable astronomical papers are to be found in *Transactions* and *Proceedings* of the Royal Society, of the Royal Dublin Society, of the Royal Irish Academy, and of the Royal Astronomical Society.

RAMBERG, rām'bērk, ARTHUR, Baron (1819-75). A German genre painter and illustrator, born in Vienna, son of Georg Heinrich von Ramberg (1786-1855, a distinguished general), and grand-nephew of Johann Heinrich Ramberg (1763-1840, Court painter at Hanover, illustrator, and etcher, whose drawings, of which the Leipzig Museum preserves an extensive collection, were exceedingly popular in his day). Ramberg received his first training at the School

of Art in Prague from Franz Kadlik and others, then studied in Dresden (1844) under Julius Hübner, and passed through a subsequent formative stage under the influence of Schwind, whose romantic trend is apparent in the "Wedding Song" (after Goethe) and other works. His great coloristic talent was, however, most successfully displayed in some characteristic scenes from rural life, such as "Women of Daehau on Sunday" (1853), "Morning Devotion in the Mountains" (1855, New Pinakothek), "Walk with the Tutor" (1856), in little humorous episodes like "Hide and Seek," "After the Masked Ball" (1858), and in the idyllic "Meeting on the Lake" (1876), and "Invitation to Boating" (1879), all breathing an atmosphere of ideal beauty. The same refined sentiment and a rare delicacy of technique suggestive of the artist's thorough study of the Dutch masters, characterize the "Reading from Wieland" and the concertino in Terborch's manner "After Dinner" (1873, New Pinakothek). In 1860 Ramberg was appointed professor at the School of Art in Weimar, where he executed the historical painting "Court of Emperor Frederick II. at Palermo" (1866, Maximilianum, Munich), collaborated with Pauwels in the decoration of the Luther room at the Wartburg, and painted the "Fairy Tale of the Frog King" (Weimar Museum). It was, however, as an illustrator of the German classics that he earned his greatest fame, notably with the drawings for Cotta's jubilee edition of Schiller's poems, those for the "Schiller and Goethe Galleries" (with Pecht), but above all with the cycles of grisailles to Goethe's *Hermann und Dorothea* and to Voss's *Laise*. In 1866 Ramberg became professor at the Munich Academy. Consult: Pecht, *Deutsche Künstler*, etc., iv. (Nördlingen, 1885), and Rosenberg, *Geschichte der modernen Kunst*, iii. (Leipzig, 1889).

RAMBLER, THE. A periodical published twice a week from 1750 to 1752, by Dr. Samuel Johnson, who wrote all the numbers but five. These ponderous essays and observations on life and manners had a remarkable influence on English morals and language in their day, showing the force of a strong judgment and a noble nature, even through an unwieldy vehicle.

RAMBOUILLET, rān'bōō'yā', HÔTEL DE. The house which, toward the middle of the seventeenth century, was the most famous meeting-place of the cultivated society of Paris. The house itself had previously been known as the Hotel Pisini, the residence of the Marquis of that name, whose daughter, Catherine de Vivonne, received it as a part of her dowry on her marriage in 1600 with the future Marquis de Rambouillet. Dissatisfied with the style of the house, she had it entirely remodeled between 1610 and 1617. After its completion the young beauty, weary of the crowded assemblies of the Louvre, decided to remain at home and make her own house supply all the society she desired. Here, for a generation, assembled the most brilliant coterie in Paris, known, from their insistence on refinement in speech and manners, as *précieuse*. Among early frequenters were Richelieu, Malherbe, Balzac, Corneille, Racan, Voiture, and, somewhat later, Bossuet, Ménage, Chapelain, Scarron, Saint-Evremond, Benserade, and La Rochefoucauld. There too were trained the ladies

who were to found literary salons in their turn, Madame de la Fayette, Madeleine de Scudéry, the Duchess of Longueville, and Madame de Sévigné. Its influence was altogether refining, but it led in some to an exaggeration which resulted in a most ludicrous affectation. It must be borne in mind that Molière, in his *Précieuses ridicules*, was satirizing not this accomplished group, but the exaggerations of their pedantic imitators. From a little before 1620 the society which assembled here represented all that was best and brightest in the social life of the time. Its lustre began to decline after the marriage (in 1645) of the daughter of the house to the Duc de Montausier; and the troubles of the Fronde, the death of M. de Rambouillet in 1652, and his wife's increasing age and infirmities put an end to it. To the movement begun by Madame de Rambouillet is to be attributed an enrichment and purification of the literary and polite language, which gained in precision and flexibility and was thus differentiated sharply from every-day speech. From her came also an improvement in the social position of women, and in the forms of good conversation, in which France has ever since excelled. Consult: Vincent, *The Hôtel de Rambouillet* (Boston, 1900); Cousin, *La société française au XVII^e siècle* (Paris, 1858); Livet, *Précieux et précieuses* (ib., 1859); Roederer, *La société polie en France pendant le XVII^e siècle* (ib., 1834); and Somaize's curious *Grand dictionnaire des précieuses* (ib., 1661; new ed. 1856).

RAMBOV, râm-bôf'. A town in Russia. See OBANIENBAUM.

RAMEAU, rà'mó'. JEAN PHILIPPE (1683-1764). A famous French composer and organist, to whom is really due the foundation of the modern science of harmony. He was born of a musical family at Dijon. He studied the organ under Marchand in Paris and became organist at Lille and at Clermont. His theories of the relationship of sounds he published in 1721, under the title of *Traité de l'harmonie*, and in 1726 he published *Nouveau système de musique théorique*. The main points of his new harmonic theory were the reduction of all possible chords to a limited number of fundamental chords, resting upon an imaginary 'fundamental bass,' which was not the same as thorough or general bass, but a series of root tones which underlie the various chord-progressions. He employed the building up of chords in thirds, and made great use of inversions. These theories received the formal approval of the Academy in 1737, and had much to do with the development of theoretical music. His dramatic composition *Samson*, with a libretto by Voltaire, was rejected at the Opéra on account of its biblical subject. His second attempt, *Hippolyte et Aricie*, obtained a hearing in 1733, but was not immediately successful, and he was tempted to abandon dramatic composition. His next effort, the operaballet *Les Indes galantes* (1735), won public favor. *Castor et Pollux* (1737) is usually considered his best work. Other operas followed in quick succession and held the French stage for a generation, besides winning for him from Louis XV. the title of Court composer, especially created for him. His other compositions include: *Les talents lyriques* (1739); *Dardanus* (1739); *La princesse de Navarre* (1745); *Zais* (1748);

Pygmalion (1748); *Platée* (1749); *Daphné et Eglé* (1753); *Zéphire* (1757); *Les surprises de l'amour* (1759); *Les Paladins* (1760). He wrote several books of compositions for the clavier which were reprinted in 1861. As developments of his operatic works for the stage he produced *Génération harmonique* (1737) and *Démonstration du prince de l'harmonie*, and on the vogue which these operas enjoyed his chief title to fame rests. His services to music were acknowledged by the erection of a statue to him in his native town in 1880. Consult Pougin, *Rameau, sa vie et ses œuvres* (ib., 1876).

RAMÉE, rà'má'. LOUISE DE LA (better known under her pen-name—OUIDA (1840—)). An English novelist, born at Bury Saint Edmunds. Her father was English, her mother French. When about twenty years old she went with her mother and grandmother to London, where she began to write for periodicals under the name of 'Ouida,' her own childish mispronunciation of 'Louisa.' Her first novel, *Held in Bondage* (1863), was followed by *Strathmore* (1865); *Chandos* (1866); *Idalia* (1867); *Under Two Flags* (1867), dramatized and often played; *Tricotrín* (1869); *Puck* (1870); *A Dog of Flinders* (1872); *Pascarel* (1873); *Two Little Wooden Shoes* (1874); *Ariadne, the Story of a Dream* (1877); *Friendship* (1878); *Moths* (1880); *The Village Commune* (1881); *In Maremma* (1882); *Bimbi; Stories of Children* (1882); *Wanda* (1883); *Othmar* (1885); *Guilderoy* (1889); *Syrlin, Ruffino* (1890); *The Silver Christ* (1894); *Two Offenders* (1894); *Le Selve* (1896); *The Massareenes* (1897); *Toxin* (1897); *La Strega* (1899); and *Street Dust* (1901). Her varied contributions, always interesting, to the magazines, she has published from time to time as *Views and Opinions* (1895) and *Critical Studies* (1900). In after years she lived near Florence. Her novels, though tawdry in sentiment, exhibit picturesque power and striking dramatic effectiveness.

RAMENGIHI, rà-mén'gè. The real name of the Italian painter commonly known as Bartolommeo da Bagnacavallo (q.v.).

RAMESSES, or **RAMSES** (Gk. *Ῥαμῆσσης, Rhamesés, Ῥάμης, Rhampsés*). The name of twelve kings of Egypt of Dynasties XIX. and XX.

RAMESSES I., the first King of Dynasty XIX., ruled for a brief period about B.C. 1355. Beyond the fact that he waged war in Nubia, where he left an inscription, and constructed some of the buildings at Karnak, little is known of his reign. His mummy was found, in 1881, at Deir-el-Bahri. His son, Seti I. (q.v.), built the Memnonium at Karnak (q.v.) in honor of his father's memory.

RAMESSES II. (c. 1340-1273 B.C.), the son of Seti I. and the grandson of Rameses I., was the *grand monarch* of Egypt, the Sesostris of the Greeks. The earlier portion of his reign was spent in war with the Cheta or Hittites who occupied the former Asiatic possessions of Egypt as far south as the northern border of Palestine. In his second year he reconquered Phœnicia as far as Berytus, and left a memorial inscription on the banks of the Nahr-el-Kelb. In his sixth year he moved against the important city of Kadesh on the Orontes, but, though he was successful in an engagement with the enemy's chariot force, no decisive result was obtained and

the city did not surrender. In the fighting around Kadesh, Rameses, with a detachment of his troops, was cut off from the main body, and was for a time in personal danger. His exploits on this occasion form the theme of the so-called poem of Pentaur (q.v.), in which they are celebrated with gross exaggeration. The war continued with varying success for a number of years, but finally a peace was arranged by the terms of which Egypt retained Phœnicia as far as Byblus and a strip of territory to the north of Palestine. In his twenty-first year Rameses concluded an offensive and defensive alliance with the King of the Hittites and cemented it by marrying his daughter. The remainder of Rameses's long reign was peaceful, and is chiefly remarkable for the large number of important edifices constructed by the King, who, as a builder, surpassed all other Pharaohs. Among the many splendid temples created or added to by him those of Abu Simbel, Karnak, Luxor, Abydos, Memphis, and Bubastis, and the Ramesseum at Thebes deserve special mention. Rameses also usurped many monuments of his predecessors, cutting away their names and inserting his own name in their stead. By his many wives and concubines he had a numerous progeny, 162 of his children being mentioned by name on the monuments. He died after a reign of 67 years, and his mummy, at first buried at Bibân-el-Mulûk, was subsequently concealed from grave robbers in the shaft at Deir-el-Bahri, where it was found in 1881. Rameses II. was formerly regarded as the Pharaoh of the Oppression, and his son, Mer-en-Ptah, as the Pharaoh of the Exodus; see, however, the section on ancient history under EGYPT.

RAMESES III., the second Pharaoh of Dynasty XX., reigned for 33 years from about 1230 B.C., or perhaps a little later. In the fifth year of his reign he expelled the Libyans who had taken advantage of the weakness of Egypt at the end of Dynasty XIX. to establish themselves in the western part of the Delta. In the eighth year of his reign he attacked and made tributary the piratical Pula-stæ or Philistines, who had recently effected a settlement in Palestine and were making incursions into the Delta. Three years later he repelled a Libyan invasion, and in his twelfth year he raided the Amorite district north of Palestine. From this campaign he brought back rich booty which he lavished upon the temples of Egypt, and especially upon the national sanctuary of Ammon of Thebes. He made, however, no permanent conquests in Asia, and Egyptian influence in that quarter soon sank to a very low ebb.

Rameses III., like Rameses II., was a great builder. The great temple of Medinet Habu (q.v.) is his work, and he restored, or made additions to, temples in many parts of Egypt. The King's mummy was among those found at Deir-el-Bahri in 1881. He was followed by nine kings of little importance, all bearing the name of Rameses (RAMESES IV.-VII.), whose reigns mark a steady decline in the affairs of Egypt. Through the enormous wealth lavished upon the temples by many successive Pharaohs, the ecclesiastical interest had by this time attained a preponderating influence in the State, and the feeble successors of Rameses III. were mere puppets in the hands of the pow-

erful priesthood of Ammon. Finally, about B.C. 1100, Heri-hor, the high priest of Ammon of Thebes, dethroned Rameses XII. and made himself King in name as well as in fact. Consult: Wiedemann, *Ägyptische Geschichte* (Gotha, 1884-88); E. Meyer, *Geschichte des alten Ägyptens* (Berlin, 1887); Budge, *A history of Egypt* (New York, 1902); Müller, *Der Bündnisvertrag Rameses' II. und des Chetiterkönigs* (Berlin, 1902); *Die alten Ägypter als Krieger und Eroberer in Asien* (Leipzig, 1903).

RAMESESE'UM (Neo-Lat., from *Rameses*). A temple built by Rameses II. on the west bank of the Nile at Thebes and dedicated to the god Ammon. The temple is now in a ruined condition. The entrance is formed by a great pylon of which the inner face is well preserved and is covered with sculptures representing scenes from Rameses's Syrian campaigns. The outer court was originally inclosed by a wall and had a colonnade on either side. At the upper end, near the entrance to the inner court, lie the broken fragments of a colossal statue of Rameses II. The inner court was colonnaded on all four sides and the upper end is a terrace leading to the great hypostyle hall, which in plan resembles that of Karnak (q.v.). Sculptures on the southern half of the east wall represent the storming of a Hittite fortress in which Rameses and his sons take part. Consult: Lepsius, *Denkmäler* (Berlin, 1849-58); Wilkinson, *Topography of Thebes* (London, 1835); Mariette, *Monuments of Upper Egypt* (ib., 1877); Dümichen, *Geschichte des alten Ägyptens* (Berlin, 1878); Quibell, *The Ramesseum* (London, 1898).

RAMESWARAM, rä-mös-wü-rüm', or **RAMISSERAM**. A small island in the Gulf of Manar, forming the western end of the line of black rocks stretching from the Indian Peninsula to Ceylon and known as Adam's Bridge (Map: India, C 7). It is low and sandy and covers an area of 53 square miles. A temple here is believed to have been founded by Rama and has been visited for centuries by pilgrims from all over India. The chief town is Pambam, at the western end. The population of the island in 1891 was 17,854, chiefly Brahmins.

RAMIE (Malay name), *Boehmeria tenacissima*, or *nirca*; CHINA GRASS. A nettle-like but

RAMIE.

non-stinging East Indian shrub of the natural order Urticaceæ. The upright stems produced by the perennial rootstock furnish one of the most

durable of vegetable fibres. It is stronger than hemp and almost equals silk in fineness and lustre. The fibre is highly valued for making cordage, nets, various fabrics, and paper which is especially esteemed for banknote making. The plant requires a hot, moist, equable climate and a rich damp soil. It is propagated by seeds, cuttings, layers, and division. When the leaves can be readily stripped off, the stems are harvested and the fibres removed by machinery or, either before or after boiling in chemicals, by hand—either process being costly or otherwise unsatisfactory. The crop can be raised in the Southern United States, but the cost of obtaining the fibre is against the establishment of the industry, and foreign fields are relied upon to supply American needs. Consult: Special United States Consular Report No. 15, pt. i., *Promotion of Ramie Industry*; United States Senate Documents, Nos. 47 and 57, Fifty-fourth Congress, second session. See *BEHMERIA*; Colored Plate of FIBRE PLANTS, accompanying article HEMP.

RAMILLIES, rá'mé'yé'. A village of Brabant, Belgium, 13 miles north of Namur, and 28 miles southeast of Brussels (Map: Belgium, C 4). It is memorable as the place near which, on May 23, 1706, one of the most important battles of the War of the Spanish Succession was fought. The French forces were under the command of Marshal Villeroy and the Elector of Bavaria, while Marlborough led the troops of the allies. Villeroy, after a battle of three hours and a half, was defeated, with the loss of almost all his cannon, the whole of his baggage, and 13,000 men in killed and wounded, the loss of the allies being only about 3500.

RAMISSERAM, rá-mís'sér-üm'. An island between India and Ceylon. See *RAMESWARAM*.

RAMLER, räm'lér, KARL WILHELM (1725-98). A German poet, born at Kolberg. He studied theology at the University of Halle, and afterwards devoted himself to literature. In 1748 he was made professor at the Military Academy of Berlin, where he lectured on logic and literature. The first of his verse was published in the *Bremische Beiträge*, and he came to be considered a master of poetical diction. King Frederick William II. nominated him member of the Berlin Academy of Sciences, granted him a pension of 800 thaler per annum, and appointed him assistant director of the National Theatre in 1790, the sole director of which he was from 1793 to 1796. His fame as lyrical poet Ramler established by his edition of *Lieder der Deutschen* (1756), which he remodeled to a certain extent, and afterwards increased and reëdited as *Lyrische Blumenlese* (1774-78). Together with Lessing he published a selection of Logaus's epigrams (1759). He was a rigid adherent to the so-called classical models, and imitated Horace. By his correct translations and elegant style Ramler exerted great influence on the development and refinement of the German language, and he is regarded as the creator of the art of translating into German. His other writings include: *Sammlung der besten Sinngedichte der deutschen Poeten* (1766), and *Kurzgefasste Mythologie* (1790).

RAMMAN, räm'mán. A deity of the Babylonian pantheon, and also a Syrian god, probably

to be identified with the Babylonian Adad and the Syrian Hadad. Ramman, whose name, from a Babylonian root, means 'the roarer,' is the storm-deity. The name occurs rarely (with certainty) in Babylonian, but is found several times in the Old Testament under the corrupt form *Rimmon*, for *Rammon*. According to II. Kings v. 18, he was the chief deity of Damascus; the name also appears in the proper name Tabrimon (I. Kings xv. 18), and probably in several Palestinian place-names. This word was once generally read in a number of famous Assyrian names e.g. Ramman-nirari III. (fl. 800 B.C.), but since 1899 such a name is read Adad-nirari. We have then the equation of Ramman with Adad, the former being an old Babylonian deity, while the latter may have entered Mesopotamia from Syria. As the storm-god, Adad-Ramman is the deity presiding over the rainy season and floods, is the genius of the battle-onslaught, and is even a god of oracles. He carries the thunderbolts and the battle-axe, and is symbolized by the bull. In the Syrian sphere Adad appears under various names, Hadad, Addu, Daddu, the name being preserved in the biblical names Hadad and Ben-hadad. Hadad is likewise a storm-god, and was the chief in the Syrian pantheon, his cult extending from Aleppo and Singiri to the south of Damascus. In Zechariah xii. 11 occurs the obscure expression Hadad-rimmon, used of either a deity or a place named after a deity; whatever the term means, it is in line with the identification of Hadad and Rimmon. Consult: Jastrow, *Religion of Babylonia and Assyria* (Boston, 1898); Zimmern and Winckler in Schrader, *Keilinschriften und das alte Testament* (Berlin, 1902); Baethgen, *Beiträge zur semitischen Religionsgeschichte* (ib., 1888).

RAMMELSBERG, räm'méls-bérk, KARL FRIEDRICH (1813-99). A German chemist and mineralogist, born in Berlin. He studied in the University of Berlin, became a professor there in 1845, and taught also in the Royal Industrial Institute and the Academy of Mines. His specialty was mineralogical chemistry, and he also contributed greatly to analysis. His chief works include: *Handwörterbuch des chemischen Theils der Mineralogie* (1841, and often); *Lehrbuch der Stöchiometrie* (1842); *Chemische Metallurgie* (1850); 2d ed. 1865); *Kristallographische Chemie* (1855-57); *Elemente der Kristallographie* (1883); and *Chemische Abhandlungen* (1888).

RAMMOHUN ROY, rá-mó'hūn roi (1772-1833). A Hindu raja, scholar, and theist, the founder of the Bralmo-somaj (q.v.). He was born at Bordnan, Bengal, of a high-caste Brahman family. He received a good native education, acquired some knowledge of Persian, and at Patna and Benares studied Sanskrit works on Hindu law, literature, and religion. His religious views aroused the antagonism of his family and of his community, and in his two or three years' residence in Tibet he also gave offense by his denial that the Lama was the creator and preserver of the world. Becoming convinced that the English sway was beneficial to India, he applied himself to the study of the English language. For five years he held the office of revenue collector in the District of Rangpur. He published various works in Persian, Arabic, and Sanskrit, their

object being the uprooting of idolatry, and he was instrumental in procuring the abolition of suttee (q.v.). Becoming convinced of the excellence of the moral theories of Christianity, he published *The Precepts of Jesus, the Guide to Peace and Happiness* (1820), a work of Unitarian tendencies. In 1830 was opened the first building in the Brahma-Somaj or Theistic Church of India, which he had inaugurated and endowed. Shortly afterwards, as representative of the titular King of Delhi, who had created him a raja, he visited England. He was deluged with invitations to social, political, and ecclesiastical meetings, and in his anxiety to see everything and to please all, overtaxed his strength and died of brain fever at Bristol, where he is buried. Consult Carpenter, *The Last Days of Raja Rammohun Roy in England, with Biographical Sketch* (London, 1866).

RAMNES, rām'nēz, or **RAMNENSES**, rām-nēn'sēz. One of the three patrician tribes—Ramnes, Tities, and Luceres—which in the oldest times constituted the *populus Romanus*.

RAMOTH-GILEAD, rām'mōth-gil'ē-ād. One of the chief cities of Gad, east of the Jordan. It is called Ramoth in Gilead and in II. Kings viii. 29 Ramah; the Gilead of Iosea vi. 8 and Judges x. 17 may mean the same place. It is mentioned as a city of refuge and a Levitical city (Deut. iv. 43; Josh. xx. 8; xxi. 38), and as the headquarters of one of Solomon's commissarial officers (I. Kings iv. 13). It was a strong fortress and the key to an important district. Abab, King of Israel, was killed there in the wars with the Syrians (I. Kings xxii.), and his son Joram was wounded there some years later (II. Kings viii. 28). Reimun in the hills of Gilead, Es-Salt, and Jerash have been suggested as possible identifications of Ramoth-Gilead; the weight of the evidence seems to be in favor of the last named. Consult Merrill, *East of the Jordan* (New York, 1881).

RAMPANT (Fr., raging). In heraldry (q.v.), a term applied to a lion or other beast of prey when erect on its two hind legs, with only one of the fore-legs elevated, the head being seen in profile. Sometimes also termed counter-rampant.

RAMPART. See FORTIFICATION.

RAMPOLLA, rām-pōll'ā, MARIANO, Marchese del Tindaro (1843—). An Italian prelate, born at Polizzi, Sicily. He was educated at the Collegio Capranica, the Jesuit College, and the Accademia dei Nobili Ecclesiastici, all in Rome. Afterwards he entered the service of the Pope, and in 1875 was appointed counselor to the Papal Embassy at Madrid. Upon his return to Rome he became Secretary of the Propaganda for Eastern Affairs, and in 1880 Secretary of Ecclesiastical Affairs. In 1882 he was made Papal Nuncio at Madrid, and it was he who suggested the Pope as arbitrator between Spain and Germany in the dispute over the Caroline Islands in 1885. In 1887 he was created cardinal and made Secretary of State to the Pope. This difficult position brought him into contact with the Italian Government, especially during Crispi's Premiership, against the penal laws directed particularly against the clergy aroused the anxiety of the Vatican. His aim, pursued with considerable vigor, was to strengthen French

sympathies for the Holy See, and in this endeavor he antagonized Germany and Austria. On the death of Leo XIII. he was considered one of the leading candidates for the succession.

RAMPUR, rām-pōōr'. A native State, feudatory to the United Provinces of Agra and Oudh (q.v.), British India, having an area of 945 square miles. Population, in 1901, 532,067.

RAMPUR. The capital of the native State of the same name, British India, on the Kosila River, 38 miles northwest of Bareilly, with which it is connected by rail (Map: India, C 3). It has a military cantonment. The manufacture of pottery and damask is an important industry. Population, with cantonment, in 1891, 76,733; in 1901, 78,758.

RAMSAY, rām'zī, ALLAN (1686-1758). A Scotch poet, born at Leadhills in the parish of Crawford, Lanarkshire, October 15, 1686. His father was manager of Lord Hopetoun's mines at Leadhills, and his mother, Alice Bower, was the daughter of a Derbyshire miner. He received the ordinary education of a parish school. In his sixteenth year he was apprenticed to a wig-maker in Edinburgh, and soon married (1712) and set up for himself. In 1716, or a little later, he gave up wigmaking and began business as bookseller, first in High Street, under the sign of the Mercury, and afterwards in the Lucken-booths, under the heads of Drummond and Ben Jonson. Here he added to his business a circulating library, the first in Scotland. Care and industry enabled Ramsay to prosper in all his undertakings but one. In 1736 he built a theatre in Carrubbers Close. In the following year the licensing act, prohibiting all dramatic exhibitions without a special license, compelled him to close his theatre. In 1755 he built a quaint and picturesque house on the north side of Castle Hill, where he died, January 7, 1758.

Ramsay's earliest poems were written for the entertainment of the Easy Club (1712-15). After setting up as a bookseller, he issued many short humorous pieces, printed as broadsides and sold for a penny each. In 1716 he published the old Scotch poem *Christ's Kirk on the Green*, adding a canto of his own, and two years later still another canto. This was followed by a volume of *Scots Songs* (1719). By this time he was writing in the Horatian manner verse epistles to his friends. His first important publication was a collected edition of his poems in 1721, on which he realized 400 guineas. There followed *Fables and Tales* (1722); *The Fair Assembly* (1723); *Health* (1724); *The Tea-table Miscellany*, an anthology of Scotch and English songs (vol. i., 1724; vol. ii., 1725; vol. iii., 1727; vol. iv., 1740); *The Evergreen*, a Scotch anthology, containing his own *Vision* (1724); a pastoral drama, entitled *The Gentle Shepherd* (1725), to which songs were added (1728); a second collection of poems (1728); and *Thirty Fables* (1730). Ramsay's tales and fables are amusing, but coarse. His verse epistles are neat and graceful. His many songs, as *The Yellow-hair'd Laddie*, are the best before Burns. His finest longer lyric is *The Vision*. *The Gentle Shepherd*, which reached its tenth edition by 1750, was long held to be the best pastoral comedy ever written. It certainly marks an epoch in English pastoral poetry—the transition from the artificiality of Pope's pastorals to real life, treated lightly and

humorously. Consult: Smeaton, *Life* (Edinburgh, 1890); *Poems*, edited with a *Life*, by Chalmers, 1800; reissued and revised, Paisley, 1877; and *Poems*, selected, by Robertson (London, 1887).

RAMSAY, ALLAN (1713-84). A Scotch portrait painter, the son of Allan Ramsay of *Gentle Shepherd* fame. He was born in Edinburgh, and studied there and in London and in Rome. In 1767 he was made Court painter to George III. His brush could not begin to keep up with the demands made upon it, and he employed several assistants. Besides the King and Queen, whom he painted repeatedly, some of his famous sitters were Lord Bute, Gibbon, Chesterfield, Hume, Rousseau, and his wife. The three last-named canvases are in the Edinburgh National Gallery. The portrait of his wife is his masterpiece, and for beauty and workmanship rivals Reynolds. His works are said to have been excellent likenesses, and are natural and unaffected.

RAMSAY, Sir ANDREW CROMBIE (1814-91). A Scotch geologist, born in Glasgow. His education at the grammar school in that city was interrupted in 1827 by the death of his father, a manufacturing chemist, who had made several important discoveries, but had patented none of them. The family was left almost without provision, and Andrew entered a counting house, and in 1837 attempted business as a dealer in calico and linen. By 1840 this project had proved a failure, but in the following year, at 9d. a day, he was appointed assistant to the Geological Survey, with which he was connected until 1881, becoming local director for Great Britain in 1845, senior director for England and Wales in 1862, and director-general in 1871. Upon retiring from active service in 1881 he was knighted. In 1847 he had been appointed to the chair of geology in University College, London, and in 1851 received a like position in the Royal School of Mines. He was president of the Geological Society in 1862-64; became a fellow of the Royal Society in 1862; received the Neill Prize from the Edinburgh Royal Society in 1866, the Wollaston medal of the Geological Society in 1870, and in 1880 a Royal Society medal. He was a good lecturer, something of an improvisator, and an ardent lover of English poetry. His rather typical Celtic nature made him over hasty in judgment at times, and as a geologist he was a stratigrapher at the expense of paleontology or petrography. His most valuable work on glacial formations, *Old Glaciers of North Wales and Switzerland* (1860), was followed by a series of popular lectures, *Physical Geology and Geography of Great Britain* (1864; 6th ed. 1894); *Rudiments of Mineralogy* (3d ed. 1885); and *Historical Geography of Asia Minor* (1890). The theory with which he was most closely identified is that many lake basins are the result of glacial excavations. Consult Geikie, *Memoir* (London, 1895).

RAMSAY, ANDREW MICHAEL (1686-1743). A Scotchman who became a Roman Catholic in France, where he was known as the Chevalier de Ramsay. He was born at Ayr, the son of a baker, studied at the University of Edinburgh, and became a tutor in a nobleman's family. Being preoccupied with religious questions, he sought the leading theologians of his own coun-

try and also those of Holland, whither he went attached to the English army during the War of the Spanish Succession. He became acquainted with the mystic Poiriet, and visited Fénelon in France in 1710, and by them was led to adopt the Roman Catholic faith. He remained with Fénelon until the latter's death in 1715, inherited the papers of his distinguished mentor, and became his biographer. After Fénelon's death Ramsay became tutor to the Due de Châteaui-Thierry, and later went to Rome to act as tutor to the two sons of the Pretender, James Francis Edward. In 1730 he visited England and was made a member of the Royal Society. After his return to Paris he became tutor to the Vicomte de Turenne. His works, composed in good French, won him considerable popularity, but are now almost wholly forgotten. Among them are: *Discours de la poésie épique*, originally printed as preface of *Telemaque* (1717); *Essai philosophique sur le gouvernement civil* (1721); *Vie de Fénelon* (1723), translated into English by N. Hooke; *Le psychomètre, ou réflexions sur les différents caractères de l'esprit, par un milord anglais*, an essay dealing with Lord Shaftesbury's *Characteristics*; *Les voyages de Cyrus, avec un discours sur la mythologie des païens* (1727); *Poems* (1728); *Plan of Education for a Young Prince* (1732); *L'histoire du Vicomte de Turenne* (1735).

RAMSAY, DAVID (1749-1815). An American physician and author. He was born in Pennsylvania and settled in practice in Charleston, S. C., in 1773. He served as field-surgeon in the Continental Army during the Revolution. He became member of the State Legislature, 1776; was a member of the Council of Safety at Charleston, and was a prisoner of the British at Saint Augustine, Fla., 1780-81; from 1782 to 1786 he was a member of the Continental Congress, and its president, 1785-86. He was again a member of the South Carolina Legislature, 1801-15, and the president of the Senate of the State. He was shot by a lunatic. Among his works are: *History of the Revolution of South Carolina* (1785); *History of the American Revolution* (1789); *Life of Washington* (1807); *History of South Carolina* (1809); and *History of the United States, 1607-1808* (1816-17).

RAMSAY, EDWARD BANNERMAN BURNETT (1793-1872). A Scotch clergyman. He was born at Aberdeen and educated at the Cathedral Grammar School at Durham and at Saint John's College, Cambridge, where he took his degree in 1816. The same year he became curate of Rodden, in Somerset, and shortly added to his care the curacy of Buckland Denham, in the same county. In 1824 he assumed the curacy of Saint George's, York Place, Edinburgh, and two years later went to Saint Paul's, Carrubbers Close. The following year he became assistant of Bishop Sandford at Saint John's Church, succeeded him in 1830, and continued in the pastorate of that church until his death. In 1846 he was appointed by Bishop Terrot Dean of Edinburgh, and though three bishoprics were offered him, he declined them. His best known work was *Reminiscences of Scottish Life and Character* (1858; 22d ed. with memoir by Cosmo Innes, 1874). Among his other works are: *Diversities of Christian Character* (1858); *The Christian Life* (1862); *Lectures on Handel* (1862); and *Pulpit Table-Talk* (1868).

RAMSAY, JAMES ANDREW BROWN. See DALHOUSIE, tenth Earl and first Marquis of.

RAMSAY, NATHANIEL (1751-1817). An American soldier. He was born in Lancaster County, Pa.; graduated at Princeton in 1767; was admitted to the Maryland bar in 1771; and in December, 1776, became lieutenant-colonel in the Continental Army. At Monmouth (q.v.), June 28, 1778, he, together with Colonel Stewart, checked the advance of the English until Washington could rally the main army, but was badly wounded and was taken prisoner. He was exchanged in December, 1780, but retired on January 1, 1781. He was a member of Congress in 1786-87.

RAMSAY, WILLIAM (1852-). A British chemist, nephew of the geologist Andrew Crombie Ramsay. He was born in Glasgow, studied there and at Tübingen, where he received his doctor's degree at the age of twenty, was professor of chemistry at University College, Bristol (1880-87), and in 1887 became professor in University College, London. Ramsay made a special study of the less known gases. With Lord Rayleigh he discovered argon, a new constituent of the atmosphere. His other discoveries are helium and the atmospheric gases, neon, xenon, and krypton. He wrote several text-books of general chemistry, translated Beilstein's *Qualitative Analysis*, and in 1896 published *The Gases of the Atmosphere, the History of Their Discovery*.

RAMSAY, WILLIAM MITCHELL (1851-). A distinguished Scotch classical scholar and Church historian, born in Glasgow. He was educated at the universities of Aberdeen, Oxford, and Göttingen, and was elected fellow of Exeter College, Oxford, in 1882, and of Lincoln College three years later. In 1886 he was appointed professor of humanity (Latin) in Aberdeen University. Professor Ramsay became widely known for his researches in the history of the Church, especially in Asia Minor. His published works include: *The Historical Geography of Asia Minor* (1890); *The Church in the Roman Empire* (4th ed., 1895); *The Cities and Bishoprics of Phrygia* (1895-97); and *Historical Commentary on Galatians* (1899).

RAMSBOTTOM. A town in Lancashire, England, on the Irwell, four miles northwest of Bury (Map: England, D 3). Its industries comprise cotton mills, bleaching fields, calico printing establishments, iron foundries, and stone quarries. Its growth dates from the installation of calico printing by Sir Robert Peel. Population, in 1891, 16,700; in 1901, 15,900.

RAMSDEN, JESSE (1735-1800). An English optician and mechanician, born at Salterhebble, a suburb of Halifax in Yorkshire. He received a good education, and, after having first been engaged as a cloth-worker, became an apprentice in the workshop of an instrument-maker (1758). In 1762 he had gained such great skill that he was employed by the best artists. In 1766 he married Dollond's (q.v.) daughter and received, as her dowry, a share of his father-in-law's patent for achromatic telescopes. The sextants of his time were very imperfect, being untrustworthy within 5' of a degree, and Ramsden succeeded in reducing the possible error to within 30". He also invented a dividing-machine, which

could graduate instruments much more rapidly and accurately than could be done by hand. For this invention he received a reward from the Board of Longitude. He constructed the theodolite used by General Roy (q.v.), and also telescopes for the observatories of Blenheim, Mannheim, Dublin, Paris, and Gotha, and mural quadrants for those of Padua and Vilna. He was one of those who strongly recommended the introduction of the mural circle in place of the quadrant (q.v.), and he constructed also two of the former instruments for the observatories of Palermo and Dublin. The minor scientific instruments invented or improved by him are also numerous. Ramsden published: *Description of an Engine for Dividing Mathematical Instruments* (1777), also the following memoirs read before the Royal Society: "Description of two new Micrometers" (1777); "A New Construction of Eye-glasses" (1782).

RAMSEUR, STEPHEN DODSON (1837-64). An American soldier, born at Lincolnton, North Carolina. He graduated at West Point in 1860, and was assigned to artillery duty at Fortress Monroe. The next year, while serving in Washington, he resigned from the army, April 6th, and was made major of North Carolina State troops. With this rank he commanded a battery of artillery at the siege of Yorktown, but was soon elected colonel of the Forty-ninth North Carolina Infantry. He was engaged in the Seven Days' battles and was severely wounded at Malvern Hill, July 1, 1862. During his convalescence he was promoted brigadier-general October 27, 1862, and took the field soon after Fredericksburg. At Chancellorsville he led the advance of Rodes's division and won special commendation from both Lee and Jackson. On July 1, 1863, at Gettysburg, by a flank attack on the Federal right he helped to take possession of the town. He was engaged in the battles around Spottsylvania Court House, and after Hancock took the Confederate works on the morning of May 12, 1864, was sent to drive him out. In this he was successful, but was again severely wounded. On May 27th he was assigned to command of Early's division with rank of major-general. He took part in Early's raid and was engaged at Harper's Ferry and at the Monocacy. In the battle at Winchester, September 19th, his division was the first to be attacked, but retreated in good order. While covering the retreat at Cedar Creek October 19th he was mortally wounded and captured.

RAMSEY, RÄM'ZI, ALEXANDER (1815-1903). An American administration, 'war Governor' of Minnesota, born near Harrisburg, Pennsylvania, and educated at Lafayette College. He took a prominent part in politics as a member of the Whig Party, and in 1849 was appointed Territorial Governor of Minnesota. In that capacity he made treaties with the Sioux and Chippewas by which much valuable land was opened to settlers. From 1859 to 1863 he was Governor of the State of Minnesota. He became United States Senator in 1863, was reelected in 1869, was Secretary of War under President Hayes, and from 1882 to 1886 was chairman of the Edmunds Utah commission on polygamy.

RAMSGATE. A seaport and favorite watering-place on the Isle of Thanet, County of Kent, England, 65 miles southeast of London (Map: England, H 5). The town consists of well-ar-

ranged streets, crescents, and terraces; the older part, situated in a natural depression or cutting in the chalk coast, opens out toward the sea. The principal buildings are a Hebrew synagogue and college, a Benedictine monastery and college, and a small but beautiful Roman Catholic cathedral. The harbors, 47 acres in extent with 3300 feet of quays, serve as harbors of refuge for the Downs. Ramsgate is an important steam-packet station, with shipbuilding and fishing industries. Anciently a fishing village, it increased in importance about the beginning of the eighteenth century, when a successful trade with 'Russia and the East country' was opened up. The chief imports are timber, ice, and stone. The municipality, incorporated in 1884, is progressive, owns the water and gas supplies, has improved the drainage and provided an iron promenade pier, public parks, and esplanades. On Ossengal Hill, one mile west of the town, are the remains of a Saxon cemetery. Pegwell Bay, to the west, is the traditional landing place of Hengist and Horsa, and a monolithic cross at Cliff's End marks the landing place of Saint Augustine in 596. Population, in 1891, 24,733; in 1901, 27,693. Consult: Wright, *Wanderings of an Antiquary* (London, 1854); Simson, *Historic Thanet* (ib., 1891); "Ramsgate Reviewed," in *Municipal Journal* (ib., 1900).

RAMSONS. A weed. See ALLIUM.

RAMUS, PETRUS (Latinized form of *Pierre de la Ramée*) (1515-72). A French humanist, philosopher, and mathematician, born at the village of Cuth, in Vermandois, the son of a charcoal-burner of noble descent. In his twelfth year he became servant to a rich student at the Collège de Navarre; and by devoting the day to his master, obtained the night for study, and made rapid progress. He was profoundly dissatisfied with the scholasticism and authoritarianism of the day, and showed his contempt for the idol of the times by maintaining as his thesis for his master's degree in 1536 that all that Aristotle had said was false. Ramus, with two learned friends, opened a special class for reading the Greek and Latin authors, designed to combine the study of eloquence with that of philosophy. His audience was large, and his success as a teacher remarkable. He now turned his attention more particularly to the science of logic, which, in his usual adventurous spirit, he undertook to reform. His attempts excited much hostility among the Aristotelians, and when his treatise on the subject (*Animadversiones in Dialecticam Aristotelis*) appeared in 1543, it was fiercely assailed by the doctors of the Sorbonne, who managed to get it suppressed by an edict of Francis I. But Ramus had powerful friends, through whose influence he was, in 1545, appointed principal of the Collège de Presles, which he raised from a condition of decay to the most splendid prosperity. In 1551, under Henry II., the Cardinal of Lorraine succeeded in instituting for him a chair of eloquence and philosophy at the Collège de France. He mingled largely in the literary and scholastic disputes of the time, and, on account of his bustling activity, came under the satire of Rabelais. He had long been suspected of a leaning toward Protestantism, and he ventured formally to abjure the old faith. The outbreak of the religious wars drove him from France to Ger-

many and Switzerland, where he continued his academic activity. Unfortunately, he returned to Paris in 1571, and was one of the victims of the Massacre of Saint Bartholomew.

Ramus holds a most honorable place in the list of intellectual reformers. His assault on scholasticism is vigorous, and, on the whole, well directed; in his assertion of reason as the supreme criterion of truth, he must be regarded as the forerunner of Descartes and the modern world. His system of logic, by which perhaps his name is best known, is marked by its lucid definitions, its natural divisions, and its simplification of the rules of the syllogism; but it fails to make any real advance upon the old logic. His followers were a widespread and for a long time a powerful body of thinkers and teachers. Consult: Waddington, *Ramus, sa vie, ses écrits et ses opinions* (Paris, 1855); Desmaze, *Ramus* (ib., 1864); Lobstein, *P. Ramus als Theolog* (ib., 1878); Voigt, *Ueber den Ramismus der Universität Leipzig* (Leipzig, 1888).

RAMUSIO, rà-mōs'zè-ò, GIAMBATTISTA (1485-1557). An Italian compiler, born at Treviso. He was Ambassador of Venice to France, Switzerland, and Rome, and subsequently until his death held the post of secretary to the Council of Ten. He published *Delle navigationi e Vaggi*, etc., a collection of travels and voyages in three volumes (1550, 1559, 1566), of which the third was composed of material important for the history of early America. The most complete edition is that of 1606.

RANC, rà-n, ARTHUR (1831-). A French politician and author, born at Poitiers. He studied law in Paris and took such a violent part in the Republican activities under the Empire that he had to leave France. After the amnesty of 1859 he returned to Paris and contributed to the *Opinion Nationale*, the *Nain Jaune*, and other journals. Because of the tone of some of these articles he was imprisoned for four months. In 1870 he was elected maire of the Ninth Arrondissement of Paris, and joined Gambetta, who gave him the directorship of police, a post in which he highly distinguished himself. The following year he was elected to the National Assembly, but he voted against the arrangements for peace and resigned from the Assembly to become a member of the Commune. The violence of that body was contrary to his own views, and he resigned from it also. Afterwards the monarchist press attacked him and his organ, the *République Française*, for the part he had taken during the Commune, and after he had been elected from the Department of Rhône to the National Assembly of 1873, he was condemned to death in *contumaciam*. He had escaped to Belgium, where he remained until the amnesty of 1879 brought him back to France. He had continued his connection with the *République Française*, and became director of the *Petite République* in 1880. In 1881 he was elected Deputy from the Seine, and in 1891 Senator. He was consistently Republican throughout the Boulanger difficulties, and he took a leading part in the revision of the Dreyfus case. His works include *Sous l'empire, roman de mœurs politiques et sociales* (1872), *De Bordeaux à Versailles* (1877), and *Le roman d'une conspiration* (1868).

RANCAGUA, rà-n-kä'gwá. The capital of the Province of O'Higgins, Chile. It is situated in a

rich agricultural district on the railroad 40 miles south of Santiago (Map: Chile, C 10). In 1814 it was the scene of an important battle in which the patriot forces were defeated by the Spaniards. Population, in 1895, 6700.

RANCÉ, rān'sā', DOMINIQUE ARMAND JEAN LEROUTHILLIER DE (1626-1700). The founder of the reformed order of La Trappe. (See TRAPPISTS.) He was born in Paris January 9, 1626, and educated there. Having taken his degree in the Sorbonne, he soon became distinguished as a preacher, and through the favor of Cardinal Richelieu obtained more than one valuable benefice. He succeeded while yet a young man to a large fortune, and lived a careless and irregular life. After a time, however, having forfeited the favor of Cardinal Mazarin, and deeply moved by the sudden death of the Duchess de Montbazou, to whom he was much attached, he resigned all his preferments with the exception of the abbacy of La Trappe, in Normandy, to which he retired in 1662, with the intention of restoring the strict discipline of the Order. He lived in this seclusion for the rest of his life, and published a large number of works, chiefly ascetical. The only remarkable event of his literary life was his controversy with Mabillon, in reply to his *Etudes monastiques*, on the subject of the studies proper for the monastic life. He also wrote *De la sainteté et des devoirs de la vie monastique* (1683; Eng. trans., *A Treatise on the Sanctity and on the Duties of the Monastic State*, Dublin, 1830). In his youth he had edited the works of Anacreon, with translation and notes (1639), and dedicated the book to Cardinal Richelieu. He died at La Trappe, October 27, 1700. Migne reprinted his *Œuvres oratoires*. Consult his *Life* by C. Butler (London, 1814), and by Dubois (Paris, 1866).

RAND. A popular designation for the gold-bearing Witwatersrand (q.v.) reef in the Transvaal Colony, South Africa.

RANDA, rān'dā, ANTON (1834—). An Austrian jurist, born at Bistritz. He studied law at Prague, where he afterwards became professor of Austrian civil law. In 1881 he was appointed life member of the Austrian House of Peers, and soon afterwards he was made a member of the Imperial Court of Justice. He is considered one of the highest authorities on Austrian civil law. His publications include *Der Besitz nach österreichischem Rechte* (1865-95), which is his chief work, and *Der Erwerb der Erbschaft* (1867).

RAN'DALL, ALEXANDER WILLIAMS (1819-72). An American public official, born in Ames, N. Y. He was admitted to the bar, and in 1840 began practice in Waukesha, Wisconsin. In 1855 he was elected to the State Legislature, in the same year was appointed a judge of the Circuit Court, and in 1857 and 1859 was elected Governor of Wisconsin. In 1861 he was appointed by President Lincoln United States Minister to Italy, and upon his return in 1862 became First Assistant Postmaster-General. From 1866 to 1869 he was Postmaster-General.

RANDALL, JAMES RYDER (1830—). An American poet and journalist, born in Baltimore, Maryland, January 1, 1839. After being educated at Georgetown College where, on account of ill health, he did not graduate, he spent some

time traveling in South America, but he returned to the United States and began newspaper work in Louisiana before the beginning of the Civil War. The news of the fighting in Baltimore when the Massachusetts troops passed through the city inspired him to write his famous "Maryland, My Maryland," which was at once set to music and with "Dixie" became the most popular of Confederate songs. For sheer poetic merit it is thought by some to be the best martial lyric composed by any American. Mr. Randall wrote other war lyrics, some of which are good, but his fame rests upon the poem that first made him famous. At the close of the war he became an active journalist and was for many years editor of *The Constitutionalist* of Augusta, Georgia.

RANDALL, SAMUEL JACKSON (1828-90). An American political leader and legislator, Speaker of the National House of Representatives from 1876 to 1881. He was the son of Josiah Randall, a prominent lawyer of Philadelphia, where he was born. There he was educated at the University Academy. He early became prominent in the Whig Party, on the break-up of which both he and his father joined the Democratic Party. In 1858 he was elected a member of the State Senate. At the outbreak of the Civil War he went to the front with the ninety-day men as a private in the First Philadelphia City Troop. At the time of Lee's invasion of Pennsylvania in 1863, he recruited a company of which he became captain, and served also as a provost marshal. In November, 1862, he was chosen as a Democrat to represent the First Pennsylvania District in Congress, to which he was thirteen times successively reelected. In the Forty-third Congress (1873-75) he was placed on the Committee on Rules with Blaine, Banks, Garfield, and Cox, and by directing the Democratic opposition to the 'Force Bill' won general recognition as the leader of his party in the House. At the opening of the Forty-fourth Congress he was appointed chairman of the Committee on Appropriations. In December, 1876, he was elected to succeed Speaker Kerr, who had died during the recess of Congress, and thus was called upon to preside during the exciting and critical period of the disputed Hayes-Tilden election. He was reelected Speaker of the Forty-fifth and Forty-sixth Congresses (1877-81). After about 1883 Randall became the leader of a small group of Democrat protectionists who consistently opposed all attempts at tariff reform. At the Democratic national convention of 1880 he received 128½ votes on the second ballot for the nomination to the Presidency. With his Pennsylvanian constituents his influence and popularity remained strong to the last, and in his last two elections to Congress he was unopposed by the Republicans.

RANDAZZO, rān-dāt'sō. A town in the Province of Catania, Sicily, situated on the northern slope of Mount Etna, 26 miles by rail north-northwest of Catania (Map: Italy, J 10). There is trade in wine, oil, and cheese. Population (commune), in 1901, 11,798.

RANDEGGER, rān'dēg-gēr, ALBERTO (1832—). An Austrian-English composer, born at Triest. He was a pupil of Lafont in piano, and of Luigi Ricci in composition, and with two other young composers, produced two ballets

and an opera, *Il Lazzarone*, in 1852. In 1854 he produced his opera *Bianca Capello* at Brescia. As teacher of singing in London, where he settled about 1855, he became well known, and in 1868 was appointed professor of singing at the Royal Academy of Music. In 1857 he conducted Italian opera at the Saint James's Theatre, and was musical director of the Carl Rosa Opera Company from 1879 to 1885; and, upon the resignation of Benedict in 1881, became conductor of the Norwich Musical Festival. He wrote a comic opera, *The Rival Beauties* (1864); a dramatic cantata, *Fridolin* (1873); two scenas for soprano and orchestra, *Medea* (1869) and *Sappho* (1875); the *150th Psalm* for soprano solo, choir, orchestra, and organ, which was given at the Boston Musical Festival in 1872; *Funeral Anthem*, in memory of the Prince Consort; numerous other vocal pieces; and a well-known *Primer of Singing*.

RANDERS, rån'ers. A town of Jutland, Denmark, situated at the entrance of the Gudenaa into the Randers Fiord, 22 miles northwest of Aarhus (Map: Denmark, D 2). The chief manufactures are railroad cars, gloves, oleomargarine, and the chief exports grain, butter, eggs, and fish. Population, in 1901, 20,057.

RAN'DOLPH. A town, including several villages, in Orange County, Vt., 25 miles south by west of Montpelier; on the Central Vermont Railroad (Map: Vermont, D 6). It is the seat of the Randolph State Normal School, and has a public library. The surrounding district is chiefly engaged in farming and lumbering. Lumber and wooden ware are the principal manufactured products. Population, in 1890, 3232; in 1900, 3141.

RANDOLPH, ALFRED MAGILL (1836—). An American Protestant Episcopal bishop, born in Winchester, Va. He graduated at the College of William and Mary in 1855 and at the Theological Seminary of Virginia in 1858; was ordained priest in the Protestant Episcopal Church in 1860; was rector of Saint George's Church, Fredericksburg, Va., in 1860-62; was a chaplain in the Confederate Army in 1862-65; and was rector of Christ Church, Alexandria, in 1865-67, and of Emmanuel Church, Baltimore, from 1867 to 1883. In 1883 he became Coadjutor Bishop of Virginia, and in 1892 was himself elected Bishop of Southern Virginia.

RANDOLPH, EDMUND JENNINGS (1753-1813). An American statesman, the nephew of Peyton Randolph (q.v.). He was born in Williamsburg, Va.; graduated at William and Mary College; early became prominent as an opponent of the measures of the British Ministry, and, in consequence, was disinherited by his father, John Randolph, a staunch Loyalist. In August, 1775, he became one of Washington's aides, and in 1776 sat in the Virginia Constitutional Convention. He was chosen first Attorney-General under the new State Constitution (1776), sat in the Continental Congress from 1780 to 1782, and was Governor of Virginia from 1786 to 1788. In 1787 he headed the Virginia delegation to the Constitutional Convention, and took a prominent part in the debates, proposing the celebrated 'Virginia plan,' and opposing, among other things, the single executive, the Vice-Presidential office, and equality of the States in the Senate. He refused to sign the instrument as finally

drafted, but in the Virginia Convention strongly advocated its ratification. He helped to codify the Virginia laws, and in September, 1789, was appointed by Washington Attorney-General of the United States. On January 2, 1794, he succeeded Jefferson as Secretary of State, but resigned in August, 1795, primarily on account of an intercepted dispatch of the French Minister Fauchet, which led to charges being brought against him reflecting on his honor. Most of these charges have in recent years been effectually disproved. Returning to his home, he became the leader of the Virginia bar, and in 1807 helped defend Aaron Burr against the charge of treason. He wrote a *History of Virginia*, which, though never published, has been much used in manuscript by other historians. He also wrote (and published): *A Vindication of Mr. Randolph's Resignation* (1795); and pamphlets, entitled *Democratic Societies* (1795) and *Political Truth* (1796). He was one of the ablest speakers and one of the foremost lawyers of his time. Consult Conway, *Omitted Chapters of History Disclosed in the Life and Papers of Edmund Randolph* (New York, 1888).

RANDOLPH, JOHN, OF ROANOKE (1773-1833). An American statesman, born at Cawsons in Chesterfield County, Va., June 2, 1773; died in Philadelphia, June 24, 1833. He was descended from an old and wealthy Virginia family, and boasted that the Indian princess Pocahontas was one of his ancestors. Educated at Princeton and Columbia colleges, he began the practice of law, but in 1799 he was elected to Congress, where he became distinguished for his eloquence, wit, sarcasm, invective, and eccentricity. At a very early stage in his career he was the Democratic-Republican leader of the House of Representatives. He denounced the settlement of the Yazoo land dispute effected by Madison and Gallatin. In 1804 he introduced a resolution impeaching Justice Samuel Chase (q.v.) and was the foremost prosecutor in the famous trial in the following year. He ultimately broke with Jefferson, and lost his influence, although as a free lance and a hurler of invectives he never ceased to be feared. He opposed the War of 1812, and the Missouri Compromise, and stigmatized the Northern members who voted for the latter as 'doughfaces.' In 1822 and 1824 he visited England, where his eccentricities attracted much notice. In 1825 he began his two years' service as Senator from Virginia, and fought his famous duel with Henry Clay. In 1830 he was appointed Minister to Russia, and gave much occasion for scandal by his short stay and heavy demands on the Treasury. By his will he manumitted his 318 slaves, and provided for their maintenance in a free state. In some respects full justice has never been done to Randolph's intellect. He was not merely a well-read man and possessed of a good style, as appears from his *Letters to a Young Relative* (1834) and many of his speeches in Congress, nor was he simply an unparalleled master of invective; he was also a far-sighted statesman, who foresaw the direction American politics would take with regard to the question of slavery, and outlined the policy of Southern defense afterwards taken up by Calhoun and his followers. He was considered a Virginian of Virginians, upon whom young Southern extremists modeled themselves. Consult *Lives of him by Garland* (New York, 1850); by Adams,

American Statesmen (Boston, 1882); and Trent, *Southern Statesmen of the Old Régime* (New York, 1896).

RANDOLPH, PEYTON (1723-75). An American patriot of the Revolutionary period. He was born in Virginia, graduated at William and Mary College, studied law at the Temple in London, and in 1748 became the Royal Attorney-General for the Colony of Virginia. In the same year he became a member of the Virginia House of Burgesses, and served as chairman of a committee to revise the laws of Virginia. In 1764 he framed the remonstrance of the Burgesses against the threatened Stamp Act. In 1766 he resigned the office of Attorney-General, and devoted himself to furthering the cause of the Patriot or Whig Party, serving as chairman of the Committee of Correspondence and as president of the Virginia Convention of 1774. In the latter year he was chosen a delegate to the Continental Congress at Philadelphia, and was unanimously elected president of that body upon its assembling at Carpenter's Hall, September 5th. In 1775 he was again elected to the Continental Congress and again chosen president. In the same year he presided over the second Virginia Convention, and served as Speaker of the House of Burgesses. Shortly after his return to Congress he died suddenly of apoplexy.

RANDOLPH, THOMAS (1523-90). An English courtier and diplomat. He was educated at Oxford, and remained there until the Protestant persecutions in Mary's reign. Elizabeth sent him on missions to Germany and Scotland, where he mingled in all the complex political dealings between England and Scotland from 1559 until 1586. Mary banished him from her Court in 1566 on the charge of being concerned in Moray's rebellion; and he was afterwards sent on embassies to Russia (1568) and Paris (1573 and 1576). Several of his letters have been preserved; they give a vivid picture of the plots and counterplots at Mary's Court.

RANDOLPH, THOMAS (1605-35). An English playwright, educated at Westminster School and at Trinity College, Cambridge, of which he was elected a fellow in 1632. Except for visits to London, where he met Ben Jonson and other wits at the Devil Tavern, he passed his time at the university. He gained a reputation for graceful Latin and English verse and for dramatic performances arranged for the students. *Aristippus, or the Jovial Philosopher* (1630), a drama in verse and prose, is a satire on university education. With it was published the *Conceited Pedler*, a monologue of a rogue much like Shakespeare's Autolycus. There appeared posthumously a volume entitled *Poems, with the Muses' Looking-Glasse and Amyntas* (1638), bound with Milton's *Comus*. *The Muses' Looking-Glasse* is a witty comedy and *Amyntas* is a pastoral drama adapted from the Italian. To Randolph have been ascribed a pleasant comedy, *Hey for Honesty* (published 1651), and a Latin comedy, *Cornelianum Dolium* (1638). Consult his *Poetical and Dramatic Works*, ed. by Hazlitt (2 vols., London, 1875).

RANDOLPH, THOMAS JEFFERSON (1792-1875). An American statesman, born at Monticello, Va. He was the oldest grandson of Thomas Jefferson, and paid the debts that Jefferson left at his death. He also acted as Jefferson's lit-

terary executor, and in 1829 published *Life and Correspondence of Thomas Jefferson* (4 vols.). As a member of the Virginia Legislature, he in 1829 introduced a post-natal plan for the gradual abolition of slavery, but the bill was defeated in the following year. In 1851-52 he was a member of the State Constitutional Convention, and for seven years was rector of the State University. In 1872 he presided over the Democratic National Convention that nominated Horace Greeley for the Presidency.

RANDOLPH-MACON SYSTEM OF COLLEGES AND ACADEMIES. A system of five collegiate and preparatory institutions in Virginia, under Methodist control, and managed by one board of trustees, comprising a college for men, with two academies, and a college for women, with one academy. The organization is designed to secure close correlation between the preparatory school and the college, with economy of time and expense to both. Randolph-Macon College, for men, the parent institution of the system, was chartered in 1830 and opened in 1832 at Boydton, Va. The college was closed during the Civil War and was reopened in 1866. In 1867 it was removed to its present location, at Ashland, Va. It has no professional schools. The course is partially elective and leads to the degrees of bachelor and master of arts. Students for the ministry are exempt from tuition fees. The college had in 1902 a faculty of 10 instructors, 127 students of collegiate grade, an endowment of \$300,000, an income of \$20,000, grounds and buildings valued at \$95,400, the total value of the college property being estimated at \$119,979. The library contained 10,000 volumes. The feeding schools of the college are the Randolph-Macon Academy, at Bedford City, Va., established in 1890, and the Randolph-Macon Academy, at Front Royal, Va., established in 1892.

Randolph-Macon Woman's College was established in 1891 at Lynchburg, Va. In 1902 its attendance was 276, faculty 26. It has grounds of 25 acres, valued with the buildings at \$165,000, an endowment of \$165,000, with a total property valuation of about \$275,000. Its income for 1902 was \$87,500. Its library contained 4000 volumes. Its preparatory school, the Randolph-Macon Institute, at Danville, Va., was admitted in 1897. The chancellor of the system is William W. Smith.

RANELAGH, răn'e-lă. A popular resort in Chelsea, England, well known during the eighteenth century. The plot of ground, on which the building stood from 1742 to 1803, had belonged to the Earl of Ranelagh. The structure was a wooden rotunda built in imitation of the Pantheon at Rome, and could accommodate more than 6000 guests. The place was at one time frequented by the most fashionable society and by writers like Johnson and Goldsmith. After 1788 a rapid decline began, and in 1803 the building was demolished.

RANENBURG, răn'nyen-boörg. A town in the Government of Ryazan, Russia, about 230 miles southeast of Moscow. The place was granted in 1702 by Peter I. to Mentchikoff. It subsequently served as a place of exile for Mentchikoff himself and for Anna Karlovna. Population, in 1897, 15,347.

RANGABÉ, răn'gá'bá', or **RHANGAWIS**, ALEXANDROS RIZOS (1810-92). A Greek author

and statesman, born in Constantinople, and educated at Odessa and in the Military School at Munich, whence he entered the Bavarian artillery. In 1831 he returned to Greece and entered governmental employ, serving for several years in the department of the Ministry of Education. There he founded a new school system, primary and secondary, and established the Greek Archaeological Society. In 1844, after two years in the Department of the Interior, he was expelled because of his foreign birth. He was called in 1845 to the chair of archæology in the University of Athens, was Minister of Foreign Affairs (1856-59), became Minister to Washington (1867), to Paris (1868), served in a like capacity at Berlin (1874-86), and then accompanied Delyannis to the Congress of Berlin. He was a leader of the classicists who urged a return to ancient Greek, in which he wrote versions of Dante, Goethe, and Lessing, lyric, epic, and dramatic poetry, and a valuable volume on Greek archæology. In French he wrote *Antiquités helléniques* (1842-55) and *Histoire de la littérature néo-hellénique* (1877; in German, 1884; in Greek, 1888). His archæological dictionary (1888 et. seq.) was not completed. His son KLEON (1842-) occupied various diplomatic positions and is the author of lyric and dramatic poetry. In 1895 he became Greek Ambassador at Berlin.

RANGE (from OF., Fr. *ranger*, to align, from *rang*, line, from AS., OHG. *hring*, *hrinc*, Ger. *Ring*, Eng. *ring*; connected with OChurch Slav. *krangŭ*, circle, with Lat. *circus*, Gk. *κρίκος*, *krikos*, ring, or with Skt. *srñkhala*, chain). A term in gunnery, indicating the extreme distance a projectile can cover after leaving the muzzle of the piece from which it was discharged. The *maximum range* of a gun is the greatest distance to which it will throw its projectile under ordinary conditions of loading. The maximum range of the most powerful gun in the world (the Water-vliet Arsenal, U. S. 16-inch B. L. R.) is about 21 miles (20.978); the U. S. 10-inch B. L. R. has a maximum range of about 11.7 miles; the 8-inch about 10.6 miles, and the 12-inch B. L. mortar about 6 miles. The Krupp 9.45 inch gun, which held the maximum record before the United States 16-inch gun appeared, fired a projectile about 12½ miles, the greatest height reached during this flight being 21,456 feet.

The *effective range*, or the range at which the projectile may be counted upon to perform the work for which it is intended, is usually much smaller than the maximum range, and of course is a much more useful thing to know. The effective range of a modern field gun firing shrapnel is about 7000 yards (in the United States 6600 yards). *Point blank* range is when the piece is fired in a horizontal position; the range then increases with the elevation. See GUNNERY; BALISTICS.

RANGE-FINDER. An instrument used in naval and military operations to determine the horizontal distance of the object to be hit from the gun which is firing. They are of three principal types, those furnishing their own bases for measurement, those depending upon a known dimension of the object aimed at, and those utilizing a time observation. Those of the first-named type have the most general application and are therefore the most desirable, but satisfactory instruments are either very cumbersome or delicate.

or are liable to give ranges considerably in error. The instruments of the second type may be made fairly accurate, but have a narrow application. Those of the third type are generally inaccurate and are not of much use since the introduction of smokeless powders and rapid-firing guns.

The simplest method of obtaining range by utilizing a base at the point of observation is called Buckner's method and was devised by Lieut. Buckner, of the United States Navy. In the figure, AB is the mast of the ship, which is endeavoring to obtain the range.

FIG. 1.

A is the water line, B the position of the observer, and D the position of the object observed; AB is therefore the height of the observer above the water; AEDC is the surface of the water from A to C (in the visible horizon of the point B); and AD is the desired range. By means of suitable tables the range AD corresponding to any height (AB) and angle (DBC) can be instantly ascertained. It therefore is only necessary to measure the angle DBC by means of a sextant or similar instrument. This method has the disadvantage that it removes the observer from the vicinity of the guns, requiring transmission of the range when it is ascertained; this takes time, and with rapidly moving ships is almost certain to cause error. Furthermore, if the enemy has more than one ship the confusion of ranges may be so serious as to render the ranges obtained nearly valueless. The form of auto-base range-finder largely used in fortifications has two observers at a short distance apart (this distance furnishing the base). Thus A and

FIG. 2.

B are the observing stations, AB the known base, and AC or BC the range. The angles CAD and CBA and the distance BA being known, the distances CA and CB are quickly determined from tables similar to those in Bowditch's *Practical Navigator* for ascertaining the "Distance of an Object by Two Bearings." Most of the recent range-finders are constructed on the same general principle, but are arranged for operation by one person. The base is therefore much shortened, and this is sought to be compensated by the magnification of the angle at C so that it will appear equal to a much larger one before the unaided eye. The most prominent range-finders of the auto-base type are the Barr and Stroud, Zeiss, Davis, Lewis, and Fiske (turret type). Of these the first two have had widespread use and are considered fairly satisfactory and the others have given good results in experiments.

The commonest means of obtaining the distance of an object whose height is known is to measure the angle it subtends by means of a sextant. Thus

FIG. 3.

let BC be the object whose height BC is known. Then by measuring the angle at A the distance AC may be at once picked out of a table of right triangles. For convenience, a special form of sextant, called a stadimeter, has been invented by Commander Fiske of the United States Navy. The reading of the instrument is in yards instead of in angular measure, so that the use of the tables is avoided.

The third type of range-finder is merely a time-measurer which gives the interval between the observed flash of the enemy's gun and the hearing of the report. As the velocity of sound in air is known, the distance may be readily determined. For convenience, the reading may be given in yards instead of seconds. The Watkins range-finder is an instrument of this type and consists of a small glass tube containing a liquid and a moving index. When the flash of the gun is seen the instrument, previously held upside down, is inverted and the index falls slowly through the liquid; when the sound of the gun is heard the instrument is turned to a horizontal position. The side of the tube is graduated and the graduation mark at which the index is seen shows the distance. Aside from errors of range due to faulty graduation and irregularities of the velocity of sound in air, accurate determination of range by an instrument of this kind is practically impossible because of the rapidity of fire of modern guns, whereby the distinguishing of the sound of a particular gun is rendered very difficult.

For further information, see the articles on BALLISTICS and on GUNNERY; *Proceedings of the United States Naval Institute* (particularly the "Professional Notes" in numbers 97 to 102); *Annual of the Office of Naval Intelligence*, United States Navy (particularly the volume for 1900).

RANGELEY (rānj'lī) **LAKES**. A chain of lakes near the western boundary of Maine (Map: Maine, B 6). The principal members are Kennebeco, Rangeley, Mooseluemaguntic, Molechuckmunk, Richardson, and Umbagog. All of these are connected by streams in the order named, and form the sources of the Androscoggin River. They lie in a wild and beautiful region, and are a favorite resort of tourists and sportsmen.

RANGER, rānj'jēr, HENRY WARD (1858—). An American landscape painter, born in New York City and self-taught. He traveled in Holland and Germany, and first became known by his Dutch landscapes. Afterwards he exhibited several Canadian scenes, painted in the region of Quebec. His subjects include marines, forest interiors, and shore and field views. His later pictures are "Pasture Lot," "Morning at Highbridge," "Bradley's Mill Pond," a work of great tonal beauty.

RANGERS, MOUNTED. In 1832 the United States Government found it necessary to increase the regular army establishment, owing to increasing Indian troubles, and particularly be-

cause of the Black Hawk War of that year. One battalion of mounted rangers was raised, and added to the establishment, but was disbanded the following year, and a regiment of dragoons substituted, which afterwards was organized into what is now the First Regiment of regular cavalry.

RANGOON, rān-gōon', or **RANGUN**. The capital and chief port of Burma, India, on the Rangoon River, the eastern branch of the Irrawaddy, about 25 miles from the sea, in latitude 16° 42' N. and longitude 96° 13' E. (Map: Burma, C 3). Rangoon is finely situated for internal as well as foreign commerce, having a continuous water communication with the vast region on the Irrawaddy. The town, well laid out with straight streets crossing at right angles, extends for over a mile along the river front, and three-quarters of a mile inland. Rangoon is a stronghold of Buddhism, and on every side are seen monuments to Gautama. The most remarkable of these is the Shoay-Dagon, a shrine, the foundation of which is said to have been laid 583 years B.C. It stands on an artificial elevation within the military cantonment on the north, is 370 feet high, 1355 feet in circumference, and contains personal relics of Buddha; it is annually visited by thousands of pilgrims. The European buildings include the Government House, the court houses, post and telegraph offices, a cathedral, college, museum, free library, and hospital. Other notable features are the native bazaars, Dal-housie Park, and the several pretty lakes in the vicinity. Street railways give access to all the principal points. The chief industrial establishments are the lumber, rice, and oil mills; there are also manufactures of silk and cottons, mats, pottery, salts, and fish paste. The river front is lined with wharves, and two-thirds in value of the exports of Burma are shipped, and almost all the imports are received at this port, which is the third in importance of British India. The principal exports are teak and rice; the imports include cotton, cutlery, petroleum, hardware, liquors, wines, silks and woollens, and raw silk. The city was rebuilt by Alompra in 1755; the British captured it in 1824, but it was retaken by the Burmese. The British again took possession in 1852, since which time the city has been held by them. Population, in 1891, 180,324; in 1901, 234,881.

RANIERI, rā-nyā'rè, ANTONIO (1809-88). An Italian author, born in Naples. He was the devoted friend of Leopardi, whom he faithfully nursed until his death. He edited the collected works of Leopardi and wrote *Sette anni di sodalizio con Giacomo Leopardi* (1880), the biographical matter in which is not altogether reliable. The publication of his novel, *Ginevra o Porfana della Nunziata* (1839), and his history, *I primi cinque secoli della storia d'Italia da Teodosio a Carlomagno* (1841), involved him in trouble with the Government, but United Italy recognized his abilities, and at the time of his death he was a Deputy and a professor at the University of Naples. His writings were published in 1862-64, and a volume of *Scritti varii* in 1891.

RANJIT-SINGH, rān-jāt' sīng'h' (1780-1839). Maharaja of the Punjab, born at Gujranwala, the son of Maha-Singh, Sirdar of Sukur-Chukeah, who died when Ranjit-Singh was about

twelve years old. His widow took charge of the administration, and attempted by every means in her power to render her son effeminate, but without success. When he was about seventeen years old she died suddenly and under somewhat suspicious circumstances, and he immediately assumed the government. In 1799, having rendered important service as an ally to Zeman Shah of Afghanistan, who had invaded the Punjab, he received Lahore, which he held despite the efforts of the neighboring sirdars. To them he next turned his attention, and succeeded in subduing some and rendering others tributary. His successes alarmed the Sikh chiefs, allies of the British, situated between the Sutlej and the Jumna, who besought the interference of Lord Minto, the Governor-General. According to a treaty made with Ranjit-Singh in 1808 by Charles Metcalfe, the English gave up all interference north of the Sutlej, on condition that that boundary should be respected. Ranjit-Singh, thus freed from the only danger he feared, by 1812 had compelled all but three of the Punjab sirdars to resign their authority, and proclaimed himself Raja. In 1813 he obtained possession of Attock, took Multan by storm in 1817, and in 1819 annexed Kashmir, assuming after these exploits the title of maharaja. In 1822 he took into his service Allard and Ventura, two French officers who had served under Napoleon, and by their aid he finished the reconstruction of his army, with the view of extending his dominion to the west of the Indus. In pursuance of this scheme, he wrested the Province of Peshawar from the Afghans in 1829. After several years of desultory war with the Afghans, his army was routed by them in 1836, but this reverse does not seem to have affected the stability of his rule, even in the most recently acquired districts, and his reign was not disturbed by a single revolt. He died June 27, 1839. He was totally uneducated and could neither read nor write, but his administration was energetic, and, for an Oriental despotism, equitable. Consult Griffin, *Ranjit-Singh* (Oxford, 1892).

RANK, ränk, JOSEPH (1816-96). An Austrian novelist, born at Friedrichsthal. He studied law and philosophy in Vienna, but devoted himself entirely to literature, and won reputation with the popular tales *Aus dem Böhmer Walde* (1843), a new series of which, *Neue Geschichten aus dem Böhmer Walde*, was published in 1847. These and his other village stories rank among the best of their kind in German literature. Elected a member of the Frankfort Parliament in 1848, he sided with the moderate liberals, lived subsequently at Stuttgart, Frankfort, Weimar, and Nuremberg, and in 1861 became secretary of the Imperial Theatre at Vienna, being afterwards appointed to a similar position at the Imperial Opera. His numerous novels and tales include: *Florian* (1853); *Geschichten armer Leute* (1853); *Von Haus zu Haus* (1853); *Achtspännig* (1856); *Aus Dorf und Stadt* (1860); *Ein Dorfbrutus* (1861); *Im Klosterhof* (1875); and *Der Seelenfänger* (1885). Posthumously appeared *Erinnerungen aus meinem Leben* (Vienna, 1896). Consult Pröll, *Joseph Rank* (Prague, 1892).

RANK AND COMMAND. In the military or naval services, the different steps or grades of command are marked by a distinct title of rank or standing. The rank is relative to the

grade or command, and an officer may be of the same grade yet be inferior in rank to another. Officers of the same grade are senior or junior to each other, according to the priority of their commission. In the United States, the Regular Army commission takes precedence of either militia or State National Guard commissions of the same grade. Where the grade and date of commission of two or more officers is the same, seniority is according to length of previous service; and should their period of service be equal, the order of appointment determines the rank between officers of the same regiment. Brevet (q.v.) rank applies only to the army.

As responsibility and subordination are the basis of organization, rank and command are the necessary correlatives. Every rank should have its proper command, and conversely every command should be accompanied by a proper rank. The only safe guide is the custom of nations, according to which all the forces of the land, comprising usually several armies, are commanded by a general-in-chief, who is often the sovereign or head of the nation himself, if he should be by education and training a soldier capable of taking the field in that capacity; each separate army is commanded by a general or field-marshal, each army corps by a lieutenant-general, each division by a major-general, and each brigade by a brigadier-general. The regiment is commanded by a colonel, assisted by a lieutenant-colonel, each battalion by a major, and each company by a captain, assisted by first and second lieutenants.

There are some slight differences in the various armies of the world. For example, in France the highest rank is that of Marshal of France, and there is no grade corresponding to the United States major-general; in Germany the generals are classified as marshal-generals, colonel-generals, generals of infantry, cavalry, or artillery (commanding army corps), lieutenant-generals (commanding divisions), and major-generals (commanding brigades)—there are no brigadier-generals, and there are two grades of captains, first and second class. In Great Britain the battalions are commanded by lieutenant-colonels, and the field batteries by majors. The grades of non-commissioned officers, other than sergeant and corporal, are also quite different in the different armies.

Promotion is an important factor in rank and command, since its rate determines the age at which any particular rank or command is reached, and the latter is a very important element in the organization of an army, because rapid promotion insures to the higher commands young, and therefore energetic, officers. Germany may be taken as the type of the Continental armies, and there promotion from second to first lieutenant takes place in the arm of the service, from first lieutenant to captain by corps, from captain to major in the arm again, and above that in the entire army; transfers are often made in order to equalize promotion, and incapable officers are retired; in the general staff promotion is more rapid, because there are more majors than captains, and the former are continually passing out for service in the line. Promotion in the German army has been as follows: to first lieutenant after 7 years of service, to captain after 12, to major after 23, to lieutenant-colonel after 30, to colonel after 33, and to major-general after

36; in the general staff, however, captaincies are attained in two or three years less than in the line, and majorities three or four years earlier than in the line. See ARMY ORGANIZATION; ARMIES.

RANKE, rän'ke, JOHANNES (1836—). A German physiologist and anthropologist, born at Thurnau, Bavaria. He was educated in Munich, Berlin, and Paris, became a lecturer in physiology at Munich in 1861, in 1869 professor extraordinary and in 1886 full professor of anthropology, his being the first chair of that science in Germany. In 1889 he became curator and director of the collection of prehistoric objects of Bavaria presented by him to the State. Ranke is also editor of the *Beiträge zur Anthropologie und Urgeschichte Bayerns*, of the *Archiv für Anthropologie*, and of the *Korrespondenzblatt* of the German Anthropological Society, of which organization he was chosen general secretary. His published works include *Tetanus* (1865), *Die Ernährung des Menschen* (1876), *Das Blut* (1878), and *Beiträge zur physischen Anthropologie der Bayern* (vols. i. and ii., 1883-92).

RANKE, LEOPOLD VON (1795-1886). A celebrated German historian, who, with Niebuhr, was the founder of the modern historical school. He was born at Wiehe, in Thuringia. At the age of eighteen he went to the University of Leipzig, where he studied theology and the classics. In 1818 he became an instructor in the gymnasium at Frankfort-on-the-Oder. His field was classical literature, and in his systematic reading of the ancient historians he was aroused to the possibility of attaching to modern history that interest and vitality, the lack of which in most writers had repelled him from the subject. When his studies had carried him by gradual chronological progression up to the fifteenth century, Ranke had come to realize his mission, and thenceforth he turned to history as his life work. He first published the *Geschichte der romanischen und germanischen Völker von 1494-1535* (1824). He was in 1825 appointed professor extraordinary at the University of Berlin, and entered upon a study of the Venetian Relations, which gave him an insight into the historical value of diplomatic history, the use of which became one of the marked characteristics of his work. The result of these studies was his *Fürsten und Völker von Südeuropa im 16. und 17. Jahrhundert* (1827). He next received a commission from the Prussian Government to go to Venice and investigate the archives there, and in 1834-37 he published *Die römischen Päpste, ihre Kirche und ihr Staat im 16. und 17. Jahrhundert* (10th ed. 1900, under the title *Die römischen Päpste in den letzten vier Jahrhunderten*), a work which attracted the attention of the entire civilized world. In 1834 he was made a full professor at Berlin. Ranke's great studies of the Reformation period in Germany, France, England, and Italy all form parts of one related whole. These works are the most notable and important of Ranke's voluminous contributions to historical literature and form a unique study of the period. Ranke became historiographer of Prussia in 1841, and was the recipient of many honors in the course of his long life. He retired from his chair in Berlin in 1871, but in 1880 began the publication of a universal history. The volumes of the *Weltgeschichte* published before his death

carry the account to the eleventh century. Two additional volumes were edited by his assistants after his death. The whole was published in nine volumes (1881-88). All his works are of great value to students of history. Among them are: *Die serbische Revolution* (1829), republished as *Serbien und die Türkei im 19. Jahrhundert* (1879); *Die Verschwörung gegen Venedig, 1618* (1831); *Deutsche Geschichte im Zeitalter der Reformation* (1839-47); *Französische Geschichte, vornehmlich im 16. und 17. Jahrhundert* (1852-61); *Englische Geschichte im 16. und 17. Jahrhundert* (1859-67); *Zur deutschen Geschichte vom Religionsfrieden bis zum dreissigjährigen Kreige* (1868); *Geschichte Wallensteins* (1869); *Zur Geschichte Deutschlands und Frankreichs im 19. Jahrhundert* (1887). His collected works are published in 54 volumes, covering the whole range of modern European history. He died in Berlin. Consult his autobiography, *Zur eigenen Lebensgeschichte*, edited by Dove (Leipzig, 1890), vols. liii.-liv. of the collected works; Gugglia, *Leopold von Ranke's Leben und Werke* (1893); Guillard, *L'Allemagne nouvelle et ses historiens, Niebuhr, Ranke, Mommsen, Sybel, Treitschke* (Paris, 1899).

RANKINE, rän'kin, WILLIAM JOHN MACQUORN (1820-72). A Scotch engineer and physicist. He was born at Edinburgh, and studied at the University of that city, where he received honors for essays in physics. He afterwards studied civil engineering and was employed on various railways in Scotland as a civil engineer. He did not in the meantime neglect his theoretical studies and communicated a number of valuable papers to different learned societies. In 1849 he was elected a fellow of the Royal Society of Edinburgh and in this year read his celebrated paper *On a Formula for Circulating the Expansion of Liquids by Heat*. He published in the *Philosophical Magazine* (1851) a paper on the *Centrifugal Theory of Elasticity as Applied to Gases and Vapors*, in which this theory was elaborated. In 1853 he was elected fellow of the Royal Society and submitted to that body a paper on thermodynamics, *On the Geometrical Representation of the Expansive Action of Heat*. After delivering lectures in the university at Glasgow, he was elected regius professor of civil engineering in that institution in 1855, succeeding Prof. Lewis Gordon. Rankine may be considered one of the founders of the science of thermodynamics (q.v.), as with Lord Kelvin (then Sir William Thomson) and Clausius he put in permanent form those parts of Carnot's theory which agreed with the view then being accepted that heat and work are convertible. In applied science his work as an engineer was of a high order, and he was the first president of the Institute of Engineers in Scotland. He was also consulting engineer to the Government and corporations and was a contributor to the *Engineer*. He was the author of the following books: *Manual of Applied Mechanics* (1858); *Manuals of the Steam Engine and Other Prime Movers* (1859); *Manual of Civil Engineering* (1862); *Manual of Machinery and Mill Work* (1869); *Cyclopadia of Machine and Hand Tools* (1869). These have enjoyed a well-deserved and widespread popularity as text-books and have passed through many editions. Rankine was also the corresponding and general editor of *Shipbuilding Theoretical and Practical*

(1866). His *Miscellaneous and Scientific Papers* were published in 1880 and contain a biographical memoir of Prof. P. G. Tait.

RANSOM (OF., Fr. *rançon*, from Lat. *redemptio*, redemption, ransom, from *redimere*, to buy back, redeem, from *red-*, *re-*, back again, anew + *emere*, to buy). A price paid by a prisoner of war, or paid on his behalf, in consideration of his being granted liberty to return to his own country. In early times, when armies received little or no regular pay, the soldier looked for his reward in the booty he might capture, and this booty included the bodies as well as the chattels of the vanquished. The conqueror had the option of slaying his prisoner; but for his profit he would make him his slave or sell him into slavery. The transition would be natural to accepting compensation from the prisoner himself and setting him at liberty. In modern warfare, where the fighting is done by professional or paid soldiers, pecuniary ransoms are scarcely ever resorted to, freedom being granted to prisoners in exchange for others of corresponding rank captured on the opposite side. In international law the term ransom is also sometimes employed to describe a sum paid to redeem captured property, such as ships and the like. For example, a ship captured by a privateer may be redeemed by her owners at an agreed price, and is then entitled to a 'ransom bill' from her captors, that is, an instrument which is supposed to assure her safe conduct to her native ports, provided she follows a prescribed course.

RANSOM, MATTHEW WHITAKER (1826—). An American soldier and statesman, born in Warren County, N. C. He graduated at the University of North Carolina in 1847, and was admitted to the bar in the same year. In 1852 he was Presidential elector on the Whig ticket, and from 1852 to 1855 was Attorney-General of the State. He was a member of the Legislature in 1858-60, and in 1861 was one of the three peace commissioners sent to the Congress of the Southern States at Montgomery, Ala. When his State seceded, he was elected lieutenant-colonel of the First Infantry, June 3d, but was soon made colonel of the Thirty-fifth Regiment. With this he was in the Seven Days' battles, and was twice wounded at Malvern Hill. At Antietam he was in command of the brigade during part of the engagement. After Fredericksburg he served in North Carolina, and when promoted brigadier-general was assigned to the brigade formerly commanded by his brother, Robert. During the Gettysburg campaign he was in command of the Suffolk line, and checked the advance toward Weldon in July. His brigade suffered heavily in the recapture of Plymouth, N. C., in April, 1864. Afterwards he was transferred to Virginia, and served before Petersburg, and on the Crater line. During the latter part of 1864 he commanded a division, though his appointment as major-general was not confirmed. He was particularly complimented by General Lee for the assault on Hare's Hill, March 25, 1865, and was engaged at Five Forks. At the close of the war he engaged in farming until elected to the United States Senate in 1872. He served continuously until 1895, and gained great influence in the Democratic ranks.

RANSOM, ROBERT (1828—). An American soldier, born in Warren County, N. C. He graduated at West Point in 1850. In 1850-51 he was

at the Carlisle Cavalry School, and from 1851 to 1854 served in New Mexico. He was assistant instructor in cavalry tactics at West Point in 1854-55, and became first lieutenant First Cavalry, March 3, 1855. From 1855 to 1857 he was in Kansas and then was on recruiting service or frontier duty until 1861. He was made captain First Cavalry, January 31, 1861, but resigned his commission on May 24th. He was commissioned captain of cavalry in the Confederate Army, organized the First North Carolina Cavalry, and was chosen colonel. In November he commanded at Vienna, Va., in the first cavalry encounter of the war. On March 6, 1862, he was made brigadier-general to reorganize the cavalry in the West and Southwest, but after the fall of New Berne was sent to oppose the Federal forces in eastern North Carolina. During the Seven Days' battles in June-July, 1862, he was attached to Huger's division. In the Maryland campaign, in Walker's division, Longstreet's corps, he took part in the reduction of Harper's Ferry, and was especially commended for judgment and skill at Antietam. At Fredericksburg he commanded the division and had immediate charge of the defense of Mary's Heights. Until May, 1863, he was in charge of the defense of the Weldon railroad, but on his promotion to be major-general was assigned to the district including Appomattox and Blackwater. In October, 1863, he was in command in East Tennessee and Southwest Virginia, and remained until April, 1864, when he was recalled for the defense of Richmond. He opposed Butler at Bermuda Hundred and commanded Beauregard's left at Drewry's Bluff, May 16. In June he commanded Early's cavalry against General Hunter, and in the expedition into Maryland. In September he served as president of the court of inquiry concerning Morgan's operations in Kentucky and in November was assigned to Charleston. Illness compelled him to resign this position, and he surrendered to General Howard at Warrenton, May 2, 1865. For a time he served as express agent and city marshal at Wilmington, N. C., and then engaged in farming until 1878. In that year he was appointed superintendent of the United States harbor and river improvements about New Berne.

RANSOM, THOMAS EDWARD GREENFIELD (1834-64). An American soldier. He was born in Norwich, Vt., studied at Norwich University, and at the outbreak of the Civil War was elected major of the Eleventh Illinois Volunteers. Promoted to be lieutenant-colonel, he took part in the attacks on Forts Henry and Donelson, and distinguished himself at Shiloh. He served on the staff of General Grant, was promoted to be brigadier-general, fought at Vicksburg, and commanded a division in the Red River campaign. He subsequently commanded the Seventeenth Corps in the operations about Atlanta, and was promoted to be major-general. Consult: Wilson, *Sketches of Illinois Officers* (1862).

RANSOME, RAN'SUM, ARTHUR (1831—). An English physician, specialist in pulmonary complaints. He was born in Manchester, and was educated at Trinity College, Dublin, at Caius College, Cambridge, at Saint George's Hospital in London, and in Paris. He lectured on biology at Cambridge from 1857 to 1861, taught hygiene and public health at Owens College up to 1895,

and became fellow of the College of State Medicine. Ransome was lecturer on phthisis before the College of Physicians in 1890, and wrote: *Stethometry* (1876); *Prognosis in Lung Disease* (1882); *Causes of Consumption* (1884); *Treatment of Phthisis* (1896); and *Researches on Tuberculosis* (1897, winning the Weber-Parkes Prize).

RANTERS. An alleged English sect of the Commonwealth period of antinomian views. They were charged with immoral practices and were speedily suppressed. Thomas Fuller, in his *Church History*, associates them with the Familists. Probably many of the stories about them were idle gossip. The Primitive Methodists were also called Ranters because of the violent physical phenomena which attended their worship.

RANTOUL, रान्तूल, ROBERT, JR. (1805-52). An American lawyer and political leader. He was born in Beverly, Mass., graduated at Harvard in 1826, was admitted to the bar in 1829, and established himself in practice at Gloucester. He rapidly won distinction in his profession, became one of the leading supporters of Andrew Jackson in the State, and from 1834 to 1838 was a member of the Legislature. He was a member of the first commission to revise the laws of Massachusetts, and in 1837 was appointed by Governor Edward Everett a member of the first State Board of Education. In 1838 he removed to Boston, where his connection with several legal cases of great importance added to his growing reputation. In 1843 he was appointed Collector of the Port of Boston, and from 1845 to 1849 was United States District Attorney. In 1852 he defended Thomas Sims, the first slave reclaimed under the Fugitive Slave Act from New England. In 1851 he was elected to the United States Senate to fill out the remainder of the term of Daniel Webster, and in November of the same year was elected to Congress as the candidate of Democrats and Free Soilers. His strong opposition to the Fugitive Slave Law and to the general pro-slavery policy of the Democratic Party led to his exclusion from the convention of 1852, which nominated Franklin Pierce for the Presidency.

RANULA (Lat., little frog; so called from a fancied resemblance of the form of the swelling to a frog). A cystic tumor on the floor of the mouth due to obstruction and dilatation of one of the several ducts of the salivary glands or mucous follicles, opening under the tongue. The tumor contains a glairy fluid, resembling mucus or saliva, and as it increases in size pushes the tongue to the opposite side. Ranula is not painful, and these tumors sometimes reach a considerable size before relief is sought. The usual method of treatment is by free incision, or by removing a portion of the sac wall; if this is not effective, and the sac refills, the interior is touched with a caustic such as nitrate of silver or pure carbolic acid, to produce an adhesive inflammation of its walls.

RANUNCULACEÆ (Neo-Lat. nom. pl., from Lat. *ranunculus*, sort of medicinal plant, diminutive of *rana*, frog), CROWFOOT FAMILY. A natural order of about 700 widely distributed species of dicotyledonous herbs or sometimes shrubs, and, with few tropical exceptions, natives of cold damp climates. Acridity is the prevailing character of the order, a property which

disappears or is greatly reduced by drying or heating. Some are reputed poisonous; some are used in medicine; some have been used as food. Many of the species produce beautiful flowers, e.g. *ranunculus*, anemone, larkspur, peony, columbine, clematis (qq.v.). The classification and chief genera according to Prantl are as follows: *Paonica*—*Paonia*; *Helleboreæ*—*Caltha*, *Trollius*, *Helleborus*, *Nigella*, *Actæa*, *Aquilegia*, *Delphinium*, *Aconitum*; *Anemoneæ*—*Anemone*, *Clematis*, *Ranunculus*, and *Thalictrum*.

RANUNCULUS. A genus of about 250 species of mostly perennial herbs of the natural order Ranunculaceæ, some of them (crowfoots and buttercups) common in pastures and gardens, many (spearworts) in moist places, others wholly aquatic. *Ranunculus Asiaticus*, Asiatic ranunculus, or garden ranunculus, a native of the Levant, has been cultivated by florists in Europe for almost 300 years. From clusters of small tubers develops an erect branched stem, bearing bipartite leaves, and in the numerous cultivated varieties, large single or double terminal flowers, of various brilliant colors. The ranunculus is propagated by seed, by offset tu-

BUTTERCUP (*Ranunculus bulbosus*).

bers, or by dividing the clusters of tubers, which may be taken up in summer, after the leaves die, and for greenhouse work planted in rich friable soil in late autumn or for outdoor use in early spring. *Ranunculus Ficaria*, sometimes called pilewort and lesser celandine, a very common European species escaped from gardens in the vicinity of New York, Philadelphia, and elsewhere, is used as a pot-herb, and the small tubers are used for food, their acridity disappearing when they are boiled. *Ranunculus acris*, *Ranun-*

culus repens, etc., abundant in pastures, are supposed to give an unpleasant taste to milk and butter if eaten while fresh by cattle, but their acidity is lost in drying, and they are not injurious to hay, except as they are less desirable than grass, clover, etc. See Plates of BUTTERCUP; DICOTYLEDONS.

RANVIER, rān'vyá', LOUIS ANTOINE (1835—). A French histologist, born in Lyons. He studied medicine there and in Paris; received his degree in 1865; was adjunct of the histological laboratory in the Collège de France until 1875, when he was promoted to the chair of general anatomy; and was elected to the Academy of Medicine in 1886, and in 1887 to the Academy of Sciences, in the zoölogical section. His works, which cover almost every branch of histology, include: *Leçons d'anatomie générale* (1878-79); *Manuel d'histologie pathologique* (with Cornil, 1869-72); *Traité technique d'histologie* (1875-88; in German and Russian versions also); and *Leçons d'anatomie générale sur le système musculaire* (1890).

RANZ DES VACHES, räns dá vâsh (Swiss Fr., lowing of the cows, or, line of the cows). A name applied to certain simple native melodies of the Swiss Alps, which are usually sung by the herdsmen, and played by them when driving their herds to and from the pasture, on the alpenhorn (q.v.). It is a peculiarity of this music that it is seldom in tune, owing to the presence of the eleventh overtone (a tone between f^2 and $f^{\sharp 2}$) on the alpenhorn. Its principal characteristics are rising and falling broken chords, repetitions, and (when sung) the use of the *jodler*. A collection of ranz des vaches, along with other Swiss melodies (*Sammlung von Schweizer Kuhreigen und Volkliedern*), was published at Berne, in 1818; and these airs are also to be found in the *Allgemeines Schweizer Liederbuch* (1851). The ranz des vaches of Switzerland are ruder in their character than the mountain melodies of the Tyrol, with which they are sometimes confounded.

RAOULT, rá'ool', FRANÇOIS MARIE (1830-1901). A French chemist, born at Fournes, Nord, and educated in Paris, where he became doctor of physical science in 1862. He became professor of chemistry (1870) and then (1889) dean of the faculty of science in the University of Grenoble. His earlier studies were in electro-chemistry; but he is better known for his work on the freezing point and boiling point of solutions. About 1884 he discovered the general law of the freezing of solutions, demonstrating that the depression of the freezing point of a liquid, caused by dissolving in it equal quantities of substances, is inversely proportional to the molecular weights of the latter. In 1886 he produced experimental evidence showing that a similar law holds good for the vapor-tension (and hence the boiling point) of solutions. Raoult's researches thus furnished the experimental basis of the modern theory of solutions, developed principally by Van't Hoff and Arrhenius. The importance of this theory cannot be overestimated. But the immediate practical value of Raoult's laws lies in the fact that they permit of determining the molecular weight of innumerable substances that are non-volatile, but that are soluble in some liquid. See SOLUTION; MOLECULES—MOLECULAR WEIGHTS; FREEZING POINT; BOILING POINT; DISSOCIATION.

RAOUX, rá'oo', JEAN (1677-1734). A French genre and portrait painter, born at Montpellier. He was a pupil of Ranc, in his native city, and of Bon Boulogne in Paris, where he won the Prix de Rome in 1704. His reception picture "Telemachus and Calypso" is in the Louvre. Most of his works are portraits of actresses as mythological personages. These include Mlle. Prevost as a Baechante, and Mlle. Quinant as Amphitrite, and subjects such as "Young Girl Reading a Letter," in the Louvre, and "Flora," in the Historical Society, New York City. His style is graceful and pleasing, but artificial. There are works by him at Versailles, Berlin, and in the Hermitage at St. Petersburg.

RAPALLO, rá-päil'lo. A winter resort in the Province of Genoa, Italy, situated on the Gulf of Genoa, 16 miles by rail east by south of Genoa (Map: Italy, D 3). Rapallo has manufactures of lace and olive oil, and fisheries of coral and tunny. Population (commune), in 1901, 10,765.

RAPE (from ME., MLGer. *rapen*, to seize, snatch, Ger. *rafen*, to snatch, Eng. *rap*, to carry away, seize, confused with the unrelated Lat. *rapere*, to seize). The crime of having carnal knowledge of a woman against her consent and by force. The essence of the offense is that force be used, and it is immaterial what is the age of the woman, and whether she is married or single, chaste or unchaste. The only difference caused by the habitual unchastity of the woman is that in such a case it is less easy to satisfy the jury that the element of consent was wanting. The two elements of rape are the carnal knowledge and the force used. As to the element of resistance on the part of the woman, or force on the part of the man, several niceties often occur in the application of the law, from the great variety of circumstances attending this crime. With regard to an idiot woman, or an infant of tender years, it has been held that it is not necessary to prove resistance on her part, and that the crime may be committed though she made no resistance. If consent be extorted by fear and threats, or where several men join together, and resistance is useless, this is the same as using violence to overpower the woman. Where the woman is stupefied by drink so that the power of resistance is annihilated it is the same as knocking her down. In case force is used in the first instance, but the woman afterwards consents, the crime of rape will not be committed, though the evidence may establish the crime of assault. Some difficult cases have occurred with reference to married women who have been beguiled by men personating their husbands, and so been, in a sense, cheated out of their consent. But it has been repeatedly decided by courts, both in England and America, that such an offense was not rape. Other courts have held it to be rape, declaring that the act which the woman permitted under such deceit cannot properly be regarded as the real act which took place. Modern statutes have declared this to be the right view. They frequently, also, punish the carnal knowledge of girls under sixteen years of age, whether they have given consent or not.

One of the important circumstances attending the crime of rape is the mode of proof, and in this respect it differs from other crimes. It is held to be all but essential, as a corroboration of the woman's story, that if her cries of resistance

were not heard, at all events she should have, immediately after the offense, complained on the first opportunity to her friends or relatives. It is not allowed to give in evidence the particulars of such complaint, but merely the fact that she made a complaint against some person. Unless this important particular be proved, her evidence is looked upon with great suspicion, and may be discredited by the jury. One of the common defenses to a charge of rape is the unchastity of the woman, the object being to render it unlikely that she did not consent, and hence it is in practice considered a proper question for the prisoner's counsel to put to her whether she had not had connection with the prisoner before or with other men; but at the same time she is cautioned by the judge that she is not bound to answer such questions unless she likes. If, however, she denies the accusation, witnesses may be called to contradict her on that point.

At common law, a boy under fourteen years of age was conclusively presumed incapable of the crime of rape. By statute, in many of our States, this presumption may be rebutted by evidence. Consult: May, *The Law of Crimes* (Boston, 1893); Beale, *Cases on Criminal Law* (Cambridge, Mass., 1894); Clark and Lindsall, *A Treatise on the Law of Crimes* (St. Paul, 1900).

RAPE. A division of the county of Sussex, England. See SHIRE.

RAPE (from Lat. *rapa*, *rapum*, Gk. *ράπυς*, *rhapyς*, *ράφως*, *rhaphys*, turnip). *Brassica campestris*. A European and Asiatic herb of the natural order Crucifera, resembling a turnip in general growth, but with a spindle-shaped root. It is widely grown in Europe for the oil expressed from its seed ('coleseed') and for its foliage, which is an important stock food. In America the latter is its only use. The very leafy plant grows from 1 to 3 feet tall and is cultivated either broadcast or in drills like turnips in deep rich well-drained friable soil and in cool climates. It is a valuable green manure, since it effectively smothers weeds. It is especially esteemed as a sheep food. For dairy cattle it is less useful, since, unless fed with caution, it may unpleasantly flavor the milk.

RAPE OF LUCRECE, THE. (1) A poem by Shakespeare (1594), founded on the story of Lueretia and Tarquinius Sextus. (2) A drama by Thomas Heywood (1630).

RAPE OF THE LOCK, THE. A mock-heroic poem by Alexander Pope (1712), enlarged in 1714, written to smooth over a quarrel caused by young Lord Petre's cutting off a lock of Miss Arabella Fermor's hair. The poem describes this incident with airy grace and vivacity, delicately satirizing the social life of the time.

RAPE OF THE SABINES. A fine marble group, the work of Giovanni da Bologna (1583), representing a young Roman carrying off a woman of the Sabines over the body of a prostrate warrior. It stands in the Loggia de' Lanzi in Florence. The same subject is treated in a painting by Giordano, in the Dresden Museum, and in one by Rubens, in the National Gallery in London.

RAPHAEL SANTI, rä'fä-ël sän'tè (1483-1520). The most celebrated painter of modern times, also noted as an architect. The modern Italian form of his name is Raffaello, and his

family name is often written Sanzio. He was born at Urbino, on Good Friday (March 28th), 1483, according to Vasari, but according to the inscription upon his tomb by Cardinal Bembo, on April 6th. His father, Giovanni Santi (q.v.), was a painter of some merit and a poet, and his mother, Magia, was the daughter of Battista Ciarla, a merchant of Urbino. Of Raphael's youth almost nothing is known. His mother died in 1491, and he came under the care of a young stepmother, against whom he appeared in a lawsuit after his father's death in 1494. He probably received a good education, and grew up in the refined and artistic atmosphere of the Court of Urbino. Like his father, he stood in high favor with Duke Guidobaldo and his wife, and especially with Giovanna delle Rovere, the Duke's sister. He acquired the rudiments of painting from his father, inheriting from him a genial eclecticism, but, by reason of the father's early death, his real instruction began with another master. According to the former view, based upon Vasari, he studied with Perugino at Perugia; but Perugino's movements before 1499 render this view extremely unlikely. Morelli has shown that Raphael's earliest works resemble those of Timoteo Viti (q.v.), an Umbrian painter, who was a disciple of Francia at Bologna, and resided at Urbino between 1495 and 1500, of whom we also know that he was a friend of Raphael. As Perugino did not return to Perugia until 1499-1500, it was probably then that Raphael became his assistant. He imitated his master so closely that their works of this period are very difficult to distinguish. He was also much influenced by Pinturicchio, though it is doubtful whether he assisted him, as Vasari states, in the frescoes of the Cathedral of Siena. Very important for this early period is the so-called Raphael's "Sketch Book" in the Academy of Venice, a collection of drawings by various Umbrian masters, which Morelli has shown are mainly by Pinturicchio, though a few are probably by Raphael after his designs.

All the works of Raphael up to the time of his removal to Florence in 1504 belong to his Umbrian period. The earliest, according to Morelli, is a small "Saint Michael" in the Louvre, which also possesses "Apollo and Marsyas" and "Saint George and the Dragon" of the same period. Best known of all is the charming "The Knight's Dream" (National Gallery, London), an allegory, resembling the mythical vision of Hercules. These works closely resemble those of Timoteo Viti, in form and miniature-like execution, as well as in a delightful poetic sentiment. For Raphael's Madonnas of the Umbrian period, see MADONNA.

Raphael's more ambitious works resemble Perugino's, except that with him everything is more refined and artistic, the space composition is better, the execution more careful and powerful. After the departure of Perugino in 1502 he appears as an independent master at Perugia in his "Coronation of the Virgin," now in the Vatican Gallery. He executed three important altarpieces in the neighboring Citta di Castello, two of which survive—one, a "Crucifixion," being in the possession of Mr. Mond in London, the other, the famous "Sposalizio" (Marriage of the Virgin), in the Brera, Milan. The latter is generally supposed to be a copy of the same subject by Perugino at Caen, though

Berenson has lately pronounced the Caen picture a copy of Raphael's picture by Lo Spagna. Raphael's work is infinitely more refined and symmetrical, and is perhaps the most important of his Umbrian period. Morelli has justly assigned to Raphael the realistic portrait of Perugino in the Borghese Gallery, Rome, formerly attributed to Holbein.

Equipped with a letter of introduction from the Duke of Urbino's sister to Soderini, the gonfalonier of Florence, Raphael removed to that city in 1504. The opportunities for the development of a young artist were at that time the most favorable imaginable. Florence was in an artistic ferment over the battle of the giants, Michelangelo and Leonardo, in their rival cartoons for the Palazzo Vecchio (see MICHELANGELO; VINCI), and Fra Bartolommeo had just returned to the brush with new designs and ambitions in art. The youthful Raphael studied the frescoes of Masaccio in the Brancacci Chapel, whose "Adam and Eve" we recognize in his own Vatican frescoes, and the sculpture of Donatello, as may be seen in his admirable replica (1506) of the Louvre "Saint George," now in the Hermitage, Saint Petersburg, into which he has introduced the dramatic action of one of Donatello's reliefs in Orsanmichele. From Leonardo he learned modeling and chiaro-oscuro; from Michelangelo anatomy and dramatic action; from Fra Bartolommeo composition and the art of enlivening statuesque groups by contrasts. His intense diligence is proved by his surviving sketches of Michelangelo's and Leonardo's cartoons, and by the innumerable studies for his pictures. Though usually begun with his adoption of a figure or an idea of some other master, his studies end in something quite Raphaelesque.

Raphael's development during the Florentine period can best be traced in his Madonnas, in which the influence of the various masters is most apparent. Though, like the Florentine, he portrays the simple relation of mother and child, his works are essentially original in the earnestness of form, the elimination of the accidental, and in the absolute harmony of all parts both in color and line. The first early example is the "Madonna del Gran Duca" (Pitti Palace), still Umbrian in the draperies and rather resembling Timoteo Viti than Perugino. The transition from fourteenth-century Umbrian to Raphael's own style is seen in the four delightful examples at Berlin, Vienna, Florence, and Paris, in which the Virgin is represented with the infants Christ and John in the midst of a beautiful landscape. All show the influence of Leonardo in sentiment and composition, and the last named, "La belle jardinière," is one of the most perfect of Raphael's creations. The last of Raphael's Madonnas executed at Florence, the "Madonna del Baldachino" (Pitti), a monumental altarpiece, shows his close association with Fra Bartolommeo. Similar in character with the Madonnas are his less numerous "Holy Families," at Madrid, Munich, and especially the one with the beardless Joseph at Saint Petersburg.

Raphael's most important commissions during his stay in Florence came from Umbria. In 1505 he executed for the convent and chapel of San Severo in Perugia the fresco the "Adoration of the Trinity," a well-balanced composition, re-

mindings somewhat of Bartolommeo's "Last Judgment." For Lady Atalanta Baglione of the ruling family of Perugia, he executed "Entombment of Christ" (Borghese Gallery, Rome), an altarpiece in memory of her murdered son. This is his most original composition of the Florentine period, and shows the influence of Michelangelo. Two apostles of Herculean strength bear to the tomb the body of Christ mild and beautiful in death, while Magdalen clasps his hand, and in the background the Virgin sinks into unconsciousness. To the same period belongs the beautiful three-quarter figure of "Saint Catharine" in the National Gallery, London. Of his portraits the chief are those of Angelo Doni and his wife (1505), the latter recalling Leonardo's "Gioconda," the "Donna Gravida"—all in the Pitti Palace—and Raphael's own youthful likeness in the Uffizi. All of these date from the early part of his Florentine period.

From a letter of Raphael's, dated April 21, 1508, we know that he was then still in Florence, but from another of September 5th, that he was at Rome in the service of the Pope. His fellow citizen of Urbino, the architect Bramante, induced Julius II. to call him thither. With his accustomed tact in making the best use of artists, the Pope commissioned him to fresco four chambers of the Vatican. They were small, irregularly built, and poorly lighted, but Raphael, aided by the advice and assistance of Bramante, transformed them into spacious halls, with far vistas and beautiful architectural effects. In this work the development of his art during the Roman period may best be traced. The first room which he decorated was the Camera della Segnatura (1509-11), so called from the Papal signatures written there. It is by far the best, because executed almost entirely by his own hand. The general plan of the decoration was to represent the four spiritual powers "Theology," "Philosophy," "Poetry," and "Justice," typified by beautiful female figures occupying medallions in the ceiling of the room. On one of the large walls, under "Theology," is the celebrated "Disputa," in two divisions. Grouped about an altar on the earth below, grave theologians and laymen are discussing the mystery of the Trinity. One of them points upward, where, in the hierarchy of the heavens, the mystery is revealed. While this work is still Florentine in character, the wall under "Philosophy," the "School of Athens," shows a more independent and classic art. The scene is laid in a beautiful architectural hall, in which all the philosophers and wise men of antiquity, grouped about Plato and Aristotle, are discussing the problem of life. Among the philosophers to the right Raphael has introduced his own portrait and that of Sodoma. Upon the irregular wall under "Justice" are three representations typifying civil and canon law. Under "Poetry," esteemed by many the most beautiful female figure which Raphael ever painted, is the celebrated "Parnassus." Surrounded by the Muses, Apollo sits on a mountain which is so painted as not to be disturbed by an intervening window, and in the spaces on either side are the great poets of Greece, Rome, and Italy.

The second chamber, the Stanza d'Eliodoro (1512-14), represents the triumph of the Church over its temporal foes and over false doctrine.

The medallions and the beautiful decorations of the ceiling are after Raphael's designs, but the wall paintings were executed, at least in part, by himself. The conception is somewhat disturbed by the introduction of Papal portraits into three of the frescoes, but granting this necessity, the composition could not have been better done. The "Expulsion of Heliodorus from the Temple," a painting of mighty dramatic power, symbolizes the expulsion of Charles VIII. of France from Italy. "Attila and Leo the Great" is a remarkable composition, designed almost entirely of horsemen. The "Miracle of Bolsena" shows how the host was changed into blood under the eyes of an unbelieving priest, and over the other window "Peter's Release from Prison" is remarkable for its portrayal of the gloom of the night, under the triple illumination of the moon, torches, and the apparition of the angel. The paintings of this room, particularly the one last mentioned, are Raphael's most remarkable coloristic production, and show the influence of the Venetian Sebastiano del Piombo, who was at that time in Rome. They also show, in the splendid dramatic action, a further influence of Michelangelo, probably derived from frescoes in the Sistine Chapel. This is still more evident in the fresco of "Isaiah" (1512; San Agostino), and in those of the "Sibyls" (1514, Santa Maria della Pace), in which Raphael enters the list as a rival of Michelangelo. A third important influence upon Raphael's art was that of the classic monuments of Rome; but he harmonized all of these factors into an individual art of his own.

Before the death of Julius II. in 1513, Raphael assumed an important position at the Papal Court, and under Leo. X. his influence increased. Upon the death of Bramante, in 1514, he was made chief architect of St. Peter's, at his dying predecessor's request, and in 1515 he was appointed conservator of all the excavations of antiquities in and near Rome. The greatest statesmen and humanists of the day sought his friendship, and kings requested, as an especial favor, a work of his hand. He attended court with a following of fifty painters, and lived like a prince. Under such circumstances it was impossible for him to execute the remaining decorations of the Vatican with his own hand. He was compelled to intrust them and the execution of his architectural and other designs to his numerous pupils. His compositions became grander than ever, even though the execution suffered. The celebrated engraver Marcantonio Raimondi (q.v.) was entirely occupied in carrying out his designs for prints.

The third chamber of the Vatican, the Stanza del Incendio (1514-17), is decorated with historical scenes from the lives of Leo III. and Leo IV., the best of which, the "Incendio del Borgo," after which the room is named, represents Leo IV. miraculously extinguishing a fire at Rome. It is a wonderful piece of dramatic realism. Of the fourth chamber, the Sala Constantina, the designs only were furnished by Raphael, and of these only two were used, the principal of which, the "Victory of Constantine Over Maxentius," was executed by Giulio Romano. Near by are the decorations of the Loggie of the Vatican, which, of all his works, show the highest influence of the antique. The adornment is mainly of grotesques, copied after the Roman models lately

discovered in the Baths of Titus, and on the ceiling is the so-called Raphael's Bible, fifty-two pictures of biblical subjects executed by Giulio Romano.

But the most powerful decorative work of Raphael's later life is the ten delicately colored cartoons for the tapestries which hung upon the walls of the Sistine Chapel. The original tapestries are still in the Vatican, and there are copies at Berlin, Dresden, and Madrid, but only seven of the cartoons survive—all of them showing wonderful technique and power. The two best are the "Miraculous Draught of Fishes" and "Peter and Paul Preaching." For his friend Agostino Chigi he also designed the architecture and decorations of the Chigi Chapel in Santa Maria del Popolo, and the beautiful decorations of the Villa Farnesina. Of these, the fresco "Galatea" (1514) is perhaps the most perfect of all modern mythological pictures. In it the antique lives again, executed, however, with the more naturalistic technique of the sixteenth century. Raphael's talent as a narrator was never more perfectly exhibited than in the Farnesina with his story of "Cupid and Psyche" (1518-20), which, though executed by his pupils, contains some of the best modern versions of antique mythology. Especially beautiful is the fresco of "Jupiter Kissing Cupid," in which the majesty of old age and the beauty of youth are charmingly contrasted.

Along with these greater undertakings Raphael executed numerous easel pictures. His portraits are admirable realistic productions with a strong and unaffected conception of character, belonging, indeed, to the greatest portraiture that has ever been produced. Among the principal examples, besides those wonderful likenesses in his frescoes, is that of "Julius II.," surviving in a number of examples, of which the original is probably in the Pitti Palace. The old man is represented as seated in an arm-chair, engaged in deep meditation. Other celebrated specimens are the portraits of Leo X. (1518) with two cardinals, a splendid piece of realism; of Cardinal Bibbiena, of which the original is at Madrid, and a good replica in the Pitti Palace; of Tommaso Ingherami at Volterra; of Baldassare Castiglione and Joanna of Aragon, in the Louvre; and the beautiful "Donna Velata," the prototype of the Sistine Madonna, in Pitti Palace. The celebrated "Fornarina," formerly supposed to be a portrait of Raphael's beloved, is now attributed to Sebastiano del Piombo (q.v.).

Among his religious pictures, the greater number were Madonnas, most of them executed by his pupils. (For an enumeration and description, see MADONNA.) The best example of his early Roman period is the "Madonna della Sedia" or "Seggiola" (Pitti Palace), so called from the chair upon which she is seated. The Virgin is represented as a beautiful Italian woman in picturesque Roman folk costume. The expression of sublime maternal love in this picture has never been excelled. The last and grandest of all of his Madonnas, the consummation and perfection of all such efforts, is the "Sistine Madonna" (Dresden Gallery). Painted as an altarpiece for the Church of San Sisto at Piacenza, it was finished just before Raphael's death. The Virgin is not represented as a mother, but as the all-powerful Queen of Heaven descending from the

RAPHAEL

"SISTINE MADONNA," FROM THE PAINTING IN THE ROYAL GALLERY, DRESDEN

clouds, which are themselves composed of the heads of thousands of cherubs. The Christ-child looks with thoughtful eyes, as if conscious of his destiny as a Saviour of the world, while on either side Saint Sixtus and Saint Catherine kneel in adoration. At the base of the picture are the two celebrated cherubs.

His other religious pictures typify the waking religious consciousness of Italy in reply to the Reformation of the North: "Lo Spasimo di Sicilia" (Christ sinking beneath the Cross) (Madrid); "The Vision of Ezekiel" (Pitti Palace), minute in execution and beautiful in color; the celebrated "Saint Cecilia" (1515, Bologna), surrounded by four saints, listening with varied expressions of ecstasy to the heavenly chords; "Saint Michel Crushing Satan" (1518, Louvre); and "The Transfiguration" (Vatican), left unfinished at Raphael's death, and completed by Giulio Romano.

As an architect Raphael was not of the same importance as a painter. He was a disciple of Bramante, whose plan of Saint Peter's he continued, though he also had one of his own. (See SAINT PETER'S CHURCH.) The Farnesina is usually ascribed to Perruzzi, and of his other palaces the Palazzo Pandolfini at Florence is the only one carried out in accordance with his plans. His chief work, the Villa Madama, built about 1516 for Cardinal Giulio de' Medici, displays forms of simple majesty. As a sculptor he is reputed to have carved the "Boy Astride of a Dolphin" (Saint Petersburg), but the attribution is doubtful. He also tried his hand at poetry, but his few sonnets are amateur in character.

Raphael died on Good Friday (April 6), 1520, at the age of thirty-seven, as a result of a fever contracted during the excavations in Rome. All Rome mourned over his loss, and he was interred with great honor in the Pantheon. His character, like his art, was a perfect harmony of the elements which go to make life beautiful, and his contemporaries valued the one as highly as the other.

The opinion of Raphael's contemporaries, that his work was the highest perfection of pictorial art, has met with dissent among certain modern artists and critics, who find him lacking in this or that technical quality. But while he did not attain the very highest in all technical qualities, perhaps no other man possessed in such a high degree so many qualities which go to make up the perfect artist. His work embodies the best of all the Middle Italian schools, and it is, in this sense, the culmination of Italian painting. To whatever he adopted he added a harmony and grace, distinctly his own, attaining the nearest to the universal of any artist since the Greeks. And in one purely technical quality Raphael has never been surpassed by any artist. In his small pictures as well as in his great frescoes, in arrangement as well as in the treatment of space, his composition is faultless.

The chief cause of Raphael's great popularity with the general public is that he was what Berenson calls 'a lovable illustrator.' With an imagination that has never been surpassed, he has, better than any other one, embodied our conception of antiquity, translating it into forms surpassing our fairest dreams. He has Hellenized the Hebraic universe, creating, in place of the stern personages of the Old and New Testament,

those beautiful, ideal types which will last as long as art lasts. In his Madonnas and ideal figures he has created the types of womanhood which "embody for the great number of cultivated men their ideals and spiritual aspirations."

BIBLIOGRAPHY. The chief original source of information remains the biography of Vasari (ed. Milanesi, Florence, 1878; English translation by Blashfield and Hopkins, New York, 1896). The biographies of the eighteenth and early nineteenth centuries are antiquated, except those of Rumohr (Berlin, 1831), and Passavant (Leipzig, 1839; Eng. trans., London, 1872), which contains a valuable catalogue of Raphael's works. The numerous volumes of Gruyer (Paris, 1864, et seq.) are full of copious information. Other biographies are those of Wolzogen (Leipzig, 1865; Eng. trans., London, 1866); Förster (Leipzig, 1867); Grimm (ib., 1872; Eng. ed., Boston, 1888); Perkins (ib., 1878); Lübke (Dresden, 1882); Minghetti (Bologna, 1885); Riepenhausen and Dohme (Berlin, 1888); Clément (Paris, n. d.); Lützwow (Vienna, 1891); Cartwright (London, 1895); Knackfuss (Leipzig, 1895); and Strachey (London, 1900). The most important modern works are those of Anton Springer (Leipzig, 1878), a scientific, appreciative, and impartial production; Eugène Müntz (Paris, 1881), remarkable for its illustrations; Crowe and Cavalcaselle (London 1882), erudite and careful. The best technical criticisms on Raphael's early period, and, indeed, on many of his later works, are those of Morelli, in his *Italian Masters* (London, 1892-93), who has almost revolutionized current opinion. For his early period consult also monographs of Seidlitz (Munich, 1891) and Gronau (Berlin, 1902); for a good characterization and list of Raphael's works, Berenson, *Central Italian Painters* (New York, 1897). For his architectural works, consult: Pontani (Rome, 1845); Geymüller (Milan, 1883); and Hofmann and Bloch (Dresden, 1900). For his drawings, see the studies of Koopmann (Marburg, 1895-97) and Fischell (Strassburg, 1898).

RAPHANIA. Another name for Ergotism (q.v.).

RAPHELENGH, rá'fá-lěng', or **RAPHE-LING,** FRANCIS (1539-97). A Flemish scholar and printer, born at Lannoy, in French Flanders. He studied classical and Oriental languages in Paris, and afterwards taught Greek at Cambridge. Upon his return to the Netherlands in 1565, he entered the printing office of Christopher Plantin, in Antwerp, where he did valuable editorial work, and supplied original matter for books, in the form of notes and prefaces. He also worked on the Polyglot Bible, printed at Antwerp in 1571, by order of Philip II. of Spain. Afterwards he was appointed professor of Hebrew and Arabic at the University of Leyden. He published a Hebrew grammar and Chaldee and Arabic dictionaries.

RAPHIDES, rá'f-t-děz (Neo-Lat. nom. pl., from Gk. *ῥαῖς*, *rhap̄is*, needle, pin, from *ῥάπτειν*, *rhap̄tein*, to sew). Elongated, needle-shaped parallel crystals of calcium oxalate occurring in plants. It has been claimed that they protect plants against herbivorous animals, but investigation shows that injuries follow the eating of plants containing them. Raphis-bearing cells are found in great quantities in the parenchyma of mon-

ocotyledons, such as *Amaryllis*, *Crinum*, *Narcissus*, and *Hyacinthus*.

RAPIDAN. A small river of Virginia, tributary of the Rappahannock (q.v.), which it joins 10 miles above Fredericksburg.

RAPID-FIRE GUNS. Cannon for firing at moving objects and for delivering a heavy fire at critical periods of an engagement. The desired rapidity of fire is obtained by using fixed ammunition; that is, ammunition in which the projectile and charge are put up in one piece. After the limit of size for machine-gun action had been reached the advantages of rapid fire to guns of calibres large enough to be effective against torpedo boats was appreciated, and 3-pounders, and then 6-pounders were made by Hotchkiss and Nordenfelft, with one barrel and worked by hand, but with quick-opening mechanism and fixed ammunition. This movement progressed and developed to a remarkable extent between 1890 and 1900, heavier and heavier guns being required as torpedo boats increased in size and protection to their boilers (by coal, etc.)—the limit being the weight of charge conveniently handled as one piece, about 5 inches calibre.

The development of rapid-fire guns may be said to date from toward the end of the year 1881, when the British Admiralty advertised for designs of a gun that should fulfill the following requirements, viz: The weight of the gun and mount not to exceed ten hundredweight (1120 pounds); the projectile to weigh 6 pounds and have a muzzle velocity of not less than 1800 feet per second; the projectile and powder to be made up in one cartridge; the service of the gun to require not more than three men; under the above-mentioned conditions, the gun to be capable

Breech Mechanism—vertical section. A, groove in which crank stud works as the block moves up and down when the crank is turned; B, hammer; C, lug which transmits pressure of main spring to hammer; D, stop bolt (on left side of gun—keeps block from falling out); E, guide slot in which works lug (P) on extractor; F, bore of gun; G, main spring; H, guide-bolt slot; J, crank; K, crank handle; L, pivot of sear; M, sear; N, extractor; O, extractor slot in left face of the housing of the breech; P, extractor lug which travels in slot E; Q, stop bolt; R, rocking shaft on which is the cocking toe; S, breech block; T, face plate; U, mainspring case; V, sear spring; W, cocking cam.

HOTCHKISS 6-POUNDER WITH DECK MOUNT.

of firing at least twelve aimed shots per minute. About the same time the French Department of Marine invited designs for a 3-pounder to fulfill relatively the same conditions. These two advertisements resulted in the production of the rapid-fire gun. Mr. Hotchkiss, an American who had established works in France, brought out a series of guns, 1, 3, and 6 pounders, and it is perhaps interesting to learn that the first order placed with him was from the United States Navy Department. Mr. Nordenfeldt brought out similar guns in England. The 3-pounder and 6-pounder rapid-fire guns advertised for by France and Great Britain were intended for use against torpedo boats, and it was considered that the calibres selected were amply large. Later experience has modified this view, but it must be remembered that the torpedo boats of 1881 were small, slow, and weak. Rapid-firing guns soon began to increase in size. In a short time the calibre of 6 inches was reached, but the fixed ammunition was found to be unwieldy and easily sprung out of shape. The next step was the separation of the projectile and powder in the larger guns, but retaining the brass case for inclosing the powder charge. The speed of fire in these guns was not reduced by the change, as the separate parts of the ammunition were more easily and rapidly handled.

tion at the same time. The system was almost immediately adopted for use in the new guns of the United States Navy, and it bids fair to be universally accepted for guns of 5-inch calibre and over.

In 1897 Messrs. Vickers Sons & Company brought out a new type in which no powder case

VICKERS-MAXIM BREECH MECHANISM.—HORIZONTAL SECTION.

The increased speed of fire in the intermediate calibres naturally led to a general improvement in the loading mechanism of all guns, and it is now safe to say that the rate of fire of large guns has been doubled in the past four or five years and gains are constantly being made. Krupp brought out what he called a *rapid-fire* 24-centimeter (9.45-inch) gun four or five years ago and in 1900 a 'rapid-fire' 28-centimeter piece, but they are not faster working than the new pieces of like calibre in the United States, British, and

1, Breech-plug; 5, carrier arm which supports the breech-plug; 9, long arm of toggle-joint lever for rotating the plug; 10, pin connecting toggle-joint lever to breech-plug; 11, pivot of toggle-joint; 12, short arm of toggle-joint lever; 13, pivot of short arm; 14, intermediate pulion with circumferential teeth set at angle of 45 and which gear into similar teeth on round end of short arm; 15, verticle pivot of 5, 12, and 14; 16, operating lever; 17, stop on intermediate pulion which prevents its turning independent of the carrier arm after the breech-plug is adequately rotated; 18, projection on carrier arm which presses against 19 and forces the loading tray into position; 19, stop on loading tray which takes against 18 and causes tray to rise; 20, firing mechanism; 21, loading tray.

VICKERS-MAXIM BREECH MECHANISM FOR 6-INCH BREECH-LOADING RIFLE.—VERTICAL SECTION.

is used. The breech mechanism is of the rapid-working type and the obturation (i.e. the prevention of escape gas to the rear) is effected by means of a modified form of the De Bange gas check. (See GUNS, NAVAL). The primer is ejected automatically when the breech is opened and a loading tray is automatically drawn up in posi-

tion. Krupp's nomenclature was so obviously misleading that many officers are now avoiding the use of the expression *rapid-fire*.

In the United States Navy the terms *rapid-fire gun* and *quick-fire gun* are now officially defined as follows: (a) "A *rapid-fire gun* is one that has a quick-working system of breech closure

operated by a single throw of a lever or crank; uses either fixed or separate ammunition, but, when using the latter, requires the powder charge to be put up in a metallic cartridge case." (b) "A quick-fire gun is one that has a quick-working system of breech closure, operated by a single throw of a lever or crank, is fitted with an automatic lock, and uses separate ammunition with

mechanisms; Austria uses Skoda and Krupp mechanisms; the Nordenfeldt (except the Maxim-Nordenfeldt) is not much used in any naval service, and the Bofors is found chiefly in the

FLETCHER RAPID-FIRE BREECH MECHANISM.—HORIZONTAL SECTION.

1, Breech plug; 2, rotating rack to revolve plug; 4, hinge plate; 6, carrier ring supporting plug; 7, hinge bolt; 9, operating lever; 10, operating lever handle; 11, operating lever worm to revolve plug; 12, operating lever teeth to retract plug; 13, extractor; 14, extractor pivot; 15 and 8, spring locks to hold pins in place; 16, automatic locking bolt to hold plug in place; 17, pivot of locking bolt; 18, locking lever operating locking bolt; 19, pivot of locking lever; 20, locking lever spring; 22, locking bolt recess; 23, steel case inclosing firing-pin; 24, electric firing-pin (insulated—note heavy black lines); 25, electric firing-pin springs for insuring contact; 29 to 34, electric attachment lug for attaching wire from battery or dynamo.

the powder charge put up in a cartridge bag." These definitions are purely arbitrary, are used only in the United States Navy, and were decided upon solely as a matter of convenience. There was no hesitation in adopting the terms, as the nomenclature of rapid-firing weapons was in so chaotic a state that any authoritative change was an improvement. The terms rapid-fire in the United States and quick-fire in England had hitherto been synonymous.

The best-known and most widely used systems of rapid-firing breech mechanism are the Fletcher,

navies of Norway, Sweden, and Denmark. The best speed of firing of guns of different calibres is about as follows: 13.5-inch, 2 minutes; 13-inch, 2 minutes; 12-inch, 1 minute and 30 seconds; 11-inch, 1 minute; 10-inch, 1 minute; 9.2-inch, 25 seconds; 8.3-inch, 20 seconds; 8-inch, 10 sec-

DRIGGS-SCHROEDER RAPID-FIRE GUN, LATEST MODEL, AMERICAN ORDNANCE COMPANY TYPE.

A, breech block; B, bore of gun; C, housing of breech; D, main shaft; E, operating cam; F, sear; G, sear spring; H, firing-pin; J, mainspring.

Dashiell, Hotchkiss, Driggs-Schroeder, Vickers-Maxim, Canet, Armstrong, Krupp, Skoda, Nordenfeldt, and Bofors. The first five kinds are used in the United States Navy; in England the Vickers-Maxim and Armstrong are chiefly used; in France the Canet and modifications of it and of other types are used; in Germany the guns are of Krupp model; in Russia various types have been used, but nearly all new guns have Canet

onds; 6-inch, 7 seconds; 5.5-inch, 7 seconds; 5-inch, 5 seconds; 4-inch, 4 seconds; 3-inch, 3.5 seconds; 2.24-inch (6-pounder), 3 seconds; 1.8-inch (3-pounder), in automatic 3-pounder, 1 second; 1.4-inch (1-pounder), in Maxim 1-pounder automatic gun, about 200 rounds per

minute. In the larger calibres the speed depends chiefly upon the mechanism of the mount and drill of the crew; in the smaller pieces, the speed depends chiefly upon the drill alone.

The rapid firing of modern guns has had a most marked effect upon battle tactics (see TACTICS, NAVAL) and design of ships. So far as the effect upon the former is concerned, naval critics are not fully in agreement, but in regard to the latter there is more unanimity of opinion. Battleships and armored cruisers are now thinly armor-plated over a very large portion of their sides, the plating being of sufficient thickness to keep out all shells from very rapid-working guns except those of the larger sizes at close range. Were it not for this armor the sides of battleships and the interior arrangements above water would soon be wrecked by the vast number of small projectiles which the numerous guns of a modern ship can deliver in a short space of time. The effect of this armor is to separate more widely the armored from the unarmored vessels and to render many old battleships unfit for modern fighting; but it likewise tends to decrease the differences between battleships and armored cruisers.

Notwithstanding the destruction effected by the rapid-firing guns of small calibre, the damage they inflict is rarely vital and decisive blows can only be delivered by large shells. In the naval battle of Santiago the smaller guns caused much destruction of life, but the damage to the Spanish ships, which caused three of them to surrender in about an hour after the first one was sighted coming out of the harbor, was caused by 8-inch and 12-inch guns. These wrecked the interior in a manner which was beyond the power of small pieces; two 12-inch shells destroyed the interior arrangements in the after end of the *Infanta Maria Teresa*, cut the fire-mains, and set the ship on fire so that access to the after magazines and shell-rooms was cut off; 8-inch shell cut the fire-mains and set fire to the *Oquendo* and *Viscaya*, and one exploded in the forward turret of the former, killing or wounding every soul in it and destroying the machinery for operating the forward 11-inch gun. A heavy shell (12-inch or 13-inch shell) burst in the after part of the *Oquendo*, causing enormous damage, and another struck the armor of the *Viscaya* at the waterline and, while it did not penetrate, the blow upon the plate crushed the frames and caused a leak which drove the people from the port engine-room and rapidly reduced the ship's speed. The destruction of life was greatest on the *Oquendo* and was chiefly due to the rapid-firing guns, which pierced the unarmored parts of her side as if they were of paper. On the *Cristobal Colon*, though she was struck by many small projectiles, the damage was trifling because her side was almost completely armored. She was brought to surrender by the heavy guns of the *Oregon*, which had just got her range and was rapidly overhauling her when she gave up and ran ashore.

The accuracy of rapid-firing guns as compared with larger pieces has been over-estimated. At long ranges they are less accurate, as the path of a small projectile is more curved than that of a large one having the same muzzle velocity; at short ranges small guns should be more accurate than large ones, as they are more readily handled.

RAPIN DE THOYRAS, rá'pán' de twá'rá', PAUL DE (1661-1750). A French historian, born at Castres, Languedoc. He was educated at the Protestant College of Saumur, and became an advocate in 1679, but the revocation of the Edict of Nantes (1685) forced him to leave France and he sought employment in England and afterwards in Holland. In 1693 he was appointed tutor to the Earl of Portland's son, with whom he traveled in Holland, Germany, and Italy, after which he took up his residence at The Hague, but in 1707 withdrew to Wesel, in the Duchy of Cleves, where he devoted the remaining years of his life to the composition of his History of England. This *Histoire d'Angleterre* was published at The Hague in eight volumes, the year before the author's death. It was translated into English by Nicholas Tindal (15 vols., London, 1725-31), and later translations and editions have also appeared.

RAPP, GEORGE (1770-1847). The founder of the religious society of Harmonists (q.v.). He was born at Iptingen, in Württemberg, Germany, and when he grew to manhood developed certain peculiar religious ideas. Having become desirous of organizing a religious community in accordance with these ideas, he gathered a number of followers; and, being persecuted in Germany, he in 1803 emigrated to the United States. In the following year he founded in Butler County, Pa., a community in which all things were held in common and where both sexes practiced celibacy. In 1815 the society removed to the banks of the Wabash in Posey County, Ind., and there founded a new settlement which they called New Harmony (q.v.). Nine years later, however, they sold out their rights to the reformer Robert Owen (q.v.), and returned to Pennsylvania, where they built the village of Economy. Of these communities Rapp was both spiritual and temporal head.

RAPP, ráp, JEAN, Count (1772-1821). A French general, born at Kolmar, Alsace. He entered the army in 1788. In 1795 he was only a lieutenant, but having become aide-de-camp to Desaix, he distinguished himself by his gallantry in Egypt, and on the death of his chief at Marengo he became aide-de-camp to Napoleon, and soon rose to be brigadier-general. His brilliant charge at Austerlitz, which put to rout the Russian Imperial Guard, was rewarded with the grade of general of division. For his services in the battle of Aspern (q.v.) he was named a count of the Empire (Aug. 1, 1809). Though opposed to the Russian expedition of 1812, he accompanied the Emperor throughout the whole of it, adding, on many occasions, to his military reputation. His defense of Danzig for nearly a year against a powerful Russian army added to his fame. The Russians, contrary to the articles of

capitulation, sent Rapp and his garrison prisoners to Russia, and he was not able to return to France till July, 1814. On reaching Paris he was well received by Louis XVIII., and in March, 1815, was one of those sent to oppose the return of Napoleon, but deserted with his troops and was appointed by Napoleon commander-in-chief of the Army of the Rhine and peer of France. In 1818 Rapp was reinstated by Louis XVIII. in the army. He left *Mémoires* (Paris, 1823). Consult Spaeh, *Le général Rapp* (Colmar, 1856).

RAP PAHAN'NOCK. A river of Virginia. It is formed by several headstreams in the Blue Ridge, flows southeastward, and enters Chesapeake Bay by a broad and long estuary running parallel with that of the Potomac and about 20 miles south of it (Map: Virginia, II 4). Its length is 250 miles. At Fredericksburg there is a fall supplying good water-power, and below that point the river is a fine, navigable tidal stream for nearly 100 miles. Its chief tributary is the Rapidan.

RAPPERSWYL, räp'ärs-vël. A town in the Canton of St. Gall, Switzerland, 22 miles southeast of Zurich, on Lake Zurich (Map: Switzerland, C 1). In the old Hapsburg Castle is the Polish National Museum containing a collection of antiquities, sculptures, and paintings. The Parish Church, the town hall, and the viaduct connecting Rapperswyl with Hurden and Pfäffikon are also of interest. Rapperswyl dates from the twelfth century. Population, 1900, 3412.

RAPPOLDI, räp-pöl'dë, EDUARD (1839—). A German violinist, born in Vienna. He studied under Jansa and Böhm, played in the Court Opera of Vienna (1854-61), then was conductor for five years of German opera at Rotterdam, and, after several years in Lubeck, Stettin, and Prague, and six years at the Berlin Royal School of Music as an instructor and a member of Joachim's quartet, in 1877 went to Dresden, where he became professor in the Conservatory and concert master at the Opera. Rappoldi wrote two sonatas for the violin and one for the piano as well as some song music. His wife, LAURA KAHRER (1853—), a teacher of piano in the Dresden Conservatory, studied in Vienna and subsequently with Liszt and Bülow.

RARITAN. A river of New Jersey. It is formed by two branches in the highlands in the northern part of the State, and flows eastward into Raritan Bay, an inlet of Lower New York Bay (Map: New Jersey, D 2). It is 75 miles long and navigable to the 'fall line' near New Brunswick.

RAROTONGA, rä'rô-tông'ä. The largest of the Cook Islands (q.v.), in the Pacific Ocean.

RASCAL LEAF-CRUMPLER. The larva of a phycitid moth (*Mincola indiginella*), which makes irregular crumpled cases on the apple leaves upon which it feeds. It works most extensively during May and June, when it is hidden by the foliage of the tree, which it helps eventually to denude. The larval cases are plainly seen in the winter time attached in clusters to the twigs by means of strong silken threads, and in these cases the larvæ pass the winter about one-third grown. In the spring, when the leaves first begin to bud out, the larvæ begin to feed, and reach full growth in June. The pupa is formed within the larval cases, and the moth

emerges in July, laying its eggs a little later. It feeds upon the apple and cherry, both wild and cultivated; upon the plum, quince, and crab-apple, and to a lesser extent upon the peach. The best remedy consists in collecting and destroying in winter the plainly visible larval cases.

RASCHDORFF, räsh'dörf, JULIUS (1823—). A German architect, born at Pless, Silesia, and educated at the Academy of Architecture in Berlin. In 1853 he became city architect at Cologne, where, besides restoring the Rathaus and several churches, he reconstructed the Gürzenich (1855-57), built the Stadt-Theater (1872), and with Felten the Municipal (Wallraf-Richartz) Museum (1855-61). Of several public structures in various other cities the House of the Rhenish Estates (1879) at Düsseldorf, in the style of the Italian Renaissance, is the most noteworthy. Appointed professor at the Academy in Berlin in 1878, he built the Technical Academy at Charlottenburg (with Hitzig, completed 1884), the English Church in Monbijou Park (1885), the Mausoleum of Frederick III. (1894), at Potsdam, and was associated with his son, Otto, in the erection, from his designs, of the new cathedral (1894-1902). Of his publications the following are the most important: *Entwürfe und Bauausführungen im Stile deutscher Renaissance* (1879); *Baukunst der Renaissance* (1880-90); *Palastarchitektur von Oberitalien und Toscana* (1883-96); and *Rheinische Holz- und Fachwerkbauten des 16. und 17. Jahrhunderts* (1895). His son, OTTO (1854—), born at Rheine, Westphalia, pupil of the Bauakademie in Berlin (1872-75), was appointed Government architect in 1882, professor at the Technical Academy in 1891, and collaborated mostly with his father, especially in the new Berlin cathedral.

RASH (OF. *rasche, rasque*, Fr. *rache*, Prov. *rasca*, rash, seurf, itch, from Prov., Sp., Port. *rasear*, to scrape, from Lat. *radere*, to scrape, shave). The common name of the exanthem of an affection of the skin, such as the eruption in nettlerash or urticaria, measles, scarlatina, erysipelas, and erythema (q.v.).

RASH'DALL, HASTINGS (1858—). An English historian and divine. He was educated at Harrow and at New College, Oxford, was ordained in 1884, was tutor at the University of Durham until 1888, when he was appointed fellow and lecturer of Hertford College, Oxford, and in 1895 received a like post at New College. He was select preacher at Oxford (1895-97), and preacher at Lincoln's Inn (1898 sqq.). His reputation as an historian is largely due to his *Life of Wielclif* in the *Dictionary of National Biography* (1900), and to his *Universities of Europe in the Middle Ages* (1895). He published, besides, *Doctrine and Development* (1889, a volume of sermons) and, with Rait, *New College*, a history (1901).

RASHER, or **RASCIERA** (perhaps from Sp. *rascaico*, sort of fish). One of the Californian rockfish (*Sebastes miniatus*) peculiar in its deep vermilion color, mottled with yellowish pink and speckled on the back and sides with clusters of black dots, so that the whole body has a dusky shade. It comes about two feet in length, and is a common market fish. See ROCKFISH.

RASHI, rä'shé (Rabbi *Shelômôh Yishâkî*, or Solomon ben Isaac, often erroneously called

Yarchi (1040-1105). A great Jewish commentator and exegete. He was born in Troyes, France, July 13, 1040. He began his studies under his father and continued them at Worms, at Mainz, and at Speyer under distinguished Jewish scholars. Returning to Troyes, he established a school for the study of the Bible and Rabbinic literature, and his fame drew scholars from far and wide, while many who could not consult him personally sought his opinion by letter. Rashi's reputation is greatest as a commentator. His Bible commentary is complete except from Job xl. 21 to the end of Chronicles. It was the first Hebrew book printed (1474), and is still generally included in good editions of the Bible for Jews. It has been translated into Latin by Breithaupt (Gotha, 1710-14). The renderings are generally the traditional ones and Midrashic authorities are followed, but simple literal explanations are also given, and the style is concise and full of meaning. Rashi also wrote a few liturgical poems of little value, and a famous commentary to 23 treatises of the Talmud, which was supplemented by his grandson, Rabbi Samuel ben Meir (Rashbam). This always accompanies editions of the Talmud. Consult: Zunz, in *Zeitschrift für die Wissenschaft des Judenthums* (Berlin, 1822); Graetz, *History of the Jews* (Eng. trans., Philadelphia, 1873).

RASK, räsk, RASMUS KRISTIAN (1787-1832). A Danish philologist. He was born at Brendekilde, near Odense, in the island of Fünen; studied at Copenhagen, and in 1808 published his first work, an introduction to the Icelandic language. In 1813 he went to Iceland, where he lived for two or three years, perfecting his knowledge of the language and history of the inhabitants. On his return to Copenhagen he was appointed sub-librarian to the university, and in 1818 published his researches on Iceland, which led Grimm to his discovery of the sound-shifting in the Germanic languages. (See GRIMM'S LAW.) After spending a year in Stockholm, where he published his Anglo-Saxon Grammar and the first critical and complete edition of the *Snorra Edda* and the *Edda Sæmundar*, he went to Saint Petersburg, where for two years he studied Sanskrit, Persian, Arabic, Russian, and Finnish. He then went to Astrakhan, where he studied the languages of the Tatars, and then began a journey through the country of the Turkomans, the Caucasus, Persia, Hindustan, and finally Ceylon, where he wrote his *Singalesisk Skrifflære* (1822). In 1823 Rask returned to Copenhagen; in 1825 he was appointed professor of literary history, and in 1828 of Oriental languages. In the following year he was made chief custodian of the university library; and in 1831, professor of Icelandic. But his immense labors had exhausted his energies, and he died at the early age of 45. Besides the productions already mentioned, Rask wrote *Frisisk Sproglaere* (1825); *Den gamle Aegyptiske Tidsregning* (1827); *Den ældste Hebraiske Tidsregning* (1828); besides grammars of several languages, and a great number of miscellaneous articles which were collected after his death, and published (1834-38), together with a *Life* by Peterson.

RASKOLNIKI, räs-kól'nä-kä, or **RASKOLNIKS** (Russ., schismatics). The generic name applied to all those of the Greek faith who dissent from the established Church in Russia. The

name used by the Raskolniki themselves is *Starobryadtsy* (old ritualists) or *Starovercysy* (old believers). The immediate occasion of schism was the correction of the old ecclesiastical books. In the first quarter of the sixteenth century Maksim, the Greek, began to revise them, but made some errors and was accused of heresy and imprisoned. The 'Hundred Chaptered Council' of 1550 undertook a correction by collating current translations, and not by comparing them with the Greek originals, and still more errors crept in and more dissatisfaction was occasioned. In the middle of the seventeenth century the Patriarch Nikon (q.v.) undertook a new revision. His predecessor, Joseph, had also corrected ecclesiastical books, and issued over 6000 copies, all containing the grossest mistakes. Nikon's opponents—and he had many, owing to his domineering spirit—now made the old revision a point of issue in their controversy with the patriarch. Prominent among them were the popes (priests) Lazar and Nikita, the deacon Fyodor, and especially the protopope Avvakum, a man uncommonly well-read, and a forceful speaker. The ecclesiastical council convened on December 11-22, 1667, approved the decisions of the previous councils with regard to religious matters and books, and anathematized those disagreeing with the council. The latter were now officially called Raskolniki, and from this time dates the rise of the *raskol*. Most of the dissenters were banished to remote monasteries, like that at Solofki on the White Sea. The Raskolniki kept up their objectionable propaganda from their places of confinement, and after a seven years' siege the monastery at Solofki was taken in 1676, the rebellious monastics were punished without quarter, and in 1681 Avvakum was executed. The anti-governmental spirit moved the Raskolniki to take a prominent part in the insurrections of the Streltsy (q.v.), and the Regent, Sofia, executed many of them in 1684.

About 1685 there came a split in the ranks of the Raskolniki. One faction considered priests a useless institution; these were called *bezpoportsy* (priestless). The other half argued that they were the champions of the old faith against the encroachments of Antichrist, and therefore priests were necessary for the struggle; these were the *poportsy* (priest party). Nikon had been declared the Antichrist, as the correction of books in 1666 (= 1000 + 666), according to apocalyptic calculations, coincided with the expected appearance of the Antichrist and the end of the world was due three years later, a date afterwards changed to 1702. After 1702, the Raskolniki turned to the internal arrangement of their Church, and then the division into the two factions mentioned above was consummated. Looking upon the Czar as Antichrist, they considered it a crime to pray for him, and everything anti-Czarist enlisted their sympathy. They were very active in the Pugatcheff rebellion in the latter half of the eighteenth century. A curious feature of the movement is the frequent occurrence of suicide among the Raskolniki. The doctrine took its rise in Avvakum's preaching of scorn for death and laudations of martyrdom. In the District of Poshekhone (Government of Yaroslav) as many as 1920 persons burned themselves during 1676-93, and in all about 20,000 people destroyed themselves up to 1690. As late as 1860 fifteen persons burned themselves in

the Olonets Government, and in 1897 a number died immured in a cellar.

The Government dealt severely with the Raskolniki from the outset, the law of April 17, 1685, prescribing death, almost without exception, to those persevering in the schism or assisting its adherents. In 1716 they were permitted to settle in cities on the payment of a double tax, but were not permitted to appear as witnesses against orthodox persons. The successors of Peter I. increased the severity of the enactments against them. In 1752 labels were required on their dress as a distinguishing mark. In 1768 and 1778 ukases forbade the building of churches and chapels and the use of bells. From 1769 on they could again appear as witnesses in court, the double tax was removed in 1782, and the following year the name Raskolniki was discontinued in official documents. Under Paul I. (1796-1801) their lot grew worse, and under Alexander I., in 1803, the word Raskolniki reappears in State papers. They are officially subdivided into three classes: I. Most obnoxious: (1) the Judaizers; (2) the Molokani (q.v.), who recognize no authority and object to taking oaths; (3) Dukhobortsy (q.v.), a variety of the preceding; (4) the Khlystovtsy, who introduce anthropolatry; (5) the Skoptsy (q.v.), enemies of society, and blasphemous as deriving their sect from Christ; (6) those Bezpopovtsy who oppose marriage and praying for the Czar. II. Obnoxious: the Bezpopovtsy who recognize marriage and pray for the Czar; these are harmful as being against priests and the Eucharist, and also on account of their democratic teachings. III. Least obnoxious: the Popovtsy, rather schismatics than heretics, as they keep most of the Church requirements and give most promise of reforming. Of the nineteen episcopal chairs among the 'old believers' thirteen are held by the Popovtsy, and only three by the Bezpopovtsy. In 1874, on account of the introduction of the universal military service, a new marriage law was proclaimed for the Raskolniki: the marriages were henceforth to be recorded by police officials, and the issue were considered legitimate. After numerous petitions presented in 1880-81, came the law of May 3, 1883, which brought considerable relief to the schismatics. Passports were now given to all Raskolniki, with the exception of the Skoptsy; they were free to engage in trade and occupy official posts, to perform divine service publicly, in private or special buildings, and to rebuild old churches, provided they are of an appearance distinct from the orthodox places of worship. Some other minor liberties were also granted, and lawful prosecution could be instituted against them for active propaganda only.

Among the distinguishing features common to all sects of the Raskolniki may be mentioned; the manner of crossing themselves with the first and middle finger; use of unrevised service-books; two-fold repetition of hallelujah; turning in church ceremonies "in the direction of the sun's movement," i.e. from left to right and not from right to left; use of seven instead of five altar-breads in the eucharistic offering; use of ancient icons and eight-pointed cross. Their predilection for everything antique appears in their use of the old Russian costume, and scrupulous objection to cutting their hair or shaving their beards. In general the Raskolniki are counted among the most industrious, sober, and intelligent elements

of the Russian population. As to their numbers a serious divergence of statistical data seems to be the rule; many Raskolniki conceal their faith before the magistrates, and even of those registered the governmental reports give only a small fraction, for fear of increasing their popularity with the masses. Thus, e.g. when the official returns in 1870 gave their number as 1,171,000, the foreign newspapers, on the basis of the secret governmental documents, gave a figure almost ten times as high. On this basis, says the Russian Encyclopædia, one can approximately guess their total number, when the report of the Holy Synod for 1893 places them a little below 2,000,000. Consult Strahl, *Beiträge zur russischen Kirchengeschichte*, vol. i. (Halle, 1827); Gerbel-Embach, *Russische Sektierer* (Heilbronn, 1883); Heard, *The Russian Church and Russian Dissent* (New York, 1887).

RASP. See FILE.

RASPAIL, rās'pä'y', FRANÇOIS VINCENT (1794-1878). A French naturalist and revolutionary. He was born at Carpentras, in the Department of Vaucluse, and went to Paris in 1815. There he became the editor of radical papers and fought at the barricades in the revolution of 1830. He opposed the Government of Louis Phillipe, and was prosecuted for his newspaper articles and for his membership of illegal societies. As leader of a mob (February 24, 1848) he forced the Provisional Government to proclaim the Republic, and with Barbés and Blanqui headed the insurrectionists who invaded the Hall of the National Assembly on May 15th, and sought to disperse the body. He was sentenced to five years' imprisonment. He was a member of the Corps Législatif in 1869 and of the Chamber of Deputies in 1876-77. As a naturalist he became known through the enthusiastic advocacy of camphor as an antiseptic. His works include: *Essai de chimie microscopique* (1831); *Nouveau système de chimie organique* (1833); *Nouveau système de physiologie végétale et botanique* (1837); *Nouvelles études scientifiques* (1861-64).

RASPBERRY (from *rasp*, OF. *rasper*, Fr. *râper*, from ML. *raspare*, to scrape, from OHG. *raspôn*, to scrape together (connected with Ger. *rappcn*, to seize, Eng. *rap*) + *berry*; so called from the rough surface). Several species of the genus *Rubus*, of the natural order Rosaceæ. The black-cap or black raspberry (*Rubus occidentalis*) is an American species with white flowers, and purplish-black fruits consisting of numerous drupes joined together. Since its introduction in 1832 it has become one of the most important of bush fruits and is extensively raised for dessert, canning, and evaporating. In nature the tips of recurved stems of the present season's growth take root during midsummer and late autumn, and give rise to a new plant—a habit utilized in cultivation. In commercial plantations the plants are set in rows 3 by 8 feet apart, given clean culture until time to put down the stem tips, when cultivation ceases. The first return, then, from a new raspberry patch is a crop of plants. The new shoots which spring up from the roots are cut back to 18 or 20 inches, when about that height, to induce the formation of fruit-bearing wood. As soon as the crop is gathered, the canes which have borne are cut away to increase the strength of the new wood which is to bear the

following season's crop. The crop is usually picked by hand; many growers, however, use a simple device consisting of an apron with a shallow box attached, into which the ripe fruit is jarred. After the fruit is dried it is run through a fanning mill to separate any leaves or twigs which fell with the fruits into the picking box.

Two species of red raspberries are cultivated, the native American red raspberry (*Rubus strigosus*) and the European (*Rubus Idoxus*.) These two plants are closely related botanically, but differ under cultivation, a marked distinction being the habit of the European species to continue fruiting throughout the season after ripening begins. This is a disadvantage to the commercial grower, but an advantage to the amateur. The European sorts are less hardy than the natives, and cannot be relied upon in the Northern States except in sheltered positions. The number of foreign varieties cultivated in the United States is comparatively small. Out of a total of 100 or more introductions not more than 6 or 8 have stood the test. Both forms of red raspberry propagate readily from sprouts and root cuttings. As a result of the habit of sprouting, the patches soon present the character of a matted row, although they are usually planted 3 by 6 feet apart in original plantations. Thorough cultivation is necessary, not only for the purpose of stimulating growth, but in order to hold the plants within bounds. The fruit of these species cannot be successfully gathered by machinery and is never evaporated. Its chief use is for dessert purposes, although the fruit is also prized in wine-making, for jam, and for canning.

Another important group of raspberries seems to have resulted from the crossing of *Rubus occidentalis* and *Rubus strigosus*. In habit of growth the plant resembles the black raspberry more closely than the red, since it propagates by 'tips,' has a firmer fruit than the red, with greater size and much better flavor than the black. For shipping it is much better than the red, and for dessert purposes superior to the black. Flowering raspberry (*Rubus oederatus*) is often planted for ornament. See Plate of RUBUS.

RASPBERRY DISEASES. The fungous diseases of the raspberry, blackberry, and dewberry are the same, and at times work serious injury. Among the most important are anthracnose and orange rust. The anthracnose (*Glaosporium necator*) is first indicated by the appearance of small rapidly growing purple spots upon the young shoots near the ground. As these spots enlarge and extend around the stems the centres become dirty white, the spots coalesce and rupture the epidermis, and the canes die as though girdled by a knife. The fruit may shrivel and remain upon the stems. Rust (*Croonia nitens*) attacks and dwarfs the young growth. Soon the leaves turn yellow and both they and the young stems become distorted and covered with masses of orange-colored spores, which rapidly spread the disease. The remedy recommended for the former is spraying with a fungicide (q.v.), for the latter digging and burning.

RASPBERRY INSECTS. The canes of raspberry bushes are attacked injuriously in the United States by two species of beetles. The raspberry cane-borer (*Oberca bimaculata*) lives

in the larval state in the centre of the cane, where it burrows downward, often causing the death of the cane. It is a native insect, feeding in the wild raspberries, but has transferred its attention to the cultivated varieties. The perfect insect is a cerambycid or long-horned beetle, with a long and narrow black body, the top of the thorax being pale yellowish. It appears in June, and the female lays her eggs toward the end of that month, girdling the young growing cane near the tip in two places and inserting the egg between the girdles. This insect feeds in blackberry as well as in raspberry stems. The remedy consists in pruning the girdled tips as soon as observed, and they are very evident from the withering of the terminal leaves. The other cane-borer is the red-necked Agrilus (*Agrilus ruficollis*). This is a buprestid beetle which lays its eggs in the stems of raspberry and blackberry, and the resultant larva makes a swelling in the cane. Several larvae will be found under the bark of one of these swellings, and when full-grown they penetrate to the pith and transform to pupæ from which the perfect beetles escape early in the summer.

Raspberry canes are sometimes damaged to some extent by the snowy tree-cricket (*Ecanthus niveus*), which perforates the stems to a distance of an inch or more, inserting its eggs in the perforations. This is the only damage done by this insect, which, after it issues, feeds upon plant-lice. The raspberry sawfly (*Selandria rubi*) in the larval condition feeds upon the leaves, and transforms to pupa at the surface of the ground or a little below the surface. This insect is destroyed, when abundant, by sprinkling with kellebore and water. Several species of Lepidoptera in the larval state feed upon the leaves of raspberry, and there is a little measuring worm which feeds upon the fruit. This species (*Synchlora arata*) reaches full growth about the time of the ripening of the raspberry, when it is about three-fourths of an inch long, of a yellowish gray color, each segment being furnished with several sharp thorns. It has the habit of disguising itself by attaching to these thorns small bits of vegetable matter, such as the anthers of flowers and bits of leaf. The adult moth is of a delicate pale-green color, and has a wing-expanse of about half an inch. The flea-like negro-bug (q.v.) is often found upon raspberries, and its presence may be discovered by the disagreeable odor of the fruit. The insect is so small that it is often taken into the mouth unnoticed until the disgusting flavor reveals its presence. Consult Saunders, *Insects Injurious to Fruits* (Philadelphia, 1889).

RASPE, räs'pé' RUDOLPH ERICH (1737-94). A German-English writer and mineralogist, born in Hanover. He studied in 1756-60 at Göttingen and Leipzig. In 1767 he became a professor in the Collegium Carolinum at Cassell, and curator of the Landgrave's cabinet of antiquities and coins. During this time he translated (1765) Leibnitz's philosophical works, wrote the poem *Hermis und Gunilde* (1766), published a critical treatise on Percy's *Reliques*, and papers on geology and mineralogy. In 1775 he was charged with purloining coins and other articles of value, and fled to England, where he published *Some German Volcanoes and Their Productions* (1776), a translation of Lessing's *Nathan der*

Weise (1781), and, with the assistance of Horace Walpole, a treatise on the origin of painting in oil (1781). Later he became assay-master at mines in Dolcoath, Cornwall (1782-85), and compiler of the excellent *Descriptive Catalogue* of more than 15,000 casts of gems, forming the collection of James Tassie of Edinburgh. In 1791 he was in the north of Scotland, where he obtained from Sir John Sinclair of Ulster funds for metallurgical experiments. He then decamped with the money to Muckross, County Donegal, Ireland. This incident was introduced by Scott in *The Antiquary*. Raspe published in 1785, in chap-book form, *Baron Münchhausen's Narrative of His Marvellous Travels and Campaigns in Russia*, based partly on his recollections of Hieronimus Karl Friedrich, Baron von Münchhausen (1729-97), who had much local renown in Hanover for his exaggerated tales of putative hunting adventures, and partly on similar material preserved in his commonplace-book. His work constitutes chapters 2-6 of the latter-day Münchhausen. See MÜNCHHAUSEN.

RÄSS, räs, ANDREAS (1794-1887). A German theologian, born at Sigolsheim, Alsace, and educated in Mainz. He was ordained priest in 1816. In 1842 he was nominated Bishop of Strassburg. At the Vatican Council he was a staunch supporter of the dogma of infallibility. Räss founded the periodical *Der Katholik*, and wrote many theological treatises. His printed works include: *Konvertiten seit der Reformation* (1866-80), and together with Weiss, Bishop of Speyer, he published *Leben der Väter und Märtyrer* (23 vols., 1821-27), a translation of Butler's *Lives of the Saints*.

RASSAM, räs-säm', HORMUZD (1826—). A celebrated Assyriologist, born of native Christian parents at Mosul. He acted as agent and overseer for Layard (q.v.) during his two expeditions in 1845-47 and 1849-51. In 1852-54 he conducted excavations at Kalat Shirgat, Nimrud, and Koyunjik under the direction of Sir Henry Rawlinson and the British Museum, and discovered the palace of Assurbanipal and the second half of the library at Koyunjik. (See NINEVEH.) In 1864 he was sent by the British authorities to Abyssinia, where the King had imprisoned certain Europeans. Rassam was himself held captive from 1866 until Sir Robert Napier's victory over the Abyssinians in 1868. After the sudden death of George Smith in 1876 the officials of the British Museum again asked Rassam to take charge of excavations in Assyria. In 1878 he began operations in Nineveh, and from January of that year till July, 1882, he was continuously in the field in both Assyria and Babylonia, with the exception of three visits to England to report and receive funds to continue the work. He strove to excavate a great number of sites and to make striking discoveries rather than to do the best kind of work, and his lack of proper training also proved a disqualification for his task. Nevertheless he made important discoveries, such as the bronze gates of Balawat (q.v.), obtained a large number of exceedingly valuable inscriptions, and identified and partially excavated the ancient Sippara (Abu Habba). He published *The British Mission to Theodora, King of Abyssinia* (1869) and *Asshur and the Land of Nimrod* (1897), an account of his excavations.

RASSE (from Javanese *rasa*, from Skt. *rasa*, flavor, taste). A Malacca weasel. A small civet (*Viverricula malaccensis*) which inhabits the Malay Peninsula, eastward to Formosa, and also the island of Madagascar, where it was probably introduced long ago. It differs from the ordinary civets, being of slighter build, enabling it to climb trees, and in lacking a mane. It has along its back and sides seven blackish stripes, more or less broken into spots, some curving bars on the throat, and a long, tapering dark-ringed tail. This animal is made to yield the scent called 'civet,' which accumulates in its prescrotal glands, and which is removed from them at intervals, by means of a little spoon-shaped instrument.

RAS'SELAS. A prose romance by Dr. Samuel Johnson (1759), written during the evenings of one week to defray the expenses of his mother's funeral. Most popular of all Johnson's works, it has been translated into most modern languages. The story of the Prince of Abyssinia, who left the Happy Valley, where he had been brought up, to explore the world, shows the vanity of human happiness, the author's protest against the easy optimism of his day.

RASTATT, or **RASTADT**, rä'stät. A town in the Grand Duchy of Baden, Germany, on the Murg, three miles from its junction with the Rhine, and 15 miles by rail southwest of Karlsruhe (Map: Germany, C 4). Its strong fortifications were dismantled in 1890. The town has a large palace (now a barrack), a gymnasium, and an industrial school. It manufactures iron hearths, tobacco, and lace. Rastatt is memorable for the two congresses held here. At the first, in 1714, a treaty of peace (following that of Utrecht) was signed which brought the War of the Spanish Succession to a close. The second congress was that of 1797-99 between France and the German Empire. It effected nothing, a new coalition having been formed against France. Its dissolution was followed by the assassination of two of the French delegates, a crime which aroused great indignation throughout Europe. For about 20 years previous to 1866 the fortress of Rastatt was occupied by the troops of the German Confederation. The Baden revolution in 1849 began and ended in Rastatt, which finally surrendered to the Prussians. Population, in 1890, 11,557; in 1900, 13,940. Consult Hüffer, *Der Rastatter Gesandtenmord* (Bonn, 1896).

RASTENBURG, rä's'ten-böörk. A town in the Province of East Prussia, Prussia, on the River Guber, 64 miles southeast of Königsberg by rail (Map: Germany, J 1). It has a royal gymnasium and a sanatorium for epileptics. Among the industrial establishments are iron and brass foundries, sugar factory, flouring mills, etc. Population, in 1900, 11,144.

RAT (AS. *raeti*, OHG. *ratto*, Ger. *Ratte*, Fr., Prov. *rat*, It. *ratto*, rat; of uncertain etymology). Any of the larger rodents of the genus *Mus*. (See MORSE.) Two species are very widely distributed over the world—the black rat (*Mus rattus*) and the brown rat (*Mus decumanus*). Both appear to be natives of Central Asia. The black rat found its way to Europe about the beginning of the 16th century, but the brown rat did not reach England until about 1728. The British Jacobites were accustomed to delight themselves with the notion that it came with the House of Hanover,

and chose to call it the 'Hanoverian rat.' It also received the name of 'Norway rat,' from a belief that it was introduced from Norway. The date of introduction into America is very doubtful, but the black or Alexandrine rat seems to have come first, and has been gradually driven westward by its large and more savage cousin. The brown rat is the larger and more powerful of the two, and has waged war against the other with such success as to cause its total, or almost total, disappearance from many districts where it was once abundant, yet in some places the black rat is still the more plentiful of the two. Both infest ships, and are thus conveyed to the most distant parts of the world, and both are 'wharf rats.'

The black rat is nearly 7½ inches in length, exclusive of the long tail. The brown rat attains a length of more than 10½ inches. Besides its large size and comparative shortness of tail, it differs from the black rat in its smaller ears and less acute muzzle, as well as in its lighter color and shorter hair. Both species are extremely prolific, breeding at a very early age, several times in a year, and producing from 10 to 14 at a birth.

Rats feed indiscriminately on almost any kind of animal or vegetable food; they make depredations in fields of grain and pulse, from which they often carry off large quantities to be stored in their holes, and thus have become a serious pest in the West Indian sugar plantations. They devour eggs; they kill poultry, partridges, and the like, and become a pest of ill-kept dwellings and storehouses. Their strong rodent teeth enable them to gnaw very hard substances, such as wood and lead pipes, either for food or in order to make their way to food. They are creatures of no little intelligence, and many curious stories are told of the arts which they employ to attain desired objects, of the readiness with which they detect the approach of danger, and the skill with which they avoid it. Under certain circumstances they undertake migrations in large companies. Their sense of smell is very acute, and the professional rat-catcher is very careful that the smell of his hands shall not be perceived on the trap. They are capable of being tamed, and have in some instances proved interesting pets.

The flesh of rats is seldom eaten. The skin is used for making a fine kind of glove-leather. During the prevalence of the bubonic plague in India, Australia, and Cape Colony, in the latter part of the nineteenth century, it was ascertained that there was a direct connection between the prevalence of the disease and the abundance of rats, and it was shown that the rats were themselves liable to the plague, and myriads perished from it. Investigation showed that the fleas, with which rats are infested, are hosts for the plague germ, and that thus rats unwittingly served as an important means for spreading the disease. Measures were taken, in consequence, to kill them in the ports of India in large numbers.

RATAFIA (Fr. *ratafia*, from Malay *araq*, from Ar. *araq*, arrack, from *araqa*, to sweat + Malay *tāfia*, spirits distilled from molasses, Eng. *taffy*). A cordial flavored with fruits or the kernels of fruits. The name is used generically to include several varieties of fruit liqueurs. Procope, the ancient master distiller of Paris, includes under this term liqueurs, or syrups as we

should say, of cherries, strawberries, gooseberries, apricots, peaches, and other fruits. He it was who first proposed the pressure of the fruits without infusing them entire. Some years afterwards Breard, one of the chiefs of the fruitery of Louis XIV., gave these (white) liqueurs the name *Hypocques*, to distinguish them from other ratafias. Consult Mew and Ashton, *Drinks of the World* (New York, 1892). See LIQUEUR.

RATE (OF. *rate*, from ML. *rata*, fem. sg. of Lat. *ratus*, fixed, settled, p.p. of *rerī*, to think). In the United States Navy the titles of petty officers are termed rates or ratings, which are synonymous with rank as applied to a commissioned or warrant officer. Ships of this navy are by law divided into classes called rates. Vessels of the first rate have a displacement tonnage in excess of 8000 tons; second rate, from 4000 to 8000 tons; third rate, from 1000 to 4000 tons; and fourth rate, of less than 1000 tons. Converted merchant vessels which are armed and equipped as cruisers are of the second rate if of over 6000 tons, and of the third rate if of over 1000 and less than 6000 tons. Auxiliary vessels such as colliers, supply vessels, repair ships, etc., if of over 4000 tons, are of the third rate. Auxiliary vessels of less than 4000 tons—except tugs, sailing ships, and receiving ships which are not rated—are of the fourth rate. Torpedo-boat destroyers, torpedo boats, and similar vessels are not rated. Ships of the first rate are commanded by captains; of the second rate, by captains or commanders; of the third rate, by commanders or lieutenant-commanders; of the fourth rate, by lieutenant-commanders or lieutenants. Vessels not rated are commanded by lieutenant-commanders, lieutenants, ensigns, or warrant officers.

RATE. The term applied to the taxes assessed and collected by local authorities in England. The objects subject to taxation being assessed, a 'rate' is fixed sufficient to bring in the needed income. The taxes being imposed by various administrative bodies such as the counties, or poor law districts, we find frequent references to 'county rates,' 'poor rates,' etc. As the entire revenue of local bodies rests upon this basis, the term rate is frequently used by English writers as synonymous with direct taxation, other forms of taxation being designated customs, duties, imposts, etc. The distinctions here noted are not in use in the practice of American communities or in the writings of American authors upon taxation.

RATEL (Fr., diminutive of *rat*, rat), or HONEY BADGER. A badger-like animal of South Africa. See BADGER.

RATH, rät, GERHARD VOM (1830-88). A German mineralogist, born at Duisburg and educated in Berlin, Bonn, and Geneva. In 1863 he became professor of mineralogy at the University of Bonn, and a few years afterwards was made director of the Mineralogical Museum there. He made scientific researches in mineralogy, petrology, and especially the geology of the Rhine, Alps, and Italy. He published the results of his researches in Poggendorff's *Annalen*, in the *Zeitschrift der deutschen geologischen Gesellschaft*, and in the *Monatsberichten* of the Berlin Academy, and in such publications of his own as *Ein Ausflug nach Kalabrien* (1871), *Durch Italien und Griechenland*.

land nach dem heiligen Land, and Naturwissenschaftliche Studien (1879).

RATHBONE SISTERS, ORDER OF. See PYTHIAS, KNIGHTS OF.

RATHENOW, rä'te-nô, or **RATHENAU**. A town in the Province of Brandenburg, Prussia, on the Havel, 45 miles west-northwest of Berlin (Map: Prussia, E 2). It manufactures optical instruments, furniture, asbestos, and stoves. Population, in 1890, 16,353; in 1900, 21,043.

RATHMINES (râth-mînz') AND **RATHGAR**, -gâr'. A municipality of Leinster, Ireland, suburban to Dublin (q.v.). Population, in 1891, 27,796; in 1901, 32,602.

RATIBOR, rä'tê-bôr. A city in the Province of Silesia, Prussia, on the Oder, 44 miles south-southeast of Oppeln (Map: Prussia, H 3). It has a handsome courthouse, a theatre, and a gymnasium. It has manufactures of iron-foundry and machine-shop products, snuff, sugar, chocolate, paper, furniture, and chemicals. The town was the capital of the former Principality of Ratibor. Population, in 1900, 25,236.

RATICHIUS, râ-tik'î-ûs (Ger. RATKE, or RATICHI), WOLFGANG (1571-1635). A celebrated educational reformer, born at Wilster, in Holstein, and educated at the Hamburg Johanneum and the University of Rostock. While sojourning in Holland (1603-11) he devised a new method for teaching languages quickly. He tried to enlist the Prince of Orange in his cause, but failing, he betook himself to Germany. At Amsterdam, Basel, Strassburg, Frankfurt, Weimar, Augsburg, Köthen, and various other places he put into operation his method of instruction. His executive ability, however, was not commensurate with the scope of his ideas, and he consequently failed in all his undertakings. His personality, moreover, alienated both assistants and patrons. He advocated, above all, the use of the vernacular as the proper means for approaching all subjects, and demanded the establishment of a vernacular school on the basis of the Latin school. His fundamental idea of method was that nature should be followed, meaning by that that there is a natural sequence along which the mind moves in the acquisition of knowledge, through particulars to the general, thus for the first time applying the Baconian theory of induction in education. Consult: Barnard, *German Teachers and Educators* (Hartford, 1878); Quiek, *Educational Reformers* (New York, 1890). See EDUCATION; PEDAGOGY.

RATIFICATION (ML. *ratificatio*, from *ratificare*, to ratify, from Lat. *ratu*s, fixed, settled + *facere*, to make). In law, acts or words by which a person adopts as his own obligation the legal effect of an unauthorized act done by another on his behalf or for his benefit, or by which a person confirms and assents to be bound by a voidable obligation. If a person ratifies and accepts the benefits of an act, he must also be responsible for any consequences of the act, such as damage committed by the unauthorized person in doing it. Ratification may be *express*, that is, by assent expressed in positive terms, or *implied*, from acts from which a reasonable person would infer assent.

In Scotch law the term is applied to the separate acknowledgment of a married woman that a deed executed by her is voluntary and

made with full knowledge of its legal effect. See CONTRACT; INFANT; and consult the authorities referred to under CONTRACT.

RATING, in naval service. See RATE.

RATIOCIANITY (Lat. *ratiocinatio*, from *ratiocinari*, to reason, from *ratio*, reckoning, relation, reason), or REASONING. Reasoning, in psychology, is a successive association of judgments. Suppose that a complex of ideas (say, the look of a cloudy sky) is presented to consciousness. The attention plays upon this complex, and in obedience to some one of its various conditions (see ATTENTION) fixes upon some one of the constituent ideas. This idea is therefore drawn out of the mass, and rendered more prominent; at the same time, it becomes liable to associative supplementing. The complex of ideas is then reconstituted; we have what is technically known as an 'association after disjunction.' When this association takes place in verbal terms, we call the resulting complex a judgment. Thus, to work out the instance taken: I look at the sky, and say, "It is going to rain!" Certain of the visual ideas have attracted my attention; they have been drawn out from the general mass of visual ideas present in consciousness, and have been supplemented by the idea of rain. The whole situation has then been put together again; there has been a reassociation after the disjunction; and the prominent idea in the reconstituted consciousness is the idea of rain. The association takes a verbal form; the promise of rain is 'pre-iated' of the total look of the sky, so that we describe it as a judgment.

In saying, then, that reasoning is a successive association of judgments, we are saying, first, that it is an extremely complicated process. For the judgments that are successively associated are themselves the products of association after disjunction. In the instance given, the disjunction may well have been the work of the passive attention; in the typical judgment of logic, the work of an active attention is presupposed, and the whole process thus becomes, on its psychological side, much more complicated than we have represented it to be. As, however, the further complication is a matter not of kind, but simply of degree, we need not go into it in detail.

Again, in defining reasoning as we have defined it, we are saying, secondly, that it is a process that must have appeared relatively late in the history of mind. For the ideas in terms of which the constituent judgments are couched are symbolic (verbal) ideas, not reproductions or pictorial ideas; and a long mental history separates the reproductive from the symbolic idea. The reproductive counterpart of reasoning is to be found in the constructions of the creative or active imagination. See IMAGINATION.

Consult: James, *Principles of Psychology* (New York, 1890); Titchener, *Outline of Psychology* (ib., 1899); Ladd, *Psychology, Descriptive and Explanatory* (ib., 1894); Wundt, *Physiologische Psychologie* (Leipzig, 1893). For reasoning as a logical process, see DEDUCTION; INDUCTION; SYLLOGISM.

RATIONALISM (Lat. *rationalis*, from *ratio*, reason). A term employed in philosophy and theology to denote a system in which the reason is supreme. In theology it is contrasted with supernaturalism, and is used to describe a movement of thought, which had its important repre-

representatives in Germany in the last half of the eighteenth century, but was to be found in England and elsewhere in the previous century in the earlier stages of development. According to one of its recent historians, Kahnis, it "makes the educated reason of the times the standard of all religious truth, and the material principle of this reason is virtue, which demands and sustains belief in God and immortality." In philosophy, the term is used to denote the doctrine that reason is an independent source of knowledge, distinct from sense-perception and having a higher authority. In this sense it is opposed to sensationalism (q.v.). It is more widely used, however, for the view opposed to empiricism (q.v.) that in philosophy certain elementary concepts are to be sought, and all the remaining content of philosophy deductively derived from them. This view was first explicitly stated by Descartes, developed by Spinoza and Leibnitz, and formulated by Wolff. Kant endeavored to transform rationalism by showing how reason was implicit in experience; and Hegel revived it in a transformed sense with the construction of experience itself as a system of reason. Consult Lecky, *History of the Rise and Influence of the Spirit of Rationalism in Europe* (London, 1865); Tulloch, *Rational Theology and Christian Philosophy in England in the Seventeenth Century* (ib., 1872); Pfeleiderer, *The Evolution of Rationalistic Theology since Kant* (Eng. trans., ib., 1892); Hagenbach, *German Rationalism* (Eng. trans., Edinburgh, 1865). See also GERMAN THEOLOGY; KNOWLEDGE, THEORY OF.

RATIONS (from Lat. *ratio*, reckoning, relation, reasoning). In the United States Army, a ration is officially defined as "the allowance for the subsistence of one person for one day, and varies in components according to the station of the troops, or the nature of the duty performed." There are four descriptions of rations, which are known severally as the garrison ration, field ration, travel ration, and the emergency ration. In active service, or during emergencies, troops receive the *emergency ration*. Beef cattle are bought only when necessary for supplying troops on the march or during a campaign. Fresh meats are issued ordinarily seven days in ten, and salt meats on the remaining three days. In the United States Navy the ration is not allowed to officers paid on the army basis, but for all others it is commuted to a cash payment of 30 cents a day. The enlisted force of the navy is furnished food in accordance with a fixed allowance table without regard to its cost, which is, however, about 30 cents a day, and this sum is allowed when the ration is commuted (i.e. paid in money).

British soldiers have only one regular ration, which is the equivalent of the United States Army garrison ration. It consists of three-quarters of a pound of meat and one pound of bread per day. In war time the meat ration is increased to one pound. The official value of the ration is sixpence (12 cents). All other food over this amount, and such articles as tea, coffee, sugar, butter, salt, pepper, etc., are bought by the soldier at his own expense. Fourpence per day is deducted from the soldier's pay, and from the fund thus raised the articles necessary are obtained. In time of war, or on transports, the Government supplies all needed food, and the soldier receives his full pay. One of the most

important features of the Army Reorganization Bill submitted by the Secretary of State for War in 1902 was the proposal that the Government supply all necessary food, without charge, to the soldiers.

In the German Army the same skill and refinement of detail that marks the entire army organization is brought to bear on the question of the soldiers' daily food, with a result that while probably it is the most economical system in Europe, it is also one of the most excellent. The component parts are bread or zwieback, rice, bacon, fresh or canned meat, coffee, and salt. Japanese soldiers in time of peace receive a ration of rice besides which they are allowed extra pay to cover the expense for meat, vegetables, and so on. The most scientific ration in the world is that of the Italian Army. There are two regular rations, the garrison and the campaign.

RATIO STUDIO'RUM (Lat., scheme of studies). A code of rules which forms the basis for the guidance of Jesuit education. See JESUITS.

RATISBON. A city of Germany. See REGENSBURG.

RATISBONNE, rà'tès'bôn', LOUIS GUSTAVE FORTUNÉ (1827-1900). A French author and critic, born in Strassburg, and educated there and in Paris. He resigned from his post in the governmental employ on the declaration of the Empire; entered journalism, being on the staff of the *Debats* (1853-76); succeeded Feuillet as librarian at Fontainebleau; and in 1874 was appointed librarian to the Senate. Ratisbonne was the literary executor of Alfred de Vigny. His critical and literary studies included a metrical version of Dante's *Divina Commedia* (1854-59) and the essay *Henri Heine* (1885). But he was better known for his felicity as a poet of childhood, in such works as *Au printemps de la vie* (1857); *La comédie enfantine* (1860); *Les petits hommes* (1868); *Les petites femmes* (1871); various *Albums* under the pseudonym Trim; and *Les grandes ombres* (1900).

RATITÆ (Neo-Lat. nom. pl., from Lat. *ratitatus*, marked with the figure of a raft, from *ratia*, raft). A primary division of modern birds (Neornithes) based on the shape of the sternum, which is flat and without a keel. (See Plate of BIRDS, Fig. 4.). The Ratitæ are a very small group of the most ancient lineage, now confined to the Southern Hemisphere. It includes the extinct groups Dinornithes (moas), and Epyornithes (rocs), and the modern ostriches, rheas, emeus, cassowaries, and kiwis. Except the kiwis all are of very large size. The body is uniformly feathered (see PTERYLOSIS), and various anatomical features are characteristic. Naturalists are not agreed as to the precise relationships which exist between the Ratitæ and certain other groups, as, for instance, the Stereornithes (q.v.), but it is plain that the group is the most primitive of any having existing representatives; and it is now generally believed that it represents a degenerate stage of descent from ancestral forms which were birds of flight. Consult Gadow, in Bronn's *Tierreich Aves* (Berlin, 1893); Beddard, *Structure and Classification of Birds* (London, 1898); Evans, *Birds* (London, 1900); and the authorities therein cited. See BIRDS, FOSSIL; FLIGHTLESS BIRDS; and the names of various species of Ratitæ, as MOA, OSTRICH, etc.

RATNAGIRI, rāt'nā-gē'rē. A district in the Territory of Concan (q.v.), British India.

RATON, rà-tôn'. A city and the county-seat of Colfax County, N. M., seven miles south of the northern boundary of the Territory, and 22 miles south of Trinidad, Colo.; on the Atchison, Topeka and Santa Fe Railroad (Map: New Mexico, F 1). It is the centre of a stock-raising and farming region, which is also noted for its extensive coal deposits. There are large railroad repair shops here, the city being a division terminal of the Santa Fe line. Population, in 1890, 1255; in 1900, 3540.

RAT PORTAGE. A port of entry in Ontario, Canada, picturesquely situated on the Lake of the Woods at its outlet, and on the Canadian Pacific Railway, 133 miles east of Winnipeg (Map: Canada, M 7). The Winnipeg River here falls about 20 feet, affording good water power. There are several flour and saw mills; also reduction works. The town has become of considerable commercial importance, owing to the development of the gold-mining district in the vicinity. Population, in 1891, 1806; in 1901, 5202.

RATRAM'NUS (sometimes incorrectly called BERTRAM, or BERTRAMUS). An Aquitanian monk and theologian of the early ninth century, connected with the Monastery of Corbie, Picardy. He wrote a famous treatise, *De Corpore et Sanguine Domini*, a defense of the purely symbolical theory as to the Eucharist. In 1526 the work was brought into prominence through its being quoted by Bishop Fisher, of Rochester, as an exposition of the Roman Catholic doctrine regarding the Eucharist. Reprinted in 1527 at Cologne, it was much read by Protestants, and was placed on the *Index* by the Council of Trent. Subsequently it was defended within the Roman Catholic Church by Sainte-Beuve and Jacques Boileau. Ratramnus also wrote *Contra Græcorum Opposita*, in defense of the whole system of Western dogma. The collected works may be found in Migne's *Patrologia Cursus Completus, Series Latina*, tome 121 (Paris, 1844).

RATTAN, **RATAN**, or **ROTTANG** (Fr. *rotin*, *rotang*, from Malay *rotan*, rattan), *Calamus*. A genus of about 200 species of mostly East Indian palms with reed-like, slender, often jointed stems sometimes several hundred feet long. A few species are found in Africa and Australia. The name rattan is extended to other similar palms of the same tribe although placed by botanists in different genera. The stem, which is very smooth, hard, and siliceous externally, is either erect, or ascends by means of hooked prickles at the extremities of the midribs of its leaves. It then descends in graceful festoons and may climb neighboring trees. All the species are useful, being much employed in their native countries for making bridges, plaited work, chair bottoms, rope, and so on, and are very largely exported, generally under the name of cane, for similar purposes. *Calamus Rotang* and *Calamus rudentium*, occurring in India, Burma, and Ceylon, are among the most useful species. The walking sticks called Malacca canes are believed to be the produce of *Calamus Scipionum*; the plant, however, does not grow in Malacca, but in Sumatra. The fruit of some species of rattan is used as food, and the young shoots, variously prepared, are used as vegetables. A very fine

kind of dragon's blood (q.v.) is obtained from a species of rattan (*Calamus Draco* or *Dæmonorops Draco*), and particularly from the fruit, on the surface of which it appears as a resinous exudation. *Calamus acanthospathus* is one of the hardest species, occurring as it does at elevations of 6000 feet in the Himalayas.

RATTANY. See RHATTANY.

RATTAZZI, ràt-tât'sé, Mme. DE SOLMS-RATTAZZI-DE RUTE. See BONAPARTE, LÆTITIA MARIE WYSE.

RATTAZZI, URBANO (1808-73). An Italian statesman, born at Alessandria, Piedmont. He studied law at Turin and became an advocate at Casale. In 1848 he was elected a member of the Sardinian Parliament, and after sitting in the Casati Cabinet was called into the Ministry of Gioberti. He was one of those who urged Charles Albert into a continuance of the war with Austria in 1849, and after the defeat of Novara he was obliged to retire from the Ministry. He became the leader of the Left Centre, or Moderate Radical Party. In 1851, when Napoleon's coup d'état complicated foreign relations, an alliance was concluded between Cavour and Rattazzi, who had hitherto been opponents. Rattazzi took the portfolio of Justice in 1853, and subsequently that of the Interior in the Cavour Ministry. He disagreed with Cavour on the French alliance and retired from the Cabinet in 1858, but returned upon Cavour's resignation after the Peace of Villafranca. He was opposed to the surrender of Savoy and Nice to France, and he again retired in 1860. In March, 1862, after the failure of Ricasoli's Ministry, he was intrusted with the formation of a new Cabinet, but resigned after a few months. He returned to office in 1867, but his ambiguous attitude regarding Garibaldi's expedition against Rome in that year led to the downfall of his Ministry in October. He died at Frosinone. Consult: *Lettres inédites du comte de Cavour au Commandeur Urbain Rattazzi* (Paris, 1862); S. G., *Urbana Rattazzi* (Turin, 1861); De Rute, *Rattazzi et son temps* (Paris, 1881-87). An edition of his speeches, edited by Scovazzi, was published at Rome (8 vols., 1876-80).

RATTIGAN, SIR WILLIAM HENRY (1842—). An English lawyer, born in Delhi. He was educated at the High School, Agra, and at King's College, London, and was entered at the bar in 1873. He was additional member of the Supreme Legislative Council of India from 1892 until 1893, and member of the Punjab Legislative Council from 1898 until 1899, and at different times was Judge of the Chief Court of the Punjab. He was knighted in 1895, and was returned to Parliament as member for Northeast Lanarks in 1901. His works include: *The Science of Jurisprudence* (3d ed. 1892); *Private International Law* (1895); *Digest of Customary Law for Punjab* (6th ed. 1901); and *De Jure Personarum, or the Roman Law of Persons* (1873).

RATTLE-POD. A species of *Crotalaria* (q.v.).

RATTLESNAKE. An American venomous serpent of the family Viperidæ and subfamily Crotalinae, distinguished from its congeners by a horny jointed appendage terminating the tail, the shaking of which causes a rattling noise likened to that of the ancient castanets or *crotali*.

RATTLESNAKES

6

1. COPPERHEAD (*Ancistrodon contortrix*).
2. EASTERN BANDED RATTLESNAKE (*Crotalus durissus*).
3. DIAMOND RATTLESNAKE (*Crotalus adamanteus*).

4. GREEN RATTLESNAKE (*Crotalus lepidus*).
5. PLAINS RATTLESNAKE (*Crotalus confluentus*).
6. HORNED RATTLER, or SIDEWINDER (*Crotalus cerastes*).

The *Crotalinae*, until recently regarded as a family (*Crotalidae*, 'pit-vipers'), stand at the head of the ophidian ranks as the "most specialized type of snake structure," and exhibit the "highest efficiency of the venom apparatus." They are viper-like serpents of moderate length—none exceeding, and few approaching eight feet—but thick, heavy,

The curious epidermal structure at the end of the tail consists of a tapering series of amber-colored horny flattened bells which are locked into one another. The oldest or terminal bell (the 'button') is in reality the horny covering of the tip of the tail which was not discarded when the skin was first molted. At each succeeding molt the tip is pushed out by the new skin, and so a 'bell' is added at the base with each new shedding of the remainder of the skin. Theoretically these bells ought to indicate the number of moltings, and the age of the snake; but wear and accident interrupt or break the set so often that the rule does not hold with any certainty.

When the serpent is excited in any way it vibrates its tail, which (unless the creature is moving) is then held upright in the centre of the coiled body, with the head erect and menacing before it. This vibration—which is indulged by many kinds of snakes under nervous excitement—produces a peculiar humming noise, which increases in intensity and pitch as the snake's alarm or anger and the speed of vibration are augmented, until it may sound like the droning of an angry bee. The origin of the rattle can only be guessed at. A tendency toward armature of the tail is apparent in several other genera of pit-vipers; and in *Sistrurus* the rattle is much less well developed than in *Crotalus*. Apart from being a mere expression of emotion, the rattle serves to warn away cattle that might tread upon it, or enemies that might wish to seize it. This warning is well understood among all the wild animals, but when antelopes and deer hear it they will often attack the reptile and cut it to pieces with their sharp hoofs. The rattle is also believed to be a useful means of calling the sexes together.

The poison apparatus, fangs (which are of the proteroglyphic type), and the manner and result of biting, are treated of under SNAKE. Here it needs only be said that, like the vipers generally, these snakes are sluggish and loth to bite when it can be avoided, or when they are not surprised into a sudden stroke. This disposition varies, however, with the weather, their hunger, the season (all are irritable when sloughing their skin), and it differs in various species. Even the smallest may cause a man serious illness and perhaps death if it succeeds in introducing much poison into a wound; while a fairly delivered bite from the larger ones is almost certain to prove fatal. Its enemies are mainly confined to a few of the larger colubrine snakes, as the blacksnake, king-snake, and the like; to the pronghorn, Western deer, and Southern peccaries. Against man the rattlesnakes can make feeble resistance. Domestic pigs kill and eat as many as they can find, and rarely suffer harm, because of the thickness of the skin and the layers of fat underneath it, which prevent the fangs from entering or carrying venom to the system. Hunting of rattlesnakes affords occasional profit to a few persons, who find a market for their skins and for the clear smooth oil yielded by their fat, which is esteemed by watchmakers and gunsmiths, and is in demand as a medicine among the ignorant.

The most common and well-known of the rattlesnakes is that one (*Crotalus durissus*) formerly abundant all over the East, from the White Mountains in New Hampshire, and Lake Superior in the North, to the borders of the dry plains,

PATTERNS OF COLOR MARKINGS.

1, Common Eastern banded rattlesnake (*Crotalus durissus*); 2, Diamond rattlesnake (*Crotalus adamanteus*); 3, green rattlesnake (*Crotalus lepidus*); 4, plains rattler (*Crotalus couffientus*).

and extremely muscular. They are viviparous, and mainly terrestrial; but one, at least (the moccasin), is decidedly aquatic, and several in Central and South America are arboreal. In colors they vary adaptively to their haunts. All are more or less distinctly marked with darker spots and patterns of squarish form. The group is predominantly American, but several species inhabit the East Indies, some of them belonging to the American genera *Aneistrodon* and *Lachesis*. The latter includes more than half of the 60 or so species of pit-vipers recognized, and is mainly Neotropical. Among its species are the large and dangerous bushmaster and fer de lance (qq.v.). Among smaller genera one is *Teleuraspis*, a spe-

RATTLE OF A RATTLESNAKE.

1, Perfect rattle of a large banded rattlesnake; 2, longitudinal section of rattle; 3, separate segments of disjointed perfect rattle of *Crotalus* (side view): a, basal 'joint'; b, button.

cies of which (*Schlegelli*) is arboreal and often winds around the stems at the centre of banana bunches, where it sometimes fatally bites the first man to handle the fruit. None of these have rattles. The true rattlesnakes, then, are only those pit-vipers which belong to the genera *Sistrurus* (three species) and *Crotalus* (15 species), all of which, except two species of *Crotalus* in South America, belong to the Northern Continent.

It is larger in the Southern States than northward, and occasionally reaches a length of five feet, with a diameter in that case of four to five inches. The ground-color above varies from bright tawny to dark brown. A light line runs from the mouth to the eye, with a dark patch below; and the body is marked with three rows of confluent irregular brown spots, forming about 21 zigzag cross-bars. The head is oval in outline. This snake inhabits wooded regions, avoiding prairies. It is especially fond of rocky districts, and hence is most numerous among mountains, where it is inclined to gather in considerable numbers in certain holes and caverns in the autumn, in order to undergo the winter sleep in closely entwined companies. About nine young are born annually in mid-summer. The Southern States have a still larger species known as the 'diamond rattlesnake' (*Crotalus adamanteus*) on account of the rhomboidal black blotches, each perfect in all its angles, and edged with yellow, which ornament its yellowish body. This snake sometimes reaches, on the Mangrove Islands of western Florida, a length of eight feet, and has so great a thickness that large individuals may be regarded as the most bulky of all venomous snakes, for the Oriental cobras, although sometimes longer, are far more slender. The range of the diamond rattlesnake extends along the coast from North Carolina to Texas, and a variety ranges westward to Lower California. Two other similar and almost equally large and dreadful snakes are *Crotalus molossus* and *basiliscus*. Southern California also has a remarkable species (*Crotalus ruber*), which has an oblong head, and whose markings are deep red or sometimes chestnut, upon a paler reddish ground. The rattlesnake of the plains (*Crotalus confluentus*) is a light-colored, obscurely marked, rather small species. It is highly variable in form and color, and is the kind constantly found in prairie-dog towns. Several other species occur in the Rocky Mountain region and Northern Mexico, one of which (*Crotalus ecrastes*) is the characteristic snake of the deserts of the valleys of the Rio Colorado and Gila, where the people call it 'sidewinder,' from its habit of progressing sideways instead of in the usual way. It takes its specific name from the fact that the plates above the eyes are thickened into hornlike cones, sometimes of considerable height. It is not of large size, but is dangerous because of the virulence of its poison.

The small, active prairie rattlesnakes, now greatly reduced in number, differ sufficiently from the genus *Crotalus* to be set apart into the genus *Sistrurus*. One of them (*Sistrurus miliaris*) is the ground-rattler of the Southern States, too frequently met with in stubble fields and grassy places. A Northern congener is the black rattlesnake or 'massasauga,' once common between the Alleghany Mountains and the plains, but now nearly exterminated except on the frontier. This species (*Sistrurus catenatus*) may reach a length of 30 inches, and is brown, with a series of darker brown transverse spots on the back, beneath each of which is a small brown spot forming a linear series along the sides. Its rattle is small, but can be heard at a considerable distance, and its bite is likely to be exceedingly troublesome to men and domestic animals, although not often fatal. These snakes prefer low, wet ground, the draining of which by the spread

of farming operations has been the principal agency in their decrease.

Consult: Cope, *Crocodilians, Lizards, and Snakes of North America* (Washington, 1900); Stejneger, "Poisonous Reptiles of the United States," in *Annual Report United States National Museum* for 1893 (Washington, 1895); Bumpus, *Standard Natural History*, vol. iii. (Boston, 1885); Stejneger, "Reptiles of Death Valley," in *North American Fauna*, No. 7 (Agricultural Department, Washington, 1893). See SNAKE and Plate of RATTLESNAKES.

RATTLESNAKE PIKE. See SAND-PIKE.

RATTLEWING, or WHISTLEWING. The golden-eye duck. See GOLDENEYE.

RATZBURG, rät'se-boōrk, JULIUS THEODOR (1801-71). A German entomologist. He was born and educated in Berlin, where in 1828 he became privat-docent at the university. Two years afterwards, upon the removal of the Berlin Forestry School to Eberswalde, Ratzburg became its professor of natural science. By his work there as a teacher and his publications, he ranks as the founder of the scientific treatment of entomology as related to forestry. Among his more important writings are: *Die Forstinsekten* (1837-44; 2d ed. 1885); *Die Waldverderber und ihre Feinde* (1842); *Die Ichneumonien der Forstinsekten* (1844); *Waldverderbnis durch Insektenfrass* (1866-68); some botanical treatises, and a *Forstwissenschaftliches Schriftsteller-Lexikon*, completed by Acherson and containing an autobiography (1874).

RATZEL, rät'sel, FRIEDRICH (1844-). A German geographer and traveler, born at Karlsruhe, and educated in science at Karlsruhe, Heidelberg, Jena, Berlin, and elsewhere. As correspondent of the *Kölnische Zeitung* he traveled in 1869 in Italy, Sicily, and Southern France, and in 1872-75 in the United States, Mexico, and Cuba. In 1876 he became professor of geography at the Polytechnic School of Munich, and in 1886 was appointed to a similar position at the University of Leipzig. Among his printed works are: *Sein und Werden der organischen Welt* (1868); *Wandertage eines Naturforschers* (1873-74); *Vorgeschichte des europäischen Menschen* (1875); *Städte- und Kulturbilder aus Nordamerika* (1876); *Die Vereinigten Staaten von Nordamerika* (1878-80); *Die Erde, in 24 Vorträgen* (1881); *Völkerkunde* (1895); and *Die Erde und das Leben* (1902). With Schweinfurth he edited Emin Pasha's letters of travel and reports (Leipzig, 1888).

RAU, rou, KARL HEINRICH (1792-1870). A German economist, born at Erlangen. He studied at the University of Erlangen, where he became privat-docent in 1812, professor extraordinary in 1816, and in 1818 full professor of political economy. In 1822 he was called to the chair of political economy at Heidelberg University. His principal works are: *Ueber das Zunftwesen und die Folgen seiner Aufhebung* (1816); *Grundriss der Kameralwissenschaft und Wirtschaftslehre* (1823); and *Lehrbuch der politischen Oekonomie* (1826-37). Rau was at first an adherent of the views of the earlier German economic writers, and defended the policy of the guild regulations and of mercantilism. In his *Lehrbuch*, which was long considered the classical German work on economics, he adopts the gen-

RAUCH
STATUE OF FREDERICK THE GREAT IN BERLIN

eral position of Adam Smith and Say, but retains a tendency to advocate the extension of the economic functions of the State. He founded in 1835 the *Archiv der politischen Oekonomie und Polizeiwissenschaft*.

RÄUBER, roi'bër, DIE (Ger., The Robbers). An early play of Schiller (1781), which, with many imperfections, attained great success by reason of its dramatic power. The hero, Karl Moor, a student in Leipzig, is disowned by his father through the machinations of his brother, and in desperation becomes the captain of a band of robbers. His exploits are directed toward righting wrongs and punishing misdeeds, and he becomes famous as an outlaw. Finally he returns to his home, rescues his father from his brother's cruelty, and in expiation of his deeds delivers himself up to the law.

RAUCH, rouk, CHRISTIAN DANIEL (1777-1857). The most celebrated German sculptor of the nineteenth century. He was born January 2, 1777, at Arolsen, in the Principality of Waldeck. His father was employed at the Court of Prince Frederick II. of Hesse, and in 1790 the lad was apprenticed to the Court sculptor Valentin at Arolsen; in 1795 he became assistant to Ruhl, Court sculptor at Cassel. On the death of his father in 1797, Rauch abandoned sculpture temporarily, and entered the personal service of King Frederick William III. of Prussia. Studying at odd moments, he came under the influence of Johann Gottfried Schadow; in 1802 he exhibited his first statue, a "Sleeping Endymion and Artemis," and in 1803 his bust of Queen Louise. In 1804 he went to Rome, provided with a small stipend. During his six years' stay at Rome his art was chiefly influenced by Thorwaldsen and by the antique. Among these early works were reliefs of "Hippolytus and Phedra," "Mars and Venus Wounded by Diomedes," and busts of the King of Prussia and Queen Louise, besides others executed by order of the King of Bavaria for the Walthalla.

In 1818 he was summoned to Berlin by the King and given the commission for a monument to Queen Louise in the royal mausoleum at Charlottenburg. The marble statue of the Queen, dressed in a light garment which charmingly reveals the figure, reclines on a simple sarcophagus. This work, one of the most interesting in modern German sculpture, gave Rauch a European reputation. A similar statue of the Queen, even more successful, was placed in the park of Sans Souci at Potsdam. While engaged upon his works he found time to model numerous excellent portrait busts, among the best of which are those of Dürer (1837, Walthalla), of Thorwaldsen for the King of Denmark, and a colossal bust of Goethe (1820). In 1819 he established a royal atelier of sculpture in Berlin, and assisted Schinkel in his scheme for the museum, which was finished in 1830.

A projected statue of Goethe for Frankfort was modeled, but not executed, though a charming statuette of the poet in his study gown is well known. Rauch made an interesting series of bronze statues of German heroes of the Napoleonic wars, the best of which are at Berlin and at Breslau. Other important works are: the monument of the two Polish princes Mieczislaw and Boleslaw, in the Cathedral of Posen (1840); the statue of Albrecht Dürer in Nuremberg

(1840); the Max Joseph monument in Munich (1833); the gable group and six smaller Victorias for the Walthalla near Regensburg. His greatest work is the immense bronze monument of Frederick the Great in Berlin (1839-51). A colossal equestrian statue of the King surmounts a pedestal, about the base of which are groups of generals and soldiers, and bas-reliefs representing scenes in the life of Frederick. Rauch's works combined, to a remarkable extent, absolute natural truth with ideality of character, and he succeeded in the difficult task of adapting modern costume to the ideal portrait representation. He was the founder of the Berlin school of sculpture, the most important in Germany, and in which his spirit yet prevails. Consult: *Abbildungen der vorzüglichsten Werke Rauchs mit erläuterndem Text von Waagen* (Berlin, 1827-29); Eggers, *Christian Daniel Rauch* (5 vols., ib., 1873-90), the leading biography, upon which Cheney's *Life of Christian Daniel Rauch* (Boston, 1893) is based; Dobbert, *Rauch* (Berlin, 1877); Eggers, *Rauch und Goethe, urkundliche Mittheilungen* (ib., 1889); also Merckle, *Das Denkmal König Friedrich des Grossen* (Berlin, 1894).

RAUHES HAUS, rou'es hous. One of the earliest industrial institutions for poor boys, founded by Wichern at Horn, near Hamburg, November 1, 1833, in an old house called by its former occupant 'Ruges Hus,' which by a mistranslation into high German became Raupes Haus. There are now about 25 buildings occupied by the boys, who live in groups (families) of 12 or 15 under the charge of a brother. The scope of the school has widened with its growth, and now comprises: (1) Department for neglected children who receive a common school education and are trained for handwork, and later on are apprenticed or employed in the institution. (2) Department for trades instruction. (3) Boarding department for boys of better families. (4) A training school, begun in 1845, for workers in charitable societies and institutions. The men are called brothers, and most of them have found service under the Innere Mission (q.v.) (5) Book department, including a printing office, started in 1844. The oversight and care of the children falls largely on the assistants, who are training for work in other institutions. The Raupes Haus with the institution at Mettray, France, have been widely and favorably known. Consult Wichern, *Das Rauhe Haus von 1833-83* (Hamburg, 1883).

RAUMER, rou'mër, FRIEDRICH LUDWIG GEORG VON (1781-1873). A German historian, born at Wörlitz, near Dessau. He studied at Berlin, Halle, and Göttingen, and held government appointments from 1806 to 1811. In that year he was made professor of political science at Breslau, and in 1819 was called to Berlin. He traveled widely during the years from 1827 to 1843, and the results of his observations were embodied in several works. He was secretary of the Berlin Academy of Sciences, but resigned in 1847. He was a member of the German National Assembly of 1848-49 at Frankfort. Subsequently he became a member of the Upper House of the Prussian Diet. His more important works are: *Geschichte der Hohenstaufen und ihrer Zeit* (1823-25, 5th ed., 1878), a

standard work on that period; *Ueber die geschichtliche Entwicklung der Begriffe von Recht, Staat und Politik* (2d ed., 1826); *Geschichte Europas seit dem Ende des 15. Jahrhunderts* (1832-50); *Beiträge zur neuern Geschichte aus dem Britischen Museum*, etc. (1836-39); *Die vereinigten Staaten von Nordamerika* (1845); *Antiquarische Briefe* (1851); *Handbuch zur Geschichte der Litteratur* (1864-66). With F. A. Brockhaus he founded in 1830, and until 1867 also edited the *Historisches Taschenbuch*.

RAUMER, KARL (GEORG VON) (1783-1865). A German geologist and educator, born at Würnitz, brother of the preceding. After studying at several German universities, and at the mining academy at Freiberg, in 1811 he became professor of mineralogy at Breslau, and in 1819 at Halle, whence in 1823 he went to the Dittmar training school in Nuremberg, and in 1827 he was appointed professor of natural history at Erlangen. Among his works are: *Geognostische Fragmente* (1811); *ABC-Buch der Kristallkunde* (1820-21); and *Lehrbuch der allgemeinen Geographie* (1832; 3d ed. 1848). On education he wrote an important *Geschichte der Pädagogik* (1843-51), which has been translated into English and published in America. Raumer's autobiography was published at Stuttgart in 1866.

RAUPACH, rou'päg, ERNST (1784-1852). A German dramatist. He was born at Straupitz, Silesia; studied theology at Halle; was for ten years tutor in Russia, and was subsequently (1816) appointed professor of philosophy, German literature, and history in the University of Saint Petersburg. Raupach left Russia in 1822, and, after a visit to Italy, settled in Berlin, where he devoted the remainder of his life chiefly to writing for the stage. His facility was remarkable, and he wrote in all about eighty plays, besides letters and poems. Among his early pieces the following are noteworthy: *Die Gefesselten* (1821); *Die Freunde* (1825); and *Isidor und Olga* (1826). Among his comedies may be mentioned *Die Schleichhändler*; *Der Zeitgeist*; and the farces, *Denk' an Cäsar* and *Schelle im Monde*. Of his posthumous works are: *Der Keckspieler* (1853); the tragi-comedy, *Mulier Taccat in Ecclesia* (1853); and *Saat und Frucht* (1854). The popular drama *Der Müller und sein Kind* still holds the stage. He collected his earlier plays in two volumes, *Dramatische Werke komischer Gattung* (1829-35), and *Dramatische Werke ernster Gattung* (1830-43). Raupach's writings display great knowledge of stage effect, a happy talent for the invention of new and interesting situations, and a fine play of verbal wit. Consult Pauline Raupach, *Raupach, eine biographische Skizze* (Berlin, 1853).

RAUPENLEIM, rou'pen-lim (Ger., caterpillar lime). A crude petroleum product resembling an impure vaseline, more or less greasy, smooth, of a butter like consistency at ordinary temperatures, and absolutely resisting wash by rains, which is frequently used to form a band about trees to keep certain insects from climbing to the branches.

RAUPP, roup, KARL (1837-). A German landscape and genre painter, born at Darmstadt. After studying under Jakob Becker at the Städels-Institute in Frankfurt, he became a pupil and zealous follower of Piloty in Munich (1860-65).

where he soon gathered a small school. From 1868 to 1878 he was professor at the School of Arts in Nuremberg, and after then at the Academy in Munich. His finely colored scenes from fishermen's and peasant life around Chiem Lake, which form his favorite subjects, show equal devotedness in the treatment of landscape and figures, and include: "In the Face of the Storm" (1885, Dresden Gallery); "Peace" (1889, National Gallery, Berlin); "Serious Meeting" (1889, Münster Gallery); and "Chiem Lake" (1898, Reichstags-Gebäude, Berlin). He published a *Katechismus der Malerei* (3d ed. 1898).

RAVAILLAC, rá'vá'yák', FRANÇOIS (1578-1610). The assassin of Henry IV. of France. He was born at Angoulême, was a notary's clerk and schoolmaster, suffered imprisonment for debt, and became diseased in health and unsettled in mind. After his release he joined the Order of Feuillants in Paris, but was expelled as a visionary fanatic, and then became inspired with hatred of the Huguenots, and determined to kill the King. On May 14, 1610, as the King was passing in his coach through the narrow street of Laferronnerie, Ravailiac climbed upon the right rear wheel of the carriage at the moment that its advance was hindered by a heavy wagon, and leaning forward he plunged a knife into the breast of the King. The first blow glanced aside but at the second thrust the knife entered the heart. Ravailiac escaped in the confusion, but was soon captured, admitted his guilt, and after a formal trial was put to death in the Place de Grève, May 27th, being torn asunder by horses. He steadily refused to say whether he had accomplices. Suspicion has rested upon the Queen, Maria de' Medici, and her favorites, the Concini, upon the Duke of Epernon, and on the Spanish Court and its Jesuit advisers, but proof is lacking. Both Martin and Poirson have examined the case against Ravailiac with care, and have come to the conclusion that the real cause was fanaticism which had degenerated into monomania. Consult: Poirson, *Histoire du règne de Henri IV.* (Paris, 1857); Loiseau, *Ravailiac et ses complices* (ib., 1873); Martin, *Histoire de France*.

RAVANA, rá'vá-ná (Skt., howler). The name of a Rakshasa (q.v.) who ruled over Lanka or Ceylon, and was said to be a monster with ten heads. He carried off Sita, the wife of Rama, to his residence, but was ultimately conquered and slain by the latter. See RĀMĀYANA.

RAVELIN. See FORTIFICATION.

RAVEN (AS. *hracfn*, OHG. *hraban*, *raban*, Ger. *Rabe*, raven; perhaps connected with OPruss. *kracco*, black woodpecker, Lat. *corvus*, Gk. *κόραξ*, *korax*, raven, Lat. *cornix*, Gk. *κόρῳξ*, *korōñc*, crow, Skt. *karava*, raven, and with Lat. *crocire*, OChurch Slav. *krakati*, to croak, as well as with OHG. *hruoñ*, AS. *hroc*, Eng. *rook*). The largest of corvine birds (*Corvus corax*), a species of crow usually more than two feet in length. The feathers on the neck are long, narrow, and pointed, forming a ruff; the bill is strong, compressed, sharp, somewhat hooked, and surrounded at the base with feathers and bristles. The wings are long and powerful; the color is uniform black, lustrous in the male, and although this bird is nowhere migratory, even during winter in the Arctic regions, it never turns white at that season, as do most Arctic

animals. The raven was originally to be found in almost all parts of the Northern Hemisphere, but is now nearly or quite extinct east of the high central plains, though still numerous in the western half of the country, and in Northwestern Canada. It goes about alone, or in pairs, and is one of the most omnivorous of birds, feeding on fruits and nuts, insects, worms, mollusks, birds' eggs and fledglings, and small mammals. It rejoices in carrion, and not infrequently attacks weak or sickly beasts, almost invariably choosing their eyes as its first point of assault. It makes its nest of sticks, coarse weeds, wool, hair, and the like, on a narrow ledge of a precipice or in some similarly inaccessible situation, usually as early as February. The eggs are green, thickly marked with dark streaks and blotches. (See Plate of EGGS OF SONG BIRDS.) Ravens are occasionally captured when young and become interesting pets. By nature they are impudent, cunning, inquisitive, and mischievous. They destroy everything that can be destroyed, apparently with real pleasure; and they will steal anything they can carry off, particularly glittering things. Moreover, they have considerable power of imitating human speech. Newton and others regard the raven as the most highly developed mentally and physically of all birds. It is celebrated for its longevity, and instances are on record of its living seventy or eighty years. In the Southwestern United States there is found a crow-like bird, the white-necked raven (*Corvus cryptoleucus*), with the neck-feathers of a raven, but their bases pure white. Several other species are known in various parts of the world. Consult Newton, *Dictionary of Birds* (New York, 1896), and authorities therein cited. Compare CROW; JACKDAW; and see Plate of JAYS, MAGPIES, ETC.

RAVENALA. A Madagascar plant. See TRAVELER'S TREE.

RAVENEL', HENRY WILLIAM (1814-87). An American botanist, born in Saint John's Parish, Berkeley County, S. C. He became a planter in Saint Johns, and then went to Aiken, S. C. He made a special study of the phenogams of South Carolina and various fungi and cryptogams. The genus *Ravenelia* of the Uredinea is named after him. His works include: *Fungi Caroliniani Essiccati* (1853 to 1860), and *Fungi Americani Essiccati* (1878 to 1882) with M. C. Cooke.

RAVENNA, rá-vén'ná. The capital of the Province of Ravenna, in the Compartimento of Emilia, Italy, situated on a marshy, unhealthy plain between the Lamone and the Fiumi Uniti, six miles from the Adriatic, and about 40 miles east by south of Bologna (Map: Italy, G 3). Ravenna, connected with the sea by a canal, is surrounded by old bastions and low walls where may still be seen the iron rings to which the cables of ships were formerly fastened when the city was a seaport. It lies in a compact form. On the outskirts are extensive parks and pleasure grounds. In the centre of the town is the Piazza Vittorio Emanuele, with two high columns erected in 1483 by the Venetians and bearing the statues of Saints Vitalis and Apollinaris. The streets are wide and the squares are adorned with interesting statues, but the houses present a gloomy appearance, and the place, in its stillness, has a rather depressing effect on the visitor. With its basilicas Ravenna

is highly important in the history of Christian art from about 400 to 800, the Byzantine and the early Roman forms of architecture being here abundantly illustrated and suggestively united in the ancient churches. The basilicas here differ in many respects from those of Rome. Their interiors manifest also Ravenna's prominence in mosaic painting. The Cathedral of Sant' Orso was rebuilt in 1734, and is of no great interest. Its ivory throne of Saint Maximian, its "Elijah" by Guido Reni, and the ornamentation of animals and foliage are, however, valued. The fine octagonal Baptistery adjoining, supposed to be part of a Roman bath, was largely reconstructed after 1865. The interior is embellished with statues, and with the oldest (fifth century) of the rare mosaics of Ravenna, one of which here represents the Baptism of Christ. The interesting Church of San Vitale, situated where the saint was martyred, was consecrated in 547. It is octagonal. Its choir is embellished with rich mosaics. Charlemagne patterned the cathedral at Aix-la-Chapelle after this church. In the vicinity is the noteworthy mausoleum of Galla Placidia, now the San Nazario e Celso, begun in the middle of the fifth century by that Empress. Its mosaics also are fine. Many of the earliest buildings in Ravenna are due to Galla Placidia and her brother Honorius. These structures form in fact the unique period of its religious architecture. The interesting Basilica of Sant' Apollinare Nuovo, containing elaborate mosaics, was built by Theodoric as an Arian church. Adjacent to the Church of San Francesco is the tomb of Dante. It was reconstructed in 1780. His remains, which were kept hidden until 1865, are now inclosed in a marble urn. Another noteworthy church is the large Sant' Apollinare in Classe Fuori, dating from 535, and restored in 1779.

In the northeast portion of Ravenna stands the old city castle, the Rocca di Brancaleone, of Venetian origin, and partly demolished in 1735. Still farther northeast is the mausoleum of Theodoric the Great, called the Rotonda, decagonal in shape, with a flat roof. A part of the palace of Theodoric, architecturally as well as historically of great interest, is still to be seen, together with a porphyry basin which is designated as the King's coffin. The archiepiscopal palace, decorated with excellent mosaics, was restored in the sixteenth century. The Academy of Fine Arts, founded in 1827, has nothing of great note. The Byzantine Museum contains sculptures, fragments of architecture, etc. The former Monastery of Classe, dating from 1515, holds the municipal collections. The communal library, dating from 1707, has about 75,000 volumes and 800 manuscripts, including several very precious ones. Ravenna is intimately associated with the lives of Dante and Lord Byron. They made famous the ancient pine forest which extends many miles along the coast to the southeast. Directly south of the city rises the column of Gaston de Foix, who on April 11, 1512, defeated the Spanish and Papal forces here and fell in the moment of victory. The principal industries are the cultivation of the vine, the spinning and weaving of silk, and the manufacture of wine, glass, leather, bricks, and musical instruments. A large fair is held in May. The commerce is in cereals, wine, fruits, rice, and fish.

The population of Ravenna (commune) was, in 1881, 60,573; in 1901, 89,957.

HISTORY. Ravenna is one of the oldest towns in Italy. In Augustan times the Roman Adriatic fleet was stationed here and there was considerable commerce. In 404 the Emperor Honorius made this, then a city on the sea, his abiding place because it was well defended. Some years later it became an archiepiscopal see. Ravenna attained its distinctive prominence after the fall of the Roman Empire. It was seized by King Odoacer, and passed (493) into possession of the Ostrogoth Theodoric and became a magnificent seat of royal power. It was taken by Belisarius in 540 (539?), and was a place of official importance under the Greek emperors until 752 (see **RAVENNA, EXARCHATE OF**); it was next ruled by the Lombards. It soon fell into the hands of Pepin the Short, who turned it over to the Papal sway. Late in the thirteenth century it fell under the sway of the Polenta family. In 1441 it became subject to Venice, under whose régime it prospered greatly. In 1509 it was taken by Pope Julius II., and it remained a Papal possession until 1797. After being under French control for 17 years it was restored to Papal dominion by the Congress of Vienna, and became a part of the Italian kingdom in 1860.

Consult: Quast, *Die altchristlichen Bauwerke von Ravenna* (Berlin, 1842); Cardoni, *Ravenna antica* (Faenza, 1879); Diehl, *Ravenna; études d'archéologie byzantine* (Paris, 1885); Gregorovius, "Von Ravenna bis Mentana," in *Wanderjahre in Italien*, vol. iv. (5th ed., Leipzig, 1892); Goetz, *Ravenna* (ib., 1901).

RAVENNA. A village and the county-seat of Portage County, Ohio, 30 miles southeast of Cleveland; on the Erie, the Pennsylvania, and the Baltimore and Ohio railroads (Map: Ohio, II 3). It is in the lake region of northeastern Ohio, and has important agricultural interests. There are also iron works, machine shops, boiler works, foundries, and manufactories of flour, lumber products, brick and tile, electrical supplies, chairs, etc. Population, in 1890, 3417; in 1900, 4003.

RAVENNA, EXARCHATE OF. The designation of that part of Italy which was under the rule of the Byzantine emperors from 568 to 752. The capital of the governor or exarch (q.v.) was at Ravenna, and for a short time he ruled over the whole of Italy. When in 568 the Lombards began to invade Italy, which had been conquered by Narses (q.v.) in 553, the old Roman names and divisions rapidly disappeared, and new ones arose. A high military functionary, the exarch, was sent from Constantinople to resist the barbarians, the first one being appointed some time between 572 and 584. The Lombards soon conquered large portions of Italy, so that the various parts of the exarchate were no longer continuous, there being finally seven separate strips of territory, the chief of which situated about Genoa, and known as Liguria, was taken by the Lombards in 640. In 752 Aistulf, King of the Lombards, captured Ravenna, and the exarchate ceased to exist. The government of the exarch was always a military one and almost independent of all control, due to the difficulty of communication with Constantinople. The name exarchate continued to be used for the territory around Ravenna, which

had been given to the Papacy by Pepin in 755, as late as the twelfth century. Consult: Diehl, *Etudes sur l'administration byzantine dans l'exarchat de Ravenne* (Paris, 1888); Hartmann, *Untersuchungen zur Geschichte der byzantinischen Verwaltung in Italien* (Leipzig, 1889).

RAVENSBURG, rä'vens-böörk. A town in Württemberg, Germany, situated in a fertile valley, on the Schussen, 52 miles by rail south by west of Ulm (Map: Germany, C 5). It is mediæval in appearance. The leading industries are the spinning and weaving of woolen and linen fabrics. Ravensburg, founded in the eleventh century by the Welfs, became a free Imperial city in 1280. It belonged to Bavaria from 1803 to 1810, when it passed to Württemberg. Population, in 1900, 13,444.

RAVENSCROFT, EDWARD. An English dramatist, of the seventeenth century, best known for his polemic with Dryden. His plays were remarkably successful translations or remodelings of old plays. *Mamamouchi*, played first in 1671, adapts Molière's *Bourgeois gentil homme*; *The Wrangling Lovers* (1676) is an imitation of Thomas Corneille's *Engagements du hasard*; *Scaramouch* is a contamination of the *Marriage forcé* and the *Fourberies de Scapin*; and in *The Canterbury Guests* (1694) Ravenscroft actually composed a play almost entirely from his own previous work.

RAVENSCROFT, THOMAS (c.1592-c.1635). An English composer. He was born near London, received his musical education in Saint Paul's choir, and had the degree of bachelor of music conferred on him in 1607. In 1611 appeared his *Melismata, Musically Phansies*, etc., a collection of 23 part-songs, some of them of great beauty; and three years later he brought out another collection of part-songs under the title of *A Brief Discourse*, an essay on the old musical modes. Turning his attention to psalmody, he published in 1621 a collection of psalm tunes for four voices entitled *The Whole Book of Psalms, composed into Four Parts by Sundry Authors to Such Tunes as Have Been, and are Usually Sung in England, Scotland, Wales, Germany, Italy, France, and the Netherlands*. This was the first publication of its kind and innumerable similar works of subsequent date have been largely indebted to it. Each of the 150 psalms has a distinct melody assigned it. Two collections of secular songs similar to the *Melismata*, and entitled *Pammelia* and *Deuteromelia*, have been assigned to Ravenscroft; but it is probable that only a few of these songs were composed by him, while he may have revised and edited the whole. A selection from his works was printed by the Roxburgh Club in 1822. He died in London.

RAVENSTEIN, rä'ven-stin, ERNST GEORGE (1834—). A German-English geographer and cartographer, born at Frankfort-on-the-Main. He became, when eighteen years old, a pupil of Dr. A. Petermann, the celebrated geographer of Gotha. Removing to England, he was for twenty years (1855-75) in the service of the Topographical Department of the War Office. He served for years on the Councils of the Royal Statistical and Royal Geographical Societies, and was professor of geography at Bedford College in 1882-83. He was thoroughly instructed in the German school

of geography and his influence upon geographical interests and improved map-making in Great Britain has been helpful. He carried out many of his ideas as to the best methods of imparting cartographic information in his *Systematic Atlas* (1884), and especially as an expert in African geography and cartography and the history of early explorations. His *Map of Equatorial Africa* (1884) was the most notable map of a large part of the continent on a large scale that had been made up to that time. He was the first to receive the Victoria gold medal of the Royal Geographical Society (1902).

RAVESTYEN, rä've-stin, JAN VAN (c.1572-1657). A noted Dutch portrait painter, born at The Hague, where he entered the guild in 1597 and was repeatedly its dean. He was the first to paint those large groups of magistrates, and governors or trustees of corporations, and the like, in which Frans Hals, van der Helst, and Rembrandt displayed such mastery. The Municipal Museum at The Hague contains four pictures of that kind by this favorite painter of the fashionable society at The Hague, to wit: "Civic Guard Issuing from the Doelen" (1616); "Banquet of the Town Council" (1618); "Meeting of the Town Council" (1636)—superior to all others in coloring, full of grave harmony—and "Six Officers of the White Arquebusiers" (1638). In the Royal Gallery at The Hague are 24 portraits, "Colonels in the Dutch Service" (dated from 1611 to 1624). In the Brussels Museum may be seen the portrait of "Kenau Hasselaar," the famous heroine of Haarlem; in Dresden that of "Maurice of Orange" (1605); and in Brunswick the portrait of a "Lawyer" (1622), and an interesting life-size "Family Group of Ten." Others are in the Louvre (1633, 1634), in Amsterdam, Berlin, Munich, Copenhagen, and Turin, and a portrait of "Lucretia van der Meulen" is in the gallery of the Historical Society, New York City.

RAVIGNAN, rä've'nyän', GUSTAVE FRANÇOIS XAVIER DELACROIX DE (1795-1858). A noted French pulpit orator. He was born at Bayonne, studied in the Lycée Bonaparte at Paris, and having embraced the legal profession (1814), and obtained his degree, was named auditor of the Cour Royale at Paris, and afterwards (in 1821) received an appointment in the tribunal of the Seine. In 1822 he resolved to enter the Church. Having spent some time in the College of Saint Sulpice, he soon passed into the novitiate of the Jesuits at Montrouge, and thence to Dôle and Saint Acheul for his theological studies, at the termination of which he was himself appointed a professor (1828). On the expulsion of the Jesuits from France (in 1830), Ravignan withdrew to Brieg, in Switzerland, where he first taught, and then preached in various places. In 1835 he appeared in the pulpit of the Cathedral of Amiens, and finally (in 1837) was selected to replace Lacordaire (q.v.) at Notre Dame, Paris, in the duty of conducting the special 'conferences' for men which had been opened in that church. For ten years Ravignan occupied this pulpit with a success which has rarely been equaled, and his 'conferences' are regarded as models of ecclesiastical eloquence. In 1842 he undertook in addition to preach each evening during the entire Lent; and it is to the excessive fatigue thus induced that

the premature break-down of his strength is ascribed. He published an apology of his Order in 1844 (Eng. trans., *On the Jesuits, Their Institute, Doctrines, etc.*, London, 1844); and in 1854 a more lengthened work with the same view, *Clément XIII. et Clément XIV.*, which was intended as a reply to the *Life of Clément XIV.*, by the Oratorian Father Theiner. These, with some occasional sermons and 'conferences' (Eng. trans., London, 1873), constitute the sum of the publications issued during his life. He died in the convent of his Order at Paris. Consult his *Life* by A. Frogier de Ponlevoy (Eng. trans., London, 1869), and Poujoulet (Paris, 1862).

RAWALPINDI, rä'wül-pin'dè or rä'al-. A municipality and large cantonment, the capital of a district of the Punjab, British India, between the rivers Indus and Jhelam, 90 miles southeast of Peshawar (Map: India, B 2). It has a fort used as an arsenal and is encircled by a chain of defensive works. Its importance is purely military. It occupies part of the site of ancient Gajipur, and interesting archaeological relics have been unearthed. In 1849 the Sikhs surrendered here after their defeat by Gough at Gujarat. Population, in 1891, 73,800; in 1901, 87,688.

RAWDON-HASTINGS, FRANCIS, first Marquis of Hastings. An English soldier and statesman. See HASTINGS, FRANCIS RAWDON-HASTINGS, first Marquis of.

RAWITSCH, rä'vich. A town in the Province of Posen, Prussia, 64 miles south of Posen (Map: Prussia, G 3). It manufactures snuff, cigars, copper, iron, carpets, furniture, and horse-hair goods. Rawitsch was founded in 1632 by Protestant refugees. Population, in 1900, 11,739.

RAWLE, rä'l, WILLIAM (1759-1836). An American jurist, born in Philadelphia. After studying law in New York for some time Rawle went to London, and completed his studies in the Middle Temple. Returning to Philadelphia, he was admitted to the bar in 1783, and in 1791 was appointed United States District Attorney for Pennsylvania by President Washington, in which capacity he prosecuted the leaders of the Whisky Rebellion. He was once counsel for the United States Bank, was chancellor of the Associated Members of the Bar of Philadelphia and of the Later Law Association of Philadelphia, and in 1830 assisted in revising the civil code of Pennsylvania. In addition to his legal activities, he took much interest in science and in philanthropic and other undertakings; was the first president of the Pennsylvania Historical Society; and was a president of the Abolition Society; and for forty years was a trustee of Pennsylvania University. His publications include: *Judication of Rev. Mr. Heckewelder's "History of the Indian Nations"* (1818); *A View of the Constitution of the United States* (1825; 2d ed. 1829); and *Discourse on the Nature and Study of the Law* (1832). Consult Wharton, "A Memoir of William Rawle, LL.D.," in the *Collections of the Pennsylvania Historical Society*, vol. iv. (1840).

RAWLE, WILLIAM HENRY (1823-). An American lawyer, born in Philadelphia. He graduated at the University of Pennsylvania in 1841. Three years afterwards he was admitted to the bar, and quickly rose to prominence in his profession. He was vice-provost of the Law Academy

of Philadelphia from 1865 to 1873, and from 1880 until his death, was vice-chancellor of the Law Association of Philadelphia. In 1852 he published the first edition of his *Practical Treatise on the Law of Covenants*, which is still an authoritative work. Besides various important works, which he edited, he wrote *Equity in Pennsylvania* (1868); *Some Contrasts in the Growth of Pennsylvania and English Law* (1881).

RAWLINS. A city and the county-seat of Carbon County, Wyo., 136 miles west by north of Laramie; on the Union Pacific Railroad (Map: Wyoming, F 5). It is the seat of the State Penitentiary. Rawlins has considerable commercial importance as the shipping centre for extensive sheep-raising and mining interests. The Union Pacific Railroad maintains repair shops here. Population, in 1890, 2235; in 1900, 2317.

RAWLINS, JOHN AARON (1831-69). An American general and Secretary of War, born in East Galena, Ill. At Galena he studied law in the office of Isaac P. Stevens, with whom in 1854 he entered into partnership. On April 16, 1861, shortly after the fall of Fort Sumter, he made a powerful war speech at a meeting which was presided over by Ulysses S. Grant. Shortly afterwards he became a major in an Illinois regiment, but at the request of Grant, who was now a brigadier-general and who had been favorably impressed by Rawlins, he resigned that post in order to become Grant's assistant adjutant-general. From that time until the close of the war he was Grant's close friend and adviser. He became chief of staff in November, 1862, and was honored with numerous promotions, ending with that of brevet major-general, March 13, 1865. Although he had had no previous military training, Rawlins showed keen insight into military problems. General Sherman said of Rawlins that he was "an intense thinker, and a man of vehement expression; a soldier by force of circumstances rather than of education or practice, yet of infinite use to his chief throughout the war and up to the time of his death." When Grant became President he made Rawlins his Secretary of War. Rawlins, however, had contracted consumption as a result of exposure during the war, and he died at Washington, September 6, 1869.

RAWLINSON, GEORGE (1812-1902). An English historian and Orientalist. He was born at Chadlington, Oxfordshire, November 23, 1812. He was the brother of Sir Henry Creswicke Rawlinson (q.v.). He graduated at Trinity College, Oxford, in 1838, taking a first class in classics; was elected a fellow of Exeter College in 1840, tutor in 1842, gained the Denyer Theological prize in 1842 and 1843, and subsequently received various high university appointments, including the Camden professorship of ancient history in 1862. From 1872 he was canon of Canterbury Cathedral, and was rector of All Hallows' Church, London, from 1888 until his death. His Bampton lectures in 1859 were published in the following year under the title of *Historic Evidence for the Truth of Christian Records*. His other works include a translation of *Herodotus* (1858-60) with notes and appendices, in which many of his brother's discoveries are incorporated; *The Five Great Monarchies of the Ancient World—Chaldea, Assyria, Babylonia, Media, and Persia* (1862); *Manual of Ancient History* (1869);

Historical Illustrations of the Old Testament (1870); the *Sixth Oriental Monarchy—Parthia* (1873); the *Seventh Oriental Monarchy—the Sassanians* (1875); *The Origin of Nations* (1877); *A History of Ancient Egypt* (1881); *A History of Phœnicia* (1889); *The Story of Parthia* (1893); and *A Memoir of Major-General Sir H. C. Rawlinson, Bt.* (1898).

RAWLINSON, SIR HENRY CRESWICKE (1810-95). An English soldier, diplomat, and Assyriologist. He was born at Chadlington, Oxfordshire, and after education at Wrington and Ealing, entered the military service of the East India Company in 1827, benefiting on the long Cape voyage to India by the company and counsels of the diplomat and Orientalist Sir John Malcolm. His facility in learning Hindustani and Persian made him interpreter at eighteen, and a year later he became paymaster of his regiment. In 1833, with other English officers, he was appointed to assist in the reorganization of the Persian Army. While stationed at Kermanshah in 1835, he began to study the Old Persian cuneiform inscriptions. The results of his research were submitted to the Royal Asiatic Society of London in 1837; in the same year his account of his travels through Susiana was printed in the *Journal* of the Royal Geographical Society, and the following year an account of a journey through Persian Kurdistan appeared. During the course of the Afghan troubles he left Persia to take up an appointment as political agent at Kandahar in 1840, and served throughout the campaign with distinction. He was appointed political agent in Turkish Arabia in 1843, consul at Bagdad in 1844, and in 1851 was promoted Consul-General. His official positions facilitated his archaeological researches, and in 1846 his successful decipherment of the Persian cuneiform inscriptions, especially that of Darius Hystaspis at Behistun, marked an epoch in the knowledge of Persia's history and ancient languages, and also prepared the way for the decipherment of the other cuneiform alphabets. Later successful work was accomplished in excavations in Babylonia for the trustees of the British Museum. He returned to England in 1855. In 1858 he was elected member of Parliament for Reigate, but the same year resigned on being appointed member of the Council of India. In 1859 he went to Teheran as Envoy Extraordinary and Minister Plenipotentiary to the Court of Persia. From 1865 to 1868 he again sat in Parliament as member for Frome. In 1871 he was elected president of the Royal Geographical Society. In 1875 his *England and Russia in the East*, created a considerable stir, owing to its revelations of the interior workings of Asiatic politics. Rawlinson received the honor of knighthood in 1891, and was a member of the Council of India until his death. His *Persian Cuneiform Inscriptions at Behistun* (1846-49), contained in the *Journal* of the Royal Asiatic Society, created an epoch in philology, and his *Cuneiform Inscriptions of Western Asia*, in collaboration with Pinches (5 vols., 1861-91), is almost equally important. He contributed largely to Farrier's *Caravan Journeys* (1856), and many of his discoveries are incorporated in *Herodotus* (1858) by his brother, Canon George Rawlinson (q.v.). Consult G. Rawlinson, *Memoir of Major-General Sir Henry Creswicke Rawlinson* (London, 1898).

RAYs AND SKATES

1. GUITAR-FISH (*Rhinochimaera lentiginosa*); upper and lower surfaces.

2. DEVIL-FISH (*Manta birostris*).

3. BIG SPOTTED SKATE (*Raja ocellata*).

4. SPOTTED STING-RAY (*Aetobatus narinari*).

5. FLORIDA STING-RAY (*Dasatis sabina*).

6. COMMON SKATE (*Raja erinacea*).

RAWLINSON, ROBERT (1810-98). An English civil and sanitary engineer, born in Bristol. He was first employed in work on docks and harbors, and then on the London and Birmingham Railway, under Robert Stephenson. Afterwards he worked in Liverpool, where he was assistant surveyor to the corporation, and Government inspector. In 1855 he was put at the head of the sanitary commission sent by England to the Crimea, and did much to lessen the terrible mortality among the soldiers. His works include: *Drainage of Towns* (1854); *Lectures on Sanitary Questions* (1876); and *Hygiene of Armies in the Field* (1883).

RAWMARSH. A town in the West Riding of Yorkshire, England, 2½ miles north of Rotherham (Map: England, E 3). It has collieries, foundries, machine works, and potteries. The municipality owns its gas and water works, electric lighting, street railways. Population, in 1901, 14,600.

RAWNS'LEY, HARDWICK DRUMMOND (1850—). An English clergyman and poet, born at Shiplake-on-Thames, September 28, 1850. After graduating from Balliol College, Oxford, he took orders in the English Church (1875), and became curate at the mission of Clifton College, Bristol, vicar of Wray at Windermere (1878-83), then vicar of Crosthwaite at Keswick and honorary canon of Carlisle. He published many volumes of verse, and among his prose works are: *Village Sermons* (two series, 1894 and 1897); *Life and Nature at the English Lakes* (1899); and *Memories of the Tennysons* (1900).

RAWSON, ALBERT LEIGHTON (1828—). An American author, traveler, and artist. He was born at Chester, Vt., and educated privately at Black River Academy, Ludlow, Vt. Always much interested in esoteric orders, he was adopted as brother by the Adwan Bedouins of Moab, initiated by the Druses on Mount Lebanon, and in America became one of the founders of the Order of Nobles of the Mystic Shrine, also a member of the Theosophical Society and the Society of the Rosy Cross. He has illustrated several books dealing with the East, among them *lives of Christ* by Beecher, Deems, and Crosby. He has published various translations from Oriental languages, a *Vocabulary of the Bedouin Language of Syria and Egypt* (1874), and a *Dictionary of Arabic, German, and English* (1876).

RAWTENSTALL, *ra'ten-stal*. A municipal borough in Lancashire, England, on the Irwell, 18 miles north of Manchester (Map: England, D 3). It is a busy manufacturing centre with woolen, cotton, and carpet manufactures, collieries, and stone quarries. Population, in 1891, 29,500; in 1901, 31,000.

RAY (OF. *raie*, *raye*, Fr. *raie*, from Lat; *raja*, ray, roach; connected with AS. *roche*, LGer. *ruche*, Ger. *Roche*, MDutch *roch*, OF. *roche*, *rosse*, Fr. *roche*, Eng. *roach*). A general name for the elasmobranch fishes of the order Batoidei, characterized by the dorso-ventrally flattened body. This order includes the saw-fishes, sea-devils, stingrays, skates, guitar-fishes, and torpedoes (qq.v.). The true rays have a flat body; the pectoral fins are large and fleshy, appearing as lateral expansions of the body, and along with it forming a circular disk or a rhomboid, to which is attached a rather long and slender tail. The pectoral fins are prolonged till they meet in

front of the snout, and backward till they join the ventral fins. The eyes and spiracles look upward. The gill-openings (five) are on the under side of the body, close behind the mouth; and toward the tail are the stomach, intestines, and other viscera. The males are furnished with claspers. Most of the species are egg-laying; but the guitar-fishes (*Rhinobatidae*) are peculiar in that their eggs are retained until they hatch within the body. The eggs are large and are inclosed in thin horny cases resembling those

TYPE OF RAY'S EGG.

of sharks, but more rectangular in form, with projections at each of the four corners, by which they catch upon and are held to eel-grass or other supports until they hatch. These eggs are familiarly known in England as 'skate barrows,' and in America as 'mermaids' purses.' Rays are found in all seas, especially in the warmer ones, and commonly inhabit sandy or muddy shores, lying on the bottom, where they feed on mollusks and are often cast up on the beach.

The most common rays in the United States are those of the typical family Rajidae, usually called 'skates.' Those of the family Myliobatidae are called 'eagle-rays' (q.v.). A large section of the order is known as the suborder Masticura, or whip-tailed rays, in allusion to the very long slender tail, which in most species, especially of the family Dasyatidae, is armed, near its base, by one or more large jagged, erectile spines, capable of inflicting a severe and even dangerous wound. This has given to those fishes the name of stingray. The common stingray of the Atlantic shore is the 'clam-cracker' (*Dasyatis centroura*), which abounds from Maine to Cape Hatteras, and sometimes reaches a length of ten to twelve feet. The color is olive-brown above and nearly white below. Until half grown the young are smooth, but as they approach maturity broad conical bucklers appear on the back and tail, and many flattened tubercles. This tendency to grow rough with age characterizes most of these fishes, but is sometimes checked, as in the case of the smooth stingray or 'bat-fish' (*Myliobatis californicus*) of the Pacific Coast. Stingrays gather upon beds of cultivated oysters, or in places where clams abound, and destroy great numbers of these valuable mollusks. No trace of any poison glands has been found, but Kingsley says that the mucus of the fish probably possesses poisonous qualities.

Fossil selachians allied to the rays are represented by fragmentary remains from Devonian and Carboniferous rocks and by more perfect and abundant material in the Mesozoic and Tertiary deposits. Exquisitely preserved skeletons of *Rhinobatis* from the Jurassic lithographic stone of Bavaria present few differences from modern species of the same genus. Consult: Kingsley, *Standard Natural History* (Boston, 1885); Goode, *Fishery Industries*, sec. i. (Washington, 1884); Jordan and Evermann, *American Food and Game Fishes* (New York, 1902). See Plate of RAYS AND SKATES.

RAY, ISAAC (1807-81). An American physician, born at Beverly, Mass. He graduated in medicine at Bowdoin College in 1827, and in 1841 was appointed superintendent of the Augusta State Insane Asylum. He was superintendent of the Butler Hospital for the Insane at Providence, R. I., from 1845 to 1866, when he removed to Philadelphia, where he wrote extensively for periodicals. He was the author of *Conversations on Animal Economy* (1829); *Medical Jurisprudence of Insanity* (1838); *Education in Relation to the Health of the Brain* (1851); and *Mental Hygiene* (1863).

RAY, JOHN (1627-1705). An English naturalist. He was educated at Cambridge, where he became a fellow and took orders in the Church of England. He resigned his fellowship in 1662 and for a time lived with his friend Francis Willughby, with whom he afterwards traveled extensively in England and on the Continent, studying botany and zoölogy. Ray published the following important works on the classification of plants and animals: *Catalogus Plantarum Angliæ* (1670); *Ornithologia*, with Willughby (1676); *Methodus Plantarum Nova* (1682); *Historia Piscium*, with Willughby (1686); *Historia Plantarum* (1686-1704); *Synopsis Methodica Animalium, Quadrupedum, et Serpentina Generis Vulgarium* (1693); *Historia Insectorum* (posthumous, 1710). Ray's position in science is an important one, in that he was the first to attempt a classification of animals and plants which should express their natural relationships and he first introduced a workable definition of the term *species*. His work furnished the basis upon which Linnaeus and Cuvier have constructed the modern systems of classification. The Ray Society of London perpetuates his worthy fame.

RAYET, râ'yâ', OLIVER (1847-87). A French archaeologist, born in Cairou (Lot), and educated at the Normal College and in the French School at Athens (1869), whither he returned after the Franco-Prussian War. Soon afterwards the Rothschilds sent him with Albert Thomas to carry on excavations in Miletus. In 1884, having acted as maître de conférences in Greek epigraphy at the Ecole des Hautes Etudes, and as suppléant in various chairs of archaeology, he became professor of archaeology at the Bibliothèque Nationale. The *Monuments de l'art antique* (1884 sqq.) was begun under his editorial charge. His other works were mostly in periodicals, but in 1888 were published a *Histoire de la céramique grecque*, edited by Max Collignon, and a series of essays, *Etudes d'archéologie et d'art*.

RAYLEIGH, râ'li, JOHN WILLIAM STRUTT, third Baron (1842—). A distinguished physicist. He was educated at Trinity College, Cambridge, graduated in 1865, as senior wrangler in the mathematical tripos, and became a fellow of the college in 1866. He succeeded to the title of baron in 1873. He was professor of experimental physics in the University of Cambridge during 1879-84, and professor of natural philosophy in the Royal Institution of London since 1887. He has been a fellow of the Royal Society since 1873, vice-president of the British Association (section A) since 1882, member of numerous other scientific societies, including the United States National Academy of Sciences, and a correspondent of the Institute of France. Since 1896 he has been the

scientific adviser to Trinity House, the British Lighthouse Board. In 1894 he discovered, in conjunction with Professor Ramsay, a new element, present in the atmosphere, which he has since prepared in quantity and has named argon. For this discovery he received from Columbia College, on recommendation of the National Academy of Sciences, the Barnard medal 'for meritorius service to science.' Lord Rayleigh ranks as one of the greatest living physicists. His experimental work has been largely in the field of electrical standards and in physical optics; but he has carried on important researches in nearly every branch of physics, especially in acoustics, where his investigations are of the greatest value. His work is characterized by extreme care and accuracy, and the use of the most simple apparatus, often home-made. He is the author of many valuable papers in the *Philosophical Magazine*, *Philosophical Transactions*, *The Theory of Sound* (2 vols., 1877-78 and 1894), and has edited J. Clerk Maxwell's *Heat*. His collected papers have been published in four volumes (London, 1899-1903).

RAYMOND VI. Count of Toulouse. See TOULOUSE.

RAYMOND, ANDREW VAN VRANKEN (1854—). An American clergyman and educator, born at Vischer's Ferry, N. Y. He graduated at Union College in 1875 and the New Brunswick Theological Seminary in 1878. He held pastorates at Paterson in 1878-81, at Plainfield in 1881-87, and at Albany in 1887-94, when he was made president of Union College.

RAYMOND, BRADFORD PAUL (1846—). An American educator, born near Stamford, Conn. He served through the last year of the Civil War, and in 1866 entered Hamline University, Red Wing, Minn. On its suspension in 1869, for lack of funds, Raymond hired the college buildings and conducted the institution to the close of the year. Having completed his academic course at Lawrence University, Appleton, Wis., he studied theology at Boston University, and philosophy at Leipzig and at Göttingen. After a short pastorate at Nashua, N. H., he became president of Lawrence University in 1883, and of Wesleyan University in 1889.

RAYMOND, HENRY JARVIS (1820-69). An American journalist and politician, born at Lima, Livingston County, N. Y. He graduated at the University of Vermont in 1840, and removed to New York City, where he studied law, and contributed to the *New Yorker*. When, in 1841, Greeley founded the *Tribune*, Raymond became associated with him as assistant editor. In 1848 he left the *Tribune*, and took an editorial position on the *Courier and Enquirer*, becoming at the same time associated with the publishing house of Harpers as a literary adviser. In 1851 he founded the *New York Times*, the first number of which appeared on September 18th of that year. He was a strong anti-slavery Whig, and after serving in the State Assembly, in 1854 he was elected Lieutenant-Governor of the State. In 1856 he became one of the most active and influential leaders of the new Republican Party in New York, was a member of its first national convention and drafted the famous *Address to the People*. In 1861 he was again elected to the State Assembly and chosen Speaker. In 1864 he was elected to Congress. After Lin-

coln's death he took the position that the Southern States had never actually been out of the Union and gave his partial support to Johnson's plan of reconstruction. In 1866 he left the Republican Party, was one of the promoters of the National Union (Loyalists') convention at Philadelphia, and wrote the *Address and Declaration of Principles* adopted by it. Raymond was the author of *A Life of Daniel Webster* (1853); *Political Lessons of the Revolution* (1854); *Letters to Mr. Yancey* (1860); and *A History of the Administration of President Lincoln* (1864), enlarged and republished in 1865 as *The Life and Public Services of Abraham Lincoln*. Consult *Maverick, Henry J. Raymond and the New York Press for Thirty Years* (Hartford, 1870).

RAYMOND, JOHN HOWARD (1814-78). An American educator, born in New York City. He graduated at Union College in 1832; studied law at New Haven, and in 1834 entered the theological seminary (now Colgate University) at Hamilton, N. Y. In 1839 he became professor of rhetoric and belles-lettres at Madison University, and in 1850 professor of belles-lettres at Rochester University. He organized the Brooklyn Collegiate and Polytechnic Institute in 1856, and from 1865 until his death was president of Vassar College and professor of mental and moral philosophy there. Consult *The Life and Letters of John H. Raymond* (New York, 1880).

RAYMOND, JOHN T. (1836-87). An American comedian, whose real name was O'Brien. He was born in Buffalo, N. Y. In 1858 he made his early success with *Sothern in Our American Cousin*, in which he afterwards appeared in London and in Paris. His greatest popular 'hit,' however, was as Colonel Mulberry Sellers in a dramatization of Mark Twain's *Gilded Age* (1873), a character that became completely identified with his own breezy optimism. Consult: McKay and Wingate, *Famous American Actors of To-Day* (New York, 1896); Matthews and Hutton, *Actors and Actresses of Great Britain and the United States* (New York, 1886).

RAYMOND, ROSSITER WORTHINGTON (1840-). An American mining engineer and metallurgist, born in Cincinnati, Ohio. He graduated at the Brooklyn Polytechnic Institute in 1858, and after spending three years in study at Heidelberg, Munich, and Freiberg, he entered the Federal Army as additional aide-de-camp with the rank of captain. In 1864 he began practice in New York as a consulting engineer, but in 1868 became United States Commissioner of Mining Statistics, a position which he held until 1876. After 1867 he was connected with mining journals, and from 1870 until 1882 he was lecturer in Lafayette College on economic geology. He published annual reports of mining statistics, 1869-76; *Peter Cooper* (1901); and several other works.

RAYMOND OF PEÑAFORTE, pá'nyá-fór'tá (c.1180-1275). A Spanish theologian, born at the Castle of Peñaforte, in Catalonia, and educated at Barcelona and Bologna. On his return to Spain he became canon of Barcelona (1219), then archdeacon, and in 1222 a member of the Dominican Order, of which he was made General in 1238. In 1230 he was appointed by Gregory IX. to codify the canon law. His *Decretalia* form the fifth volume of the present canon law,

and his *Summa de Pœnitentia* (printed in 1603) make a compendium of ecclesiastical jurisprudence. Raymond became Archbishop of Tarragona in 1235, and was prominent in the work of the Inquisition in France and Spain, and in preaching crusades against the Moors. He was canonized in 1601, and January 23d was made his day. Consult *Danzas, Raymond de Pennafort* (Poitiers, 1885).

RAYMOND OF SABUNDE, sá-bōōn'dá (?-1437). A Spanish theologian. He was born in Barcelona, taught theology, philosophy, and medicine at Toulouse (1430-32), and died as rector of the university there. His fame rests upon his natural theology, which he wrote in Spanish, but which appeared in a Latin translation after his death, and has been widely circulated (latest edition, Sulzbach, 1852). Montaigne translated it into French (Paris, 1569; latest edition, 1605). This famous book employs the expression now so familiar that there are two books by which the truth can be known: the book of Nature and the book of Revelation. The essential contents of these two books are the same. The difference is that in the latter truth is given dogmatically in the shape of precept, whereas in the former truth is arrived at by means of investigation and ratiocination. He even endeavors to demonstrate that the book of Nature contains evidence of the divine mysteries of Christianity. His assertion in his prologue that although reason unaided by revelation could not discover these mysteries, yet, given these mysteries, reason was competent to explain them, caused this prologue to be put upon the index by the Council of Trent, and so it is not given in the edition of 1852. He was a mystic of the school of Raymond Lully. Consult: Matzke, *Die natürliche Theologie des Raymundus von Sabunde* (Breslau, 1846); Huttler, *Die Religionsphilosophie des Raymundus von Sabunde* (Augsburg, 1851); Kleiber, *De Raymundi Vita et Scriptis* (Berlin, 1856).

RAYNAL, rá'nál'. GUILLAUME THOMAS FRANÇOIS (1713-96). A French author. He was born at Saint-Geniez, and was educated for the priesthood with the Jesuits of Péczenas. In 1747 he went to Paris, and was attached to the Church of Saint Sulpice. His peculiarities soon led him out of the Church, and he became one of the editors of the *Mercur de France*, where his philosophic mind found associates and scope, and his taste for history made him an historian. His works, though not now of high value, were conspicuous in their time, when philosophy and literary independence were novelties. Among them was *Histoire philosophique et politique des établissements et du commerce des Européens dans les deux Indes* (1770), which contained writings of Diderot as well as Raynal, and fell under the condemnation of the Parliament in 1781. His *Révolution d'Amérique* appeared in an English translation in London (1781), and was severely criticised by Thomas Paine.

RAYNOUARD, rá'nōō'ar', FRANÇOIS JUSTE MARIE (1761-1836). A French philologist and poet, born at Brignoles, September 18, 1761. He studied at Aix, became advocate, entered politics as a Girondin Deputy (1791), was imprisoned during the Terror, achieved reputation as a dramatist and poet; was elected to the Academy (1807), and became its perpetual secre-

tary (1817). After the fall of the Empire he distinguished himself by linguistic researches, especially in Provençal. His theories, though often false, stimulated the progress of Romance philology. (See ROMANCE LANGUAGES.) Note-worthy are his poem *Socrate dans le temple d'Aglaure* (1803), the tragedy *Les templiers* (1805), his anthology of Troubadour poetry (1816-21), and a Troubadour Lexicon (*Lexique roman*, 1838-44). His linguistic theories are embodied in the *Recherches sur l'ancienneté de la langue romane* (1816), and the *Grammaire comparée* (1821).

RAZIN, rä'zén, STENKO (?-1671). A Russian rebel, born in Teherkask. In 1667 he was elected leader of the rebellious Cossacks, and, after plundering the caravans and fisheries along the Volga and meeting defeat in Persia (1668), he attacked Russia. Pardonned once by Alexis, he rebelled again. Joined by dissatisfied elements, Razin was at first successful, captured many cities, and ruled along the Volga as far as Nizhni Novgorod. Then he was several times defeated, and in 1671 was executed at Moscow. He was a hero of the popular *bilini*, and Kostomaroff made him the subject of an historical monograph (Saint Petersburg, 1859).

RAZORBACK. A whale, the finback (q.v.). Also, a name in the United States for a semi-wild hog, common in the Southern States.

RAZORBILL, or RAZOR-BILLED AUK. An auk (*Alca torda*), very common on the coasts of the North Atlantic, frequenting lofty precipices, from which its eggs are taken, with those of guillemots, by persons who are let down by ropes. The eggs are esteemed a delicacy, and the flesh of the bird itself is much used for food. The razorbill is about 17 inches long, and takes its name

BILL OF RAZORBILL.

from its sharp-edged, puffin-like beak. The anterior parts, back, wings, and tail, are black, the breast and belly white. It is a very fierce bird, and, if seized, will lay hold of the hand in return. The egg is about three inches long, bluish-white or buffy, heavily spotted with brown. Great numbers of razorbills, are annually killed for the sake of their feathers, particularly on the coast of Labrador, where they are extremely abundant. See AUK.

RAZOR-CLAM. An edible bivalved mollusk of the family Solenidae, whose elongated shell, gaping at each end, suggests the handle of a razor. (See Colored Plate of CLAMS.) The species are numerous, and inhabit the sands of all shores except in the coldest parts of the world. The common species of the eastern coast of the United States is *Ensatella Americana*, which is an inhabitant of sand flats and bars where the water is pure. They live in holes which run down vertically, two or three feet, and into which they retreat when alarmed. It is useless to attempt to dig them out, as they burrow so rapidly that they are soon beyond the reach of the spade. This species is five or six inches long, about an inch broad, and handsomely colored.

RÊ, rä (less correctly RA). The name by which the sun-god was most generally known in

ancient Egypt. According to the Egyptian myths, Rê appeared upon the surface of the primeval ocean and, overcoming the powers of darkness, brought order out of chaos, and assumed the government of the world. He reigned for a long period, but finally grew old, the gods became unruly, and the great goddess Isis, who was profoundly versed in magical lore, took advantage of his failing strength to wrest from him by a stratagem his secret name, the source of his power. Even men rebelled against him, and in his anger he sent down the goddess Hathor to destroy them, but he relented at the sight of the terrible slaughter and turned the goddess from her purpose. Wearing at length with the struggle, Rê gave up the government of the world and retired to rest in heaven upon the back of the celestial cow. With the spread of the solar religion throughout Egypt, Rê was identified with a number of local deities who were regarded as special manifestations or phases of the same god. Horus of Edfu, for example, was the morning sun rising upon the horizon or the sun of spring coming forth in renewed activity after gloom of winter. Tum or Atum of Heliopolis, the great centre of solar worship, was the sun setting in the west, and Osiris represented the same phase. The identification was gradually extended to divinities like Ammon of Thebes and Min of Koptos, who originally possessed no solar character whatever, and in course of time nearly every divinity in the Egyptian pantheon came to be identified with Rê. Amenophis IV., of the Eighteenth Dynasty, carrying this theological tendency to its logical conclusion, endeavored to establish a species of monotheism based upon the worship of Rê, under the new name of Aten or the solar disk, as the universal source of life, but the reformed religion died with its founder. Rê is usually represented as a hawk-headed man holding in one hand the symbol of life and in the other the royal sceptre. Upon his head is the solar disk in the coil of the uræus serpent. In the Book of the Dead (q.v.) the god is conceived as sailing through the heavens during the day in his bark, giving light to the world, and as continuing his voyage at night through the lower world, to rise again the following day. As he advances, his brilliant rays overwhelm the fiends who would impede his progress. The Egyptian Pharaohs were believed to be the direct descendants of the god, and from the time of the Fifth Dynasty the title 'Son of Rê' formed an essential part of the royal titulary. Consult: Erman, *Life in Ancient Egypt* (London, 1894); Wiedemann, *Religion of the Ancient Egyptians* (New York, 1897). See also EGYPT, section on the religion of ancient Egypt.

RÊ, rä, ÎLE DE. A small island on the coast of the French Department of Charente-Inférieure, opposite the city of La Rochelle, from which it is separated by the Pertuis Breton (Map: France, E 5). It is about 16 miles long and 3 miles broad, and consists mainly of sand dunes, with cliffs on the southeast coast, where there are several forts. Saint-Martin, the capital of Rê, is a well-fortified little town, with a good harbor and trade. The chief occupations of the inhabitants, who in 1901 numbered 14,232, are fishery, oyster-farming, viticulture, and the manufacture of salt. In 1627, while the Huguenot stronghold of La Rochelle was besieged by

the forces of Louis XIII., the English, under the Duke of Buckingham, made a powerful but unsuccessful expedition against the island.

REACTION. In psychology, a term used to denote response to sensory stimuli. In experimentation this response takes the form of physical action, and as the stimulus applied is also physical, the time between the giving of the stimulus and the response may be readily measured by means of electrical appliances and delicately adjusted clocks. This time is called the reaction time, and includes physical, physiological, and psychical factors in the process measured. Reaction time is found to vary much both with individuals and with practice, and since the physical and physiological processes may be assumed or shown to be fairly constant, it affords a fair test of variation in the times of mental processes.

Simple reaction time may be determined in many ways. Let us suppose that a clock, recording accurately to the $\frac{1}{10000}$ second, is connected electrically with a hammer and an electric key. The connections are so arranged that the hands of the clock begin to move when the hammer falls upon its block. The sound thus made serves as stimulus to the reactor, who presses the button of the electric key as soon as he has heard it; the pressing of the button stops the clock hands, and the time of reaction (the time elapsing between the giving of the simple stimulus and the execution of the simple movement made in response to it) is thus registered in thousandths of a second. Very many observations have been made, with auditory, visual, and tactual stimuli, so that the norms of reaction are now well established. The simple reaction time is, evidently, the time required for the purely physiological process of conduction of excitation from sense-organ to brain; for the psychophysical process of sensation and impulse; and for the purely physiological process of conduction of excitation from brain to hand. If we know the rate of conduction in sensory and motor nerves, we can, by subtraction, determine the time required for the central or psychophysical process alone.

The simple reaction time varies largely with direction of the attention. There are three possibilities. The reactor may seek to distribute his attention, to attend both to the coming stimulus and to the movement of reaction; or he may attend predominantly (almost exclusively) to the sensory stimulus, or again to the movement. So we have three norms of reaction time: the central or natural time, the sensorial or complete time, and the muscular or abbreviated time. The natural time of an untrained subject will differ, according as he is disposed by his mental constitution to attend mainly to his own movement or to the stimulus presented to him; but it will, in every case, lie somewhere between the two extreme times. The norms for these (in thousandths of a second), as determined with practiced subjects, are:

	Sensorial	Muscular
Sight.....	270	180
Sound.....	230	120
Touch.....	210	110

The times differ, that is, with differences of sense-organ appealed to; and the average differ-

ence between the two times for the same sense department is $\frac{1}{10}$ second.

The simple reaction experiment presents two aspects, a qualitative and a quantitative. Regarded in the first aspect, the reaction is the exact type of a voluntary action; it is an impulsive action reduced, by laboratory devices, to its lowest terms; it differs from the impulsive actions of real life only by greater simplicity of motive (stimulus) and greater simplicity of responsive movement. We may therefore make it the basis of an introspective examination of action at large—in which case the time-values have merely a regulative importance, as an external check or control upon the validity of introspection. Regarded in its second aspect, the reaction measures the duration of a certain complex mental process. If, then, we vary this process in known ways, the consequent variation of the reaction times gives us a similar measure of other mental processes.

(1) Under the first heading we note that the course of the simple reaction may be qualitatively changed in various ways. The subject may be required to react to stimuli of different quality (e.g. tones, colors); to stimuli of different intensity (e.g. weak and strong pressures); to stimuli of varying intensity or quality (e.g. irregular alternation of loud and weak noises); under distraction; and without preadjustment of attention, i.e. without any signal that the experiment is about to begin. Further, the complex types of action may be studied. (See ACTION.) The subject may react to one of two or more known stimuli; he is told, perhaps, that either black or white will be shown, and that he is not to move until he has 'made sure' of the nature of the impression (discrimination reaction). Or he may be left in the dark, save in a general way, as to the nature of the stimulus: he is to react to a visual impression, and not to move until he has made sure of it, but the impression may be black, white, gray, or a color (cognition reaction). Again, he may be told that either black or white is to be shown, and that he is to respond to black by a right-hand and to white by a left-hand movement. Here we have the conflict of impulses characteristic of selective action. Once more, he may be told to respond to black, but not to answer at all if white is shown: here we have the conflict between impulse, on the one hand, and a group of ideas which do not prompt to movement, on the other, that is characteristic of volitional action. Selective and volitional actions may also be put together on the basis of the cognition reaction.

(2) Under the second heading we note, first, that an association may be interpolated into the course of the reaction. The reactor is shown a color; he is not to move until he has associated some idea to the color. The time of the association reaction *minus* the time of the simple reaction to the same stimulus gives us a rough measure of the duration of association. It averages three-quarters of a second. Secondly, we find that the cognition of intensities takes a longer time than that of qualities. This accords with the fact that quality is the absolute, and intensity a relative attribute of sensation. Thirdly, the reaction time to tonal fusions lasts longer, the higher the fusion degree: we cognize a minor third more quickly than we cognize a major third. Finally, the reaction method en-

ables us to trace the course of habituation, fatigue (q.v.), expectation, and practice (q.v.).

See PSYCHOLOGICAL APPARATUS.

REACTION (in medicine). A special vital movement tending to overcome some noxious action or influence affecting the organism. The term is also applied to an effect produced by the application of a stimulus to a nerve or muscle. In surgery the term has a special significance, and is used to indicate the process of recovery from a state of collapse. Collapse, reaction, and the general effects of shock upon the system are considered under SHOCK.

REACTION, CHEMICAL. A term applied to the transformations of substances into other substances having more or less different properties. (See CHEMISTRY.) It is noteworthy that the mutual transformations of the allotropic modifications of one and the same element must be considered as chemical reactions. Thus, the transformation of yellow phosphorus into red phosphorus is a chemical reaction. In essence the two substances are identical; but they nevertheless differ in their chemical behavior, and under the same physical conditions they possess different physical properties; so they must be considered as two distinct chemical individuals and their transformation into each other must be considered as a chemical reaction.

The general laws according to which chemical reactions take place include the law of the conservation of matter, the law of the conservation of the elements, the law of definite combining masses, the law of combining volumes, the law of mass action, and, of course, the law of the conservation of energy. The conservation of energy plays an important part in thermo-chemistry and electro-chemistry (q.v.). The other laws, with the exception of that of mass action, have been considered in the general article CHEMISTRY (q.v.). In the present article it remains to discuss briefly the action of masses.

At first consideration the concept of mass action appears to contradict the law of definite proportions. According to the latter, while substances may be mixed in any proportion whatever, chemical combination only takes place between definite relative quantities. Thus, oxygen combines directly with hydrogen only in the proportion of eight parts (by weight) of the former to one of the latter, whether a given mixture in which the reaction is caused to take place contains the two gases in this or in any other proportion. What, then, can the masses of the reacting substances have to do with the course of the reaction? A simple example may serve to illustrate the point in question. Ordinary alcohol and acetic acid combine in the proportion of 46 parts of the former to 60 parts of the latter. If 46 grams of the alcohol should be left in contact with 60 grams of the acid for a sufficiently long time, 30.7 grams

of the alcohol would combine with 40 grams of the acid ($30.7 : 40 = 46 : 60$), yielding 58.7 grams of ethyl acetic ester and 12 grams of water. The rest of the alcohol (15.3 grams) and of the acid (20 grams) would remain uncombined, side by side with the ethyl acetic ester and water, no matter how long the mixture were kept (in one experiment the mixture was actually kept for seventeen years). Now, if instead of 46 grams a larger quantity of alcohol were left in contact with 60 grams of acetic acid, more of the latter would ultimately be found to have entered into combination, and consequently less than 20 grams of it would ultimately remain free. But the proportion of alcohol and acid combined would still be 46 parts of the former to 60 parts of the latter. This example illustrates the following principles: (1) Whatever the proportion of the reacting substances present, chemical combination takes place between the same relative quantities; (2) whatever the proportion of the reacting substances present, the possible maximum of each may not enter into combination, a fraction of the several substances present refusing to combine at all, as long as they remain in contact with the products of the reaction; (3) the amounts of the substances present determine the fraction that will enter into combination and the fraction that will remain free. The first of these principles is nothing else than the law of definite proportions. On the other hand, the doctrine of mass action has reference to the second and third of these principles, dealing, not with the relative combining quantities, but with the extent to which combination takes place.

A fact of the greatest importance for the theory of chemical transformations is that the course of many reactions can be reversed. For instance, we just said that ordinary alcohol and acetic acid partly combine to form ethyl acetic ester and water. But ethyl acetic ester and water, if allowed to remain mixed for a sufficient length of time, will react and produce free acetic acid and alcohol. In this transformation again the ester and water would partly react (in accordance with the law of definite proportions) and partly remain unchanged. Quantitative experiment would reveal the following facts: (1) If we should mix 88 grams of the ester with 18 grams of water (88 and 18 are, respectively, the reacting weights of the two substances), then $29\frac{1}{3}$ grams of the former and 6 grams of the latter would react to form 20 grams of free acetic acid and $15\frac{1}{3}$ grams of alcohol, while the remaining $58\frac{2}{3}$ grams of the ester and 12 grams of water would refuse to enter into reaction; (2) if after all change has ceased in our mixture, we should add to it a further quantity of either ester or water, then a further (but not complete) decomposition of ester into alcohol and acid would take place; (3) if, on the contrary, after all change has ceased in our mixture, we should add to it, not ester or water, but either free acetic acid or alcohol, a further change would take place, resulting in the formation of more ester and water. It would thus become clear that in a mixture of reacting substances with the products of their reaction, when the mixture is in a state of 'chemical equilibrium,' we may cause a reaction to take place either in one direction or in the opposite direction, by changing the relative masses of the ingredients. In other words, the masses of

substances may determine the course of a chemical reaction. The importance of this statement in chemical theory will be so much the more obvious if we consider that there is good reason for assuming that *all* reactions are reversible. Says Nernst: "It has been formerly often maintained that 'reversible reactions' are exceptional, or that two different classes of reactions must be distinguished, reversible and non-reversible. But no such definite line of demarkation exists by any means, and there is no doubt that under appropriate experimental conditions it will be possible to cause any reaction whatever to take place now in one, now in the opposite direction; that is to say, *in principle every reaction is reversible.*"

But what, then, becomes of the old notion of chemical affinity? According to that notion, a chemical change takes place solely because the components of a given substance have a greater affinity for the components of another substance than for one another: two compounds AB and CD react and yield AC and BD solely because the affinities between A and C, B and D, are greater than the affinities between A and B, C and D. If this notion were correct, the opposite reaction, viz. the transformation of AC and BD into AB and CD, would evidently be impossible. But many reversible reactions are known as a matter of fact. Therefore the old notion of chemical affinity as the sole cause of reactions must be either discarded or essentially modified. A careful study of facts leads to the following conclusion: The course of reactions and the final equilibrium to which that course leads are certainly influenced by the chemical affinities (whatever may be their ultimate nature); but those affinities are not alone in determining the chemical phenomena which they influence. In studying reversible reactions it is found that the action of masses comes in as a factor in all cases, without an exception. But it is also found that if chemically equivalent masses are started with in all cases, the fractions of those masses actually entering into reaction and the fractions remaining unchanged vary from case to case. In other words, as just stated, the equilibrium finally attained depends both on the nature of the reacting substances and on the masses present to start with. Still another factor takes part in influencing the course and end of reactions, viz. the temperature. Or, more exactly, the specific affinity factor at work in each case varies with the temperature. But this variation will be considered under THERMO-CHEMISTRY, and may be left out of account in the present discussion, in which all reactions are assumed to take place at constant temperature.

We have seen above that the total fraction found transformed when a reaction is over depends, among other things, on the masses present at its beginning. Similarly, it may be demonstrated by facts that the fraction transformed in a given interval of time *during* the reaction depends on the masses present at the beginning of that interval. And since the reaction itself obviously changes the masses present, part of the original substances gradually disappearing as such and masses of the products of the reaction gradually appearing in their stead, it is evident that the magnitude of the fraction transformed in unit of time varies from instant to instant. Were this not so, the 'velocity' of

a chemical reaction might be defined in terms of the amounts found transformed in any finite interval of time. But since, as just explained, the velocity is variable, it can be defined only in terms of the infinitely small amounts transformed in infinitely short intervals of time. (If this does not seem clear, see the article CALCULUS.) It may, however, be asked: But why consider at all the velocity of reactions? The answer is, Because it is the velocity that is immediately determined by affinity and mass action; and so, conversely, it is by measuring the velocity that affinity and mass action can be studied quantitatively. In the case of a reversible reaction, the direction of the change is the direction in which the velocity of reaction is the greater; the amount actually found transformed in any time depends on the difference between the velocities with which the two opposite reactions take place; and when the two velocities are equal, there is equilibrium. Thus the velocities of a reaction describe its course completely.

The development of the principles discussed in the preceding paragraphs forms the object of chemical kinetics and statics, the two subdivisions of the modern 'doctrine of affinity.' Chemical kinetics deals with chemical change; chemical statics with chemical equilibrium. At the basis of both is the law of mass action in its precise mathematical form, which may now be considered as established beyond the slightest possibility of doubt. For it has been demonstrated in three different ways: (1) by mathematical deduction from the kinetic theory of gases; (2) by mathematical deduction from the laws of thermodynamics; and (3) by extensive experimental observation. Correctly, but vaguely, the action of masses was first understood by the Frenchman Berthollet, in the beginning of the nineteenth century. In 1867 Guldberg and Waage, two Norwegian investigators, published a work (*Etudes sur les affinités chimiques*) in which the principles of chemical statics and kinetics were first stated and demonstrated in their rigidly mathematical form. But this work remained unknown for a number of years. Meanwhile Van't Hoff discovered the law of mass action independently in 1877; and from this date may be said to commence a new epoch in theoretical chemistry. The principal names connected with the demonstration and mathematical and experimental development of the law are, besides those of Guldberg and Waage, the names of Van't Hoff, Horstmann, Gibbs, Arrhenius, and Ostwald.

For further information, consult the works on theoretical and physical chemistry recommended in the article CHEMISTRY. See also ACIDS; DECOMPOSITION; DISSOCIATION; ELECTRO-CHEMISTRY; ESTERS; SOLUTION; THERMO-CHEMISTRY.

READ, CHARLES (1819-98). A French scholar, born in Paris, where he studied law, and served first in the magistracy and then in the administration, in the department of religious education (1852-58), and in that of historical documents (1865-70). In 1852 he founded the French Protestant Historical Society. His own labors preliminary to a history of the Reformation in France, which he did not complete, were mostly editorial, and include editions of Chamier's journal (1859), of Agrippa d'Aubigne's *Tragiques* (1872), and of his *Enfer* (1873) and

Printemps (1874), and of *Hotman's Tigre* (1875).

READ, GEORGE (1733-98). An American patriot, one of the signers of the Declaration of Independence. He was born in Cecil County, Md., received an academic education at Chester, Pa., studied law, and in 1752 was admitted to the bar in Philadelphia. Two years later he established himself in practice in Newcastle, Del. From 1763 to 1774 he was Attorney-General for the Crown for the counties of Kent, Delaware, and Sussex. In 1774 he was elected to the first Continental Congress. He was conservative, and at first stoutly opposed the idea of independence, but finally became convinced that independence was the only course, and affixed his signature both to the petition to King George and to the Declaration. Thenceforward he was enthusiastic in his support of the colonial cause, and as chairman of the first Naval Committee (1775-77) was largely instrumental in the establishment of the first American Navy. In 1776 he framed the new Constitution of Delaware, presided over the convention which adopted it, and became Vice-President and acting President (Governor) of the new State. He codified the Delaware laws, and in 1782 became a judge of the United States Court of Appeals for Admiralty Cases. He was a delegate to the Annapolis Convention of 1786 and to the Constitutional Convention in the following year. He was elected United States Senator in 1789 and again in 1791, but resigned in 1793 to become Chief Justice of Delaware, which post he continued to hold until his death. Consult W. T. Read, *Life and Correspondence of George Read* (Philadelphia, 1870).

READ, JOHN MEREDITH, JR. (1837-96). An American diplomat and writer. He was born in Philadelphia, graduated at Brown University in 1858, and at the Albany Law School in 1859, and was admitted to the bar. From 1860 to 1866 he was Adjutant-General of New York State, and was an active political organizer. Three years later he was appointed the first United States Consul-General to France and Algeria, where he organized the American consular service, and where, during the Franco-German War, he acted as Consul-General for the German States. In 1873 he was transferred to Greece as United States Minister to that country; and there he displayed such skill and energy, especially during the critical period which followed Russia's defeat of Turkey in 1878, that he earned the thanks of his Government. In 1879 he resigned and aided Greece in securing the territory which had been ceded to her by Turkey. His later years he spent mostly in Paris, engaged in study and research. He was a member of several societies and published a number of works, including *Military Reports and Suggestions* (1861); *Historical Inquiry Concerning Henry Hudson* (1864-66); *Charles Reade at Home* (1873); *The English Ancestry of Washington* (1894); and *Historic Studies in Vaud, Berne, and Saroy, from Roman Times to Voltaire, Rousseau, and Gibbon* (1897?).

READ, NATHAN (1759-1849). An American inventor. He was born in Warren, Mass., graduated at Harvard in 1781, and was tutor there from 1783 to 1787. In 1788 he conceived the idea of utilizing the steam engine for propelling boats and carriages, and, with that end in view,

began a series of experiments which resulted in the invention (1789) of the vertical multitubular fire-box boiler (patented August 26, 1791) now in general use. In 1796 he established the Salem Iron Foundry for the manufacture of anchors and chain cables, and in 1798 patented a machine for cutting and heading nails at one operation. He was a member of Congress from 1800 to 1803, and in 1807 removed to the vicinity of Belfast, Me., where he was for some years Chief Justice of the Court of Common Pleas. Among his inventions were: a pumping engine, a threshing machine, a method for equalizing the action of windmills, and a plan for utilizing the force of the tide, by means of reservoirs. Consult *Nathan Read: His Invention of the Multitubular Boiler and Portable High-Pressure Engine* (New York, 1870), by his nephew, David Read.

READ, OPIE PERCIVAL (1852-). An American author and editor, born in Nashville, Tenn. He edited the *Kansas Gazette* from 1878 until 1881. In 1883 he established the *Arkansas Traveller*, of which he was editor until 1893. His works include: *A Kentucky Colonel* (1889); *Emmett Bonlore* (1893); *A Tennessee Judge* (1893); *My Young Master* (1896); *Bolonyo* (1897); *The Wives of the Prophet* (1894); *In the Alamo* (1901); and several plays.

READ, THOMAS BUCHANAN (1822-72). An American poet and artist, born in Chester County, Pa., March 12, 1822. Apprenticed to a tailor, he ran away, learned cigarmaking in Philadelphia, sign painting in Cincinnati, other trades in other cities, published newspaper verse in Boston (1843), and for the rest of his life gave himself up to painting, visiting Europe several times, and finally residing in Rome. He achieved fair success in this art and somewhat in sculpture, but he is best known as a poet, especially for his stirring *Sheridan's Ride*, and his charming stanzas entitled *Drifting*. His first volume, *Poems*, appeared in 1847. *Lays and Ballads* followed the next year; *The New Pastoral*, an elaborate description of Pennsylvania life (1854); *The House by the Sea* (1856); and several other volumes attest his energy. In 1848 he compiled a volume entitled *Female Poets of America*, which was illustrated by engravings of portraits painted by himself. He also wrote a prose romance, and was conspicuous in his generation for versatility of talents, which, if concentrated, might have won him permanent fame. He died in New York City, May 11, 1872. Consult his *Poetical Works* (Philadelphia, 1865 and 1867).

READE, CHARLES (1814-84). An English novelist and playwright, born at Ipsden House, in Oxfordshire, June 8, 1814. He entered Magdalen College, Oxford, graduating A.B. in 1835 and M.A. in 1838; was elected lay fellow of his college (1835); made dean of arts at Magdalen (1845), and vice-president (1851); in the meantime had studied at Lincoln's Inn, and was admitted to the bar (1843). Reade never married, but formed a platonic friendship with an actress named Laura Seymour. He passed several years at his rooms in Magdalen, made many tours abroad, but lived mostly in London. Combative by nature, he was engaged in numerous lawsuits. He died at Shepherd's Bush, April 11, 1884.

Reade began his literary career as a playwright, and to the end continued to write plays

either single-handed or with others. He had great facility in expanding a play into a novel or in reducing a novel to a play. In 1852 *Masks and Faces*, written with Tom Taylor, was brilliantly received at the Haymarket. Reade turned this play into the novel *Peg Woffington* (1853), which was soon followed by the delightful *Christie Johnstone* (1853), having as heroine a New-haven fisher lass. In 1856 appeared *It is Never Too Late to Mend*, exposing prison discipline in England and Australia. This 'novel with a purpose,' which created a sensation, was succeeded by *Hard Cash* (1863), dealing with the iniquities of insane asylums; *Griffith Gaunt* (1865), on the marriage problem; *Put Yourself in His Place* (1870), on the terrorism of trades unions; *A Terrible Temptation* (1871); and *A Woman Hater* (1877), advocating woman's rights. All these novels are powerfully written. By itself stands Reade's masterpiece, *The Cloister and the Hearth* (1861), an historical romance, having as hero the father of Erasmus, and dealing in a wonderfully vivid manner with student and vagabond life in Europe toward the close of the Middle Ages. After Reade's death appeared *The Jilt and Other Tales* (1884) and *Good Stories of Man and Other Animals* (1884).

Reade is not among the greatest novelists. He had not a keen artistic sense. His character drawing is picturesque rather than psychological, and he often develops his situations in a highly sensational way. But he always had a story to tell; and therein he excelled perhaps all his contemporaries. Consult: Compton Reade, *Charles Reade, a Memoir* (London, 1887); and for a cordial estimate, Swinburne's *Miscellanies* (ib., 1886).

READE, JOHN (1837—). A Canadian journalist and author. He was born in Ballyshannon, Ireland, was educated at Queen's College, Belfast, and in 1856 came to Canada, where he established the *Montreal Literary Magazine*, and subsequently was connected with the *Montreal Gazette*. In 1864 he was ordained to the ministry of the Church of England. He was elected president of the Montreal Society for Historical Studies in 1887, and in 1896 a fellow of the Royal Society of Literature of Great Britain. His books include: *The Prophecy and Other Poems* (1870); *Language and Conquest* (1883); *The Making of Canada* (1885); *Literary Faculty of the Native Races of America* (1885); *The Half-Breed* (1886); and *Aboriginal American Poetry* (1887).

READE, WILLIAM WINWOOD (1839-75). An English traveler and novelist, nephew of Charles Reade. He began his travels by a visit to the western coast of Africa (1862), and on his return published an account of his tour called *Savage Africa*. Inspired by Du Chaillu's spirited sketches, he returned to Africa in 1868, started from Sierra Leone and traveled to the source of the Niger. Shortly afterwards he published the *African Sketch Book*, and in 1873-74 was special correspondent for the *London Times* during the Ashantee War. In addition to his *Story of the Ashantee Campaign* and other works on travel, he wrote several novels of no great merit, such as *Charlotte and Myra* (1859); *The Veil of Isis, or the Mysteries of the Druids* (1861); the singular work called *The Martyrdom of Man* (1872); and *The Outcast* (1875).

READER (from *read*, AS. *rǣdan*, Goth. *rēdan*, OHG. *rātun*, Ger. *raten*, to counsel, advise: connected either with Lat. *creri*, to think, or with Ochurch Slav. *raditi*, to be anxious for, Lith. *rodas*, willing, Skt. *rādḥ*, to be successful). The title of the third among the minor orders of the Roman Catholic Church, designating a class whose duty it was originally to read the lessons (q.v.) of Holy Scripture in public worship. Traces of their existence as a distinct clerical class are found as early as Justin Martyr, Tertullian, and Cyprian. By present usage, however, the office is nothing more than a formal step to the priesthood. See also LAY READER.

READING, rēd'ing. A municipal, Parliamentary, and county borough, the capital of Berkshire, England, on the Kennet, near its confluence with the Thames, 36 miles west of London (Map: England, E 5). The town is irregular in plan, but well built, and has fine buildings which include a municipal block with two town halls, clock tower, free library, valuable museum, concert hall, etc. Other buildings are the assize courts, the grammar school, founded in 1445, the University Extension College, and Sutton's Abbey Hall. Reading has interesting churches, and the remains of a magnificent Benedictine abbey, founded in 1121 by Henry I., whose burial place it became. Of its three parks the Palmer Park forms a fine recreation ground. The town owns valuable real estate, water, abattoirs, and markets; maintains bathing places, libraries, museum, art gallery, sewage farm, and provides technical instruction. It has an important trade in corn and agricultural produce; famous seed farms and biscuit manufactories, iron works and foundries, breweries, and manufactures of silks, ribbons, velvets, paper, and sauce. The town was of importance in 871, when the Danes made it their headquarters. Domesday mentions it as Radynge. Stephen built a castle which was destroyed by Henry II. Nine parliaments were held within the abbey, which Henry VIII. converted into a palace. In 1643 Reading surrendered to the Parliamentarians, who destroyed the abbey palace. Population, in 1891, 60,054; in 1901, 72,214. Consult: Coates, *History and Antiquities of Reading* (London, 1810); Doran, *History of the Borough and Castle of Reading* (ib., 1832); Jones, *Sketches of Reading: Historical, Archæological, and Descriptive* (Reading, 1870).

READING. A town in Middlesex County, Massachusetts, 12 miles north of Boston, on the Western Division of the Boston and Maine Railroad (Map: Massachusetts, E 2). It is chiefly a residential town. There is a public library with more than 8600 volumes. Church organs, organ pipes, carriages, boots and shoes, rubber, rubber cloth, imitation leather, games, and wire brushes are the most important manufactured products. The government is administered by town meetings convened annually. Reading was settled in 1638 and was incorporated in 1644. Population, in 1890, 4088; in 1900, 4969.

READING. A city and the county-seat of Berks County, Pennsylvania, 59 miles northwest of Philadelphia; on the Schuylkill River and the Schuylkill Canal, and on the Philadelphia and Reading, the Pennsylvania, and the Wilmington and Northern railroads (Map: Pennsylvania, F 3). It covers an area of about six square miles,

and is regularly laid out. There are 72 miles of paved streets, more than two-thirds of this distance being laid with macadam. The public park system comprises 198 acres. Mount Penn, to the east, and the Neversink Mountain to the south of the city, which afford magnificent views, are reached by inclined and electric railways. The more important educational institutions in Reading are the Inter-State Commercial College, the Reading Classical School for Boys and Girls, and Schuylkill Seminary. Other noteworthy features include the county court house, city hall, opera house, Girls' High School building, Masonic Temple, the public and the Berks County Law libraries, and the Reading, Homeopathic, and Saint Joseph's hospitals. The annual county fair is held here, handsome grounds and a race-track being maintained by the association in the northern part of the city. Reading is situated in a region possessed of much mineral wealth, including iron, coal, and limestone, and is an important manufacturing centre. In the census year 1900 an aggregate capital of \$27,975,628 was invested in the various industries, which had an output valued at \$36,902,511. Nearly one-third of the capital and one-fourth of the output were represented by the iron and steel-interests. There are extensive shops of the Philadelphia and Reading Railroad, foundries and machine shops, breweries, and manufactories of cigars, hosiery, knit goods, hats, carriages, pottery, paper, and wood pulp.

The government is vested in a mayor, chosen every three years, and a bicameral council, and in subordinate officials, the majority of whom are either elected by the people or appointed by the council. The school board is chosen by popular vote. The city has a net debt of about \$1,300,000; and the assessed valuation of property (real and personal) is about \$46,000,000. For maintenance and operation, there is spent annually about \$923,000, the main items being \$256,000 for schools, \$235,000 for the water department, \$69,000 for municipal lighting, \$61,000 for sinking fund and interest on debt, \$57,000 for streets, \$52,000 for the police department, \$42,000 for the fire department, and \$33,000 for sewers. The water-works, which were constructed at an expenditure of \$1,937,762, are owned by the municipality. Laid out in 1748 and settled mostly by Germans, Reading (named from Reading, England) was incorporated as a borough in 1783, its population then being 2100, and in 1847, with a population of about 12,000, it was chartered as a city. Its boundaries were extended in 1867 and 1869. Population, in 1890, 58,661; in 1900, 78,961.

READING. The process of conveying to the mind by sight written or printed words or symbols. Almost as commonly the word refers to the vocal expression of that which written or printed symbols are intended to convey. Still more broadly, reading is used to designate the art of speaking to an audience what has been composed by another.

The oldest method of teaching reading and the one that has been most widely followed is the alphabetic or synthetic method. By this a pupil first learns to identify the letters of an alphabet with certain sounds, and then to group these sounds in such a way as to produce others which stand for mental images. In the sixteenth

century Iekelsamer, the publisher of a German primer, pointed out that the sounds representing letters only confused the beginner when he came to combine them into words; but it was not until the latter part of the eighteenth century that any other method was able really to establish its claim to superiority. Since then, the analytic method, usually subdivided into the Look-and-Say or word method and the Syllabic method, has been constantly growing in favor. By this, pupils are first taught to associate a mental image with a single word or combination of words, and only later to analyze these combinations into their phonetic or alphabetic elements. The reading book has been made a means of inculcating certain dominant national ideals and principles as well as a drill book. The tendency has been to use selections from standard authors, and to provide for unabridged selections, rather than for extracts.

Reading as the oral expression of literature differs from the ordinary reading aloud in that the expression is usually to an audience, and in that the speaker commonly recites from memory, instead of reading from a printed page. As an art it is to be distinguished from oratory, where the speaker deals with that which he has himself composed.

READJUSTERS, or REFUNDERS. The name applied to a political party in Virginia, from 1878 to 1885, which favored the 'readjustment' or scaling down of the State debt. At the close of the Civil War the public debt of Virginia amounted to about \$41,000,000, which was increased by the extravagance and corruption of the reconstruction governments. On account of the general impoverishment of the time, the interest account could not be met, although the rate of taxation had been enormously increased. An act of 1870-71 to refund the debt was repealed in the following year, but the repealing act was not sustained by the courts. Still the arrears of interest increased, and by 1878 the State was pretty well divided between 'debt payers' and 'readjusters.' During that year the Legislature passed the 'McCulloch Bill' which provided for the issue of new bonds to be exchanged for outstanding bonds dollar for dollar, and to bear interest at 3 per cent. for ten years, 4 per cent. for twenty years, and 5 per cent. for ten years, making an average of 4 per cent. for forty years. The 'readjusters' organized themselves into a political party, and succeeded in gaining a majority of the seats in both Houses of the Legislature. Their leader was H. H. Riddleberger, who won notoriety by his bill declaring that the State ought not to pay any part of the interest upon the public debt which had accrued during the Civil War and the period of Reconstruction. The bill proposed to scale down

the public debt from \$31,102,571 to \$19,665,196, and to devote to its payment only that portion of the State revenues for which no other use could be found. The bill passed both Houses of the Legislature, but was vetoed by the Governor. In the State election of 1881 the readjusters, with the help of the Republicans, defeated the Conservative Democratic Party, which approved the McCulloch bill. The readjusters now passed three important measures. The first two, popularly known as 'Coupon Killers,' were designed to prevent the payment of State taxes by means of coupons from bonds issued in pursuance of the McCulloch act and the act of 1871. The third measure was substantially the Riddleberger bill reënacted. The majority of the bondholders refused to accept the settlement and tested the constitutionality of the 'Coupon Killer' acts in the courts. In nine decisions, generally known as the 'Virginian Coupon Cases,' the United States Supreme Court declared in substance that the later act forbidding the receipt in payment of taxes of those coupons which were received under the act of 1871 was an impairment of the obligation of contracts in conflict with the Constitution of the United States and therefore void. In the legislative session of 1884, before the final decision was made, several acts were passed for the purpose of rendering the coupons worthless, and in the sessions of 1886 and 1887 still further attempts of this kind were made. Recently a final settlement in the nature of a compromise between the State and the bondholders has been effected, and the long-continued controversy over the debt question seems to have come to an end. Consult Scott. *The Repudiation of State Debt* (Boston, 1893).

REAGAN, rē'gan, JOHN HENNINGER (1818—). An American statesman, born in Sevier County, Tennessee. In 1839 he removed to the Republic of Texas and settled east of the Brazos. He began the study of law and was admitted to the bar in 1846. From 1852 to 1857 he was judge of the Ninth Judicial District. From 1857 to 1861 he was a member of Congress, but resigned to serve as delegate to the Texas Secession Convention, by which he was elected a Deputy to the Provisional Congress of the Confederate States. On March 6, 1861, he was appointed Postmaster-General of the Confederate States under the Provisional Government, and was reappointed in February, 1862, after the permanent Constitution was adopted. In 1865 he was also acting Secretary of the Treasury. He was captured with President Davis, May 10, 1865, and was confined in Fort Warren until October. While in prison he wrote the celebrated *Fort Warren Letter* to the people of Texas, advising them to confer civil rights upon the negro and admit the more intelligent to the suffrage, lest worse and more radical measures should follow. This was misconstrued and subjected him to much harsh criticism in the State. From 1875 to 1887 he was a member of Congress, and for ten years he was chairman of the Committee on Commerce. He was the author of the Reagan Interstate Commerce Act, which became law in 1887. In 1887 he was elected to the United States Senate, but resigned in 1891 to become chairman of the Texas State Railroad Commission.

REAL ACTION. Under the common-law system of pleading, an action brought for the recovery of the possession of real property. A real action may be based merely on the right of possession, as where a tenant under a lease is ejected and seeks to recover back possessions, in which case it is classed as *possessory*; or it may be based on right of title in the property, as where an heir claims inherited real estate, in which case the action is said to be *droitural*. A real action was begun by a writ. Thus, a possessory real action was begun by a writ of entry or writ of assize, whereas a *droitural* real action was commenced by a writ of right, writ of formodon, or a writ of dower, according to the nature of the right or title involved. A real action was distinguished from a mixed action by the fact that in the latter damages could be recovered.

The old forms of real actions have been superseded in nearly all jurisdictions by the more modern action of ejectment, and in code States by statutory proceedings to recover real property. See ACTION; EJECTMENT; FORMS OF ACTIONS.

REAL ASSETS. See ASSETS.

REAL ESTATE. Land, together with such growing crops, trees, etc., and improvements thereon as are considered to be a part of and pass with it, or any interest in land greater than a term of years. In general, all movables and interests in land less than a freehold are called personal property to distinguish them from the above. Real estate descends to the heirs of a deceased owner, and is subject to dower and curtesy. Greater formalities are required to convey or incumber real estate than are necessary in dealing with personal property. The terms 'real estate' and 'real property' are used interchangeably, and for a more complete discussion of the rules of law applicable thereto, see the article under the latter title. Consult: Blackstone, *Commentaries*; Leake, *Digest of the Law of Land*; Washburn, *Real Property*.

REALF, rälf, RICHARD (1834-78). An English-American poet, essayist, and reformer, born in Sussex. He published his first volume of verse in London in 1852: it was entitled *Guesses at the Beautiful*. At the age of twenty he emigrated to the United States, and settled in Kansas, where he became interested in the anti-slavery movement and was an adherent of John Brown. During the Civil War he served in the Union army, and at the close worked in behalf of the negroes. In 1870 he was writing for the Pittsburg *Commercial*, and lectured in various parts of the country. He died by his own hand at Oakland, California. An edition of his poems was issued in 1899 by Col. Richard J. Hinton.

REALGAR (from Ar. *rahj al-ghār*, powder of the mine, mineral powder). A mineral arsenic monosulphide that crystallizes in the monoclinic system, and is of a red or orange-yellow color, with a resinous lustre, and is generally translucent, though sometimes transparent. It occurs with lead and silver ores at various localities in Bohemia, the Harz, Hungary, and Transylvania; also in Utah and California in the United States. Realgar was formerly somewhat used as a pigment; it is also called 'red orpiment,' or 'ruby sulphur.'

REALGYMNASIA. See GYMNASIA.

REALI DI FRANCIA, *ra-ä'le dö frän'ehä*, I. (It., royal men of France). A chivalric romance attributed to the Italian writer Andrea da Barberino, and therefore of about the end of the fourteenth or the beginning of the fifteenth century. It is a legendary account of the kings of France, whose history is traced back to a Roman origin, since their line is made to begin with Constantius, the banished son of Constantine the Great. The simple and straightforward style is attractive, despite the crudities of expression. Consult the critical edition of the *Realì* by Bandedli (Bologna, 1892).

REALISM. In philosophy, a term used to denote (1) the metaphysical theory that universals have an existence independent of individual objects (see **NOMINALISM**); and (2) the metaphysical view that objects of experience have an existence independent of the consciousness to which they are presented; opposed to idealism (q.v.). See **KNOWLEDGE, THEORY OF; METAPHYSICS.**

REALISM AND NATURALISM. The doctrine of a school of novelists who opposed and still oppose idealism or romanticism. Realism soon spread throughout Europe and the United States. Although we technically apply 'realistic' to a nineteenth-century school of writers, realism may be traced back through the ages. We find it in Boccaccio and in Chaucer, in the picaresque novels of Spain, in Nash, in Voltaire, and in Richardson, still more in Fielding, Smollett, and Defoe, each of whom intended to produce illusions of actual every-day life or reality in exceptional phases. Each of these writers is quite as realistic in the main as the authors of *Mme. Bovary* and of *Une vic*. The early modern realists were at last submerged in romanticism.

The romantic school had regarded the function of the novelist as one of the imagination. His task was to imagine a series of incidents more or less probable, and a set of characters more or less heroic or unusual. His world was in many respects an ideal world. The idealist, who has always existed, wishes for his part to choose beautiful themes, to improve on men, one might almost say, to make angels out of them at times—in a word, to paint things not as they are, but as the idealist would have them. Poets have lived in a dream-world oftener than writers of prose. Fairy tales are mostly idealistic, even when their personages are witches and goblins, for such beings are merely idealizations of evil. Realism is avowedly closest to nature; romanticism elings to nature, but loves freakish things, whether they be ugly or pleasing; idealism says what is ugly can be made beautiful, and that what is beautiful can be made more beautiful. Idealism gives us beautiful works, such as *A Midsummer Night's Dream*, *La petite Fadette*, Valera's *Peppita Jimenez*, and *Undine*, as well as many pastoral romances about people who are preternaturally beautiful, or good or bold, or even wicked, whose conversations sparkle with epigrams, whose main business, in fine, is not closely related to the dead level of existence or to average truth. But realism, naturalism, romanticism, and idealism, vague words, to say the least, are all only Nature reflected by various mirrors held up to her in countless ways. Each denotes a tendency stronger at one period than at another, and the tendency is never hard to feel, yet always too subtle, too shifting, to be

defined. Again, the realism of literature in another phase is the realism of sculpture and the graphic arts. The extreme realists conceive of the vocation of the novelist as that of an accurate reporter of what he has carefully observed in the every-day life of the world about him. Fancy, they say, hinders this exact reproduction of truth, for the realistic school deals only with facts. To it nothing is too trivial, or too commonplace, or too unpleasant to be recorded. In a word, 'any corner of nature,' if accurately depicted, will be profoundly interesting.

The progenitor of this school is said by the French nineteenth-century realists themselves to have been Rousseau, who in his *Confessions* adopted the plan of setting forth minutely the exact details of his life, concealing nothing, not even those incidents that were in the highest degree discreditable and shameful. But Rousseau merely furnished the suggestion of the tremendous force that lies in outspoken truth, and did not himself apply the theory to fiction. This was done by Marie Henri Beyle (1783-1842), better known by his pseudonym 'Stendhal,' who, in his novels *Armance*, *Le rouge et le noir*, and *La chartreuse de Parme*, developed a process of ruthless vivisection based on observation of social and physiological phenomena. The realistic method was carried out on a grand scale by Honoré de Balzac (q.v.) in his *Comédie humaine*. In this marvelous series of works Balzac attempted to delineate the entire life of his time, extenuating nothing, glozing over nothing, but setting forth motive and action with minute fidelity to truth. The discrepancy between Balzac's theories and his practice is obvious to those who would hold him to his word. Closely following him came Gustave Flaubert (q.v.), whose *Madame Bovary* (1857) achieved forthwith a great success and as great a scandal. It was a study of provincial life, as unsparing as any study of Balzac's, but superior in style. Joris-Karl Huysmans (1848—) pushed realism to extreme lengths, choosing subjects and scenes that are usually banished from polite society, and his *Marthe* (1876), which was too crude for even the indulgent censorship of modern France, may be taken as a sublimated type of the 'naturalistic,' as distinct from the merely 'realistic,' novels.

The naturalists of fiction are realists and something more. They profess to derive from Stendhal through Balzac and Flaubert. That is to say, they adopt the analytic method and devote themselves chiefly to the study of character. But they go further and object to the processes of art. According to them, literature, to be strictly 'scientific,' is comparable not with painting or drawing, but with anatomy and dissection. It is worth our while to observe that the so-called realistic and then the naturalistic school rose with, or after, the great rise of experimental science in the early years of the nineteenth century. Yet few genuine scientists would admit the scientific pretensions of the most conscientious realists or naturalists; for, even when their science is not imaginary or the work of dabblers, it is necessarily perverted or modified so as to give a continuous picture of life. No biologist, psychologist, or any other scientist, save the linguist, would think of looking for trustworthy observations in the works of realistic or naturalistic novelists. Unfortunately, too, the extreme realistic school, and

later the naturalistic writers, sought their material in the baser walks of life, for they found little in the humdrum existence of decent mediocrity wherewith to stir their readers. True, some realists asserted that 'truth' (meaning their observations) is never dull, and it must be confessed that the Goncourts combined to 'report' with extraordinary interest, and often charmingly, many scenes which at first blush would be called dull and unsuggestive; but this result was achieved by dint of talent, which found a hundred new thoughts in relations and presented them with skill. If, however, we were to gather statistics from the more modern realistic school; especially in the Romanic countries, we should almost certainly find that the school called realistic has dealt rather slanderously with the national life. It has dwelt on freakish or morbid themes and has made its appeal to the beast in man. On the other hand, it has served to awaken readers to the falsehoods or to the fatuous aspects of the romantic and idealistic schools. But there are no hard and fast boundaries. Zola is often romantic; Victor Hugo is often realistic. Realism is a tendency in authorship and not a definite province in literature. This observation may be verified by perusing the works of Stendhal, Balzac, Flaubert, Maupassant, the Goncourts, Zola, and Daudet in France, of Verga, Fogazzaro, and Gabriele d'Annunzio in Italy, of Valdés and Galdós in Spain, of Hauptmann and Sudermann in Germany, of Tolstói's later work, and of Ibsen and Björnson in Scandinavia. In England the later realists had their greatest representatives in Thackeray, Dickens, and George Eliot. Here again it may be said that the most consistently realistic of these, George Eliot, was closely affiliated with experimental scientists, just as was the case in France. But English realism was never extreme. It has not wallowed; it has not treated its fictitious personages with the cynical scorn of the French school. It has had no Zola to be repudiated by his 'master' Taine. Realism, however, took a firm foothold in England. Thackeray and George Eliot have been followed by George Meredith, Thomas Hardy, and George Moore, and by W. D. Howells in the United States, in whom is many a romantic touch, but also imaginative common sense, decency, gentleness, and an agreeable absence of those scientific pretensions which once roused the smiles or the indignation of scientific men in France and elsewhere.

Those whom we are wont to reckon in the realistic school are novelists or tellers of short tales. Their object ostensibly is to observe, analyze, and describe the actions of others, or their thoughts as uttered, or it may be only as implied. This condition requires imagination; for fragmentary manifestations in other beings must be supplemented by the experiences of the author in order to make a continuous narrative. If now we turn to the diarist and the autobiographer, we shall find that realistic portrayal is not thus hampered; for the diarist and the autobiographer find a ready-made continuity in their own experience. Fancy is not a necessary factor of their art. Hence Pepys is a realist of the first order; so, too, is Benvenuto Cellini; nor need we wonder that the French realistic school discovered a prototype, if not a pattern, in Jean Jacques Rousseau.

1880); id., *Les Romanciers naturalistes* (Paris, 1881); Chandler, *Romances of Roguery* (New York, 1899); Brunetière, *Le roman naturaliste* (Paris, 1892); Cross, *Development of the English Novel* (New York, 1899). See articles on the various authors cited; also NOVEL and ROMANTICISM.

REAL PROPERTY. In the artificial classification of property rights adopted by the English and American law, real property comprehends the larger part of the rights (those, namely, known as "freehold" interests) in land, together with a limited number of other rights, which have for one reason or another, been subjected to the same rules of law. The most important of the latter are certain "incorporeal" interests, as they are called, such as hereditary offices, titles of honor, franchises, annuities, tithes, and the like; while, on the other hand, not a few interests in land, such as leaseholds, mortgages, and certain other creditor's estates, have, for historical or practical reasons, found their place in the rival category of personal property. The famous expression, "lands, tenements and hereditaments," usually employed as an exhaustive description of real property rights, is thus an inaccurate statement of such rights, certain landed interests, as has been seen, not being included in the description of real property, while other forms of such property, as heirlooms and the "incorporeal" interests above referred to, not being in the feudal sense "held" of a superior lord, cannot be described as tenements. The term "hereditament," alone, has come to represent all the varieties of property known as "real," and to be in a sense coextensive in meaning with that class of interests, as they all have the common quality of heritability. Indeed, from the conception of heritability as a quality, or incident of estates in real property, we have, by a curious process of inversion, arrived at the notion of real property as anything capable of inheritance, and have included in the category of real property many classes of rights having nothing to do with land, for no better reason than that, by local custom or otherwise, they descend, like freehold estates in land, to the heir of the possessor.

The ordinary division of real property into "corporeal" and "incorporeal hereditaments" has been considered in the general discussion of property rights. (SEE PROPERTY.) Though not free from objection, it may be taken as a convenient description of such interests in land as rest on possession and such as do not involve possession, respectively. The former comprise the so-called freehold estates of possession (fee simple, fee tail, and life estates), and the latter all future estates (as remainders, reversions and the like), a great variety of equitable interests in land (of which the most important are trusts and equities of redemption), and the large class of interests in the land of others, known as easements and profits.

The feudal origin of our real property law and the strange conception derived therefrom that lands are not like chattels, susceptible of absolute ownership, but only of tenure and of the qualified ownership described by the term "estate," has been considered elsewhere. (SEE ESTATE; FEE; PROPERTY.) It remains to be noted that incorporeal as well as corporeal heredita-

ments are subject to be "held" in estates, rather than owned outright, and that there may as well be a fee simple, a fee tail, or a life estate in a remainder, a trust or an easement, as in the visible land with which all of these terms are concerned. The difference between the two classes of hereditaments lies rather in the processes by which they may be acquired and transferred. Both descend to the same heir upon the same event, and both are alike subject to the free power of alienation, but the nature of the one renders it incapable of seizure or possession, and therefore alienation by the ancient process of livery of seisin to "lie in livery," i. e. to be susceptible of delivery, wherefore it "lies in grant," and is transferred only by deed. Our modern instrument of conveyance is merely the ancient deed of grant, originally appropriated to the incorporeal hereditament, but now employed for the alienation of corporeal property as well. See ALIENATION; DEED; GRANT; HEREDITAMENT.

The history of the law of real property is one of the most interesting chapters in the long record of social and political progress from the Norman conquest of England to the present time. The rise and decay of the system of feudal tenure, the transformation of the law of land by the court of chancery in the institution of uses and trusts and in its assumption of jurisdiction over mortgages, the changes which that law underwent in its migration to America, are only the more obvious and dramatic developments of a long and steady process of amelioration. The base rights of inheritance and alienation gained in the thirteenth century have been followed by a constantly enlarging conception of the rights of offspring to the inheritance and by a growing freedom of alienation. Conveyancing, once the most intricate and technical of professional tasks, requiring the services of a specially trained class of lawyers, has been robbed of its terrors, and promises, in the near future, to become as simple a matter as the sale of a horse. Entails and other restrictions upon the free control of the land by the generation in possession have been well nigh done away with, and the paramount rights of the State have been narrowed to the rare exercise of the right of escheat upon the failure of heirs. Consult the authorities cited under the title PROPERTY, and, in addition, Kent, *Commentaries on American Law*; Digby, *Introduction to the History of the Law of Real Property* (5th ed., Oxford, 1897); Jenks, *Modern Land Law* (Oxford, 1899); Tiffany, *The Law of Real Property* (St. Paul, 1903).

REALSCHULE, rä-äl'shōō'le. A German school of secondary instruction differing from the Gymnasium inasmuch as it offers no instruction in the classical languages and lays stress on science. The Realschule is an outgrowth of the realistic tendencies of the seventeenth and eighteenth centuries. The institutions that Francke established at Halle toward the close of the seventeenth century laid unusual stress on the study of nature. At the same time notable efforts were being made to introduce more science into the classical schools generally. In 1747 Hecker established at Berlin an *öconomisch-mathematische Realschule*, which may be regarded as the prototype of the Realschule of to-day. It gave instruction in the German, French, and Latin languages, writing, arith-

metic, drawing, history, geography, and the elements of geometry, mechanics, and architecture, and also in religion and ethics. Some optional study of various occupations and trades was also provided.

The Realschule of to-day has a six years' course, and its graduates go directly into business life. Those who wish to take the university courses in science and mathematics attend the *Oberrrealschule*, which has a nine years' course. The programme in this school is like that in the Realgymnasium, with the exception of the omission of Latin and the substitution thereof of more work in mathematics, natural history, chemistry, mineralogy, French, and English. Graduates of these two types of schools are regarded as on the same plane educationally, but both are looked upon as somewhat inferior to the graduates of the Gymnasium. Consult: Russell, *German High Schools* (New York, 1899); Bolton, *Secondary School System of Germany* (ib., 1900). See NATIONAL EDUCATION; GYMNASIA AND REALGYMNASIA.

REAPERS, REAPING (from *reap*, AS. *ripan*, to reap; connected with OHG. *rifi*, Ger. *reif*, AS. *ripe*, Eng. *ripe*). The first implement used for reaping was the reaping hook or sickle, dating from the Stone and Bronze ages (Fig. 1, a, b,

FIG. 1. VARIOUS FORMS OF SICKLES AND SCYTHES.

c, d). Records of this implement are found in Egyptian history n. c. 1400 to 1500. The earliest form of the sickle had a slightly curved blade with straight handle; later the blade was toothed or serrated, and its form approached that of the modern sickle. As a rule the edge was made plain and sharp like a knife. The ancient Jews used a sickle of the Egyptian form. In China and Japan to-day are found sickles of much the same form as those which have been used there from time immemorial. The Greeks and Romans used smooth-bladed sickles or a sickle with toothed blade attached to a curved stick. The latter also used a small hooked knife resembling a pruning hook. The scythe followed the sickle and was apparently introduced by the Romans, by whom it was employed mainly for cutting grass. Pliny, in his writings, distinguishes between the sickle and the scythe, and Crescenzo described both in 1548. At first the scythe was intermediate in construction between the sickle and the modern scythe, as in the Hainault scythe (Fig. 1, f). In time the blade became lighter, and the handle underwent numerous changes in form and material until the modern crooked wooden pattern was evolved. The next step was the fastening of fingers (one to four) to the scythe parallel with the blade, thus evolving the so-called cradle scythe (Fig. 2, a). The fingers were

at first made shorter than the blade, and the operator cut toward, and left the cut grain leaning against, the standing grain. The Americans made improvements in these old forms, and developed the American cradle scythe (Fig. 2, *b*) about the period from 1776 to 1800. This implement

little progress was made until 1822, when Henry Ogle brought out his side-draught machine, with reels, reciprocating knife (straight-edged) over

FIG. 2. FORMS OF CRADLE SCYTHES.

was in universal use in America at the beginning of the nineteenth century. It is now employed only where the use of reaping machines is impracticable. Both sickle and scythe are widely useful agricultural implements.

The first reaping machine recorded in history is the Gallic header (Fig. 3) mentioned by Pliny, A.D. 23, as used in the extensive fields of the lowlands of Gaul. This consisted of a large box with projecting teeth along its front edge, which was pushed through the grain by an ox hitched in rear. The heads were caught and torn off by the teeth and were raked into the box by an attendant. A similar machine was

FIG. 3. THE GALLIC HEADER.

mentioned by Palladius four centuries later, but it was forgotten for ages. In modern times the idea of a mechanical reaper seems to have originated with Cabel Lloft of Britain, who in 1785 suggested a machine somewhat after the pattern of the Gallic header. It was probably never constructed. After that date numerous unsuccessful attempts were made to construct a practical reaping machine on the Gallic header plan or using the revolving knife idea. In 1807 Salmon of Woburn made the first reciprocating and advancing-motion machine, its cutter consisting of vibrating knives over stationary cutters. This machine as well as that of Gladstone was provided with a rake to sweep the grain from the platform. A number of machines were invented and given trial about this time, but

FIG. 4. OGLE'S REAPING MACHINE.

stationary fingers, dividers, and platform, thus foreshadowing the essential features of the modern reaper (Fig. 4). In 1827 Patrick Bell invented a machine which was used with considerable success in England and Scotland. Its cutter worked on the shear principle. The cut grain was carried to one side by means of revolving rollers. It had reels and dividers, and was pushed through the grain by a team hitched in the rear. This machine, although built on a wrong principle, is important because it was simple in construction and fairly efficient in practice. It was introduced to some extent in America.

From this time forward independent English development of the reaper practically ceased, and reaper construction began to be influenced by American ideas and methods.

The first patent for a reaping machine in America was granted to Richard French and T. J. Hawkins of New Jersey in 1803. In 1812 a patent was granted to Peter Gaillard of Pennsylvania for a grass-cutting machine, which was the first of its kind in America or England. A more successful grass cutter was invented by Jeremiah Bailey of Pennsylvania in 1822. It was built on the revolving cutter plan, with side-draught and an arrangement for keeping the cutter at a uniform distance from the ground. Several other machines followed these, the most important of which was that of William Manning of New Jersey, patented in 1831, which had a cutting device very closely resembling those of Hussey and McCormick, which afterwards became important. It also had a grain divider, the first recorded on an American machine. At this epoch American genius combined all the best features of preceding inventions, English and American, in two practical machines, that patented by Obed Hussey of Maryland in 1833 and that patented by C. H. McCormick of Virginia in 1834. These machines were very similar in principle. Hussey's was provided with a cutter of pointed blades attached to a bar, which vibrated through slots in iron fingers projecting from the front of the cutter bar. The grain fell on a platform and was raked off by a man riding on the machine. It had no reels. McCormick's had a serrated edge knife with

way outline instead of pointed sections as in Hussey's. It was provided with a divider and reels, but no seat for the attendant who raked off the cut grain. Both were side-draught machines. McCormick's was arranged so that it could be either drawn or pushed. These two machines furnished the basis upon which all successful modern machines have been constructed. They continued to be improved, but not until nearly the middle of the century could

wire. The most practical of these earlier machines, although not strictly a binder, was that known as the Marsh harvester, patented in 1858, in which the cut grain was elevated to a receiving box from which it was taken and bound by two men riding on the machine. This machine contained many features of the modern binder, especially the delivery of the grain by a canvas carrier over the drive wheel as distinguished from the 'low-down' type in which

the binding device was attached to the self-rake. In 1864 Jacob Behel invented the knotting bill, which, with slight modifications, is used in almost all modern binders. In the meantime various fairly successful wire-binding machines were put on the market by different manufacturers, but in 1875 John F. Appleby, who had invented a successful twine knoter as early as 1859, made a binding apparatus, which with subsequent improvements furnished the basis for the binding apparatus of almost all modern binders, which are essentially a combination of this binding device with the Marsh type of harvester.

FIG. 5. A MODERN HARVESTER AND BINDER—FRONT VIEW.

they be said to have achieved any practical success. They were entered in competition with each other and with English machines at the Exposition in London in 1851. Development was rapid thereafter. Both machines were introduced into England, where they influenced reaper construction to the abandonment of the older types.

In 1848 Nelson Platt, an American, invented a self-acting rake, which swept over a quadrantal platform and left the grain in gavels at the side of the machine. This was the first of the sweep-rake type, although numerous devices for delivering the grain in gavels at the side of the machine had been patented. In 1851 Palmer & Williams and William H. Seymour obtained patents for sweep-rakes over quadrantal platform. In 1856 Owen Dorsey of Maryland patented a self-rake which was an improvement of Hoffheim's type, invented in 1852. McCormick introduced his self-rake in 1861, based on S. A. Lindsay's patent of 1859. In this, which may be taken as a type of the self-rake machines, a rake is so used that "during one part of the revolution of the gathering-reel it acts as one of the vanes of the reel in bending the standing grain to the cutting blades. When the rake reaches the cutting blades in front of the platform, it ceases to revolve around the reel-shaft (which continues its rotary motion), and is made to move horizontally upon a vertical hinge, to which one end is attached (the points of the teeth being near the surface of the platform), sweeping the cut grain off at the side, and depositing it on the ground in sheaves ready for the binder."

The first recorded attempt to bind grain by machinery was made by John E. Heath of Ohio, who obtained a patent in 1850, which was for a twine or cord binder. Other patents rapidly followed for machines using cord, straw, and

The most advanced and complicated type of harvester is probably the combined header and thresher which is used to a considerable extent in some parts of the Western United States and in Australia, where there is no fear of rain during the harvest. This machine heads, threshes, cleans, and sacks the grain at one operation. Machines of this kind are pushed through the grain either by a traction engine or by horses, thirty to forty of the latter being required for each machine. They have a capacity of from 60 to 125 acres per day. Headers are also made for use uncombined with a thresher. The cut grain is deposited by means of elevators in wagons which are drawn beside the headers. It is stated that as early as 1850 a machine was invented and successfully tried in Devonshire, England, which stripped the grain from the straw, cleaned it, and ground it into flour at one operation.

The mower developed simultaneously with the reaper. In fact, many of the earlier machines were designed to be used either as a mower or as a reaper. A separate machine for cutting grass was patented as early as 1812 by Peter Gaillard of Pennsylvania. Hussey's original machine was really a mower, being built on principles afterwards adopted and developed in the construction of mowers. The most prominent name connected with the early development of mowers is that of W. F. Ketchum, who patented in 1847 a mower of simple design, having a single driving wheel. After the adoption of the Hussey type of cutter this machine proved a very successful mower of the rigid bar class. The first patent for a mower of the flexible bar type was granted to Cyrenus Wheeler in 1854. The flexible bar idea was further developed in a machine invented by Jonathan Haines in 1855. This had two drive wheels and a cutter bar

joined to the main frame in such a manner that it could be lifted over obstructions. In 1856 Aultman & Miller patented a machine which contained practically all of the essential features of the successful modern mower, viz. two driving wheels (the best types of modern reapers have one), the flexible cutter bar, with rapidly reciprocating blades, having smooth-edge sections, which was so hinged to the main frame that it could be raised and folded over against the latter when the machine was not in use. While combined reapers and mowers are still made, separate machines for the two purposes are considered preferable. The modern reaper has been adapted to the harvesting of all crops, such as maize, rice, peas, etc., and modified to meet all sorts of conditions, and has enormously decreased the labor involved in harvesting. (Edinburgh and London, 1871); Scott, *Textbook of Farm Engineering* (London, 1885); Swift, *Who Invented the Reaper?* (Chicago, 1895); Stabler, *Overlooked Pages of Reaper History* (ib., 1897); *Official Retrospective Exhibit of the Development of Harvesting Machinery at the Paris Exposition, 1900*, United States Department of Agriculture Office of Experiment Stations, Bulletin 103.

REAR-ADMIRAL. See ADMIRAL.

REAR GUARD. A detail of troops assigned to the duty of protecting the baggage and rear of a column on the march. Rear guards are practically advance guards reversed, and are used to protect a force advancing against or retreating before an enemy. In the former case they pro-

tect the rear of the column against attacks by guerrillas (q.v.), partisans of the enemy, or other marauders, and prevent straggling. The most important as well as most difficult duty, however, is when covering and protecting a column in retreat, in which case the rear guard is subject to incessant attack. To organize speedily an effective rear guard out of troops demoralized by defeat is a crucial test of both officers and men. Coolness, courage, and absolute discipline are demanded of the men, while resourcefulness and tactical skill in the officer commanding must be second only to his bravery. Under ordinary conditions the distance of a rear guard from the main body is about the same as that of an advance guard (q.v.). At night the distance is considerably lessened. The ever-present danger with a rear guard is the danger of being turned, and to guard against this flanking patrols are sent out to reconnoitre and patrol the flanks. Every available method and opportunity is taken to delay the pursuing force; bridges and roads are destroyed, passages or defiles blockaded, fords rendered difficult of passage, crops destroyed, and horses and wagons removed. Whenever possible, the rear guard consists of all three arms, and particularly of cavalry, the strength of the guard varying according to the circumstances of the case. The diagram shown is a theoretical disposition of a rear guard consisting of a company of infantry, 100 men.

REAR HORSE. See MANTIS.

REASON. See RATIOCINATION; UNDERSTANDING.

RÉAUMUR, rá'ó'múr', RENÉ ANTOINE FERCHAULT DE (1683-1757). A French naturalist and physicist, born in La Rochelle, February 28, 1683. He was educated in the Jesuits' College at Poitiers and at Bourges, and in 1703 he went to Paris, where he continued the study of physics and mathematics. His earliest publications were mathematical and obtained him an election to the Académie des Sciences in 1708. He then interested himself in the study of marine animals; he proved the power of regeneration in crustaceans, studied locomotion in starfishes, showed that zoöphytes were animals, studied the action of the electrical organ of torpedo and the phosphorescence of marine animals. In 1710 he began to compile a large work for the Government, *Description de divers arts et métiers*. Somewhat later a series of important memoirs on the production of steel and on improvements in the manufacture of iron won him a yearly pension of 12,000 livres. He discovered the method of tinning iron; studied the production of fine porcelain; also the condition of forests, mines, auriferous rivers, and the fossil beds of France. He invented the Réaumur thermometer, in which for the first time the zero-point was made to coincide with the freezing-point. (See THERMOMETER.) Amid all these activities Réaumur was constantly carrying on his investigations in the field of natural history. The most important of all his publications are his works in this department; of these the greatest is *Mémoires pour servir à l'histoire des insectes* (6 vols., 1737-1748). He left materials for a history of quadrupeds and birds afterwards made use of by Brisson and Buffon.

REBEC (OF. *rebec*, *rebeke*, Fr. *rebec*, from Ar. *rabāb*, *rebec*, from *rabba*, to be master). A three-stringed instrument played with a bow. It was of Indian origin, and from Persia it was carried to Arabia, Northern Africa, and, about the eighth century, by the Saracens into Spain. It was in outline like the mandolin, shaped like the half of a pear, with a long neck, finished by

tect the rear of the column against attacks by guerrillas (q.v.), partisans of the enemy, or other marauders, and prevent straggling. The most important as well as most difficult duty, however, is when covering and protecting a column in retreat, in which case the rear guard is subject

a curved human head. Two trefoil-shaped sound holes ornamented the belly, and the instrument was fitted with a bridge and sound-post. The performer held it against his breast, or under his chin, like a violin. The rebec was the parent of the violin, and the three gut strings were tuned like the three lower violin strings, G, D, and A. The tone was loud and harsh, but powerful, which made it a favorite in mediæval orchestras. Specimens are very rare. For illustration, see Plate of MUSICAL INSTRUMENTS.

REBECCA. The beautiful Jewess, daughter of Isaac of York, in Scott's *Ivanhoe*. She loves the hero, whom she nurses after the tournament at Ashby, but is pursued by the Templar Bois Guilbert. Convicted of sorcery, she is condemned to the stake, but is saved by Ivanhoe, who enters the lists as her champion. With her father, Isaac the Jew, she leaves England for Spain, a country then more hospitable to the Jews than England.

REBEKAH. See ISAAC.

REBELLION (Lat. *rebellio*, from *rebellis*, making war again, from *re-*, back again, anew + *bellum*, war). In its narrowest sense, open resistance to authority. In its public-law signification rebellion is the armed opposition to the government of a portion of its subjects for the purpose of securing a change in the constitution or laws, or with a view to preventing the execution of the laws. Unless the authority against which the resistance is directed be lawful there is no rebellion. Thus, resistance to an officer who is acting beyond his legal powers is not an act of rebellion. Rebellion is sometimes said to differ from insurrection in that it is a more general and more perfectly organized resistance than insurrection, and usually undertaken with a view to subverting the government, that is, the difference chiefly is one of degree. This is the view taken by the United States Supreme Court (*Price Cases*, 2 Black). Other authorities hold the reverse to be true. According to the latter view a rebel is one who openly refuses to obey the authority of the State, while an insurgent goes further and attacks the government with the intent of overthrowing it or replacing it by another. According to the public-law view civil war is a struggle between two parties occupying substantially the same geographical limits for the possession of the government, each claiming to be the legitimate party. Rebellion, on the other hand, in its advanced stage (or insurrection, according to the second view propounded above), is the attempt of a section of the people to overthrow the government or its authority with a view to replacing it by another of a different type, or for the purpose of constituting a separate nation with a separate sovereignty. Finally, there is the distinction between rebellion and revolution, which may be summed up as the difference between failure and success.

Every person who engages in rebellion is liable to the criminal penalties for treason established by the government against which he rebels and he is dealt with by the ordinary civil authorities, but when the rebellion becomes so widespread as to embrace a vast majority of the inhabitants of a considerable portion of the country, and when the rebels have succeeded in establishing a government and raising an army or navy, and especially if they have won recognition as bel-

ligerents from foreign nations with the rights incident thereto, those who are captured are usually treated as belligerents in conformity with the rules of civilized warfare. While endeavoring to enforce its constitutional rights against armed rebellion, a nation has all the powers, not only of a sovereign, but also of the most favored belligerent. The Constitution of the United States authorizes Congress to provide for calling out the militia to suppress insurrections, and Congress has done so by empowering the President to call upon the militia whenever in his judgment danger from rebellion requires that step. The Supreme Court has decided that the President is the sole judge as to when the exigency shall have arisen. In pursuance of this authority the President has called out the militia three times in our history—namely, in 1794, to suppress the Whisky Rebellion in Pennsylvania; in 1812, to repel the British invasion; and in 1861, to suppress the insurrection in the Southern States.

REBELLION, WAR OF THE. See CIVIL WAR IN AMERICA.

REBENSTEIN, rä'b'en-stĕin, A. The pseudonym of the German author Aaron Bernstein (q.v.).

REBER, rä'bĕr, FRANZ VON (1834—). A German art-historian, born at Cham, Bavaria. After studying in Munich and Berlin he went to Rome, and in 1858 established himself as lecturer at the University of Munich, was appointed professor at the Polytechnicum there in 1863 and director of the Royal Gallery in 1875. His writings include: *Die Ruinen Roms und der Campagna* (2d ed. 1879); *Geschichte der Baukunst im Altertum* (1864-67); *Kunstgeschichte des Altertums* (1871; trans. and supplemented by Clarke, New York, 1882); *Geschichte der neueren deutschen Kunst* (2d ed. 1884); *Kunstgeschichte des Mittelalters* (1886; trans. 1887); *Geschichte der Malerei vom Anfang des 14. bis zum Ende des 18. Jahrhunderts* (1894); and *Die phrygischen Felsdenkmäler* (1897). He translated the ten books of Vitruvius on *Architecture* (1865) and the *History of the Antwerp School of Painting* by Rooses (1880).

REBER, rä'bär', NAPOLÉON HENRI (1807-80). A French composer, born at Mühlhausen, Alsace. He studied with Reicha and Le Sueur, wrote chamber-music, and set to music the new songs of the best French poets. He became professor of harmony at the Conservatory in 1851, and succeeded Halévy as professor of composition in 1862. He was inspector of the branch conservatories from 1871 and elected to Onslow's chair in the Académie in 1853. Among his works are: A ballet, *Le diable amoureux* (1840); the comic operas, *La nuit de Noël* (1848), *Le père Gaillard* (1852), *Les papillotes de M. Benoist* (1853), and *Les dames capitaines* (1857). His instrumental works, which are written in the spirit of the German classics, consist of four symphonies, one overture, and one suite for the orchestra, three stringed quartets, one stringed quintet, one pianoforte quartet, seven pianoforte trios, and pieces for the pianoforte and violin. For the voice he wrote thirty-three songs with pianoforte accompaniment, a *Chœur de pirates*, *Le soir*, an *Ave Maria* and *Agnus Dei* for two sopranos, tenor, bass, and organs, besides

Vocalises for soprano or tenor. His *Traité d'harmonie* (1862) ranks among the best modern works on theory and has been reprinted several times. He died in Paris.

REBMANN, räb'män, JOHANNES (1820-76). A German missionary and African explorer, born at Gerlingen, Württemberg. He was sent by the British Church Missionary Society to Mombasa, East Africa, as an assistant to Krampf, with whom in 1849 he discovered the mountains Kilimanjaro and Kenia. Rebmann spent thirty-eight years in Africa and acquired considerable knowledge of several of the native languages. He published a *Dictionary of the Kinyassa Language* (1877) and a map of East Africa (1856).

REBOLLEDO, rä'bó-lyä'bó, BERNARDINO DE, Count (1597-1676). A Spanish poet, born at Leon. From his youth he was a soldier and fought against the Turks and in Barbary and in the Thirty Years' War. He was made Ambassador to Denmark (1647) and afterwards to Sweden, and lived for several years in the north. In 1663 he was appointed Minister of State, a post he held until his death. His works include: *Ocios* (1650), a poem; *Selva militar y política* (1652), a didactic poem; *La constancia victoriosa* (1655), and some epistles, epigrams, and excellent ballads. His style is prosaic, but it is simple and usually unaffected. The three-volume edition of his works (Madrid, 1778) contains a biography.

RECALESCENCE. See HEAT.

RÉCAMIER, rá'ká'myá', JULIE, Madame (1777-1849). A famous French leader of society, born at Lyons. In 1793 she married a wealthy but aged Parisian banker, Jacques Récamier, and his wealth enabled her to shine in society. Her *salons* became famous as the rendezvous of the foremost writers and thinkers of the time. For Madame de Staël she had a great and lasting regard, and in 1806, after M. Récamier was ruined, she was the guest of Madame de Staël at Coppet, in Switzerland. In 1811 Napoleon ordered her to leave Paris on account of her political views, and she then resided for several years in Switzerland. In 1815, however, she returned to Paris and established herself in the Abbaye-aux-Bois, where her beauty and charm made her the centre of a group of the brilliant men and women of the time. Châteaubriand, Balanche, and others were her friends and admirers. The only suitors for her hand toward whom she evinced any partiality were Prince August of Prussia and later Châteaubriand. The history of their efforts to win her in marriage is well known, but though her husband died in 1830, she remained a widow until her death. Consult: *Souvenirs et correspondance tirés des papiers de Mme. Récamier* (Paris, 1859); Mme. Lenormant, *Madame Récamier* (ib., 1872); Brunier, *Vie de Madame Récamier* (ib., 1875); English translations of first two of these (Boston, 1867 and 1869); Châteaubriand, *Mémoires d'outre tombe*, vols. 8-10 (Paris, 1848).

RECANATI, rä'ká-nä'té. A town in the Province of Macerata, Italy, situated on a hill between the Musone and the Potenza, 15 miles south of Ancona (Map: Italy, II 4). It has a fourteenth-century Gothic cathedral, a statue of the poet Leopardi, a library, and a new town hall. There are manufactures of silk, and wine and

olive oil are made. Population (commune), in 1881, 19,524; in 1901, 15,586.

RECAPITULATION THEORY (Lat. *recapitulatio*, from *recapitulare*, to recapitulate, from *re-*, back again, anew + *capitulum*, chapter, diminutive of *caput*, head), or BIOGENETIC LAW. A statement of the fact that the development of the individual is an epitome of that of the order or class to which it belongs. The basis of the law or principle is the well-grounded view or assumption now universally held by biologists that all animals have had a common ancestry, proved by the fact that all the animals whose embryological development has been carefully studied pass through stages or temporarily inherit structures or states of structures which are permanent in and characteristic of the more primitive or ancestral members of the class to which they belong. Compare PALINGENESIS. See BIOGENESIS.

RECAPTURE. In international law, a term having reference to the retaking by an armed vessel of one belligerent or its ally of a prize captured by a vessel of the other belligerent from a subject or citizen of the first. To adjust the conflicting rights of original owner and recaptor, a legal fiction, the *jus postliminii* of the Romans, was devised. According to this rule the title to property recaptured from an enemy in war was reverted in the original owner upon payment of salvage to the recaptors. The rights of persons recaptured from the enemy were restored upon the payment of a certain sum. The amount of salvage is determined by a prize court in accordance with the law of the State to which the recaptor belongs. The law of the United States recognizes the principle of reciprocity as regards the amount paid foreign vessels recapturing American vessels from the enemy. With regard to salvage allowed domestic recaptors, the law prescribes from one-twelfth to one-half the value of the prize, according to the difficulty involved in making the recapture and the character of the vessel. The law of France allows one-tenth; that of England, one-eighth; that of Spain, one-eighth to one-sixth; Denmark, one-third; Sweden, one-half. According to the practice of the United States salvage is not allowed if the recapture takes place after condemnation by a prize court, since the title is regarded as having passed from the original owner to the captor, and if sold by the court, the title of the purchaser is incontestible. The English practice is to restore the recaptured property to the original owner upon payment of salvage without regard to the time of recapture.

RECEIPT (OF. *reccete*, *recepte*, Fr. *reccette*, from ML. *recepta*, receipt, fem. sg. of Lat. *receptus*, p.p. of *recipere*, to receive, from *re-*, back again, anew + *capere*, to take). The transaction by which one takes into his possession or custody property delivered to him by another. It is also the technical name for an acknowledgment of the receipt of property executed in writing by one who has taken the property into his possession or custody.

A written receipt is evidence only of the fact that money or property was received by the persons executing it. It does not differ in legal effect from any other evidence of the fact of receipt, although it may be more conclusive than mere verbal testimony. A written receipt may accordingly be explained or contradicted by other

evidence and will have no effect if fraudulently procured or untrue in fact. It is owing to its character as evidence that a receipt is to be distinguished from a release (q.v.), which operates as a discharge or extinguishment of a legal obligation. In a few States, however, notably New York, it has been held that a simple receipt, when given with intent to extinguish a debt, would be deemed a gift of the debt although given without consideration and would thus extinguish the debt. This is anomalous, inasmuch as a receipt is evidence only and not a contract. A receipt is not subject to the parol evidence rule. (See EVIDENCE.) It may, however, be incorporated in a contract, as in the case of bills of lading (q.v.) or warehouse receipts (q.v.), which may and usually do contain both a receipt for the goods delivered to the carrier or warehouseman and a contract fixing the terms of the bailment. So far as the bill of lading or warehouse receipt is a contract it is subject to the parol evidence rule and cannot be contradicted by oral testimony; but its effect as a receipt may be explained or contradicted by such testimony. This rule, however, varies when the bill of lading or warehouse receipt has been indorsed to an innocent holder for value. The carrier or warehouseman will then be estopped to deny the receipt as written. It seems probable that one delivering property or paying money in performance of a legal obligation may not lawfully demand a receipt as a condition of the performance of his obligation. The question, however, is not settled. Receipts are required by statute to be given in some cases. Consult the authorities referred to under CONTRACT.

RECEIVER (OF. *receveur*, *receveur*, Fr. *receveur*, from *recevoir*, to receive, from Lat. *recipere*, to receive). An indifferent person between the parties to a litigation appointed by a court of equity to take charge of and preserve property or money involved in the litigation, and to collect the rents, issues, and profits thereof pending a final disposition of the controversy. A receiver is an officer of the court. Property placed in his care is regarded as being *in custodia legis*, to be administered by him under direction of the court; and it thus is not subject to other judicial process, and jurisdiction cannot be acquired over it by other courts having concurrent jurisdiction over the subject of the suit. See JURISDICTION.

The appointment of a receiver is one of the important forms of the preventive remedy exercised by courts of equity, and is of great benefit when there is danger that property which is the subject of judicial controversy may be wasted, destroyed, or removed from the jurisdiction of the court pending the litigation. By the appointment of a receiver the court insures its preservation and final appropriation as its decree may direct. As the mere legal custody of the receiver is sufficient for this purpose, he acquires no title or lien upon the property. He is a ministerial officer, and in general his powers are those only which are granted by the order or decree appointing him. If acting within his powers he has some discretion and may exercise his judgment as to the manner of their exercise. In that case he is not liable for errors of judgment, but if negligent or acting outside his authority, he is personally liable for his misconduct. When in doubt as to his powers he may apply to the court for author-

ity and directions as to their use. A creditor or other interested party may also apply to the court for modification of the order appointing the receiver or for supplementary orders to govern his conduct, or in a proper case for an order removing him. In general a receiver has no authority to sue unless directed by the court to bring an action; and action may not be brought against him without the express authority of the court. He is deemed to have implied authority to employ counsel when reasonable and proper. The powers and duties of receivers are now generally regulated by statute or to some extent by rules of court.

The following are the more important cases in which a receiver will be appointed, although the classification is not exclusive: (1) When there is no present legal owner of property involved in the proceeding, although the parties to the litigation are equitably entitled to it, as in case of an intestate's personal property. The same relief is now generally obtained by the appointment of a temporary administrator. (2) When the legal owner is incompetent to manage his property, as in case of infancy or lunacy, and there is no guardian or commission having legal authority to protect the property. In most jurisdictions guardians of infants and committees of lunatics have statutory authority sufficient to render the appointment of a receiver in such cases unnecessary. See GUARDIAN. (3) When the litigants are equally entitled to the custody of the property and justice requires that neither one should be permitted to control it to the exclusion of the other, and circumstances do not permit their joint control, as in the case of the dissolution and winding up of a partnership or the partition of real estate. (4) When the title or possession of property is held by one in a fiduciary capacity or relation who is not properly performing his trust, as a mortgagor in an action to foreclose a mortgage, a trustee in an action for an accounting, or one having property claimed in a judgment creditors' action. (5) When the appointment of a receiver is necessary to assist in carrying out the decree of the court, as where in judgment creditors' actions, in order to satisfy the judgment, a receiver is required to sell the property conveyed in fraud of creditors.

The appointment of a receiver is always a matter within the discretion of the court and cannot be claimed as an absolute right. Often the propriety of granting an application for a receiver is a matter of great delicacy and importance, requiring the highest judicial capacity.

Courts of equity would not exercise their jurisdiction to appoint a receiver for an insolvent corporation merely because it was insolvent. Statutory jurisdiction is now generally given for that purpose and in many other cases where it was formerly not the practice to grant relief by the appointment of a receiver. Thus, for example, statutes now authorize the appointment of receivers to take charge of assets in the winding up of corporations; to preserve the estate of a bankrupt pending bankruptcy proceedings; to receive sums due on judgment debts and apply them to the payment of the judgment; and in many other cases.

The expenses of the receivership, including the receiver's own fees, are a first lien on the property held by him as receiver. In some cases the court will authorize a receiver to raise money for the

purpose of preserving the property and continuing it in business by issuing receiver's certificates, which are made a first lien on the property. This will ordinarily be done only when some public interest will be subserved by the continuance of the property in business, as in the case of railroads or other public-service companies. Such certificates, when issued, are non-negotiable securities, payable out of the fund in the receiver's hands. They create no personal liability and their validity depends upon their compliance with the order authorizing their issue. If issued below par the holder can recover only the amount actually received for them by the receiver unless he was authorized to issue them at a discount. One who indorses a receiver's certificate does not become liable as an indorser of negotiable papers, but as a mere assignor only. The holders in general will not be allowed to sue upon them, but may in a proper case obtain an order of the court directing their payment. See CHANCERY; EQUITY. Consult: High, *Treatise on the Law of Receivers* (3d ed., Chicago, 1894); Short, *Railroad Bonds and Mortgages* (Boston, 1897); Cababé, *Receivers by Way of Equitable Execution* (3d ed., London, 1900); Kerr, *Treatise on the Law and Practice as to Receivers* (4th ed., ib., 1900).

RECEIVING SHIP. In the United States Navy, vessels are stationed at each navy yard for the enlistment of men and to furnish quarters for men from the time of their enlistment until drafted into sea-going ships. While on board these receiving ships the men are drilled and trained as far as the time of their retention and other circumstances will permit. On some receiving ships there are schools for yeomen (ship's clerks), petty officers, etc.

RECEIVING STOLEN GOODS. A criminal offense which consists in taking possession or control of stolen goods with a guilty knowledge of the fact and with the fraudulent or dishonest intention of continuing to deprive the rightful owner of the possession of his property. By the early common law in England, the offense was merely a misdemeanor, but by statute it has been made a felony. In the majority of the United States it is a distinct criminal offense, classed as a felony, and is punishable with about the same severity as larceny. A number of States classify the offense under the general head of larceny. Consult the authorities referred to under CRIMINAL LAW.

RECENT PERIOD (Lat. *recens*, fresh, new). In geology, the name given to the epoch that has elapsed since the Pleistocene and the beginning of history. Many geologists now include it under the Pleistocene period (q.v.).

trace with any definiteness either their origin or history. According to II. Kings x. 15-28, Jehoradab, the son of Rechab, displayed great zeal for the Yahweh worship in the days of Jehu. In the days of Jeremiah the Rechabites are found in Judah and they took refuge in Jerusalem when Nebuchadnezzar invaded the land (Jer. xxxv.). In Nehemiah iii. 14, Malchiah, the son of Rechab, is mentioned as one of those who assisted in rebuilding the walls of Jerusalem. The Rechabites represent the extreme conservative element of the Hebrew and allied clans which maintained the old nomadic customs and rites and opposed the higher forms of culture. They continued to live in tents, and their antagonism to agriculture manifests itself in their scruples about drinking wine (Jer. xxxv. 6-10), which in the ancient Orient was a symbol of agricultural fertility. This element was probably not limited to any single clan; the same conservative tendency appears in various incidents in the Old Testament. For example, in the narrative of Cain and Abel a distinct preference is shown for Abel, the pastoral nomad, over Cain, the agriculturist. And again in Genesis ix. 20-27 the Rechabite point of view is represented in the story of Noah and the vineyard which he planted. Consult the Old Testament theologies of Oehler, Schultz, and Dillmann; also Smend, *Alttestamentliche Religionsgeschichte* (Freiburg, 1893); Robertson Smith, *Religion of the Semites* (2d ed., London, 1894); Bennett, *Commentary on Jeremiah* (ib., 1895); Budde, *The Religion of Israel to the Exile* (New York, 1899).

RECIDIVISTS (from Lat. *recidivus*, falling back, from *recidere*, to fall back, from *re*, back again, anew + *cadere*, to fall). The term applied in penology to those who have been more than once sentenced for crime, i.e. old offenders. It is a striking commentary on the effectiveness of penal systems that according to official returns from the leading nations of the world the recidivists are 40 per cent. or more of the prison population. Z. R. Brockway estimated the percentage in the prisons of New York at not less than 60; while W. D. Morrison, of England, estimates that the percentage is not less than 70. It is even possible to find an individual who has been arrested 1000 times, while in the large cities, even of America, individuals who have served more than 100 short sentences are by no means unknown. H. M. Boies estimates that "at least two-thirds of the crimes in America are committed by recidivists and that the yearly cost of their incarceration could be estimated at \$400,000,000."

Yvernes in his work, *La Récidive en Europe*, gives the following table:

RELAPSED	England, 1871	Sweden, 1871	France, 1826-74	Italy, 1870	Scotland
	<i>Prisoners</i>	<i>Thieves</i>	<i>Tried</i>	<i>Tried</i>	
Once	38%	54%	45%	60%	16%
Twice	18%	28%	20%	30%	13%
Thrice	44%	18%	35%	10%	

RECHABITES, rēk'á-bīts (Heb. *Rēkābīm*, from *Rēkāb*, Rechab). A Kenite clan (see KENITES) who retained their nomadic habits and mode of life in the midst of agricultural Palestine. The notices of them in the Old Testament are too few to make it possible to

According to the census of 1890 the percentage of recidivists in the United States was 26.42. This is undoubtedly far too low, as criminals in America conceal their identity by passing from State to State. None of the foregoing figures can be accepted as absolute, and comparisons between

countries are unsatisfactory because of varying laws and differing degrees of success in enforcing them. The statistics serve roughly to show that recidivism is a serious aspect of crime and to throw light on the practical question of crime prevention.

Drähms has figured from various sources the percentage of recidivists in the different countries as follows:

	Year	Percentage
England.....	1897	56
Germany.....	39.7
Holland.....	44
France.....	1895	41
Belgium.....	1898	39
Norway.....	1895	50
Prussia.....	1898	82

It is clear that short sentences and fines do not protect society against instinctive and professional criminals. Nothing short of permanent incarceration should be thought of in many instances. In others where the possibility of reform may still be admitted the indeterminate sentence may wisely be employed. In England the Habitual Offenders Act deprives the recidivist of the presumption of innocence until guilt is proved and keeps him under surveillance when not in prison. A few timid experiments have been made here and there by American commonwealths in the direction of greater severity toward 'second offenders,' but in general American law on this subject is lax and unscientific. Sentimentalism, indifference, and a prevailing belief (which has no basis in fact) that criminals in general are victims of circumstances and may usually be 'reformed' by humane treatment, have made the United States a veritable paradise of professional offenders. Consult: Yvernes, *La récidive en Europe* (Paris, 1874); Wines, *Punishment and Reformation* (Boston, 1895); Drähms, *The Criminal* (New York, 1900). See CRIMINOLOGY; PENOLOGY.

RECIFE, rá-sê-fá. The capital of the State of Pernambuco, Brazil. See PERNAMBUCO.

RECIPROCAL (from Lat. *reciprocus*, alternating, reciprocal, probably from **recus*, backward, from *re-*, back again, anew + *procus*, forward, from *pro*, before). One number is said to be the reciprocal of another if their product is unity. E.g. $a \cdot \frac{1}{a} = 1$, hence a and $\frac{1}{a}$ are reciprocals. Also $\frac{a}{b} \cdot \frac{b}{a} = 1$, hence $\frac{a}{b}$ and $\frac{b}{a}$ are reciprocals. The term is variously used in geometry. See POLE AND POLAR; DUALITY.

RECIPROCAL EQUATIONS. An equation is said to be reciprocal when its roots admit of being arranged in pairs of the form $r, \frac{1}{r}$. In the case of a reciprocal equation of even degree the coefficients of the terms equidistant from the extremes are equal and have the same sign. In the case of those of odd degree, the coefficients of the terms equidistant from the extremes have the same absolute value and have either the same or opposite signs. One root of a reciprocal equation of odd degree must therefore be +1 or -1. Dividing by $x \pm 1$, such an equation reduces to one of even degree.

RECIPROCITY (from Lat. *reciprocus*, alternating, reciprocal). A tariff policy under which two or more sets of tariffs contemporaneously exist; a high schedule of duties for countries which have entered into no special agreement with the enacting country, and one or more lower schedules for such others as may be willing to offer correspondingly reduced schedules in return. The reciprocity system sprang up as a means of relief from the old navigation laws, and was then gradually extended, not only to tariff duties, but to general matters of commercial privilege as well. The organization of the German Zollverein (q.v.) gave a strong stimulus to the idea of mutual freedom of exchange; and the movement thus begun gradually developed into a semi-free-trade era, which lasted until about 1870. Great Britain repealed the corn laws during the years succeeding 1846, and in 1860 negotiated a treaty with France containing liberal commercial concessions. This was followed by some twenty-seven other reciprocal arrangements between the leading European States, which resulted in great freedom of exchange, and largely stimulated trade. A similar movement in the United States culminated in the liberal tariffs of 1846 and 1857. Very generous treaties of reciprocity were negotiated by the United States with the German Zollverein and Mexico, respectively (1844 and 1859), but both failed of ratification.

The first real experiment in reciprocity made by the United States is found in the Canadian treaty of 1854. Between the years 1846 and 1855, it was several times sought to secure the passage of 'concurrent legislation' by the two countries, making mutual tariff concessions. These efforts failed—partly for political reasons, but largely because of difficulties connected with the allied questions of fisheries and the navigation of the Saint Lawrence. Finally, the reciprocity treaty was negotiated, and passed by the Senate (receiving the President's signature August 5, 1854), owing largely to personal work in Washington by Lord Elgin, then Governor-General of Canada. As ultimately adopted, the Canadian treaty covered the navigation of the Saint Lawrence, the fishery question, and provided for mutual free trade between Canada and the United States in the products of the two countries. The immediate effect of the treaty was apparently to stimulate trade. Its popularity, however, received a severe blow in the crisis of 1857, which reduced both the imports and exports of the United States in the Canadian trade, but the volume of business almost immediately revived. Various complaints, however, arose against continuing under the treaty, a principal objection being that the Canadians were not keeping good faith. Commissioners of the United States examining into the advisability of the reciprocity relations made diametrically opposite reports. Between 1860 and 1865, the question of abrogating the treaty was much discussed in Congress. The strained relations with England on account of the *Alabama* claims brought the question to the front and finally, in 1865, a Senate resolution terminating the agreement was concurred in by the House, being signed by the President January 18, 1865. The relations of the United States with Canada under the treaty closed March 17 of the same year. Since that time numerous efforts have been made to renew the reciprocity trade relations between the two

countries; in 1866 by a Canadian delegation; in 1869 by Sir John Rose; in 1873 by George Brown and Sir Edward Thornton, and in 1890-92 by Hon. Robert Bond, all with no result. So also various bills and resolutions for reciprocity with Canada were tabled or voted down in Congress from time to time. Attempted amendments to tariff bills met the same fate. The most recent development in the struggle for better trade relations with Canada has been the appointment of the 'Joint High Commission,' which was to settle all points in dispute between the two countries, including reciprocity. Its work has thus far had no result.

An important experiment in reciprocity was undertaken in the treaty of 1875 between the United States and Hawaii. The plan of annexing the Hawaiian Islands had been brought forward several times before 1875, and one or two abortive efforts to secure a reciprocity treaty with them had been made. What finally forced the question upon the attention of Congress was the growing power of England in the Pacific, and the development of British trade with the islands, added to the fact that American citizens had acquired large holdings of land in Hawaii, and were desirous of receiving discriminating trade advantages. The signal for action was given by internal disturbances in the islands in 1874, and the accession of a king strongly favorable to American interests. A treaty was finally negotiated and was signed by the President April 17, 1875, going into effect June 30. A bill to make the modifications of duties rendered necessary by the treaty was brought up and passed in the House of Representatives. By this treaty the United States admitted, free of duty, sugar and a few tropical products, including rice, while Hawaii relieved of duty various kinds of agricultural and meat products as well as machinery and other manufactures. At the time the treaty was adopted, our imports from Hawaii amounted to about \$1,300,000 annually, our exports being a little over \$600,000. No reduction in the price of sugar resulting, there naturally occurred a great increase in the price of sugar lands in Hawaii and a great growth in exports of sugar to the United States. This meant, of course, a corresponding loss of duties to our Government without any compensating growth of exports to the islands. Our imports were \$4,606,444 in 1880, \$8,887,497 in 1885, \$12,313,908 in 1890, \$7,888,961 in 1895, and \$17,187,380 in 1898; as against exports of \$2,086,190, \$2,787,922, \$4,711,417, \$3,723,057, and \$5,907,155 during the same years. Most of the imports were of sugar, and it was estimated that the duties lost to the United States during the life of the treaty ranged from \$2,000,000 to \$12,000,000 a year. In 1883 the question of renewing the treaty (first concluded for seven years) came up in Congress and strong opposition to it was shown; but a new agreement was finally ratified and put into effect (December 7, 1887). The growth of hostile feeling displayed during this reciprocity struggle had, however, alarmed the sugar interests, who now began to fear the ultimate abrogation of their reciprocity privilege. This fear led to a vigorous annexation movement in the islands, resulting eventually in the annexation of the islands in 1898.

During the decade 1880-1890 reciprocity first

began to be advocated in the United States as a definite tariff policy. The revision of the tariff by the Republicans in 1833 was unsatisfactory to the manufacturers, who were beginning to build up an export trade, and who wanted larger foreign markets. In 1883 a treaty was negotiated with Mexico, and in 1884 one with Spain for Cuba and Porto Rico, and another with Santo Domingo, were arranged, but they were all either killed or withdrawn by President Cleveland. In 1884 President Arthur, under authority from Congress, sent a commission to visit the South American countries and discuss the question of reciprocity with their governments. On its return, a report was made by the commission in which tariff reductions on wool and sugar were laid down as a necessary basis for reciprocity with South America, and practical failure in negotiations was reported as a result of the commission's lack of power to hold out promises of such concessions. About this time President Cleveland took office (1885) and sought to secure general tariff revision, in place of further efforts to get reciprocity treaties. A Republican majority, however, appeared in the Congress which met in 1889, and that party concluded to act upon the recommendation made by the South American commission that a Pan-American congress be summoned to discuss trade relations. Such a congress met in 1889 at Washington, under the title of the "International American Conference." This body favored reciprocity, but indicated that tariff treaties must be based upon real reductions of duty on important articles. Many delegates expressed great doubt as to the intentions of the United States in this respect, and the general result of the conference was rather discouraging.

A considerable surplus had been accumulated in the national treasury during the first Cleveland administration, and it was desired by the Republicans on coming into office in 1889 to reduce incomes without lowering the tariff in general. This was done by the McKinley Act (1890), which admitted raw sugar free of duty, and offered a bounty to domestic sugar-growers. At the same time, it was sought to appease our exporters (who wanted larger markets) by using the reduction of sugar duties as a means of forcing corresponding reductions in foreign tariffs. This attempt was made in Sec. 3 of the McKinley Act, known as the reciprocity section, in which the President was ordered to impose specified duties upon raw sugar, molasses, coffee, tea, and hides, otherwise to be admitted free, unless the countries of origin should grant us compensating tariff concessions. These provisions had been brought about largely through the efforts of Mr. Blaine, who regarded some concessions to our agricultural and exporting interests as a political necessity. The principal article included in the reciprocity section was, of course, sugar; and this was admirably adapted for use as a basis for tariff bargaining, because of the sugar bounty system of Europe. The bounty system had resulted in tremendous overproduction of sugar and had thus led to a great desire to find outside free markets for it. In the debate on the McKinley reciprocity section the meaning of the policy was explained with greater fullness than ever before. It was shown (1) that the products admitted to the United States must not compete with those

produced by us; (2) that the countries traded with must be such as would take our surplus of manufactures and farm produce; and (3) that the volume of trade gained by us under any agreement must be fully equivalent to that granted to the foreign country. The McKinley Act was adjudged constitutional by the Supreme Court (*Fields vs. Clark and Boyd vs. U. S.*) and Mr. John W. Foster, representing the State Department, negotiated treaties under it with Brazil, Spain for Cuba and Porto Rico, and England for Jamaica, Trinidad, Barbadoes, Guiana, and the Leeward and Windward Islands. Treaties were also signed with Santo Domingo, Guatemala, Salvador, Costa Rica, Honduras, and Nicaragua. These treaties closely resembled one another and were designed to carry out the idea of South American reciprocity. They all included reductions of duty on live animals, some grains, corn, meat products, bridge-building materials, cottonseed and its products, cars, wagons, etc., railway material, timber and iron for ship-building, and engines. Colombia, Haiti, and Venezuela declined to make tariff treaties; and President Harrison, therefore, enforced against them the retaliatory duties provided in the McKinley Act. Treaties of a rather different sort were negotiated with Germany and Austria-Hungary, by which we secured some reductions on certain cereals, meat products, flour, etc., and on sundry manufactures of cotton, wool, chemicals, and machinery. These were the so-called 'beet-sugar treaties.' Little effect could be seen as a consequence of the reciprocity treaties, but it should be noted that during the life of these agreements trade conditions all over the world were much disturbed, so that the period was not a good one for observing their working. In general, their effects were slight and confined to a few countries, while imports were more largely stimulated than exports. So far as the latter grew at all, the increase is found in cereals, iron, steel, etc.

The accession of President Cleveland to office for the second time (1893) was the signal for an effort to reduce the tariff. A bill introduced by William L. Wilson for this purpose retained raw sugar on the free list as well as coffee, tea, and hides, and reduced the bounty to domestic growers. In the Senate, however, the tariff on raw sugar was restored. It had not been intended by Mr. Wilson to interfere with the existing reciprocity treaties, although he did intend to repeal the section granting power to impose retaliatory duties. The re-imposition of the sugar tariff, however, *ipso facto* abrogated the treaties, and protests were filed by the representatives of Germany and Austria, while complaints were made by Brazil, Guatemala, Nicaragua, Costa Rica, and Santo Domingo. Trade, however, does not appear to have been materially affected by the abrogation of the reciprocity treaties, save in one or two unimportant cases. In some instances an improvement in trade followed. One of the first acts of the Republicans, as they gradually regained power after the passage of the Wilson bill, was to announce their allegiance to reciprocity as a policy. A crop of bills and resolutions on the subject came up in the first session of the Fifty-fourth Congress and were referred to the House Committee on Ways and Means.

The Republican victory of 1896 was interpreted as a verdict in favor of higher tariff duties and

of reciprocity treaties. A bill providing for both had been drafted, and was early introduced, by Mr. Dingley. In this bill as first presented, reciprocity, like that of the McKinley Act, was contemplated. The original draft offered moderate reductions of duty upon various commodities, but while the bill was under debate an amendment was offered authorizing the President to negotiate reciprocity treaties which should later be ratified by the Senate. As finally passed, the act thus authorized the Executive to conclude treaties based upon a few unimportant commodities and to negotiate such other reciprocity treaties as he might deem appropriate for submission to the Senate. President McKinley, under this act, appointed Hon. John A. Kasson special commissioner for the negotiation of reciprocity treaties. Treaties were negotiated and proclaimed with France, Portugal, Germany, and Italy. Later, an arrangement with Switzerland was executed. No agreements with South American countries were entered into. The treaties with the European countries mentioned gave us favorable treatment for a few agricultural products, oils, and some machinery. These reciprocity treaties are the only ones now in operation. Mr. Kasson, however, negotiated treaties with various countries under the clauses of the Dingley Act, authorizing the President to secure such agreements as he might deem best for submission to the Senate. These 'Kasson treaties' included treaties with France, Great Britain on behalf of Barbadoes, British Guiana, Turks and Caicos Islands, Jamaica, and Bermuda, Denmark for Saint Croix, and with Ecuador, Nicaragua, and Santo Domingo. These had nearly all been sent to the Senate by the end of 1899. They were coldly received and referred to the Foreign Relations Committee. The treaties with South American countries were chiefly concerned from our side with reductions of duty on cane sugar and tropical fruits, wool, and a few other products, that with France made some concessions on knit goods, bric-à-brac, cheap jewelry, cutlery, and similar small articles. None of them was seriously discussed except that with France, and even in that case, so loud a protest was raised by manufacturers who conceived their interests to be attacked that the treaty was pigeonholed. It was, however, very generally conceded that the terms of this agreement were unexceptionable. A general reciprocity discussion began in the newspapers, and protectionists displayed a strong disposition to repudiate the whole reciprocity policy. It was more and more felt that danger inhered in the discussion of such treaties, because of the probability that they would make a breach in the protection system which might lead to too general tariff revision. This opinion was distinctly voiced in the so-called 'reciprocity convention' of manufacturers, which met in Washington in October, 1901. President McKinley, however, seemed inclined to recede from his advanced protectionist position, and in a noteworthy speech at the Buffalo Exposition, just prior to his assassination, in September, 1901, had taken strong ground for reciprocity. This gave a factitious impetus to the reciprocity movement which ultimately concentrated its strength in an effort to secure reciprocity with Cuba.

No treaty with Cuba had been negotiated by Mr. Kasson. This was due to the fact that the

war and subsequent negotiations with Spain lasted during the time that his reciprocity negotiations with the various countries were in progress. After the United States had assumed control of Cuba, it imposed upon the constitutional convention of the Cubans the so-called Platt Amendment, which was passed, after much opposition, partly on the strength of an alleged promise made by President McKinley to a delegation of Cubans that, should the amendment be accepted, he would secure a large tariff reduction for Cuban sugar exported to the United States. President Roosevelt attempted to fulfill this supposed promise by urging Cuban reciprocity upon Congress at the session 1901-02. A bill providing for a mutual 20 per cent. reduction of duties on Cuban and American products was introduced in the House of Representatives, but met with strong opposition from those representing beet-sugar interests, which had sprung into prominence subsequent to 1890. These men charged that the advocates of reciprocity with Cuba were playing into the hands of the refining combination, which, it was said, had bought largely of Cuban lands and was seeking to secure cheap raw material through reciprocity. As a compromise it was proposed to grant the desired reductions, provided that the protection accorded under the Dingley Act to the process of refining (sugar 'differential') should be revoked. Such an amendment was incorporated into the reciprocity bill and it was passed by the House. The Senate, however, objected to the amendment and the bill was killed in committee. The autumn elections (1902) strengthened the Administration. During the recess a reciprocity treaty was negotiated with Cuba and placed before the Senate at the session 1902-03. Although nothing was then done, a special session of the Senate in the spring of 1903 passed the Cuban treaty. In its original form, it secured important reductions on American agricultural and manufactured products exported to Cuba in return for the concession of 20 per cent. on Cuban imports to the United States, but the beet-sugar interests contrived to have it amended by a clause providing that no reductions should be granted to any but Cuban sugar during the life of the treaty. This stipulation necessarily implied the destruction of all prospect of passing the other treaties negotiated by Mr. Kasson with South American countries, inasmuch as these were largely based on sugar. Meantime, Secretary Hay had negotiated (October-November, 1902) a reciprocity treaty with Newfoundland whereby certain of our products were to be admitted to that colony in exchange for bait privileges for our fishing vessels in Newfoundland ports. This treaty was pigeonholed during the session 1902-03, owing to the influence of New England fishing interests. During the years 1902-03 an unusually strong agitation for reciprocity with Canada sprang up in the Northwest and in New England. This was due to the growing need for cheap lumber, ores, and coal along the northern boundary of the United States.

At the present time reciprocity in Europe has assumed a somewhat different form from that which has been developed in the United States. That is primarily due to the interpretation put upon what is known as the 'most-favored nation clause' in international agreements and which differs from the meaning assigned to that clause in

American diplomacy. According to European usage, treaties incorporating the 'most-favored nation clause' assure to the signatory countries treatment as favorable as that granted to any other nation. Tariff concessions made to others become at once common to all nations having 'most-favored' relations with the country making such concessions. On the other hand, American statesmen have adhered consistently to the view that trade concessions offered by it to some other country need not become common to a third country unless that third country grants concessions similar to those of the second country. It has been noted that under the European view of the most-favored nation clause the reciprocity treaties adopted subsequent to 1860 inaugurated an era of very free trade. This was terminated shortly after 1870, owing partly to the desire to increase national customs revenues, and partly to the hostilities engendered by war and political struggles. Elaborate tariffs were adopted by most European countries between 1870 and 1885. These gradually developed into two principal systems—that of 'general or conventional' tariffs and that of 'maximum and minimum' tariffs. The former is the plan adopted by Germany, Austria, Switzerland, and Italy, while the latter is pursued by France, Russia, Spain, Norway, Greece, and Brazil. Under the general or conventional tariff system, a higher schedule is applied to those countries which have entered into no special commercial arrangement, while another or 'conventional' tariff is granted to those which receive favored-nation treatment. Under the maximum and minimum system minimum rates are given to most-favored nations, and the home produce is thus assured fixed protection. Maximum rates, or such others on such articles as the Executive may see fit, are enforced against nations not receiving favored-nation treatment, and the Executive is allowed to bargain with these other countries for mutual tariff concessions. The latter system is of course more flexible than the general or conventional tariff. As against these methods, which might be regarded as general reciprocity, our reciprocity system must be placed in the light of a series of special bargains based on no systematic plan. Reciprocity in Europe to-day is represented by the network of commercial treaties existing under these two systems. These have become exceedingly complex and interdependent. Whereas the older notion of reciprocity seemed to be based on mutual concession, the essential idea of the policy to-day seems to be that of retaliation. A movement for higher and higher retaliatory duties seems to be growing very general in Europe, while the introduction of such a system is vigorously urged in England, the classic country of free trade. This is shown by Mr. Chamberlain's proposal in the early summer of 1903 for an Imperial customs tariff, or reciprocity, union between the colonies and the mother country, which would simply mean lower colonial tariffs to English exports, in exchange for retaliatory English tariffs against foreign products competing with those of the colonies. The difficulty, of course, lies in the danger of making food dearer in Europe. It is to be observed that so soon as reciprocity becomes general in scope it is indistinguishable on the one hand from the idea of tariff revision and reduction, and on the other from that of tariff retaliation. When not general in scope it implies

special arrangements carrying benefits usually to special classes in the community, at the expense of other classes.

RECITATIVE (It. *recitativo*, from It., Lat. *recitare*, to recite). A species of vocal composition which differs from an air in having no definite rhythmical arrangement, and no decided or strictly constructed melody, but approaches, in tonal succession and rhythm, to the declamatory accents of language; it is, in fact, as near an approach as possible to speech delivered in musical sounds. When any part of a recitative is to be performed in strict time, this is indicated by the words *rec. a tempo*. When a recitative is accompanied merely by a few simple chords of an instrument it is called *recitativo secco* or *parlante*, declaimed recitative. When the voice is accompanied by a considerable portion of the instruments of the orchestra, either in sustained chords or florid passages, it is termed *recitativo accompagnato*, *stromentato*, or *obbligato*. See LEITMOTIV; MELOS.

RECKE, rĕk'e, CHARLOTTE ELISABETH CONSTANTIA VON DER, usually known as ELISA (1756-1833). A German author, born on the estate Schönburg, in Courland, a daughter of Count Friedrich von Medem. In 1771 she married Baron von der Recke, from whom she was divorced six years later. Her unhappy married life and the untimely death of her daughter produced in her an inclination to mysticism and spiritualism, which was increased through acquaintance with Cagliostro, whom she met at the Court of her sister Dorothea, Duchess of Courland. In 1784, while she was living at Karlsbad, she was made aware of Cagliostro's character, and was thereupon prompted to write *Nachricht von des berühmtesten Cagliostro Aufenthalt in Mita* (1787). Her other books include *Geistliche Lieder einer vornehmen Kurländischen Dame* (1780-1815) and *Gebete und religiöse Betrachtungen* (1826).

RECKE, ERNST VON DER (1848—). A Danish poet, born in Copenhagen. His first lyric drama, *Bertran de Born* (1872), with music by P. Heise, achieved an immediate success at the Royal Theatre, and retains its popularity. His other works also show marked dramatic ability. They include: *Lyriske Digte* (1876); *Kong Liurigild og hans Sønner* (1878), a tragedy; *Knud og Magnus* (1881), a tragedy; *Fru Jeanna* (1891), an opera; and *Hertuginde af Burgund* (1891), a play. He also wrote two creditable books on Danish verse, *Principerne for den danske Verskunst*, etc. (1881), and *Dansk Versloerei kortfattet Fremstilling* (1885).

RECKLINGHAUSEN, rĕk'ling-hou'zen, FRIEDRICH VON (1833—). A German pathologist, born in Gütersloh, Westphalia. He studied in Bonn, Würzburg, and Berlin. 1852-55, graduating from the University of Berlin. He took up pathology under Virchow, and later pursued his studies in Vienna, Rome, and Paris. After serving as an assistant to Virchow in the Pathological Institute in Berlin, he became, in 1865, professor of pathological anatomy in Königsberg, whence he was called six months later to Würzburg, and thence, in 1872, to the University of Strassburg. His researches in pathology, especially of the nervous system, have been notable and valuable. Among his contributions to literature are: *Die Lymphgefäße und ihre Beziehung zum Bindegewebe* (1861); *Ueber die multiplen Fibrome der*

Haut und ihre Beziehung zu den multiplen Neuromen (1882); and "Handbuch der allgemeinen Pathologie des Kreislaufs und der Ernährung," in Billroth und Lücke's *Deutsche Chirurgie* (1883), as well as articles in *Virchow's Archiv*.

RECKONING (from *reckon*, AS. *ge-recenian*, Goth. *rahnjan*, OHG. *rĕkhanōn*, Ger. *rechnen*, to reckon; connected with AS. *raeu*, account, OHG. *rahha*, thing). In navigation, the reckoning is the calculation of the position of the ship by means of observations of heavenly bodies and the record of courses and distances sailed which is to be found in the log. *Dead reckoning* (q.v.) is where the ship's position is computed merely from the record of its movements made in the log without making astronomical observations. See NAVIGATION; SAILINGS.

RECLUS, re-kly', ELISÉE (1830—). A French geographer, born in the Gironde. He was educated in Rhenish Prussia, and subsequently studied at Montauban and under Karl Ritter at the University of Berlin. His republican principles forced him to leave France after the coup d'état of Louis Napoleon in 1851, and he then traveled in Great Britain, the United States, and South America. After his return to France in 1858, he published the results of his travels and geographical studies in several geographical works and in contributions to the *Revue des Deux Mondes* and the *Tour du Monde*. His repugnance to the Napoleonic reign induced him to join the Internationals in 1869, and, arrested as a soldier of the Commune during the siege of Paris in 1871, he was sentenced to transportation for life. Charles Darwin and other distinguished scientists united in a petition to the French Government for his recall, on the ground of the services which he had rendered to science and popular education, and in 1872 his sentence was commuted into one of banishment. He then established himself in Switzerland until he returned to France under the amnesty of 1879. In 1882, however, he was condemned with Prince Krapotkin as a leader and organizer of the anarchist movement and again fled to Switzerland. Twelve years later he was sentenced to transportation for twenty years. While in exile in Switzerland he began his masterpiece, *Nouvelle géographie universelle* (20 vols., 1874-94). This work, which was published in English under the title *The Earth and Its Inhabitants*, containing over thirty-five hundred maps, in addition to numerous engravings, is an evidence of Reclus's remarkable talent for exposition and his extraordinary scientific knowledge. Of his other geographical works, mention should be made of *La terre* (1867; 4th ed. 1877; Eng. trans., *The Earth*, 1871) and *Les phénomènes terrestres, le monde et les météores* (1872). In 1892 he became professor of comparative geography at the University of Brussels. At the outbreak of the Civil War in the United States his articles were of conspicuous value in arousing public sympathy in France for the administration of President Lincoln.

RECLUSE (OF., Fr. *reclus*, from Lat. *reclusus*, p.p. of *recludere*, to shut up, from *re-*, back again, anew + *cludere*, to close). One of a class of hermits who, from a motive of special penance, or with a view to the more strict observance of Christian perfection, remained shut up from all converse, in a cell or other place of

strict retirement. To avoid the danger of the practice ministering to mere self-will or to fanatical and unbalanced austerity, it was strictly regulated from the middle of the seventh century; and the recluse, who must be a person of tried virtue, was with due solemnity locked up in the presence of the abbot or the bishop, who placed his seal upon the door, not to be removed without the authority of the bishop himself. Nuns also were found to practice the same voluntary seclusion, especially under the rules of the Benedictine, Franciscan, and Cistercian Orders. Consult: Pavy, *Les recluseries* (Lyons, 1875); Hauber, *Leben und Wirken der Eingeschlossenen* (Schaffhausen, 1844).

RECOGNITION (Lat. *recognitio*, from *recognoscere*, to know again, from *re-*, back again, anew + *cognoscere*, from *co-*, together + *gnosere*, to know). An object is said to be 'recognized' when it appears as familiar. Thus one recognizes an acquaintance or a locality that has been visited before. Recognition stands midway between the feeling of strangeness or novelty, on the one hand, and the affective indifference which characterizes the cognition of a well-worn environment, on the other. Associations apart, unknown objects tend to arouse a feeling of uneasiness, or even of alarm; very familiar objects, such as one's tools, or breakfast table or writing desk, tend to become indifferent, taken for granted, while objects which are encountered occasionally produce a mildly pleasant mood which forms the core of recognition. There is a fourth stage in the affective reaction which appears in tedium or ennui. At this stage active interest has gone beyond its indifference point and has passed into monotony. One is said to feel bored, to be tired of one's surroundings, etc.

It is not always easy to discriminate between recognition and cognition. In fact, the terms have often been used indiscriminately. But it is better to reserve the word cognition for the identification of well-known or commonplace objects which do not arouse the cognitive mood, or again, of objects whose kind is well known, although the individual perceived may be unknown.

Recognition is closely related to memory (q.v.). In memory, it is a *recollection*, that appears familiar. The remembrance of a debate in which one took part, or of a fire witnessed last week, bears the mark of familiarity in the sense that it comes before one as a part of past experience. In recognition, it is a present *perception*—the object before one—that is familiar. The recognition need not refer explicitly to the past; the memory always does.

There are two forms of recognition: direct and indirect. (1) In *direct* recognition there arises at once a belief that the object perceived is known. This belief appears under two forms. Either it takes the general form, 'this object is familiar,' or some specific form, such as, 'this object is my neighbor's dog, Rover.' In the first case there is bare familiarity; in the second case there is familiarity *plus* additional knowledge of the object as a particular object. (2) In its *indirect* form, recognition is brought about mediately; i.e. an object is recognized by means of its environment, by reason of the surroundings in which it is set. This takes place when the object itself fails to arouse the mood of

familiarity and is known only through attendant circumstances either past or present.

Recognition has performed a very important biological function in the history of the race. It is one of the means by which the organism adapts itself to its environment. Like many of the more important emotions—fear, anger, sympathy—it is deeply rooted in instinct. The animal learns to trust that which is familiar, that which has stood the test of acquaintance, and to show distrust in the face of the novel and untried. Thus have developed, side by side, a pleasant aggressive mood of confidence in presence of the known and an unpleasant shrinking mood of diffidence and dislike in presence of the unknown. The refined and modified successors of these instinctive attitudes persist in our moods of familiarity and unfamiliarity.

RECOGNITION MARKS. The bars and stripes of various animals which Wallace thinks serve for recognition by animals of their own species. He claims that color for recognition is "a totally distinct category, to some extent antagonistic or complementary" to protective coloration (q.v.). Recognition colors and markings are prevalent among butterflies and moths, and among them "its chief function may have been to secure the pairing together of individuals of the same species." Recognition marks during flight are very important for all birds which congregate in flocks or which migrate together; and they usually consist of well-contrasted markings on the wings and tail. These markings occur in pigeons, hawks, finches, warblers, ducks, etc., and are illustrated graphically in *Bird Lore*, vol. iii. (New York, 1901). Recognition marks occur in many mammals, such as the zebra, many antelopes, gazelles, and allied African forms, including the eland, koodoo, etc.

On the other hand, objectors assert that such stripes and spots are for protection, i.e. concealment (see PROTECTIVE COLORATION), and that they represent "spots or streaks of sunlight passing through foliage or reflected from leaves." Consult: Wallace, *Darwinism* (New York, 1889); Pocock, "Antelopes and Their Recognition Marks," in *Nature*, vol. lxii. (London, 1900).

RECOGNIZANCE, *rê-kôg'nî-zans* or *rê-kôn'î-zans* (ML. *recognoscantia*, from Lat. *recognoscere*, to know again). An obligation entered into by a person with a court of record, whereby he binds himself under a penalty to do or not to do a particular thing required of him by the court, and which is made a part of the record. Recognizances differ but little in form from ordinary bonds, except that they need not be executed with the same formality, as they are entered into before the court, and that they are commonly given by persons under a criminal charge. In many jurisdictions recognizances need not be

signed by the person binding himself, as the simple fact of his assent being made a part of the record by order of the court is considered sufficient.

Recognizances are commonly given by prisoners accused of trivial crimes to secure their temporary release, or even permanent release on probation, and, as the name indicates, they contain or imply a recognition or acknowledgment of the offense. The most frequent conditions are that the 'recognitor' keep the peace, or appear at some adjourned hearing of his case. In such a case the prisoner is said to be discharged 'on his own recognizance.'

Recognizances differ from bail bonds in that the latter are usually required to be executed by sureties who can qualify as owning real estate of a certain value. A further distinction is that a recognizance is usually considered as a sort of conditional judgment, and on the default of the recognitor a *scire facias*, or order to show cause, issues to him, requiring him to show good reason why execution should not issue against him immediately for the amount named in the recognizance. In many of the United States bail bonds have entirely superseded recognizances. See BAIL; BOND.

RECOIL (from OF., Fr. *reculer*, from ML. *recolare*, to go backward, from Lat. *re-*, back again, anew + *culus*, posterior; connected with Ir. *cúl*, back). The force of the high pressure suddenly produced by the explosion of a charge of powder acts with equal intensity in all directions. Hence its tendency to set in motion, not only the projectile, but also the gun—just as a spring compressed between two bodies would tend to set both moving in opposite directions. The retrograde movement of the gun, after the explosion of the powder, is known as its recoil, which in the early days of artillery development was responsible for many serious accidents. Devices for utilizing the recoil have now reached so high a degree of perfection that the total time consumed in the recoil and return to firing position—or to battery—is for heavy guns but a fraction of a second. See ORDNANCE.

REC'OLLET (OF. *recollet*, Fr. *récollet*, from Lat. *recolletus*, p.p. of *recolligere*, to recollect, from *re-*, again + *com-*, together + *legere*, to gather). A name given to the members of certain reformed bodies of monastic Orders, whether of men or women, in the Roman Catholic Church. Among Orders of men, an offshoot of the Augustinian hermits, which, under Louis de Montaya, in 1530, obtained considerable popularity in Spain, was called by this name, and the Order still exists at Medina-Sidonia, Leon, and Pamplona; but outside of Spain this Order is better known under the title of the Reformed Franciscans, who were established in France under Henry IV. and Louis XIV., and spread thence into Belgium, their houses in these countries and Germany becoming so numerous that they reckoned no less than ten provinces. A reform of the Cistercian Order of nuns in Spain was called by the same name.

RECONNAISSANCE (Fr., recognition). The acquiring of information as to the strength and disposition of the enemy, features of terrain, etc. The great prerequisite of successful strategy is the possession of accurate information regarding the number, character, and ef-

fectiveness of the enemy, together with a complete knowledge of his position, disposition, and of the intervening terrain. The method of securing this information is (1) by scouts; (2) by reconnoitring patrols; (3) by special reconnaissance; (4) by reconnaissance in force; and (5) by topographical reconnaissance. Efficient scouting is more a necessity under modern conditions than ever before, smokeless powder and magazine rifles combined rendering it almost an impossibility for the ordinary cavalry patrol, and occasionally for even the infantry patrol, to secure information. The invisibility of the rifleman, and the difficulty of determining whether the firing is from a strong force firing individually or a small force using their magazines, make the employment of cavalry in a special reconnaissance, which is usually designed to develop the enemy without risking a general engagement, an extremely hazardous undertaking. In a difficult or broken country they come within the death zone before becoming aware of the presence or vicinity of an enemy. Under favorable conditions, or against an inferior foe, the special reconnaissance is a very effective operation. A reconnaissance in force is almost invariably the precursor of a general engagement, all three branches of the service taking part in it. It is an operation designed to develop the enemy, compelling him to disclose his disposition for defense or counter-attack, and if possible to betray any weakness there may be in his plans. On the development of the reconnaissance will largely depend the nature and character of the attack, as well as the point and general direction of its delivery. A topographical reconnaissance is carried out by specially selected officers, with or without escorts, who map out the country over which an advance or attack may be made, having special reference to the immediate plans of the commanding general. For more detailed information regarding this branch, see ENGINEERING, MILITARY.

RECONSTRUCTION (from Lat. *re-*, back again, anew + *com-*, together + *struere*, to heap). In American history, the process by which, after the Civil War, the seceded States were restored to their normal relations with the Union. The only provision of the Constitution that seemed to have any bearing on the matter was that which makes it the duty of the United States to guarantee to every State in the Union a republican form of government. Even this was not explicit, for it was not stated which branch of the Government—whether the Executive or Congress—was charged with the execution of the constitutional mandate. Among the views as to the status of the States at the close of the war several deserve a brief explanation: First, there was the Southern view, based on the assumption that the acts of secession were invalid and of no effect. Its cardinal doctrine was the indestructibility of a State, either by its own act or by act of the United States Government. All that was necessary, therefore, to the reestablishment of normal relations with the Union was for the State governments to cease their resistance to the Government of the United States, and repeal all measures passed in furtherance of secession and rebellion. Second, there was the view of President Lincoln, based on the assumption that the act of rebellion in each State was the act not of

the State itself, but of combinations of disloyal persons who had unlawfully subverted the loyal State governments. The States, therefore, continued to exist as members of the Union, though they were out of their 'proper practical relations' with it. According to this view the problem of reconstruction consisted simply in placing the loyal element in the seceded States in control of the State governments which had been subverted by the disloyal element. Furthermore, President Lincoln regarded the problem as one devolving upon the Executive rather than upon Congress—for the work of creating a loyal element necessarily involved the exercise of the pardoning power, which alone was vested in the President—and the support by the military arm of the loyal governments so established. Thirdly, there was the Congressional view, which held that reconstruction was a legislative problem; that as a result of rebellion the Southern States were 'deprived of all civil government,' and that all *de facto* governments set up during the war were illegal. This view has been called the 'forfeited rights' theory. The States continued to exist, but as disorganized communities subject to the paramount authority of the United States. In pursuance of this view Congress passed an act in July, 1864, which was fathered by Henry Winter Davis in the House and Benjamin F. Wade in the Senate, and which provided a remedy for the defects of the Presidential scheme as understood by the supporters of the Congressional view. The view embodied in this measure differed from that of President Lincoln, first, in regarding the problem of reconstruction as a legislative problem; second, in requiring the loyalty of a majority of the adult white males of the State for the basis of the reconstructed government instead of the loyalty of one-tenth, as required by President Lincoln's plan; thirdly, in requiring the abolition of slavery as the starting point in the process of reconstruction. President Lincoln refused to sign the bill before the expiration of the session, thus indirectly defeating it. A fourth view was the so-called State suicide theory of Charles Sumner, enunciated by him in a series of resolutions offered in the Senate in 1862. The gist of these resolutions was that the attempt of a State to secede from the Union, involving as it did an attempt to exclude the Constitution of the United States from the territory of the State, was, if successfully sustained by force, equivalent to a practical forfeiture by the State of all rights under the Constitution. It involved, furthermore, the immediate extinction of the State sovereignty and its reduction to the position of a Territory under the exclusive jurisdiction of the Government of the United States. Finally, there was the view ably expounded by Thaddeus Stevens, and popularly called the conquered province theory, according to which rebellion against the national authority by a State of the Union not only put an end to its existence as a State, but even forfeited its rights as a Territory under the Constitution. The inhabitants of such a community were remanded to the status of an unorganized province owned by the National Government and subject to its dominion without the restraint of constitutional limitations. The advocates of this theory appealed to the actual facts of the case to show that at the close of hostilities the Southern States were in the condition of de-

pendent provinces subject to the absolute dominion of the conqueror.

Of the several theories advanced, that held by President Lincoln was the first to receive attention. Early in 1862, large portions of Louisiana, Arkansas, and Tennessee having been recovered by the Federal armies, the President appointed 'military governors' in those districts with somewhat vague and undefined powers. In general they were to take the initiative in the movement to reestablish civil governments and prepare the way for representation in Congress. In his third annual message of December 8, 1863, the President announced a more definite and systematic plan of reconstruction, to which was appended a proclamation of amnesty offering a full and complete pardon to all who would take an oath to support the Constitution of the United States and the Union of the States thereunder, as well as all acts of Congress passed during the war, and all proclamations of the President, with reference to the slaves. From the benefits of the amnesty were excluded certain classes of men who had held high military or civil offices under the Confederate Government or who had left the service of the United States to engage in the rebellion. He then proposed to restore the State governments in the seceded States to the amnestied class by declaring that whenever a number of persons not less than one-tenth of those who had cast votes in such State at the Presidential election in 1860 had taken the oath, if they were qualified voters by the State law in force at the time of secession, and had reestablished a State government republican in form, such government should be recognized by the Executive as the true Government of the State. He said, however, that whether members sent to Congress from any State so reconstructed should be admitted to their seats rested exclusively with the two Houses. The proclamation did not apply to Virginia, both the President and Congress having from the first recognized the loyal Pierpont Government at Alexandria as the true Government; nor did it apply to Missouri and Kentucky. 'Ten per cent.' governments, so called, were accordingly established in Louisiana and Arkansas in the following year. Representatives were also elected to Congress, but when the new members from the reconstructed States appeared with their credentials neither House would admit them to seats. In Tennessee the President's plan of reconstruction was put into operation early in 1865. Representatives were chosen to Congress, but they were refused admission to their seats in December, 1865. In the meantime Congress had assumed the right to take in hand the matter of reconstruction, and had passed the Wade-Davis Bill, to which reference has already been made. In February, 1865, it also passed a resolution which prohibited the counting of any electoral votes for President or Vice-President in the election of 1864 from States which had passed secession ordinances. The refusal of the President to sign the Wade-Davis measure, and his proclamation in regard to the subject in which he stated his objections to the setting aside of the constitutions and governments in Louisiana and Arkansas, made a breach between the President and Congress inevitable.

After the assassination of President Lincoln, President Johnson took up the policy of his predecessor without material change, and on

May 29th issued a proclamation of amnesty and pardon to all persons who had neglected to avail themselves of the benefits extended by the amnesty proclamation of President Lincoln. His proclamation of amnesty differed from that of President Lincoln only in the enlargement of the classes of excepted persons. Besides those who had held high rank in the Confederate military and civil service and those who had resigned positions in the service of the United States to enter the rebellion, and a few other classes, President Johnson excluded all who had voluntarily taken part in any capacity in the Confederate service and who were the owners of taxable property of the value of more than \$20,000. Persons excluded from the benefits of the amnesty were allowed to make special application to the President, who promised that such clemency would be extended as appeared to be consistent with the facts of the case and the peace and dignity of the United States. By subsequent proclamations the President appointed provisional Governors for the States of North Carolina, Mississippi, Georgia, Alabama, South Carolina, and Florida, and directed them to call constitutional conventions in their respective States for the purpose of restoring the said States to their constitutional relations with the United States. The heads of the several executive departments were at the same time directed to put the laws of the United States into operation in these States, and the United States judges were required to open the courts and to proceed with the business on their dockets. President Johnson regarded the States of Virginia, Louisiana, Arkansas, and Tennessee as already reconstructed, and therefore provisional Governors were not appointed for those States. During the summer and autumn of 1865 conventions were held in all the States not yet reconstructed, except Texas; and when Congress assembled in December of that year they had all passed ordinances either 'repealing' the ordinances of secession or pronouncing them null and void *ab initio*; they had all abolished slavery by constitutional amendment; and with one or two exceptions all had passed ordinances repudiating State debts incurred in aid of the rebellion. They had, moreover, held elections for members of the Legislature, for State officers, and for members of Congress, and the Legislatures had met and with two or three exceptions had chosen United States Senators and ratified the Thirteenth Amendment to the Constitution of the United States. When, therefore, Congress met in December, the President was able to inform that body that all the States except Texas, whose convention did not meet until March, 1866, "had been reconstructed and were ready to resume their places in the two branches of the National Legislature."

Congress, however, did not accept the view of the President, but appointed a joint committee of nine Representatives and six Senators to inquire into the condition of the seceded States and to report by bill or otherwise whether any of them were entitled to representation in Congress. Pending the report of the committee and the action of Congress thereon, it was resolved that no member should be received into either House from any State lately in arms against the United States. The chief reason for the rejection of the President's plan was the character of the police legislation passed by several of the Southern Legisla-

tures in the autumn of 1865. On account of the general demoralization of the freedmen after emancipation, together with their habits of improvidence and shiftlessness, all the Southern States passed stringent police measures to prevent disorder and pauperism among them. One of the chief objections urged against these laws was that in most cases they applied only to the negro race. In Mississippi, for instance, negroes were prohibited from renting or leasing land in incorporated towns and they were allowed to be competent witnesses only in cases at law in which they were parties. The Republicans in Congress professed to see in these measures an attempt to reenslave the freedmen of the South. In the meantime the Thirteenth Amendment, abolishing slavery, had secured the ratification of the requisite number of States and had been promulgated by the Secretary of State as the law of the land. In March, 1866, Congress passed the Civil Rights Bill (q.v.) conferring the rights of citizenship upon the freedmen. This act established complete equality in the enjoyment of civil rights for all citizens without respect to color or race. On March 27th President Johnson vetoed the bill, but early in April Congress passed it over his veto. About the same time Congress passed a measure to enlarge the powers of the Freedmen's Bureau (q.v.). It too was vetoed, and was not passed over the veto. In July another measure for the same purpose was passed, was vetoed by the President, and passed over his veto. In the meantime Congress was debating a proposition to amend the Constitution so as to place beyond the reach of any subsequent Congress the provisions of the Civil Rights Bill. In June the proposed amendment secured the necessary two-thirds majority of both Houses and was sent to the State Legislatures for ratification.

In the same month the Joint Committee on Reconstruction made its report declaring that the seceding States had deliberately abolished their State governments and Constitutions so far as these connected them with the Union, and were consequently disorganized communities; and that guarantees of future security should be required as an essential condition of restoration to normal relations with the Union. The committee recommended denial of representation to these communities until "sufficient guarantees were provided which would tend to secure the civil rights of all citizens, temporary restoration of suffrage to those not guilty of participation in the rebellion, and the disqualification from office of at least a portion of those whose crimes have proved them to be the enemies of the Union and unworthy of public confidence." During the period intervening between the report of the joint committee and the reassembling of Congress a riot had occurred between the white and black races in New Orleans, resulting in the death of 40 or 50 persons and the wounding of 160 others; and the President in the course of a journey to Chicago had used indiscreet language in his criticism of Congress. When Congress met in December, 1866, it made an unsuccessful effort to impeach the President, and then, in order that the President might be prevented from carrying out his policy of reconstruction, enacted a law requiring the new Congress, which contained a large majority opposed to the executive policy, to meet on March 4, 1867. Next it passed the

Tenure of Office Act (q.v.) to limit the President's power of removal. It then passed acts establishing negro suffrage in the District of Columbia and in the Territories. Finally it practically deprived the President of his power of command over the army and vested it in General Grant, whose position was further made irremovable.

Meantime Congress was spurred on by the action of all the Southern States except Tennessee in rejecting by votes nearly or quite unanimous the proposed Fourteenth Amendment. It now took up the work of reconstruction in earnest, showed little or no disposition to yield to the views of the President, and in February passed an "Act to provide for the more efficient government of the seceded States," assigning as a reason that "no legal State governments or adequate protection of life, liberty, or property existed in those States, and that it was necessary that peace and good order should be enforced in them until loyal and republican State governments could be legally established." The bill was promptly vetoed by the President, and on the same day was passed over his veto. The act divided the ten seceding States into five military districts, as follows: (1) Virginia; (2) North and South Carolina; (3) Georgia, Florida, and Alabama; (4) Mississippi and Arkansas; (5) Louisiana and Texas. Each district was to be under the command of an army officer not below the rank of brigadier-general, appointed by the President, and charged with the duty of protecting all persons in their rights of person and property, of suppressing insurrection, disorder, and violence, either by military commission or through the local courts. In the meantime the existing civil governments were to be deemed as provisional only and subject to the authority of the United States. The act also contained provisions for the calling of a convention by the people of the State with a view to restoration in the Union. By a supplementary act passed March 19th by the new Congress, the voluntary action of the States was anticipated and the process of reconstruction hastened. This measure directed the district commanders to cause to be registered as voters all persons, without regard to race or color, not disqualified by participation in rebellion; to hold an election for delegates to a State convention; and if a majority of the registered voters were in favor of holding a convention, to call it together for the purpose of adopting a new constitution. As soon as the Constitution was ratified it was to be transmitted to Congress, and if it were approved by that body, the State was to be readmitted to representation in Congress. The President promptly vetoed the act, on the ground that some of its provisions were without constitutional warrant, that it purposed to disfranchise the great body of respectable whites, and that it conferred the suffrage on the mass of ignorant freedmen. With equal promptness the measure was passed over the executive veto. The President, despite his hostility to the act, at once appointed the district commanders, his first appointees being Generals Schofield, Sickles, Ord, Thomas, and Sheridan. These officers with military commands assumed control of their respective districts and immediately put into operation martial law. Orders were issued in every district for the regulation of various matters of private law and for the prevention of discrimina-

tion against the blacks. Boards of registration were appointed in each county and the work of registering the new electorate was soon in full progress. In the early winter of 1867 elections were held in all the military districts, and by February, 1868, conventions were in session in every Southern State that had seceded from the Union. The Constitutions drafted by these bodies reflected the views of the delegates, a majority of whom in most instances were freedmen and Northern Republicans who had emigrated to the South after the war, and who came to be called in derision 'carpetbaggers.' The constitutions drafted by them provided equality in civil rights and in some cases undertook to secure social advantages for the blacks. They established negro suffrage and in most cases disfranchised those whites whom the proposed Fourteenth Amendment would disqualify from holding office. In several States those who had violated the rules of civilized warfare or had voted for secession were likewise disfranchised. Everywhere except in Mississippi, Texas, and Virginia reconstruction constitutions were promptly ratified by the new electorates. In Mississippi, on account of several provisions of a proscriptive character in the new Constitution, a determined and systematic campaign was undertaken by the whites for the purpose of defeating ratification. By the aid of a considerable proportion of the colored voters they were successful, and the State was left to continue for a while longer under military rule. In Texas and Virginia the obnoxious features of the constitutions created such strong opposition that the reconstructionists were induced to delay indefinitely the submission of those instruments and these States likewise continued under military rule. In the other States, the constitutions having been duly ratified and the Fourteenth Amendment adopted by the newly constituted Legislatures, Congress on June 22, 1868, readmitted Arkansas into the Union, and on June 25th Georgia, North Carolina, South Carolina, Florida, Alabama, and Louisiana. The Fourteenth Amendment was also declared by the Secretary of State to have been adopted by the requisite number of States and was accordingly promulgated as a part of the Constitution. In the meantime the Georgia Legislature had rejected the negro members elect to that body, and the United States Senate thereupon refused admission to the Senators from that State after the act of June 25th had declared the State reconstructed. Thus at the time of the accession of General Grant (1869) to the Presidency four of the States were still unrestored to their full places in the Union. He at once recommended to Congress the submission of the constitutions of Virginia and Mississippi to the people in such a manner as to enable them to vote separately upon the obnoxious provisions. Congress acted upon the President's recommendation and the constitutions were promptly ratified without the objectionable clauses. By the same act Congress authorized the President to submit the Constitution of Texas to the voters, which was done and it, too, was ratified. In the cases of these three States, however, Congress imposed an additional condition which had not been required of the other reconstructed States, namely, the ratification of the Fifteenth Amendment. In January, February, and March, 1870, respectively, Virginia, Mississippi, and Texas were restored to

their full positions in the Union, but subject to certain conditions which to some extent impaired their equality with the original States. Finally, after being twice reconstructed, Georgia complied with the new conditions imposed by Congress, and by an act of June 24, 1870, was again restored to her place in the Union and military government was withdrawn.

From the technical point of view reconstruction was now complete, but the consequences of what has come to be generally recognized as a mistaken policy were destined during the ensuing years to be far-reaching in their effects upon the reconstructed States. As a result of the disfranchisement of large classes of whites and the enfranchisement of the negro race, which outnumbered the whites in some of the Southern States, the local and commonwealth governments fell into the hands of unscrupulous adventurers from the North and West, who controlled the colored vote and excluded the native whites from participation in the administration of the government. Negroes who but a few years earlier were in slavery now filled up the Legislatures, held many of the executive offices, many of the minor judicial positions, and in some cases occupied seats on the benches of the higher courts. An era of extravagance, amounting to outright plunder in some States, now set in. Legislative sessions were frequent and long drawn out, the members voting themselves a large per diem as compensation for their services. Bulky codes were enacted and numerous offices, amounting to sinecures in many cases, were created for the benefit of the 'carpetbaggers,' who now came in great numbers to the South. The rate of taxation everywhere was increased out of all proportion to the ability of the people to pay in their then impoverished condition. In Mississippi the rate rose from one mill on the dollar to fourteen, and resulted in the confiscation of one-sixth of the entire land of the State for non-payment of taxes. In most of the States large debts were created for projected improvements, many of which were never carried out. In Louisiana and South Carolina a wholesale system of plunder was inaugurated. In the latter State the public debt was increased from \$5,000,000 in 1868 to \$18,000,000 in 1872, with little to show for it. The tax levy of \$500,000 a year was raised to \$2,000,000, although the value of taxable property had decreased from \$400,000,000 to \$200,000,000. Soon disorders began to arise in all the Southern States, and presently the Ku-Klux Klan (q.v.) was organized to terrorize the negroes and exclude them from the enjoyment of their newly acquired political rights. The disorder became so great that Congress was called upon to take action to preserve order and protect the blacks. By the so-called Enforcement Act of 1870 the Federal courts were given jurisdiction of a series of offenses committed with the intention of denying equal rights to any citizen of the United States. The Federal district attorneys now bestirred themselves throughout the South, and many indictments were found under the act, but few convictions followed. In the following year Congress passed the so-called Ku-Klux Act, which authorized the President to suspend the writ of habeas corpus and employ military force for the suppression of violence in any community. Acts were also passed providing for Federal supervision of elections, and

finally, in 1875, an act was passed to secure equality of treatment to negroes in theatres, railway cars, hotels, and other public places. This act, however, as well as the chief provision of the Ku-Klux Act, was declared by the Supreme Court to be unconstitutional, not being within the power of Congress. As the extravagance and corruption of the carpetbag governments increased, the determination of the whites to regain control of affairs became fixed. The withdrawal of the military forces from the South left the reconstruction governments without power to maintain themselves. Already by 1870 North Carolina, Tennessee, Texas, Georgia, and Virginia had been 'reclaimed' from the Republicans. Meantime the wholesale removal of political disabilities by Congress restored to public life many old and respected citizens of the South. This, together with the division of the Southern Republicans into conservative and radical wings, the former coalescing with the Democrats, made possible Democratic success. In 1874 Alabama and Arkansas went Democratic, and the carpetbag governments in those States came to an end. In the following year a great campaign was waged in Mississippi not unaccompanied by violence, intimidation, and even riots, but which resulted in the defeat of the Republicans. The 'Mississippi plan' was applied with success, in 1876, to the three remaining States of Louisiana, South Carolina, and Florida. The 'redemption' of the Southern States was now complete, and was followed by a general emigration of the 'carpetbaggers' to the States of the North and West. The subsequent virtual disfranchisement of the negro race in the South marks the final recession from the status established by the process of reconstruction.

RECORD (OF. *record, recort*, from ML. *recordum*, witness, record, judgment, from Lat. *recordari, recordare*, to remember, call to mind, from *re-*, back again, anew + *cor*, heart), **JUDICIAL**. A written history or account of the entire proceedings in a case. The importance of keeping such records was not recognized until long after regular tribunals of justice had been established. It seems to be undisputed that William the Conqueror introduced the practice into England. At the early common law it was the custom for the proper court official to enter upon pieces of parchment the pleadings and a brief account of all the steps and proceedings taken in the action, including the judgment. These various pieces were attached together in regular order, and wound into a spiral roll for convenient safe keeping. This was known as the 'judgment roll,' and this term is still applied to the various

pleadings and papers including the judgment when filed together as a part of the record. Afterwards the records were kept by writing them in books instead of on parchment, and in a few jurisdictions to-day every item of a judicial record is entered in books which become the public records of the court. However, in many jurisdictions the record of a case is composed partly of entries in the clerk's books, and partly of the original pleadings and judgment filed in the proper office.

A complete judicial record of an action should contain, in some form, the date of issue, the pleadings, the various necessary steps taken before trial, a minute of the fact of the trial, the appearances for the parties, the name of the judge before whom the cause was tried, the verdict of the jury or disposition by the court, and the final judgment. Under most practice acts, the successful party, in order to enforce his rights under the determination of his case by the court, must attend to the entry of judgment by presenting to the clerk of the court an instrument containing a statement of the determination of the action and an order for the proper relief, which is then signed by a judge or a clerk for the court, and entered. If he is careless the record may remain incomplete, and no process can be issued to carry out the direction of the court. The record of a court is conclusive evidence of the facts which it sets forth as between the parties thereto, and cannot be attacked collaterally. See PLEADING; PROCEDURE; RES JUDICATA, and consult the authorities referred to under PLEADING; PRACTICE.

REC'ORDE, ROBERT (c.1510-58). An English mathematician, born at Tenby, in Pembroke. He was educated at Oxford, and was elected fellow of All Souls' in 1531. He afterwards went to Cambridge and studied medicine, receiving his degree in 1545. In London he is said to have become Court physician. He became comptroller of the mint at Bristol (1549), and general surveyor of the mines and money (1551). He died while imprisoned for debt in King's Bench Prison, Southwark. Recorde was one of the first in England to adopt the Copernican system, then in its infancy. He was the first to introduce algebra into England, and his views of the science were very advanced for the time. His invention of the sign of equality, =, given in his *Whetstone of Witte*, and his method of extracting the square root of polynomials, are the only evidences of originality generally recognized by mathematicians. The equality sign seems, however, to have been a mediæval abbreviation for *est*. His text-books were recognized authorities in England for many years, and it was more than a century after his death that they ceased to be used in the schools. His chief works were: *The Grounde of Artes* (1540, and frequent editions until 1699); *The Whetstone of Witte, or the Second Part of Arithmetike*, a work on algebra (1557); *The Pathway to Knowledge, or the First Principles of Geometry* (1551); *The Castle of Knowledge, a Treatise on Astronomy and the Sphere* (1551); *The Urinal of Physick*, a work on medicine (1547).

RECORDER. In England, the sole judge of a borough court of Quarter Sessions, and frequently judge of the borough civil court of record. Only barristers of five years' standing are eligible, and the appointment is for life or

during good behavior. The recorder does not take charge of the administrative duties of the Court of Quarter Sessions (q.v.). In most boroughs he may practice law, as his salary is often merely nominal. He is appointed by the Home Secretary on behalf of the Crown. This title is also applied to the chief judge of the Mayor's Court of London, and to one of the judges of the Central Criminal Court.

The title is seldom applied to judges in the United States. The principal instance of note is in New York, where one of the judges of the Court of General Sessions is called the Recorder. The name was derived from that of the English judge. He devotes his entire time to his duties, just as the other criminal judges, not being allowed to practice. It is an elective office.

RECORDER. The name of a musical instrument formerly in use in Great Britain, somewhat like a flageolet, but with the lower part wider than the upper, and a mouth-piece resembling the beak of a bird. Its pitch was an octave higher than the flute, and it had a pleasing tone. Its compass was about two octaves, from f¹ to f².

RECORDING ACTS. Under this head are included all statutes providing for the recording or registration of conveyances, liens, and incumbrances of every description, affecting the title to real and personal property. The chief object of such laws is to provide a means of giving public notice of the existence and character of all instruments affecting titles to property, and thereby prevent fraud and render titles more secure than under the common law. Such acts are not usually mandatory in their terms, but in effect they render it unsafe for a purchaser or incumbrancer to neglect to have his instrument of title recorded. For example: if A sells a piece of land to B, and the latter neglects to have his deed recorded, and A subsequently executes another deed of the same land to C, an innocent purchaser for value, the latter will take precedence over B if he has his deed recorded first. Recording acts usually provide for the establishment of record offices, and inspection by the public at reasonable hours. Usually the whole instrument must be copied in the record books, but sometimes only the substance is noted. Instruments presented for record should be duly acknowledged or executed in the form required by statute. The effect of recording is to give constructive notice of the existence of an instrument, which is made equivalent to actual notice. See RECORDING OF DEEDS; TITLE, REGISTRATION OF.

RECORDING OF DEEDS. At common law, the transfer of title to real property by livery of seisin (q.v.) was a public and notorious act, making unnecessary any formal public record of the transaction. The modern practice of recording transfers of property on public records was therefore unknown to the common law. The Statute of Uses (27 Henry VIII., c. 10), which made permissible the conveyance of real estate by deed privately executed, gave rise to the necessity of some method of publicly recording all instruments of conveyance. The first step in this direction was taken by the Statute of Enrollments (27 Henry VIII., c. 16), which provided for the enrollment or recording of all deeds of bargain and sale. As the statute did not in terms apply to leases of real estate, the lawyers

of the time speedily invented a method of evading the statute by means of conveyance by lease and release (q.v.). The Statute of Enrollments thus became practically inoperative almost from the time of its enactment. (See CONVEYANCE.) A later statute (7 Anne, c. 20) required the recording of deeds of all real estate located in the County of Middlesex, and this was followed by some other statutes having a purely local application. There is, however, no statute in England of general application requiring that deeds be recorded, and the practice of recording deeds has never become common in that country.

In the United States from the earliest time there have been statutes providing for the recording of conveyances of real estate, and now generally in the different States there are statutes providing for the recording of all deeds or instruments affecting the title to real estate, and in certain cases instruments affecting the title to personal property. Thus generally deeds, leases, mortgages, assignments, and releases of mortgage, wills, lis pendens, mechanics' liens, and liens upon or affecting real estate may be recorded. And in many States mortgages and conditional sales of personal property may be recorded. The method of recording is usually prescribed by statute. Generally the document is transcribed on public record books provided for the purpose. The place of record is usually, in case of real estate, the county in which the property is located, or, in case of personal property, the town or city in which the property is located or where the mortgagor or owner resides, or both; and there are numerous special provisions governing the recording of instruments affecting transitory property, as vessels, canal boats, and the like. The instrument to be recorded must be properly executed, and it is generally required that it shall be acknowledged before a notary or a corresponding public officer. It is generally deemed to be recorded from the time it is filed in the office of the public officer whose duty it is to record the instrument.

The effect of recording a deed or conveyance in accordance with the various recording acts is to give constructive notice of the deed or conveyance to all who deal with the property. Recording a deed is not necessary to determine the rights of those who are parties to it and their privies; but if the deed is not recorded a subsequent purchaser who has recorded his deed and who had no notice of a prior conveyance will be deemed to have title rather than the first purchaser who did not record his deed. In other words, as between two innocent parties claiming from the same grantor he has a good title who first records his deed.

Unless the recording act specifically otherwise provides, creditors or those buying with notice of a prior conveyance will not be protected by the recording act, but will acquire only the title actually vested in their grantor. The effect of the recording acts, therefore, is to make the public record the conclusive record of the ownership or interest in real property to all who rely upon it, and any one who deals with the property, except a creditor or one having actual notice of an unrecorded instrument affecting the property, may rely upon the state of the public record on the date of taking a deed or conveyance as determining completely the right or interest which he acquires. In England, owing to the practice

of not recording instruments of conveyance, it is usual to give the buyer of real estate who is entitled to receive them all the conveyances affecting the property as muniments of title. In the United States this is not necessary or usual, as the public record is sufficient evidence of the title; and the buyer is entitled only to the grantor's conveyance with the usual covenants of warranty.

RECORDS, PUBLIC. In the broadest sense, a public record is a written account, history, or memorandum of a fact or event of general public interest, made by a public official in the performance of his duties, and intended to be preserved as permanent evidence of the matters to which it relates. However, the term is usually confined to authenticated accounts of legislative acts and proceedings, the judgments and records of proceedings of courts of law, and the originals or copies of wills, mortgages, and conveyances, preserved under recording acts.

The nations of remote antiquity had very little idea of preserving these memorials for the public benefit. Accounts of the doings of the rulers were indeed preserved, as by the clay tablets of Nineveh and Babylon, but they recorded merely military expeditions or the splendor of the monarch, rather than laws or rights affecting the general public. However, as the world became more enlightened and the common people were accorded some rights, it became customary to promulgate laws and preserve them in writing in some royal repository, and these were the first true public records. No provision was made for their inspection by the people, and where it was desirable to promulgate a law affecting the people in general, it was usually written upon parchment, or some more indestructible substance, and posted in a public place, or communicated to those in authority in various districts and proclaimed by them, through their subordinates or deputies, to the people in their respective districts. No method of recording titles to real estate was known until comparatively modern times. Thus, in A.D. 303, the principal laws of Rome were painted on twelve wooden boards, known as the 'Twelve Tables' and exhibited in the Forum. During the mediæval ages the laws were usually written on parchment and preserved by certain public officials, but it seems that no systematic record of judgments or conveyances was kept. The French were probably the first nation to keep judicial records in the sense we employ the term now, and the Normans introduced the practice into England.

Under the feudal system the method of conveying land was by feoffment with livery of seisin, a sort of dramatic ceremony on the land itself, and written conveyances were not introduced until after the Statute of Uses, 27 Hen. VII., c. 10. By 27 Hen. VIII., c. 16, known as the Statute of Enrollments, it was provided that conveyances by 'bargain and sale' should be enrolled, that is, recorded. These acts were the basis of the recording acts in England and the United States.

England has the most complete collection of public records of any of the older nations of the world. However, until 1838, these records were so negligently kept that many valuable ones were destroyed or lost. The oldest English records are the 'tallies in exchequer,' which were made

by means of wooden sticks marked on one side with notches to indicate the sum for which the tally was an acknowledgment, while on the other two sides were written the amount, the name of the payer, and the date of the transaction, and then dividing the stick longitudinally, so that it could be fitted together again and read, the one half being preserved in exchequer, and the other given to the person who had paid the money. This rude contrivance was probably of Norman-French origin, the name being derived from the French *taille* (to cut off), and it probably proved satisfactory in those simple times. This method continued until 1783, when the statute of 23 Geo. III., c. 82, abolished the office of 'tally-cutter,' and substituted indented paper checks as receipts for payments into exchequer. Most of the accumulated tallies, being practically useless, were destroyed by burning.

During the era of the Norman kings the Parliamentary records were in the Norman-French language, and were written on parchment. This language continued to be used for Parliamentary records until the fifteenth century, and Latin was in common use in judicial records until the reign of George II. Various methods for preserving the records were employed before the art of bookbinding came into practical use. Some were crudely bound in book form; others were attached together and wound up in rolls (q.v.); and the parchments containing many records were simply folded and filed in their original form. One of the most noted ancient records is the 'Domesday Book,' which, as its name indicates, is in book form, and contains a record of land surveys and titles to land, compiled by order of William the Conqueror. This was probably the first attempt to make a complete record of the ownership or tenure of land. Such records as had been kept by the Saxons prior to the Conquest had been preserved by the clergy in monasteries and religious houses, and this practice was continued as to many important records for centuries. Many copies of the *Magna Charta* were put under the Great Seal and delivered to the archbishops for safe keeping.

During the reign of the Conqueror and his immediate successors, great progress was made in the matter of keeping public records. The elaborate system of feudal tenures introduced by William necessitated records in order to protect the King in his rights to military services, taxes, etc., and also in the interests of the great lords of the realm, whose power constantly encroached upon and abridged that of the King, and records were an effective means of preserving useful precedents, which would thereafter be considered binding on the Crown. The early court records were scattered about in the various palaces where the kings sojourned during their visits to the different parts of the kingdom. This was due to the fact that the principal court, the *Curia Regis*, followed the King's person, as he was the 'fountain of justice' and originally heard certain petitions, etc., himself. Upon the permanent establishment of the higher courts at Westminster, the court records were deposited in the cellars of Westminster Hall, which were damp and ill adapted for the purpose. A large number of valuable records were also deposited in the Tower. At various times since the thirteenth century the problem of the preservation,

and indexing of the records has been agitated in England. In 1800 a Parliamentary committee accomplished a great deal in the way of discovering and arranging ancient public records. Various commissions supplemented this work between the latter date and 1835, when a Parliamentary committee, appointed for the purpose, made a complete investigation of all that had been previously done in this regard, and their report was the basis of the subsequent legislation on the subject. The statute of 1 and 2 Viet., c. 94, restores to the Master of the Rolls his ancient authority as chief custodian of the court records, giving him in addition the charge of all the records of the kingdom. The act also provided for the establishment of a Public Record Office and for the erection of suitable buildings, and authorized the Master of the Rolls to appoint deputies and assistants, and to take all necessary steps for the careful preservation of all public records. In pursuance of this statute, the Master of the Rolls appointed a deputy keeper, who has active charge of the Record Office, and who issues yearly reports of the work of his department. Provision has been made for the reasonable inspection of records, and authenticated copies may be obtained, which will be received as evidence by the courts. The main Public Record Office building is situated in Fetter Lane, London.

A committee of the House of Commons in 1837 described the public records of England as comprised under four classes: (1) Independent series of records of territorial surveys at different periods; (2) series of enrollments comprising on one roll, varieties of distinct entries, classed together according to their formal character; (3) records of judicial proceedings; (4) separate documents, as letters, inquisitions, and privy seals. The act of 23 Viet. above referred to defines what is legally a public record. It provides that the term 'public records' shall include "all records, rolls, writs, books, proceedings, decrees, bills, warrants, accounts, papers, and documents whatsoever of a public nature belonging to her Majesty."

Some of the records collected were obtained in the library of the Vatican at Rome, being records of taxation by the Popes. One class consists of the various territorial surveys, beginning with the Domesday Book, and including, among others, the *Rotuli Hundredorum*, *Extenta manerii*, *Testa de Nevill*, *Pope Nicholas's Taxation*, *Henry VIII's Survey*, and the *Survey of the Commonwealth*. Another extensive class belongs to the exchequer, including the *Pipe Roll*, or great roll of the exchequer, beginning with the second year of Henry II., containing yearly accounts of the revenues of the Crown; the *Memoranda* and *Originalia* rolls, records of the *First Fruits and Tenths*, records of the *Court of Augmentations*, instituted to decide questions regarding possessions belonging to the Crown on the dissolution of the monasteries; and the *Placita*, or records of pleadings and judgments. The *Rotuli Curie Regis* contain the record of the proceedings in the King's Court; and there are numerous classes of records of the proceedings in the various courts of common law and in the Court of Chancery. The record of *Fines and Recoveries* is an unbroken record of the transfer of lands from 25 Henry II. down to 1833, when this species of conveyance was abol-

ished. The *Charter Rolls* are records of charters, of grants of privileges to religious houses, towns, and corporations, and creations of nobility from 11 Edward II. to Edward IV. The *Patent Rolls* are enrollments of instruments written on open (*patentes*) sheets of parchment, having pendent from them the great seal, and addressed to the liege lords of the kingdom. The *Close Rolls* are records of such letters under the great seal as were dispatched closed or sealed up—royal mandates to particular persons for particular purposes, and not intended for public inspection. The *Liberate Rolls* contain writs issued out of Chancery ordering the payment of money from the treasury. The *Fine Rolls* contain accounts of fines paid to the King for license to alienate lands, freedom from knight service, passing or renewal of charters, wardships, safe conduct, pardons, etc. The *French Rolls*, *Norman Rolls*, and *Gascon Rolls* relate to the affairs of France, Normandy, and Gascony, when held by the English; and the *Rotuli Scotiae*, to transactions with the ancient Kingdom of Scotland. An important class of the records are those connected with Parliament, including *Statute Rolls*, *Parliament Rolls*, *Records of Parliament*, and *Statutes* from 1485 to the present time, with the *Journals of the Lords and Commons* from Henry VIII. to the present time, and the *Writs of Summonses* and returns to Parliament. The *State papers* originally sprung from Privy Council and Chancery, and include the correspondence of the Privy Council, Secretaries of State, and other public departments, with miscellaneous domestic papers from the time of Henry VIII. to George II., a mass of correspondence with foreign powers, and an extensive collection relating to ecclesiastical affairs after the Reformation. Since 1855 the State Paper Office has become a part of the Public Record Office.

SCOTLAND. The ancient Parliamentary and judicial records of Scotland were removed to the Tower of London by Cromwell, and after the restoration of Charles II. were ordered to be shipped back to Scotland, but the ship on which they were loaded foundered in a storm and they were lost. Many of the curious ancient records, however, have been preserved, and together with the modern and contemporary records are kept in the General Register House under the care of the Lord Clerk Register. There are district register houses in Scotland, and when a volume of records is completed in one of these, it is sent to the General Register House.

IRELAND. Many of the ancient records of Ireland were destroyed during the wars which ended in the subjugation of the Irish people by the English. The system of keeping public records has never been so complete as in England, but the more important of the older records are now kept in repositories in Dublin.

UNITED STATES. Our Government started with the English methods of keeping public records from its beginning, and no nation pays more attention to the preservation of these muniments of private rights. In all States deeds, mortgages, etc., are required to be recorded to protect a title to land, and practically all instruments affecting property, real or personal, must be recorded in most States. Judicial records are kept by the clerks of the various courts. The statutes, etc., are kept by the State officials, and are open for inspection. The Federal Govern-

ment carefully preserves the *Declaration of Independence* and all Federal papers and documents. Each State, county, and municipality makes provisions for the safe-keeping of its own records.

LAW AS TO PUBLIC RECORDS. By the common law the general public had no absolute right to examine records preserved by the governmental authorities. For example, a person could not demand to see a record of title to real estate simply because he desired to make an abstract thereof out of curiosity or for historical research. Only such persons as had an interest in the property, or expected to acquire an interest in it, could, as a matter of right, demand to see the records, and compel the custodian to allow inspection in case of his refusal. The theory of this rule was that the time of public officers should not be taken in showing records to persons having no actual interest in seeing them. This has been carried to the extent of refusing to allow title guaranty companies the privilege of examining records of titles to land for the purpose of making abstracts thereof for use in their offices. This rule is also true as to judicial and other public records by the common law, and it still obtains in some of the United States. However, in England and in most of the United States, the statutes provide that public records may be inspected by any one, with reasonable regulations as to time and manner of examination.

A public record is good evidence of the matter to which it relates, and most jurisdictions provide that copies of a record, duly authenticated by the official custodian, shall be received in evidence with the same force and effect as the originals. This saves the public inconvenience of having records in daily use transported to the courts during a trial. The printed statutes of a State are deemed to be official, and must be accepted as such by the public.

Consult: Cooper, *An Account of the Most Important Public Records of Great Britain* (London, 1832); Thomas, *Official Handbook to the Public Records* (ib., 1853); Ewald, *Our Public Records* (ib., 1873); Scargill-Bird, *A Guide to the Principal Classes of Documents Preserved in the Public Record Office*; Reeve, *History of English Law* (ib., 1869); and the *Commentaries* of Blackstone and Kent. See CONVEYANCE; JUDGMENT; LIEN; MECHANICS' LIEN; RECORDING OF DEEDS; RECORD, JUDICIAL.

RECOUPMENT (OF., Fr. *recoupment*, from *recouper*, to recoup, cut off, or again, from *re-*, back again, anew + *couper*, to cut, from *coup*, cut, from Lat. *colpa*, from Gk. *κόλαφος*, *kolaphos*, blow with the fist, from *κόλαπτειν*, *kolaptein*, to strike). The right of a defendant in an action at law to reduce the amount of the plaintiff's recovery in the action by the amount of any damage which he has suffered by the act or omission of the plaintiff growing out of the transaction or contract sued upon. The term originally signified a mere reduction of the amount of the recovery because of partial payment or former recovery, but in modern practice it denotes any affirmative claim for damages growing out of the cause of action brought which the defendant asserts as a defense for the purpose only of reducing the amount of the plaintiff's recovery, although he might at his option assert the claim in an independent action. Thus in an action

upon contract for the purchase price of goods, the defendant may recoup damages which he has suffered because of the plaintiff's breach of a collateral warranty of the quality of the goods; or in an action by a common carrier to recover freight money, the defendant may recoup for loss or injury to the goods resulting from a violation of the plaintiff's obligation as a common carrier. In an action upon contract damages recouped may be for tort, or vice versa provided the recoupment grows out of the transaction sued upon. Recoupment differs from 'set-off' and counterclaim.

Recoupment is a common-law doctrine and has become established in the several States of the United States by judicial decision. The exact limits of the application of the doctrine vary considerably in the different States, and a discussion of the rules of the different States would involve the consideration of technical details not within the scope of this article. In many States, particularly those having codes of civil procedure, there are statutory forms of counterclaim which include both recoupment and set-off. See SET-OFF; COUNTERCLAIM.

RECOVERY. See COMMON RECOVERY.

RECREATION PIERS. In several American cities, wharves reserved for the use of the public and designed to supplement the park system of the city as breathing places for the inhabitants of the congested districts. Those in New York City may be taken as typical. In 1892 the Legislature provided that certain docks in the city of New York be set aside as 'recreation' piers and that these be covered with permanent structures, the upper story to be wholly free to the public, while the lower decks were to be devoted to the exigencies of trade. The first pier was completed in 1896, and in 1903 there were seven such in Greater New York, situated as follows: East Third Street, East Twenty-fourth Street, East 112th Street, Christopher Street, West Fiftieth Street, and West 129th Street, in the Borough of Manhattan, and North Second Street in Brooklyn. Fireproof pavilions of steel have been erected on all of these piers, which vary in length from 200 feet to 722 feet (at East Third Street). Seats are provided for the use especially of mothers and children, and in the evenings there is music, and frequently dancing. The attendance at the East Third Street pier during the first year was estimated as ranging from 500 to 2000 in the afternoon, and from 3000 to 7000 in the evening. The piers are naturally open only during warm weather, but at East Third and East Twenty-fourth streets there are glass inclosures so that these may be utilized for winter-garden purposes.

RECRUITING OFFICER, THE. A comedy by George Farquhar, produced in 1706. The military scenes are sketches from life, drawn from Farquhar's experience in the army. The title-character is Sergeant Kite.

RECRUITMENT (Fr. *recrutement*, from OF. *recruter*, Port. *recrutar*, *reclutar*, from ML. *reclutare*, to recruit, patch, mend, from Lat. *re-*, back again, anew + *AS. clūt*, from Welsh *clwt*, Ir. Gael. *clud*, Manx *clooid*, clout, patch), MILITARY. The raising of men for military service. Recruitment of armies in general is by voluntary enlistment (the method adopted by the United States and Great Britain) or by con-

scription, or compulsory enlistment (the system in use on the Continent of Europe). The recruiting system of Germany is the model for nations adopting compulsory service. The country is divided geographically into as many corps districts as there are army corps (the latter are more or less permanently located), and these are subdivided into division, brigade, regimental, battalion, and company districts. Each company is recruited in its own geographical district. Each brigade district has also from two to six *Landwehr* (the reserve of the active army on the war footing) districts, which are the units of recruitment for this body. The recruits are examined by a commission of civil and military officers. Those physically, mentally, or morally unfit are rejected; the rest draw lots, the lower numbers being taken to fill the annual contingent, the higher passing to the Erastz Reserve (a reserve of recruitment). Ordinarily the young men are not called out till they are twenty years of age nor after they are forty. Between seventeen and twenty and over forty they belong to the *Landsturm*, the last reserve of the Empire. After completing his term of service in the ranks the soldier passes into the reserve of the active army, retaining his place in his regiment, borne on its books, and liable to recall till about twenty-six years old; he then passes to the *Landwehr* battalion of the district, the *Landwehr* command keeping the register of names and addresses. The special method of recruitment for an army in the field, now adopted by all nations, whatever the general system of recruitment may be, is by so-called *depot* battalions, etc., which remain in the home country and receive and train all the recruits for a particular regiment, etc. The methods for recruitment used in the United States will be found discussed under ENLISTMENT, where information as to the qualifications of recruits is given. The accompanying illustration shows a circular used in the American Revolution to obtain recruits. See ARMIES; ARMY ORGANIZATION; etc.

RECTANGLE (OF., Fr. *rectangle*, from Lat. *rectiángulum*, right-angled triangle, from *rectus*, right, straight + *angulus*, angle). A parallelogram having four right angles. See PARALLELOGRAM; MENSURATION.

RECTIFYING. See DISTILLED LIQUORS.

RECTOR (Lat., ruler, director). An ecclesiastical and academic title, meaning in the former sense a clergyman who has the charge of a parish and full possession of all the consequent rights and privileges. In the Church of England a rector differs from a vicar in that the latter is entitled only to a certain portion of the ecclesiastical income specially set apart to the vicarage. The office of rector as developed in England was carried over to the American colonies, where, however, a unique development came about. Under the American civil church law (q.v.) the parishes of the Protestant Episcopal Church, like the religious societies of other denominations, received civil incorporation, and the American rector, instead of continuing to be regarded, like the English, as a corporation sole, became *ex officio* the president of a corporation constituted of the rector, wardens, and vestrymen. To the rector belongs the possession and use of the temporalities of the parish, but only for the service of the church. In the Roman Catholic

Church the title of rector is frequently given to a parish priest or to the superior of a college or a religious house, more especially the superior of a Jesuit seminary or college. A 'missionary rector' in this Church is a priest appointed by the bishop to certain parishes in England, and in the United States to the charge of any parish. Some few are known as 'irremovable rectors'; these cannot be transferred to other parishes or removed for any other cause than proved misconduct.

In academic usage the title of rector is given in many places to the head of a college or of a university. In this sense it was employed by the colonial institution of America until the middle of the eighteenth century, for instance, the head of Yale College was called rector.

RECTUM (abbreviation of Lat. *rectum intestinum*, straight intestine). The lowest (or, in animals, the most posterior) part of the large intestine. Some anatomists include the sigmoid flexure of the large gut as a part of the rectum. In this view, the first part of the rectum consists of a loop beginning in the left iliac fossa and ending opposite the third piece of the sacrum. When unfolded this loop resembles the Greek capital letter omega, and is about 17½ inches in length. It lies wholly within the pelvis, and it is attached by a meso-colon to the abdominal and pelvic wall. The remaining part of the rectum extends from the middle of the third piece of the sacrum to the anus. The term rectum should be limited to this portion, free of meso-colon, lying in the hollow of the sacrum to the tip of the coccyx, thence curving backward and downward to the anal orifice. The portion that lies against the sacrum is about 3½ inches long, the remaining part about 1½ inches long. The upper part of the rectum proper is covered with peritoneum, which ceases at a point five inches above the anus. The structure of the rectum is considered under **INTESTINE** (q.v.).

RECTUM, DISEASES OF THE. The rectum is the seat of a number of congenital deformities. Imperforate anus or entire abscess of the anus is sometimes found in newly born children. Occasionally the rectum opens into the vagina or urethra. These conditions have to be met with prompt surgical measures. An imperforate anus is punctured or incised and kept open by bougies until healing takes place, and a preternaturally narrowed rectum or anus is dilated with rectal sounds, or with the finger. Sometimes an artificial anus has to be made, either at the natural site or higher up in the inguinal region. In feeble or ill-nourished children prolapse of the rectum or anus is apt to occur from diarrhoea and excessive straining at stool, or in connection with worms, stone in the bladder, or other irritation. Prolapse is reduced by the application of cold compresses, and gentle replacement of the protruding tissue with the fingers. It is then retained by a pad, and recurrence is combated by the use of astringent and antiseptic injections. A perfect cure, however, is only to be secured by the removal of the causative condition.

Adults are subject to numerous disorders of the rectum. Inflammation (proctitis) results from constipation and from chronic diarrhoea and dysentery. Ulceration of the rectum may be due to abrasions from hardened fecal masses, to syphilis, or to tuberculosis; it may be single or

multiple. Ulcers are treated locally by cleansing and astringent injections, with constitutional remedies adapted to the individual case. Spasm of the rectum (proctospasm) or sphincter ani is a not uncommon manifestation of neurasthenia and hysteria, but its most usual causes are anal fissure and hemorrhoids. Stricture, which may result in complete occlusion, may be simple or malignant. It is often caused by cancer of the rectum. When due to cancer the pain is intense and lancinating, and the patient has an emaciated appearance. The stools are often flattened out like ribbons, and contain blood and mucus. Stricture of the rectum is best treated by laxatives, cleansing injections, and by gradual dilatation with soft rubber bougies. In the case of cancer, however, these measures are only palliative. Here it is often necessary to remove a part or all of the rectum and stitch the colon to the edges of an artificial opening in the abdominal wall at the groin, thus forming a new anus. Patients can thus live in comparative comfort.

Fissure of the anus is a crack at the anal opening, producing spasm of the sphincter muscle. It causes violent burning pain during defecation, and the dread of this suffering results in voluntary inaction of the bowels and habitual constipation. Intense itching often accompanies fissure. Strict cleanliness and the application of healing ointments usually suffice to cure this condition. Touching with the point of a stick of lunar caustic is a valuable remedy. Fistula in ano consists of the unhealed track of an abscess adjacent to the lower part of the rectum on the verge of the anus. An abscess in this region heals with great difficulty, because of the constant movement of these parts and the passage of feces, which reinfect and irritate it. Fistula is not uncommonly associated with hemorrhoids, cancer, or stricture. These are the varieties of fistula: The *blind external* terminates in a cul-de-sac near the bowel and opens at or near the margin of the external sphincter; the *blind internal* fistula opens into the bowel and has no external orifice; the *complete* has both an internal and an external opening. The symptoms are passage of wind and feces through the opening and of a discharge which stains the clothing. Repeated attacks of inflammation ensue and new abscesses form. Treatment in all varieties of fistula is free incision and cutting out of the fistulous tract. See **FISTULA**.

Hemorrhoids or piles are venous tumors situated either within, without, or on the margin of the anus, and are caused by congestions and inflammation of the abundant vascular areas of the rectum. (See **PILES**.) Polypus of the rectum is a tumor attached by a narrow pedicle, and originating in a relaxed fold of the mucous membrane, or in granulation tissue springing from an ulcer, or in a mass of hemorrhoids. The only remedy is removal.

Pruritis of the anus is a symptom of many diseases, both local and distant. It may and often does accompany such widely diverse affections as piles, fissure, seat worms, eczema, nerve disturbances, Bright's disease, jaundice, constipation. The itching is almost unbearable and is worse at night. The general treatment will depend on the exciting cause. Locally sedative lotions and ointments are employed and strict cleanliness observed. Eczema (q.v.) often affects this region.

RECUSANT (OF. *recusant*, Fr. *récusant*, from Lat. *recusare*, to reject, from *re-*, back again, anew + *causa*, cause). In English ecclesiastical legislation, any person who refuses to attend the services of the Established Church. Laws against recusants have borne most heavily upon Roman Catholics, who in earlier times were generally suspected of plotting against the Government and the person of the sovereign. The first of such laws was passed under Elizabeth in 1581, but the culmination of such legislation in her reign was in 1593. A law passed in that year read that all Popish recusants over sixteen years of age must "repair to their places of dwelling where they usually heretofore made their common abode, and shall not, at any time after, pass or remove above five miles from thence." If they did remove, their goods were forfeited to the Crown. A careful list was made of all such persons. If they had no property they were required to leave the country, upon penalty of being treated as felons. If they made public submission, they were to be absolved. Consult the act in Gee and Hardy, *Documents Illustrative of English Church History*, pp. 498-508 (London, 1896). The Popish recusants still being considered a source of danger after Elizabeth's reign, additional and more stringent laws were passed against them. Thus in the third year of King James (1606) there were two such acts, "for the better discovering and repressing of Popish recusants;" and "to prevent and avoid dangers which may happen from Popish recusants;" in the twenty-fifth year of Charles II. (1685), one "for preventing dangers which may happen from Popish recusants;" and there were similar laws under William and Mary and Anne. All such legislation was abrogated in the reign of Victoria.

RED. One of the three primary colors, the rays of which are least broken, and which is, consequently, at the end of the spectrum (q.v.). It is much used, as well in the fine arts as in dyeing and other applied arts. The mineral, animal, and vegetable kingdoms contribute the materials from which red colors are derived. The mineral world furnishes vermilion and the red ochres; the animal, carmine, scarlet, and others; and the vegetable, the different madder pigments. (See these titles.) Since 1848 the term red, as being the color of blood, has been applied by their opponents to the radical parties, especially in France. The red flag has been adopted as the emblem of their creed by the Social Democrats the world over.

RED ADMIRAL. See ADMIRAL and Colored Plate of BUTTERFLIES.

REDAN (OF. *redun*, *redent*, Fr. *redan*, from Lat. *re-*, back again, anew + *dens*, tooth). A work in fortification which consists of two parapets, whose faces join in forming a salient angle toward the enemy, like a letter V, in which the apex is to the front. The construction is similar to a redoubt (q.v.). See FORTIFICATION; SIEGE AND SIEGE WORKS.

RED ANT. See HOUSE ANT.

RED-BACKED MOUSE, or WOOD-MOUSE. A small meadow-mouse (*Erotomys Gapperi*) of the wooded regions of Canada and the Eastern States, especially numerous in boggy regions. The color of the back is bright reddish chestnut, lightening below into buffy white. There is

also a Northern gray variety. These mice have the general habits of meadow-mice, but those of southern New Jersey inhabit exclusively the Sphagnum bogs, where they burrow deeply in the moss, making tunnels and nests below the frost-line.

RED-BACKED SANDPIPER. A shore-bird, the dunlin (qq.v.), also known to American gunners as 'winter snipe' and 'blackbreast.'

RED BANK. A town in Monmouth County, N. J., 26 miles south of New York City, with which it has steamboat connection; on the Shrewsbury River, and on the Pennsylvania and the Central of New Jersey railroads (Map: New Jersey, D 3). It is an attractive residential place and a popular summer resort. There are in Red Bank Shrewsbury Academy, and public and high school libraries. The leading manufactories include carriage shops, a clothing factory, a large canning factory, boiler works, and gold-beating establishments. Population, in 1890, 4145; in 1900, 5428.

RED BAT. A small North American bat (*Lasiurus borealis*) 4.4 inches long and 11 inches in expanse of wing. Its fur varies from bright rust-red to gray, with a whitish patch on each side of the breast. It is one of the commonest of our bats, dwells in dark eaves and garrets, and is more likely to come out in daylight than any other species. Those of the Northern States migrate southward in winter. It was formerly called the New York bat.

RED-BELLIED SNAKE. A common harmless snake (*Storeria occipitomaculata*) of the eastern half of the United States, allied to the garter snakes, but shorter and more robust; it is also called 'wampum-snake.' It is chestnut or grayish brown; a paler line, about three scales wide, runs along the spine; the hindhead shows three pale blotches, and the abdomen is salmon red. A nearly related species is DeKay's snake (*DeKayi*), but this is more grayish and has a gray belly. Another small red-bellied snake in the Mississippi Valley is Kirtland's (*Tropidoclonium Kirtlandi*), but its head is shining black, and lines of round black spots mark its whole length. A much larger species is the red-bellied water snake (*Natrix erythrogaster*), which is found in the Southern States and northward to Michigan. It reaches a length of 4 feet.

REDBIRD. A local name for many different birds of red plumage. In the United States the name is given to the tanagers and to the cardinal-bird (qq.v.).

REDBREAST. See ROBIN.

RED-BREASTED (or ROBIN) **SNIPE.** A dowitcher (q.v.).

REDBUG. A heteropterous insect (*Dysdercus suturellus*) which damages cotton and oranges in the Southern United States; also called cotton stainer. (See COTTON INSECTS.) The term 'redbug' is also applied in parts of the Southern United States to the larvæ of certain harvest mites, also called jigger.

REDCAP. A breed of domestic fowls, the largest of the Hamburg group, and long established in good repute.

RED CEDAR RIVER. See CEDAR RIVER.

RED CLOUD (translation of his native name, *Maappya-luta*) (c.1825—). A chief of the Ogala Sioux. He was born about 1825, and rapidly rose to the first rank in his band by his bravery and success upon the warpath and wisdom in council. He was active in wars with the Crow, Blackfoot, and other tribes, and fought against the Government in the war which began in 1863 and lasted almost continuously until 1868. With Sitting Bull he opposed the sale of the Black Hills in 1876, and also the agreement of 1889, by which the Sioux surrendered half of their remaining country. He supported the Messiah doctrine and the ghost dance in 1890. In his warrior days, according to his own statement, he 'counted coup' eighty times, i.e. performed eighty separate deeds of valor against the enemy, any one of which entitled him to some distinguishing badge of honor. His most notable encounter was an engagement with the Crows, in which he is said to have killed fourteen of the enemy. As a delegate for his people he made numerous visits to Washington.

RED CROSS, KNIGHTS AND LADIES OF THE. A fraternal and benefit order founded in 1879 by members of the Ancient Order of United Workmen and other societies. The order provides death, old age, and disability benefits, and claims to have an ample reserve fund to meet all contingencies. It is under the supervision of the Insurance Departments of the various States in which councils exist, and the rates for insurance are based on the Fraternal Congress Experience Table of Mortality. The ritual is founded on the life and teachings of Constantine the Great. The emblem of the order is a red Greek cross, surmounted by a crown with a white five-pointed star in the centre. The motto is 'Omnia pro caritate.' The total membership in 1902 was 427,426.

RED CROSS, ORDER OF THE. (1) A Russian order with two classes, established in 1878 at the close of the Turkish War. It is conferred on women only, and is bestowed by the Empress. (2) An English order founded by Queen Victoria, in 1883, for women who have distinguished themselves in the care of sick soldiers. It is conferred on foreigners as well as English women. The decoration is a golden cross bearing the words 'Faith, Hope, Charity,' and the date 1883.

RED CROSS KNIGHT, THE. The hero of the first book of Spenser's *Faerie Queene*, typifying holiness, and secondarily Saint George, also the Church of England. At first an awkward clown, when armed he becomes the "goodliest man in that company" and the champion of Truth (Una) against the dragon. Deceived by Archimago, he deserts Una for Duessa (Rome), and Una with the lion (Reason), meeting Archimago disguised as the Red Cross Knight, is deceived also. The real Knight is attacked by Orgoglio (Pride) and thrown into prison, from which he is rescued by Prince Arthur. After resting in the House of Holiness he wins the victory over the Dragon and marries Una.

RED CROSS SOCIETIES. International associations whose purpose is to mitigate the horrors of war by alleviating the sufferings of the sick and wounded. They are the result of an agitation begun by M. Jean Henri Dunant (q.v.), a philanthropic citizen of Geneva, Switzerland.

On June 24, 1859, he chanced to be present at the battle of Solferino and was an eyewitness to the vast amount of unnecessary suffering that resulted from the inability of the regular surgical corps to care for the thousands of wounded who lay upon the field. Three years later he published the widely read book, *Un souvenir de Solferino*, in which he vividly described the horrors he had witnessed and proposed that societies should be formed in every country in time of peace for the purpose of training nurses and collecting supplies so that when war broke out the work of the regular military surgical corps could be supplemented. M. Dunant's proposal was well received by the Genevan Society of Public Utility, and an agitation was begun which resulted in an international conference at Geneva in October, 1863. A provisional programme was agreed upon by the delegates of the sixteen nations that were represented, and in the following August a more formal diplomatic congress, composed of representatives from the same number of nations, was held in the same city. On the 22d of that month was signed what is known as the Geneva Convention (q.v.). Contrary to generally received opinion, the Convention makes no direct provision for the organization of Red Cross societies, but it renders such societies possible; and at the previous conference it had been stipulated that each nation which should ratify the Convention should have one national committee or society, civil in its character and functions, which should alone have the right to authorize the sending of surgical corps to a war. The Convention was quickly ratified by fourteen nations, a number that has now been increased to forty-three, and thus its provisions have come to be a recognized part of international law. During the Servian War of 1876 the Turkish Government notified the signatory powers that it had adopted the crescent instead of the red cross as the badge of its societies, and Russia, which shortly afterwards entered the conflict, agreed to accept the substitution provided Turkey would respect the red cross of her adversaries.

When the American National Red Cross Society was formed in 1881 (the Convention was ratified by the United States in the following year) its president, Miss Clara Barton (q.v.), decided that its usefulness should be widened by including not only relief during war, but also during great calamities, such as famine, pestilence, flood, or fire. This new feature received the unanimous sanction of the international and national committees. In carrying out the idea the American Association has expended about \$2,000,000 since its organization, and has afforded valuable relief to the sufferers from the Michigan fires of 1881, the Florida yellow fever of 1888, the Johnstown flood of 1889, the Russian famine of 1891-92, the South Carolina tidal wave of 1893, the Armenian massacres of 1896, the Spanish reconcentrado system in Cuba in 1897-98, the Galveston tidal wave of 1900, the Mont Pelée eruption of 1902, and other disasters. The assistance which the association rendered during the Spanish-American War of 1898 should also be mentioned.

It was soon found that the Convention of 1864 was in certain respects inadequate and that some revision was desirable. In 1867 the first

International Red Cross Conference, held at Paris, proposed such a revision, and in the following year a diplomatic congress convened at Geneva to consider the matter. This congress agreed to add a few supplementary clauses, one of which provided that the principles of the Convention should be applied to naval warfare. Owing to the Franco-Prussian War and to other causes, however, the clauses were not ratified by the powers and consequently had no binding force as international law. It was not, in fact, until the Hague Peace Conference of 1899 that it was agreed to apply the principles of the Convention to war upon the seas. At other international conferences of the Red Cross Societies, at Berlin in 1869, Geneva in 1884, Karlsruhe in 1887, Rome in 1892, Vienna in 1897, and Saint Petersburg in 1902, other subjects for amplification were discussed. Among these were the relations of the Red Cross to the army, the means that should be taken to impress upon the soldiers the necessity of respecting the red cross, and the measures that would best prevent the abuse of the emblem by persons who might make use of it to cloak hostile designs. This last subject, in particular, was much discussed during the South African War. All the conferences have, however, been hampered by the fact that they can only recommend changes; in order to become an integral part of international law such changes must be ratified by the nations.

The various national Red Cross associations are not intimately connected, but the society at Geneva is regarded as the central committee of all. Through it all international communications are made, and by it an international bulletin is published. Many of the national committees also issue publications. The president of the Geneva Committee is Gustave Moynier; that of the American national organization is Miss Clara Barton.

Y., 1881); Barton, *History of the Red Cross* (Washington, 1883); id., *History of the Red Cross in Peace and War* (New York, 1898); *Bulletin international des sociétés de la Croix-Rouge*, published four times a year by the International Committee of Geneva; *Memorial des vingt-cinq premières années de la Croix-Rouge, 1863-1888*, published by the same committee; and *American National Red Cross Relief Committee Reports* (New York, 1898; 2d ed. 1899).

RED DEER. The common deer of Europe, the males of which are the 'stags' hunted in Scotland and elsewhere. See DEER; DEER-STALKING.

RED'DING. A city and the county-seat of Shasta County, Cal., 170 miles north of Sacramento, on the Sacramento River, and on the Southern Pacific Railroad (Map: California, B 1). The court house and sanatorium are note-

worthy features of the city. Redding is situated in a mining and lumbering section, and manufactures lumber, foundry and machine-shop products, etc. Population, in 1890, 1821; in 1900, 2946.

RED'DITCH. A town in Worcestershire, England, on the Arrow, 13 miles southwest of Birmingham (Map: England, E 4). It is the centre of the needle-manufacturing industry, and pins, fish-hooks, and fishing tackle also are largely made. The municipality owns its electric lighting plant. Population, in 1891, 11,300; in 1901, 13,500.

REDDLE (also *raddle*, *ruddle*, from AS. *rudu*, redness, from *rēad*, red), or RED CHALK. An ochreous red iron ore used for making crayons and as an abrasive for polishing glass.

REDEEMER, ORDER OF THE. A Greek order founded in 1829 and reorganized by King Otto in 1833. Its membership consists of persons distinguished in the War of Liberation, and in commerce, industry, science, or art. The decoration is a white cross on a green wreath of oak and laurel; on the medallion is an image of the Saviour. The reverse bears the Greek cross. See PLATE OF ORDERS.

REDEMPTION (Lat. *redemptio*, from *redimere*, to buy back, redeem, from *red-*, *re-*, back again, anew + *emere*, to buy). In law, the determination of a creditor's right in property, real or personal, by the discharge of the obligation for which the property is held. The term is most frequently employed to denote the release of a pledge or mortgage. In either case the legal interest of the creditor (pledgee, mortgagee) is terminated *ipso facto* by the performance by the debtor of his obligation or the legal tender thereof, and thereafter the possession of the creditor is wrongful. See PLEDGE; CONDITION; EQUITY OF REDEMPTION; FORECLOSURE, etc.

REDEMPTIONISTS. See TRINITARIANS.

REDEMPTORISTS (Fr. *rédeemptoriste*, from Lat. *redemptor*, redeemer, from *redimere*, to buy back, redeem), also called LIGORIANS. A congregation of missionary priests founded in 1732 by Saint Alphonsus Liguori (q.v.). The members of the Congregation of the Most Holy Redeemer were bound to seek their own perfection by the obligations and rules of a religious life and to devote themselves to apostolic work among the most neglected and forsaken souls, especially in country places. The instructions given by the members are of the simplest and plainest character. The congregation was originally founded in Naples, but being approved by Benedict XIV. in 1749, spread rapidly throughout Italy and afterwards extended into Germany and Switzerland. The suppression of the Jesuits in 1773 left a hiatus in missionary fields which the Redeemtorists were called upon to fill. By the end of the eighteenth century the congregation had spread throughout most of the countries of Europe and in the early part of the nineteenth century houses were established in North and South America and in Australia.

Saint Alphonsus founded also an Order of Nuns called Redeemptoristines. This is a strictly contemplative Order with a number of convents in Italy, three in Austria, four in Belgium, three in Holland, two in France, and one in Ireland. For their constitution and early history, see Dumor-

tier, *Les premieres Redemptoristines* (Lille, 1884).

The Redemptorists are noted for their faculty of doing effective missionary work among the uncultured classes of the population. Their missionary system includes frequent 'renovations' in order effectively to secure the good already done, and the frequent reception of the sacraments is recommended for the perpetuation of the fruit of the missions. According to the latest official catalogue of the Redemptorist Order (1901) there are 16 provinces and one vice-province of the congregation. These are known as the Roman, Neapolitan, Sicilian, Lyonesse (which has houses in Chile and Peru), the Austrian, the Belgian (which has houses in Canada, in the West Indies, and in the Congo region), the Baltimore (which has a mission in Mayaguez, Porto Rico), the Bavarian (with two houses in Brazil), the Province of Holland (which has a mission in Surinam), the Lower German (with three houses in the Argentine Republic), the English, the Irish (with three houses in Australia), the Province of Paris (with three houses in Ecuador and Colombia), the Spanish, and the Province of St. Louis, U. S., besides the Province of Prague in Bohemia, and the Vice-Province of Alsace-Lorraine. Altogether there are 175 houses, with 3300 members, of whom 1620 are priests, 489 clerical students, 150 choir novices, 733 professed lay brothers, and 300 lay novices. In the United States there are 520 members, of whom 270 are priests. For the history of the Order in America, consult Wuest, *Annales Provinciae Americanae* (Hchester, Md., 1888).

REDFIELD. A city and the county-seat of Spink County, S. D., 40 miles south of Aberdeen; on the Chicago and Northwestern and the Chicago, Milwaukee and Saint Paul railroads (Map: South Dakota, G 5). It is the seat of Redfield College (Congregational), opened in 1887, and of the Northern Hospital for the Feeble-Minded, a State institution. Population, in 1890, 796; in 1900, 1015.

REDFIELD, WILLIAM C. (1789-1857). An American man of science and affairs, born at Middletown, Conn. In 1820 he became interested in steam navigation and after studying numerous boiler explosions which at that time were alarming the public, he founded a line of *safety barges* towed by a steamer at a safe distance to ply between New York and Albany. After public confidence had been restored this line was utilized for the carriage of freight and became the predecessor of the lines now in operation. Mr. Redfield was also active in beginning the New York and Albany, now the Harlem Railroad, and the New Haven and Hartford and the Hudson River railroads; and as early as 1829 he proposed the construction of a road connecting the Mississippi with the Hudson. In science, though he devoted some attention to geology, his principal contributions were in the field of meteorology. He developed a theory of storms by which he sought to demonstrate that all violent gales are whirlwinds and have a rotary and progressive movement; that the direction of revolution is always uniform; and that the velocity of rotation increases from the margin toward the centre of the storm. He reorganized the American Association of Naturalists and Geologists as the American Association for

the Advancement of Science, and became its first president in 1843. Among his publications are "Remarks on the Prevailing Storms of the Atlantic Coast of the North American States" (*American Journal of Science*, vol. xx.); "Notice of American Steamboats" (ib., vol. xxiii.); "On the Courses of Hurricanes" (ib., vol. xxxv.); "Short Notices of American Fossil Fishes" (ib., vol. xli.); and "The Law of Storms and Its Penalties for Neglect" (*New York Journal of Commerce*, June 19, 1850). Consult Ohmsted, *Scientific Life and Labors of William C. Redfield* (New Haven, 1857).

REDFIN. The name given to two or three dace or minnows, which have notably red fins, and especially to the common shiner (*Notropis cornutus*), found in almost every small stream east of the Rocky Mountains and north of Georgia. It exhibits many local varieties of form and color, some never exceeding four inches, while others reach eight inches in length. It may be distinguished from other shiners by its large size, steel-blue back, with a gilt line along the spine, and another along each side, and the rosy tint of the lower fins. Compare SHINER; and see Plate of DACE AND MINNONS.

REDFISH. (1) The red drum or channel bass' (*Sciaenops ocellatus*). It is a rich iridescent gray in color, often washed with coppery red, and

REDFISH OR CHANNEL BASS.

reaches a length of five feet and a weight of 75 pounds, but is usually much smaller. It is to be found along the whole southern coast of the United States, is everywhere valuable as a food-fish, and on the Texas coast is said to exceed in economic importance all other fishes found there. (2) In southern California, a large and handsome fish (*Pimelometopon pulcher*) related to the doncellas. The body is somewhat deep and compressed, and the blunt forehead in the adult carries a very prominent fatty hump, whence the fish is frequently called 'fathead.' In the males the head, dorsal, anal, and caudal fins are purplish-black, and the rest of the body varies from clear crimson to blackish-purple. The females are dusky rose-color. This handsome fish, which reaches a length of three feet and a weight of 13 to 15 pounds, is caught abundantly with hook and line in the kelp beds along the shore, and is a favorite with the Chinese, who salt and dry its flesh. (3) One of the most important and richly colored of the Californian rosefishes (*Sebastes marinus*). See ROSEFISH. (4) The Alaskan name for the 'red' or blue-back salmon (*Oncorhynchus nerka*). It is known in two forms, one large and one small. See SALMON.

RED GAME, or GROUSE. The common moor-fowl or ptarmigan (*Lagopus Scoticus*) in its summer dress. See GROUSE; PTARMIGAN.

REDGAUNTLET. A novel by Sir Walter Scott (1824). The hero, Sir Arthur Redgauntlet, brought up as Darsie Latimer, falls unknow-

ingly into the hands of his uncle, an ardent Jacobite, and is forced into the plot to restore the Pretender, Charles Edward. After the failure, Mr. Redgauntlet follows the Pretender to France, where he retires to a monastery. Sir Arthur, now in possession of his estate, bestows his sister on his faithful friend and rescuer, Alan Fairford.

RED GRAVE, RICHARD (1804-88). An English genre and landscape painter, born in London. After exhibiting the "River Bent, Near Hanwell" at the Royal Academy in 1825, he was admitted to its schools the following year. In 1850 he was made Royal Academician. He was head master of the school of design in 1848 and art superintendent in 1852. In 1857 he was made inspector general of art schools and surveyor of Crown positions, holding the latter position until 1880. Among his paintings are "Gulliver on the Farmer's Table" (1837); "Quinten Matsys, the Blacksmith at Antwerp" (1839); "Ophelia" (1842), one of his best figure pictures; "Country Cousins" (1848, National Gallery); and "Hidden Among the Hills" (1881). Redgrave is author of *An Elementary Manual of Colors* (1863). His brother, **SAMUEL** (1802-76), studied architecture at the Royal Academy in 1833, but is best known as a manager of a number of important art exhibitions, and especially as an author on art topics. Assisted by his brother, he published *A Century of Painters of the English School* (1866). He also prepared a *Dictionary of Artists of the British School* (1874).

REDHEAD. A numerous and widespread American duck (*Aythya Americana*), closely allied to the canvasback, but differing from it in having the head chestnut red and in other par-

1. BEAK OF CANVASBACK. 2. BEAK OF REDHEAD.

ticulars given under **CANVASBACK** (q.v.); also in the shorter bill, as illustrated herewith. They appear in great numbers in spring and fall, especially about fresh-water marshes, assembling in large migratory flocks and keeping close together; but they are strong, hardy birds and swift fliers. Early in March they hasten northward to breeding places in Canada. They are excellent eating, and are constantly substituted by dishonest gunners and caterers for the highly prized canvasback. Consult: Elliot, *Wildfowl of the United States and British Possessions* (New York, 1898); Job, *Among the Waterfowl* (New York, 1902); and books relating to shooting.

REDHOUSE, SIR JAMES WILLIAM (1811-92). An English Orientalist and diplomat, born near London, and educated at Christ's Hospital. He entered the employ of the Turkish Government as a draughtsman in 1826, and in 1838, after various travels, became translator to the Grand Vizier. In 1854 he was appointed Oriental translator to the British Foreign Office, and in 1857 at Paris he took a prominent part in the treaty with Persia. His great work, a dictionary of Persian, pure Turkish, and Arabic, was left un-

finished and in manuscript. His published works include: *Grammaire raisonnée de la langue Ottomane* (1846); *A Dictionary of Arabic and Persian Words Used in Turkish* (1853); *English-Turkish and Turkish-English Dictionary* (1856); *Lexicon of English and Turkish* (1861); *History, System, and Varieties of Turkish Poetry* (1880); and a version of Merlana's *Mesneri* (1881).

REDINTEGRATION (Lat. *redintegratio*, from *redintegrare*, to restore, from *red-*, re-, back again, anew + *integrare*, to make whole, from *integer*, entire, from *in-*, not + *tangere*, to touch). A term first introduced into the psychology of association (q.v.) by Hamilton, for whom it meant the reinstatement, through the suggestion of one element, of all the elements which had previously constituted an act of cognition. A tendency has, however, arisen in modern psychology to restrict the word to those cases of association in which a constituent part of an original situation associatively reinstates the total situation. James calls such cases 'impartial redintegration.' Whether impartial redintegration ever occurs in complete form is more than doubtful; as a functional type of the reproducing consciousness it may, however, be usefully distinguished from 'mixed' association and 'focal' association. Consult: Hamilton, *Lectures on Metaphysics*, vol. ii. (Edinburgh, 1859); Reid's *Works*, vol. ii., Notes, edited by Hamilton (ib., 1863); James, *Principles of Psychology* (New York, vol. i., 1890); Hodgson, *Metaphysics of Experience* (London, 1898).

RED JACKET. A village in Houghton County, Mich., 14 miles north of Houghton; on the Mineral Range, the Copper Range, the Chicago, Milwaukee and Saint Paul, and the Chicago and Northwestern railroads (Map: Michigan, E 1). It is noted for its mining interests, being situated in the highly productive copper region of northern Michigan. Population, in 1890, 3073; in 1900, 4668.

RED JACKET (*Sa-go-ye-wat-ha*, 'he keeps them awake') (c.1751-1830). A celebrated chief of the Seneca Indians. He received his English name in reference to the great pride he took in a scarlet jacket given to him shortly after the Revolution, by an English officer. During the Revolution he fought on the side of the English, and in 1784 bitterly opposed the Treaty of Fort Stanwix, by which the Iroquois ceded some of their land to the United States. Though originally without rank in his tribe, he soon, through his eloquence in council, became one of the principal chiefs. In 1810 he gave the United States Government some valuable information concerning the schemes of Tecumseh, and during the war on the frontier (1811-14) assisted the United States troops. Subsequently he became a confirmed drunkard, and for this and other reasons was deposed by a council of chiefs in 1827, but was soon restored to his old rank. He was never prominent as a warrior and seems to have been a coward, but as an orator he was unrivaled, and in council had the greatest influence. By many he has been considered the most eloquent speaker the Indian race ever produced. Though at first in favor of the education of his people, he subsequently changed his mind and became the bitterest opponent of schools and of Christianity. He has been called "the last of the Senecas," he having been the last of that tribe's great chiefs.

Consult the biography by Stone (1867), and that by Hubbard (1886).

REDLANDS. A city in San Bernardino County, Cal., 68 miles east of Los Angeles; on the Santa Fe, the Southern Pacific, and the San Bernardino and Redlands railroads (Map: California, E 4). It is situated among the foothills of the San Bernardino Mountains in one of the most beautiful regions of the State. Among the features of the city are the A. K. Smiley Library and two attractive parks. The vicinity is known as one of the greatest orange-producing sections in the world, and for the shipment of this and other fruit Redlands is an important centre. It carries on a trade also in barley, wheat, and building stone, and manufactures brick, piping, and lumber products. The city is governed by a board of trustees, one of whom is the president, whose term of office is four years. Redlands was settled in 1881, and was incorporated seven years later. Population, in 1890, 1904; in 1900, 4797.

REDLEG. The red-legged partridge. See PARTRIDGE.

RED-LETTER DAY. A lucky day, a fortunate or auspicious day; so called because in the old liturgical books the greater holy days were always marked with red letters. See RUBRIC.

RED LIQUOR. A crude aluminum acetate used as a mordant in calico printing. It is prepared in various ways, often by dissolving eight parts of alum in boiling water, which is then added to a solution of six parts of lead acetate and the mixture is well stirred. Lead sulphate is formed, which is precipitated as a heavy mass, the supernatant clear liquid being the 'red liquor.'

RED MEN, IMPROVED ORDER OF. A fraternal and beneficial order claiming unbroken succession from the 'Sons of Liberty' (q.v.), and other Revolutionary societies, and reorganized in 1835 at a convention in Baltimore. The Grand Council of Maryland was created at this convention, the old ritual was revised, and soon the council-fires of the order were lighted in several States of the Union. In 1847 the Grand Council of Maryland called another convention at which was organized the Great Council of the United States, which was made the supreme governing body of the order. The government of the order is modeled after that of the United States. The Great Council of the United States is composed of representatives of the various State Grand Councils, which in turn are made up of representatives from the various tribes in the State jurisdiction. The ritualistic work consists of three degrees, viz.: Adoption, Warrior, and Chief. The officers of the tribe are prophet, sachem, senior sagamore, junior sagamore, chief of records, and keeper of wampum. The officers or chiefs of the Great Council of the United States are great inehonee, great senior sagamore, great junior sagamore, great prophet, great chief of records, great keeper of wampum, great toekon, great minewa, great guard of forest. The conditions of membership are: age twenty-one years, citizenship in the United States, good health and character, and belief in the existence of a Supreme Being, 'the Great Spirit.' There is a Chieftain's League or Uninformed Rank in the order. The Degree of Pocahontas is for the especial benefit of the female relatives of the Red Men, who are eighteen years of age and over. The Improved Order of

Red Men (including the Degree of Pocahontas, which has a membership of 50,000) had at the close of 1902 a total membership of over 300,000. During the decade ending that year it had paid for the relief of members nearly \$4,000,000, for the relief of widows and orphans \$125,000, and for the burial of the dead nearly \$1,000,000. The emblem of the order is the eagle and the motto, 'Freedom, Friendship, and Charity.'

REDMOND, JOHN EDWARD (1851—). An Irish Parliamentary leader, head of the Nationalist Party. He was born in Dublin, the son of William Archer Redmond, and at twenty-five, after the completion of his course in Trinity College, Dublin, having been admitted to the bar, was elected to the House of Commons. There he became a whip of the then weak Irish Party and was one of the most prominent organizers of the Home Rule propaganda throughout England. On the break in the Nationalist ranks, consequent on the Parnell divorce case, Redmond sided with the minority which urged that Parnell's leadership should still be followed; but in 1900, in spite of his bitter abuse of the other wing of the Irish Party, he became a leader in the movement for union and was chosen to succeed Dillon as head of the reorganized party. His *Historical and Political Addresses, 1883-97*, were published in 1898.

RED OAK. A city and the county-seat of Montgomery County, Iowa, 50 miles east by south of Omaha, Neb.; on the East Nishnabotna River, and on the Chicago, Burlington and Quincy Railroad (Map: Iowa, B 4). It makes brick, tile, apiary supplies, pottery, and flour. Red oak was incorporated in 1869. Population, in 1890, 3321; in 1900, 4355.

REDONDELA, rā'dón-dá'lá. A town of Northwestern Spain, in the Province of Pontevedra, situated at the head of the Bay of Vigo, 12 miles south of Pontevedra. The inhabitants are chiefly engaged in fisheries. Population, in 1900, 11,488.

REDOUBT (OF. *reduit*, Fr. *réduit*, from ML. *reductus*, refuge, redoubt, from Lat. *reducere*, to lead back, from *re-*, back again, anew + *ducere*, to lead). A field fortification. A redoubt varies in form and solidity according to the exigencies of the case, and the time at the disposal of the defenders. The cavity caused by the excavation of earth for the construction of the parapet is called the ditch, and constitutes a formidable obstacle to the enemy. The sides of the ditch are known as the escarp and the counterescarp, respectively (see Plan in article FORTIFICATION), and are made as steep as possible. Chevaux-de-frise (q.v.) or similar constructions are placed along the bottom of the ditch. If the parapet is very high, a berm (q.v.), or narrow strip, will be left between the base of the parapet and the edge of the ditch, and generally fortified by *fraizes*, or sharp-pointed stakes, projecting over the ditch, from both berm and counterescarp. The exterior slope of the parapet has been found to resist artillery fire to greater advantage when left at its natural slope; but the superior slope is constructed with an incline of 1 in 6, permitting the defenders to observe the ground in front of the ditch without injuring the crest of the parapet. The interior slope (1 in 3 or 4) is strongly revetted. In field redoubts, the height of

the parapet rarely, if ever, exceeds 12 feet. Traverses (q.v.) are constructed similarly to the parapet, and are usually thrown across the covered way or other important points as a protection against enfilade fire, or (as *parados*) to defend the troops garrisoning the rear face from fire coming from the front. See SIEGE AND SIEGE WORKS.

REDOWA (Bohemian *rejďowák*, *rejďowachka*, from *rejďowati*, to turn around). A Bohemian dance introduced into Paris and London about 1846. In Bohemia two varieties exist: the *Rejďovák* in $\frac{3}{4}$ or $\frac{3}{8}$ time, and the *Rejďovacke* in $\frac{3}{4}$ time. The dance resembles the Polish mazurka. Meyerbeer introduced it into his opera *Le prophète* in 1849.

REDPATH, JAMES (1833-91). An American journalist and political writer, born in Berwick-on-Tweed, Scotland. He came to New York at eighteen and the next year joined the staff of the *Tribune*. His articles on the effects of slavery on society and on production caused him to be denounced as an abolitionist. In 1859 he made two visits to Haiti, where he was appointed Commissioner of Emigration. Returning to America, he founded a Haitian bureau and published a weekly newspaper, *Pine and Palm*, to advocate the emigration movement of negroes from America to Haiti, in which he induced several thousands to participate. During the war he was with the armies of Sherman and Thomas. At Charleston he was made Superintendent of Education, reorganized the school system of South Carolina, and founded the Colored Orphan Asylum. During the Irish famine of 1881 he represented the New York *Tribune* in the famine district, and afterwards lectured on Irish subjects in the United States and Canada, founded *Redpath's Weekly* (1881-83) to promote the Irish cause, and edited the *North American Review*. Among his books are: *Hand-book to Kansas* (1859); *The Roaming Editor* (1859); *Southern Notes* (1860); *Guide to Hayti* (1860); *Life of John Brown* (1860); and *Talks About Ireland* (1881). He also assisted Jefferson Davis in the latter's historical and autobiographical work.

REDPOLL. A small northern linnet-like finch of the small genus *Acanthis*, visiting the United States and Central Europe in winter. The plumage is streaky with dusky white and buffy shades, the face and throat often blackish. The males have the crown crimson and the breast rosy or carmine. All the redpolls are birds of high latitudes and breed in extreme Arctic regions, making nests of dried grasses, lined with hair, feathers, and down, in a low bush or tuft of grass, and laying pale blue, finely speckled eggs. The best-known in America is the "common" redpoll (*Acanthis linaria*), a bird less than $5\frac{1}{2}$ inches long, appearing irregularly in the Northern States, in flocks of considerable size, and feeding on small seeds, like goldfinches.

RED RIDING HOOD, LITTLE. The popular fairy-tale of the little girl devoured by the wolf which personates her grandmother. The source of the English version is *Le petit chaperon rouge* in Perrault's *Contes du temps passé* (1677). Tieck gives the tale in his *Volksmärchen* in 1795, and the brothers Grimm in their collections of fairy-tales. In the latter the wolf is cut open by

a hunter, and the child is set free; this feature allies the story with many monster-swallowing incidents in various folk-lore, while the tale itself in varying forms is widespread.

RED RIVER, or SONG-KOI. A river of Tongking, French Indo-China. It rises in the mountains of Southern China, and flows in a nearly straight southeast course of over 600 miles, emptying into the Gulf of Tongking through a large delta (Map: China, B 7). Its course is obstructed by several rapids, which, however, have been partly overcome so that small specially constructed steamers can ascend the river to Lao Kai on the Chinese frontier. Hanoi, the capital of Tongking, lies on its banks, and the river is of considerable commercial importance. Its delta is the most fertile and populous part of the country.

RED RIVER. The southernmost of the large tributaries of the Mississippi. It rises in the northern part of Texas in the fissures of the Llano Estacado, and flows eastward along the northern boundary of Texas until it enters Arkansas, where it turns to the south, and entering Louisiana traverses that State in a southeasterly direction to its junction with the Mississippi, 341 miles above the mouth of the latter, and opposite the southwestern corner of the State of Mississippi (Map: Texas, D 1). Its length is estimated at 1550 miles. For the first 60 miles it flows through a cañon with perpendicular rocky sides 500 to 800 feet high, after which it enters a sandy and arid plain, where it broadens out to a width of nearly 3000 feet, but with a very shallow depth. Farther down it enters the fertile alluvial bottoms, which throughout its middle course are densely wooded. Here the course becomes very sluggish and meandering, while the river continually shifts its bed by washing away the material from one bank and depositing it on the other, thus offering serious impediments to navigation. Here also the river shows a remarkable tendency to form snags or rafts of driftwood. Up to 1873 such a raft of tree-trunks and driftwood 32 miles long extended from a point some distance above Shreveport, La. In that year a navigable channel was cut through, and now the river is kept clear by constantly removing the floating timber. In its lower course in Louisiana the Red River sends out numerous bayous, some of which rejoin it, while others penetrate directly to the Gulf of Mexico, parallel with the Mississippi. The chief of the latter is the Atchafalaya (q.v.), which has up to the present received a large part of the volume of the main stream, though engineers are now endeavoring to force the whole of the Red River into the Mississippi by damming up the bayou. (See MISSISSIPPI RIVER.) Large sums have been expended by the National Government in improving the navigation of the Red River. It has a navigable length of about 1250 miles, and its tributaries, chief of which is the Washita, afford in addition 2100 miles of navigable waterways. Steamers drawing four feet can ascend to Shreveport at all seasons except in extreme low water, while at high water they can reach nearly to the Texan boundary. Consult Marcy, *Exploration of the Red River of Louisiana* (Washington, 1853).

RED RIVER OF THE NORTH. A river rising in the northwestern part of Minnesota a

few miles from the sources of the Mississippi (Map: North Dakota, H 1). It flows first southward through a chain of numerous lakes, then westward to the boundary between Minnesota and North Dakota, which it follows in a northerly course until it enters Manitoba, where it empties into the southern extremity of Lake Winnipeg. Its length is about 700 miles. Its course lies through an almost perfectly level plain which was formerly the bottom of Lake Agassiz (see LAKE), and which is a famous wheat-producing region. The river and its branches have cut narrow channels through the plain with clay banks 20 to 60 feet high. The southern branch of the Red River connects through Lake Traverse with the Minnesota and Mississippi rivers, so that during high water small steamers may sometimes pass from the Mississippi to Lake Winnipeg. Owing to the difference in latitude between the upper and lower courses, spring sometimes arrives at the former while the latter is still ice-bound, so that the waters are piled up and inundate the plain.

REDROOT. A popular name for various unrelated plants. One of the best known is *Lachnanthes tinctoria*, of the natural order *Hæmодо-*

REDROOT (*Lachnanthes tinctoria*).

raceæ, which grows in wet sandy soils near the coast of the Eastern United States. It has sword-shaped leaves mostly close to the ground, and an unbranched almost leafless stem which bears at its summit a dense compound cyme of woolly yellow flowers. The perennial roots contain a red coloring matter sometimes used in dyeing. Alkanet (*Alkanna* or *Achusa tinctoria*), certain American pigweeds (*Amarantus* spp.), and *Ceanothus americanus* are also called redroot. See CEANOTHUS; ALKANET; AMARANTH.

RED'RUTH. A town in Cornwall, England, the centre of a famous mining district, $9\frac{1}{2}$ miles northwest of Falmouth (Map: England, A 6).

In 1792 gas was first used here for lighting purposes. Tin, from numerous mines in the vicinity, is smelted in the town, and iron foundries are in operation; another important product is copper. Population, in 1891, 10,324; in 1901, 10,450.

RED SANDSTONE. A term formerly applied to the combined Devonian and Permian rocks, when their relations to the Carboniferous strata were unknown. The discovery that one set of the Red Sandstone was below the coal, while the other was above it, caused the division into the Old Red Sandstone, or Devonian, and the New Red, or Permian. For some time after this division, the original term was retained by a few geologists, but it is now quite given up. See OLD RED SANDSTONE; PERMIAN SYSTEM.

RED SCALE. The name applied in Florida to *Aspidiotus ficus*, and in California to *Aspidiotus citri*, two common and destructive enemies of the orange. See ORANGE INSECTS.

RED SEA (Lat. *Mare Rubrum*, Gk. *Ἐρυθρὴ Θάλασσα*, *Erythrē Thalassa*), or **ARABIAN GULF**. An arm of the Indian Ocean separating the Arabian peninsula from Northeastern Africa, and lying between latitudes $12^{\circ} 30'$ and 30° N. (Map: Asia, C 6). It extends in a northwest direction from the Strait of Bab-el-Mandeb, 20 miles wide, through which it communicates with the Gulf of Aden, to the Isthmus of Suez, and is 1380 miles long. It is narrowly elongated in shape, with a breadth between 100 and 200 miles maintained for the greater part of its length. In the north the sea divides into two arms, cutting off the Sinai Peninsula: these are the Gulf of Suez in the west, 170 miles long and 25 miles wide, and the Gulf of Akabah in the east, 110 miles long and 12 miles wide. The Gulf of Suez is connected by the Suez Canal (q.v.), about 100 miles long, with the Mediterranean. The basin of the Red Sea is formed by a line of fracture running through the great Archæan mass capped by the limestone plateaus of Egypt and Arabia. The Archæan rocks are exposed here and there along the coast. A branch fissure with steep rocky sides forms the Gulf of Akabah, and runs northward as the depression called El-Arabah, the deep sink of the Dead Sea, and the valley of the Jordan. The shores of the Red Sea are bordered on the Arabian side by sandy deserts, which form a narrow strip backed by the limestone range. On the Egyptian side there are wide, sandy plains in the north, rising farther south into elevated tablelands, and finally into the mountains of Abyssinia. Each shore, particularly the eastern, is lined with immense coral reefs which in some places extend 25 miles or more from land. They have occasioned numerous islands and archipelagoes. The principal groups are the Farsan Islands near the Arabian shore and the Dahlak Islands near the African. The mean depth of the Red Sea is about 2000 feet. Through the greater part of its length runs a central channel with a depth exceeding 3000 feet, divided by comparatively shallow ridges into three basins, of which the northern and southern have a maximum depth of about 4200 feet, and the central of nearly 7500 feet. The Strait of Bab-el-Mandeb is 1200 feet deep. In the Gulf of Suez the depth is scarcely more than 200 feet.

The mean temperature of the surface water is 77° in the north, 80° near the middle, and 84°

in the south. Below a depth of 1200 feet there is a uniform temperature of 71° in all parts of the sea and down to the greatest depths. The sea differs in this respect from the open ocean, where the temperature continues to fall through a much greater depth. The surface temperature of the Red Sea sometimes rises above 100°, and there is an enormous evaporation, the air being almost constantly saturated as fast as it is supplied by the winds. The heat being intense, the climate on the Red Sea is very depressing. Its salinity amounts to about 4.2 per cent., increasing with the depth, while that of the ocean is 3.5 per cent. The tides are irregular, and in some places imperceptible. The prevailing winds are north and northwest, but in the southern section they change to the southeast during winter. The marine flora and fauna of the Red Sea are very rich and interesting. The indigenous species are quite different from those of the Mediterranean, showing that the two seas must have been separated since the Eocene epoch. Since the opening of the Suez Canal, however, there has been a considerable inter-migration. From the earliest times the Red Sea has been a great highway of commerce between India and the trading peoples of the Mediterranean lands, and was used successively by the Egyptians, the Phœnicians, Arabs, and in the Middle Ages by the Venetians, until the discovery of the route around the Cape of Good Hope. Since the opening of the Suez Canal in 1869 it has regained its importance as the main route of commerce between Europe and the East.

Consult: Luksch, *Vorläufiger Bericht über die physikalisch-oceanographischen Untersuchungen im Roten Meer* (Vienna, 1896); Hood, "The Red Sea Currents and Navigation," in *Nautical Magazine*, vol. lxxviii. (London, 1899).

REDSHANK. One of the best known of the British and European sandpipers (*Totanus calidris*), having conspicuous red feet. Compare GREENSHANK.

RED-SHOULDERED HAWK. See BUZZARD; HEN-HAWK.

RED SNAPPER. See SNAPPER.

RED SPIDER. A name among florists for one of the spinning mites of the genus *Tetranychus*, and particularly of *Tetranychus telarius*, a cosmopolitan species, probably originally European. They frequently do considerable damage to plants, causing the leaves to turn a rusty color, but they may be kept in check by the application of a kerosene emulsion spray to which flowers of sulphur has been added. See MITE.

REDSTART (from *red* + *start*, AS. *stort*, Ger. *Sterz*, tail; perhaps connected with OHG. *stürzen*, Ger. *stürzen*, to hurl, or with Gk. *στόρν*, *storthē*, prong). Either of two small warblers. The American redstart (*Setophaga ruticilla*) is one of the wood-warblers (q.v.). The male is black, with white belly, and the sides, basal half of wing, and tail-feathers are bright salmon-red; the female is ashy where the male is black and yellow where he is salmon. It winters in tropical America, but appears in the United States early in the spring. The nest is built of fine strips of bark, leafstalks, and the like, lined with fine rootlets, in the fork of a small tree some distance from the ground. The eggs are white spotted with brown. The redstart feeds

wholly upon insects, which it pursues with great activity. He is not much of a songster, but his beauty and liveliness make him a well-known and popular bird. See Colored Plate of WOOD-WARBLEDERS.

The European redstart is a similar bird, but of the family Sylviidae, and is widely diffused over Europe, Asia, and the north of Africa. It has a very soft melodious song, which is continued during the breeding season far into the night, and resumed at early dawn. In confinement it becomes very tame, and has been known to imitate the song of other birds, and even to learn a tune.

RED-TAILED HAWK. See BUZZARD; HEN-HAWK.

RED TAPE. A term used to denote excessive routine and formality in the management of official affairs; a servile adherence to precedent. Before the invention of the modern appliances of elastic bands, file-holders, and other means for securing papers, all official documents were bound together by red ribbons or tapes. The necessary delay caused by the undoing of tapes by slow-moving Government officials, before business could be transacted, came at length to stand as representative of all delays. The 'Circumlocution Office' in Dickens's *Little Dorrit*, representing the roundabout ways of a fictitious public office, is an amusing satire on this subject.

REDTOP GRASS (*Agrostis alba*, and its variety *vulgaris*). This grass varies greatly in its habit of growth. Some of its forms are tall-growing and are largely cultivated for hay, being usually sown in mixtures with timothy and clover. It is one of the best grasses for permanent pastures in the New England and Eastern States, and thrives best in moist soils unsuited to other valuable grasses. When once established this grass will maintain itself against encroachment by weeds or less valuable grasses. Some forms are very useful for lawns. This grass is also called florin, bent grass, and, in the Eastern United States, herd's grass. The names are all applied to other species of *Agrostis* in different regions.

REDUPLICATION (Lat. *reduplicatio*, from *re-*, again + *duplicare*, to double, from *duplex*, double, from *duplus*, double, from *duo*, two + *-plus*, -fold.) In *inflection* (q.v.), a prefix to a word which normally consists of the initial consonant or consonants with a vowel which is either the vowel of the root (q.v.) of the word or is *e*. The reduplication is generally found in verbs, although it sometimes occurs in the formation of nouns. In the verb it is a characteristic in Sanskrit (q.v.) and Avesta (q.v.) of the intensive and desiderative formations, as Sanskrit *hanti*, 'kills,' *janghanti*, 'kills repeatedly,' *jighāmsati*, 'desires to kill.' It is also found in some aorists, as Sanskrit *dharati*, 'holds,' *adidharam*, 'I held,' and in a number of present formations, as Sanskrit *dadāmi*, Greek *δίδωμι*, 'I give.' It is most usually found, however, in the perfect tense, of which it is a distinguishing mark in Sanskrit, Avesta, and Greek, as Sanskrit *dr̥śti*, 'hates,' *didr̥śa*, Avesta *didraēša*, 'I hated,' Greek, *λύω*, 'I loose,' *ἐλύω*, 'I loosed.' There are sporadic instances in Latin, as *mordco*, 'I bite,' *momordi*, 'I bit,' while examples are comparatively numerous in Gothic, as *faiƿah*, 'seized,' from *fāhan*; *haihāt*, 'called,' from *hāitan*; *taitōk*,

'touched,' from *tēkan*. The original force of the reduplication seems to have been intensive or perfective. This view explains its use in the perfect and aorist tenses of the verb, and also its employment in the Sanskrit intensive and desideratives. Its occurrence in nouns is probably based on analogy with its normal use in the conjugation of verbs.

RED WATER. At times the water of the open sea near coast lines and of harbors more or less suddenly turns red, and at the same time the phenomenon is accompanied by the death of fishes and molluscs in great quantities. This has been found to be due to the presence in enormous numbers of an animalcule known as *Peridinium* (or *Glenodinium*). This is an infusorial form representing a singular type of flagellate protozoa, class Mastigophora and order Dinoflagellata. It differs from ordinary flagellate infusoria by being protected by a remarkable and often beautifully ornamented and complex shell formed of cellulose. The body is nearly symmetrical; from a longitudinal groove springs a large flagellum, while a second flagellum lies in a transverse groove. The protoplasm in one

GLENODINIUM.

species examined contains chromatophores colored with chlorophyll, or an allied pigment of a yellow color, called 'diatomin.' Other forms live in fresh water.

In Hertwig's *Zoology* it is stated that these organisms have recently been placed near the plants because with their brown chromatophores their food relations are like those of plants, although the taking of solid food by a mouth-opening has been observed. The armor, formed of cellulose plates, is also plant-like. The pigment appears to vary in hue in different species, being yellow, brown, or reddish brown.

RED-WATER, BLOODY URINE, MOOR-ILL, HAEMATURIA. A disease of cattle, and occasionally of sheep, attributed to eating coarse, indigestible, imnutritive food, continued exposure to inclement weather, and other indefinite causes. Attention to the proper nutrition of the stock, a supply of good water, and the improvement of pastures by draining, liming, and manuring, have been recommended as preventives.

RED WHELK. See SPINDLE-SHELL.

RED WING. A city and the county-seat of Goodhue County, Minn., 40 miles southeast of Saint Paul, on the Mississippi River, here spanned by a high bridge, and on the Chicago, Milwaukee and Saint Paul, and branches of the Chicago and Northwestern and the Chicago Great Western railroads (Map: Minnesota, F 6). It has a State training school, the Hauge Seminary, the Lutheran Ladies' Seminary, and city and private hospitals. Red Wing is situated in a rich agricultural region, but is better known for its manufactures, which include stoneware, sewer pipe, furniture, linseed oil, malt, beer, lime, hats, flour, lumber products, and shoe specialties. The government is vested in a mayor, elected biennially, and a unicameral council. Settled in 1845, Red Wing was incorporated in 1858. Population, in 1890, 6294; in 1900, 7525.

REDWING. (1) An American blackbird (*Agelaius phoeniceus*) of the oriole family (Icteridae). The male in full plumage is jet-black, with the bend of the wing bright scarlet, bordered with buff. The female is variegated with brown and buff, black and white. The redwing is 9½ inches long. It breeds throughout the United States, but winters from Virginia southward. The nest is built of coarse grass and rushes among the bushes or reeds of a swamp, and the eggs are pale blue, with peculiar pen-stroke markings of dark purple or black. (See Colored Plate of EGGS OF AMERICAN SONG BIRDS.) The note is a loud clear call well imitated by the syllables *cong-ka-rée*, the last one accented and prolonged. The redwing is one of the first of the spring migrants in the Northern United States, and often appears in large flocks. Even when breeding the birds are more or less sociable, and several pairs are usually found in the same marsh. Like its relatives, the other blackbirds and the bobolink, the redwing feeds on both insects and seeds, and also enjoys unripe corn or grain, and occasionally raids the maize fields to a destructive extent. See BLACKBIRD.

(2) An English thrush (*Turdus iliacus*) which spends the summer in the northern parts of Europe and Asia, and migrates southward in winter as far as the Mediterranean. The general color is a rich clove-brown on the head, upper parts of the body, and tail; the lower parts whitish, tinged and streaked with brown; the under wing-coverts and axillary feathers bright reddish orange. The redwing congregates in large flocks and has an exquisite song.

(3) One of several other birds with red on the wings, as one of the South African partridges (*Francolinus Le Vaillantii*).

REDWITZ, rēd'vīts, OSKAR, Baron von (1823-91). A German poet, dramatist, and novelist, born in Lichtenau, near Ansbach. He is best known for his ultrapatriotic poem *Das Lied vom neuen deutschen Reich* (1871, 11th ed. 1876). Other noteworthy poems by him are *Amaranth* (1849, 36th ed. 1886) and *Odilio* (1876). A novel, *Hermann Stark* (1868), and the dramas *Philippine Welser* (1859), *Der Zunftmeister von Nürnberg* (1860), and *Der Doge von Venedig* (1863) may also be named.

REDWOOD (*Sequoia sempervirens*). A California conifer which grows upon the Pacific Coast mountains and is next in size to the *Sequoia gigantea*, or 'big tree.' (See SEQUOIA.) It often attains a height of 250 feet, and sometimes 300 feet, with a diameter, in the largest, of 15 feet. The young wood is red, but on exposure to the air and light it sometimes fades. The timber, which is common on the Pacific Coast, is soft, straight-grained, easily worked, durable, and well suited for inside finishing of houses, since it takes a good polish. The redwood sends up suckers from the stumps, and seeds itself well, so that the forests are maintained. Redwood is also a name given

A BRANCH OF REDWOOD.

REDWOOD

SEQUOIA SEMPERVIRENS

a leguminous tree of India, where the wood is much used as a dye.

REDWOOD, BOVERTON (1846—). An English consulting chemist and authority on petroleum. He was born in London, studied at University College School, and learned pharmacy. As an expert on coal oils, Redwood traveled in Europe and America, acted as a member of technical juries of award in international expositions and health exhibitions, and was frequently consulted by the English Parliament on legislation in regard to the oil trade. His published works include: *Cantor Lectures on Petroleum and Its Use* (1887); *Reports on Accidents with Mineral Oil Lamps and on the Transport of Petroleum Through the Suez Canal* (with Abel, 1890 and 1892); *Treatise on Petroleum* (1896); *Detection of Inflammable Gases* (1896, with Clowes); and, with Thomson, *Handbook on Petroleum* (1901).

REE. A North American Indian tribe. See **ARIKARA**.

REED (AS. *hrēod*, OHG. *hriot*, riot, Ger. *Ried*, *Riet*). The common name of certain tall grasses growing in moist or marshy places. The common reed (*Phragmites communis*) is abundant in Continental Europe, Asia, and America in wet meadows and stagnant waters, and by the banks of rivers and ditches. It grows chiefly in rich alluvial soils. The hard, almost woody culms are 5 to 10 feet high, and bear at the top a large reddish-brown or yellowish much-branched panicle. They are used for making garden screens, light fences, and frameworks to be covered with clay in partitions and floors. Cattle readily eat the young shoots, but refuse the hard old ones. Nearly allied to this is *Arundo Donax*, the largest of European grasses. It is 6 to 12 feet high, and has thick, hollow, woody culms, and a purplish yellow panicle, silvery and shining from silky hairs. The woody stems are an article of commerce, and are used by musical instrument makers for reeds of clarinets and mouthpieces of oboes. They are also made into walking-sticks and fishing-rods. The creeping roots contain much starch and some sugar. *Arundo Karka* is supposed to be the grass called *Sur* in Sindh, of which the flower-stalks are very fibrous; and the fibres, being partially separated by beating, are twisted into twine and ropes. The sea reed (*Ammophila arundinacea*) grows along the sandy shores of the Great Lakes and the Atlantic Ocean, and is one of the best sand-binding grasses for regions adapted to its growth. The small cane *Arundinaria tecta* is called reed in the United States.

REED. In music, a thin strip of cane, wood, or metal secured at one end in front of an aperture, through which a current of air passing sets it in vibration. The vibrations thus started are either communicated to an inclosed column of air, or are released into the open air, in either event producing a musical sound. The reed is of two kinds, the *beating* reed and *free* reed. The former is used in the reed-pipes of an organ (q.v.), and requires to be placed within a tube in order to produce a musical sound. It consists of a metallic cylinder, with the front part cut away, and a brass spring or tongue placed against the opening and attached at the upper end. The resultant note is dependent for its pitch on the length of the tongue, which is regu-

lated by a strong spring of wire pressing against it. The quality of the sound is determined to a large extent by the length and form of the pipe in which the reed is placed. The double reed consists of two beating reeds striking against each other. The *free* reed differs from the beating reed in that the tongue is a little smaller than the opening, and strikes, not the edge of the opening, but the air. Its note is more smooth and mellow than that of the beating reed, and it has the advantage of not requiring a pipe, which is a necessary appendage to the latter. Besides being occasionally adapted to organ-pipes, it is used without a pipe in the concertina and harmonium. The history of the beating reed can be traced back to the earliest known civilizations; the single form is now represented by the clarinet, chalumeau, and saxophone; while the double form is now seen in the krumhorn, oboe, and bassoon. The free reed was introduced into Europe in the eighteenth century, its prototype being the Chinese *chéng*. See **MUSICAL INSTRUMENTS**.

REED, ANDREW (1787-1862). An English clergyman and philanthropist. He was born at Beaumont House, Saint Clement Danes, London. In 1807 he entered Hackney College, and in 1811, after preaching in many parts of England, he decided upon the Congregational Chapel at New Road, London. He continued the pastorate of this congregation until 1861. As a philanthropist his efforts were devoted to the establishment of orphan asylums. His other charitable works were the Asylum for Idiots, founded in 1846, and the Royal Hospital for Incurables, begun in 1855, with its home at Putney House, Surrey. He was the author of various works of a religious character. Consult his *Memoirs*, edited by his sons (London, 1863).

REED, SIR CHARLES (1819-81). An English politician, educator, and philanthropist. He was the son of Rev. Andrew Reed (q.v.), and was born near Sonning, in Berkshire. He was educated chiefly at the Hackney Grammar School. At the age of seventeen he was apprenticed to a firm of woolen manufacturers at Leeds, and in 1842 he entered the printing business in London. A prosperous career led to his independent establishment as type-founder in 1861, a business which continued until his death as 'Sir Charles Reed and Sons, Limited.' He held many offices of public trust, besides taking an active part in the administration of the institutions founded by his father. In 1868 he entered Parliament as Liberal member for Hackney, and retained his seat until 1874. He was re-elected as member for Saint Ives in 1880. During his Parliamentary career he was identified with the discussions of educational questions, and was elected chairman of the London School Board in 1873, retaining the post until his death. In 1876 he was president of the Judges on Education at the International Exhibition of Philadelphia. He made collections of antiquities as an avocation, and was part translator with H. T. Riley of *Liber Albus*, the *White Book of the City of London*, published in the Rolls Series in 1862, besides being a frequent contributor to *Notes and Queries*. He was also joint editor with his brother Andrew of *Memoirs of the Life and Philanthropic Labors of Andrew Reed, D.D.* (1863).

REED, SIR EDWARD JAMES (1830—). A British naval engineer, born near Sheerness. He was

educated at the School of Mathematics and Naval Construction at Portsmouth, and became secretary of the Institution of Naval Architects. From 1863 to 1870, when he resigned, he was chief constructor of the British Navy. In 1886 Gladstone appointed him Lord of the Treasury, and from 1874 to 1895 he was a member of Parliament. In 1880 he was created a knight commander of the Bath. He published: *Our Iron-clad Ships* (1869); *Letters from Russia in 1875* (1876); *The Stability of Ships* (1884); and, in collaboration with Admiral Simpson, *Modern Ships of War* (1888).

REED, HENRY (1808-54). An American educator and critic, born in Philadelphia, Pa. He graduated at the University of Pennsylvania in 1825, studied law, and was admitted to the bar in 1829. In 1831 he became assistant professor of English and of moral philosophy in the University of Pennsylvania, and in 1835 was made professor of rhetoric and English literature at the same institution. This he held till the year of his death, which occurred in the sinking of the steamship *Arctie*, September 27, 1854. His literary work consisted mainly of the posthumously published lectures and essays on literature; *Lectures on English Literature* (1855); *Lectures on English History and Tragic Poetry as Illustrated by Shakespeare* (1856); and *Lectures on the British Poets* (1857). He did much by his editions of Wordsworth to further the study of that poet in America. His works were edited by his brother, William Bradford Reed (q.v.).

REED, JOSEPH (1741-85). An American patriot of the Revolutionary period. He was born at Trenton, N. J., August 27, 1741, and graduated at the College of New Jersey, now Princeton, in 1757. From 1763 to 1765 he studied law in England, being entered at the Middle Temple. He then began practice at Trenton, and in 1767 became deputy secretary of New Jersey. On his return in 1770 from a second visit to England, where he married a daughter of Dennis Deberdt, the agent of Massachusetts in England, he removed to Philadelphia, served on the Committee of Correspondence, and was president of the Pennsylvania Provincial Congress in 1775. In 1775 he served as a delegate to the Continental Congress and became Washington's secretary and aid-de-camp. He was adjutant-general during the New Jersey campaign, the success of which was due in no small degree to his knowledge of the country. In 1777 he declined the posts of Chief Justice of Pennsylvania and Commissioner of Indian Affairs, and a promotion to the rank of brigadier-general, and remained in the army as a volunteer without pay, serving with credit in the battles of Brandywine, Germantown, and Monmouth. He was a member of the Continental Congress in 1778, and signed the Articles of Confederation. He was president of the Pennsylvania Supreme Executive Council from 1778 to 1781, in which capacity he helped to suppress the revolt of the Pennsylvania line in the latter year. He had previously caused the trial of Arnold for maladministration. During his administration he aided in founding the University of Pennsylvania and advocated the gradual abolition of slavery. Reed died March 5, 1785. Consult W. B. Reed, *Life and Correspondence of Joseph Reed* (Philadelphia, 1847).

REED, THOMAS BRACKETT (1839-1902). An American lawyer and political leader, born at Portland, Maine. He graduated at Bowdoin College in 1860; emigrated to California, where he taught school, in the meantime devoting his spare moments to the study of law; returned to Portland in 1864, and was appointed paymaster in the United States Navy, in which capacity he served until his honorable discharge in November, 1865. Shortly thereafter he was admitted to the bar and began the practice of law at Portland. In 1868-69 he was a member of the Lower House of the Maine Legislature, and in 1870 sat in the State Senate.

From 1870 to 1872 he served as Attorney-General of Maine, and from 1874 to 1877 was solicitor of the City of Portland. In 1876 he was elected to Congress and was continuously reelected until 1898. In 1889 he was chosen Speaker of the House. Again in 1895 and in 1897 he was elected Speaker, but before the expiration of his last term he resigned his seat in Congress and entered upon the practice of law in New York City. As Speaker of the National House of Representatives, he made a notable innovation upon the parliamentary procedure of that body by adopting the practice of counting as present those members of the opposition who, though physically present, refused to vote in order to prevent a quorum. This innovation created a storm of opposition in the House and was denounced as revolutionary. His rulings, however, were sustained by the majority. The practice was soon acquiesced in by the Democrats, and it has come to be a permanent part of the procedure of the Lower House. In 1896 Reed was a prominent candidate for the Republican nomination for the Presidency, but was defeated by William McKinley. He died at Washington in December, 1902. Speaker Reed was an able parliamentarian and an efficient speaker, his addresses often being enlivened by rare wit and humor.

REED, WALTER (1851-1902). An American army surgeon, sanitarian, and bacteriologist, born in Virginia. He received his medical education in the University of Virginia and in Bellevue College Hospital, New York City. He was appointed assistant surgeon in the army in 1875, and in 1890 was assigned to duty in Baltimore, where he remained a year. During this period he made an especial study of bacteriology in the laboratory of Prof. William Welch in Johns Hopkins University. In 1893 he was appointed curator of the Army Medical Museum in Washington, and established a laboratory in which he gave instruction in bacteriology to the student officers of the newly established Army Medical School, and did much original work in bacteriology and in the conduct of special sanitary inspections and investigations. In 1898 he was placed at the head of a board, of which Drs. Victor C. Vaughan and E. O. Shakespeare were the other members, to investigate the epidemic occurrence of typhoid fever among the troops assembled for the Spanish-American War. It developed the surprising fact that infected water was not an important factor in camp epidemics of typhoid fever, but that the infection was distributed by the agency of flies and on the hands, feet, and clothing of the men. Their work is remarkable for the patience and skill with which a vast number of facts were brought together and collated. In 1899 Reed, with his assistant, Carroll, demonstrated the

fallacy of the claim of Sanarelli that the bacillus *icteroides* was the causative agent of yellow fever. In 1900 Reed went to Havana at the head of a commission to investigate the etiology of yellow fever, and demonstrated that yellow fever is transmitted from man to man only by the bite of mosquitoes of a certain variety (*Stegomyia fasciata*), which have become infected by previously biting persons sick of yellow fever. The work of this commission is remarkable for the accuracy and completeness of its experimental work, the devotion with which its members exposed themselves (two of them having submitted to experimental inoculations with infected mosquitoes), and the far-reaching importance of their conclusions. Practical application of this discovery was at once made by the American military authorities, with the result that yellow fever was exterminated in Cuba. At the time of his death Major Reed was first on the list of majors of the Medical Department of the United States Army, to which rank he had been promoted in 1893, and the Secretary of War had recommended to Congress his promotion by a special act to the rank of colonel for this work, saying: "The brilliant character of this scientific achievement, its inestimable value to mankind, the saving of thousands of lives, and the deliverance of the Atlantic seaboard from constant apprehension, demand special recognition from the United States." Congress granted to his widow a pension of \$125 a month. See INSECTS, PROPAGATION OF DISEASE BY. Consult Kean, *Senate Document No. 118*, "The Scientific Work and Discoveries of the Late Major Walter Reed, Surgeon, U. S. A."

REED, WILLIAM BRADFORD (1806-76). An American politician and journalist, born in Philadelphia, brother of Henry Reed (q.v.). After graduating at the University of Pennsylvania in 1825 he went to Mexico as private secretary of Joel R. Poinsett; studied law; was elected State Attorney-General (1838); was made professor of American History at the University of Pennsylvania (1850); in 1857 became Minister to China, where he negotiated the treaty of June, 1858; and on his return (1860) was active in Democratic politics and in New York journalism. He was for a time American correspondent of the *London Times*, author of many controversial and historical pamphlets and of essays contributed chiefly to the *American Quarterly* and the *North American Review*. He wrote also an excellent *Life and Correspondence of Joseph Reed*, his grandfather (1847), and *Life of Esther de Berdt*, afterwards Esther Reed, his grandmother (1853). He died in New York, February 18, 1876.

REEDBIRD. The name in the Middle States of the bobolink (q.v.). In England the name belongs to a warbler, the 'reed-wren' (*Acrocephalus streferus*), and to the reed-bunting (q.v.).

REEDBUCK, or REITBOK. A small goat-like antelope of Central and Southern Africa (*Cervicapra arundineum*), the males alone of which were provided with horns, which vary greatly in size and shape. It is never found far from water, is slow and unsuspicious, and hence is becoming rare. Consult Selater and Thomas, *Book of Antelopes* (London, 1894-1900).

REED-BUNTING, or SPARROW. A small dark-colored European finch (*Emberiza scharniculus*), fond of marshes and wet meadows, which is common throughout Europe, and frequently called

'black-headed bunting.' See Plate of BUNTINGS AND GROSBEAKS.

REED'ER, ANDREW HORATIO (1807-64). The first Governor of Kansas Territory. He was born at Easton, Pa.; was educated at Lawrenceville, N. J., studied law, and practiced with great success at Easton. He became influential in the Democratic Party and in 1854 was appointed Governor of the new Kansas Territory by President Pierce. It was expected by those who had secured his appointment that he would assist in the work of making Kansas a slave State, but this, owing perhaps to the lawless behavior of the border ruffians from Missouri, he did not do, and instead became favorable to the Free-State Party in the Territory. As a result of his attitude, a delegation of Democrats, headed by Jefferson Davis, demanded his removal. With this demand the President complied, and Reeder was removed from office after a tenure of a little more than a year. He then became one of the leaders of the Free-State Party, and in September, 1855, was nominated as delegate to Congress by the Big Spring convention. A little later he was again chosen delegate by the same party, but was never allowed to serve. In the following July he was elected United States Senator by the Legislature organized under the Topeka Constitution, but as Kansas was not admitted to Statehood, he was not permitted to take his seat. Not long afterwards he returned to the East, and was received with great enthusiasm by the opponents of slavery. Upon the outbreak of the Civil War he was appointed a brigadier-general, but felt himself too old and infirm to serve. Consult Robinson, *The Kansas Conflict* (New York, 1892), and Spring, *Kansas* (Boston, 1885).

REEDFISH. One of the two ganoid fishes (the other being the bichir, q.v.) which constitute the sole remaining representatives of the order Crossopterygii, which was of great importance in ancient times. This modern ganoid is a small fish dwelling in the rivers on the west coast of Africa, and has an elongated, terete body with a curiously divided dorsal fin and no pelvic fin. There is only one species (*Calmoichthys Calibarius*) which lives in deep pools, and apparently buries itself in the mud at the bottom, where it feeds on fishes and other aquatic animals.

REED INSTRUMENTS. Properly speaking, those musical instruments which are sounded by means of a reed. This general class is divided into two groups: those sounded by the beating reed, and those sounded by the free reed. The first group comprises the single beating reed, typified by the saxophone; the double beating reed, typified by the oboe, and a combination of single and double, with the addition of an air reservoir. The best known example of this latter arrangement is the bagpipe.

Free reeds were copied directly from the Chinese chêng. They are limited almost wholly to instruments of the concertina and harmonium type, though they are occasionally used in pipe organs. Reed organs were invented and perfected in this country, between 1812 and 1850. Their universal form was that of a small organ without pipes, having free reeds and a treadle bellows, although the various modifications received different names. See HARMONIUM; MELODEON; MUSICAL INSTRUMENTS.

REED-MACE. A plant. See TYPIA.

REEF (Dutch *rif*; probably connected with Icel. *rifa*, fissure, from *rifa*, to split, Eng. *rive*). A barrier of rock or sand extending along the shore of an island or continent. The most common type of a rock reef is that formed by coral organisms which flourish in the shallow portions of tropical seas. (See CORAL ISLAND AND CORAL REEF.) The sediment carried seaward by rivers and the sands beaten up by waves accumulate along the seashore as sand reefs inclosing long, narrow lagoons. See BAR.

REEF. See SAIL.

REEL (AS. *rēol*, *hrēol*, Icel. *hræll*, *ræll*, Gael. *ruidhil*, weaver's reel). A lively, gliding dance whose origin is probably Celtic, though its resemblance to a Danish national dance has led many to ascribe it to Scandinavian sources. It is usually danced by two couples, but admits of a greater number. The music is in general written in 8-bar phrases in common time of four crotchets in a measure, but sometimes in jig time of six quavers. The principal characteristic of all reel figures is a circular movement during which the performers face each other and describe a series of figures of eight. The strathspey (q.v.) is merely a slow form of the reel.

REENTRY. The act of entering into possession of lands in the exercise of a right reserved to a lessor or grantor in a lease, deed, or other conveyance upon certain conditions. In order to take advantage of a right of reentry, a person should first demand payment, or compliance with the terms of the lease or conveyance, and upon a refusal or neglect to do so, enter peaceably, if he can, but otherwise he must proceed at law. Right of reentry may be waived by receiving rent accruing after breach of a condition, with knowledge of that fact.

REES, ABRAHAM (1743-1825). A British encyclopædist, born at Llanbrynmair, Wales. He studied for the ministry at Hoxton Academy; was for many years mathematical tutor there, and pastor of a Presbyterian church in Southwark. In 1783 he was settled over a church in the Old Jewry. Between 1781 and 1786 he improved and greatly enlarged *Chambers's Cyclopædia*, which had first appeared in two folio volumes in 1728. Encouraged by the success of this work, he set to work upon *The New Cyclopædia, or Universal Dictionary of Arts and Sciences, Biography, Geography, History*, etc. The first volume of this was issued January 2, 1802, and the last, or forty-fifth volume, in August 1820.

REES, JOHN KROM (1851—). An American astronomer, born in New York City and educated there at Columbia College and School of Mines. After teaching at Washington College, Saint Louis, he became adjunct (1881) and then full professor (1884) of astronomy and geodesy at Columbia University. He had witnessed the solar eclipse of 1878 at Fort Worth and published a report thereon; and in 1884 published *Observations of the Transit of Venus, December 6, 1882*. He became a prominent member of the American Meteorological Society and wrote on international time systems and on variation of latitude, especially that of New York City. In 1900 he received the title of Chevalier of the Legion of Honor in recognition of services as juror in the department of instruments of precision at the Paris Exposition. Professor Rees was intimately connected

with Rutherford in the latter's work of celestial photography, and was one of the American delegates to the Astronomical Congress on Photography.

REEVE (AS. *gerēfa*, probably from *ge*, generalizing prefix + **rōf*, OHG. *ruova*, Icel. *rōf*, number, or from *rōf*, famous, Goth. *hrōps*, OHG. *ruof*, Ger. *Ruf*, outcry, AS. *hrōpan*, to cry out). The name given in England, especially in Anglo-Saxon times, to various officials. The reeve was ordinarily the presiding officer of a district, and was known by his district, e.g. *tūngerēfa*, the reeve of the township; *scīrgerēfa*, the reeve of the shire (our modern sheriff). In later times the reeve is prominent in constitutional history, since he and four men from each township attended the great hundred courts held by the sheriffs twice a year. Furthermore, it was the reeve and four men from each township on the royal demesne who were summoned to the Council of Saint Albans in 1213, this being the first instance in which the commons were represented at a Great Council. Consult Stubbs, *Constitutional History of England*, vol. i. (6th ed., Oxford, 1897).

REEVE, CLARA (1729-1807). An English novelist, daughter of William Reeve, perpetual curate of St. Nicholas, Ipswich, in Suffolk. She was educated by her father. On his death (1755) she settled with her mother and two sisters at Colchester, in Essex, where she began authorship. In 1772 she translated Barclay's *Argenis*, a famous Latin romance of the seventeenth century, under the title of *The Phœnix*. In 1777 appeared *The Champion of Virtue, a Gothic Story*, reissued the next year with its title changed to *The Old English Baron*. This romance, interesting in itself, is also of considerable significance as a link between Horace Walpole's *Castle of Otranto* and the romances of Mrs. Ann Radcliffe. Miss Reeve also wrote other novels and some verse. In historical criticism she produced the pleasant *Progress of Romance* (1785). Consult Beers, *English Romanticism* (New York, 1898), and see ROMANTICISM.

REEVE, HENRY (1813-95). An English man of letters, born at Norwich, and educated at Geneva and Munich. He traveled extensively and met the leading literary people of his day. From 1837 to 1887 he was registrar of the Privy Council, and from 1855 until his death he was editor of the *Edinburgh Review*. He translated De Tocqueville's *Democracy in America* (1835-40) and Guizot's *Washington* (1840); edited Greville's *Journal of the Reigns of King George IV. and William IV.* (1874); and wrote *Royal and Republican France* (1872), and *Petrarch* (1878).

REEVE, TAPPING (1744-1823). An American lawyer and jurist, born at Brook Haven, Suffolk County, Long Island. He graduated at Princeton in 1763, was a tutor there from 1767 to 1770, and in 1772 established himself at Litchfield, Conn., in the practice of law. He was an ardent patriot during the Revolution, was a member of several important local committees of safety and defense, and served as a recruiting officer. Shortly after the close of the war he opened at Litchfield a law school, which for a number of years was the best known and most successful institution of the sort in the country. This school he

conducted alone until 1795, and then in association with James Gould until 1820. He was a strong Federalist, but except for brief terms in the Connecticut Legislature and council, his services were all of a judicial nature. In 1798 he was elected a judge of the Connecticut Supreme Court, and remained on the bench for sixteen years, becoming Chief Justice shortly before his retirement in 1814. His publications include: *The Law of Baron and Femme; of Parent and Child; of Guardian and Ward; of Master and Servant, etc.* (1816), since republished in many editions, and *A Treatise on the Law of Descent* (1825).

REEVES, rēvz, Mrs. HENRY (HELEN BUCKINGHAM MATHERS) (1853—). An English novelist, born at Misterton, in Somersetshire, August 26, 1853. She was educated at Chantry, near Frome. In 1876 Miss Mathers married Henry Reeves, a London surgeon. Her first novel, *Comin' Thro' the Rye* (1875), gained wide attention. It was followed by the popular *Cherry Ripe* (1877), *My Lady Green Sleeves* (1879), and several others, including novelettes, *The Land o' the Leal* (1878) and *As He Comes Up the Stair* (1878). Among her later novels are: *A Man of To-Day* (1894); *The Lovely Malineourt* (1895); *The Sin of Hugar* (1896); *Bam Wildfire* (1898); and *Becky* (1900).

REEVES, JOHN (c.1752-1829). An English writer on law, born in London. He was educated at Eton, Cambridge, and Oxford, and was admitted to the bar in 1779. In 1791-92 he was Chief Justice of Newfoundland. In 1792 he proposed "An association for preserving liberty and property against Levelers and Republicans," of which for a time he was chairman. This society was the outcome of his strong feeling against the French Revolution. An anonymous pamphlet published by him in 1795 was considered a libel on Parliament, and he was arraigned for publishing it, but though his opinions were condemned, he was acquitted. His most important work is his *History of the English Law, from the Time of the Saxons to the End of the Reign of Edward I.* (1783, afterwards brought down through the reign of Elizabeth, 1829; the whole in 5 vols.; American edition, 1880). His other works include *A History of the Law of Shipping and Navigation* (1792) and *A History of the Government of the Island of Newfoundland* (1793). As King's printer, he produced several editions of the Bible—particularly one with notes in nine volumes (1825)—and of the Prayer-Book.

REEVES, JOHN SIMS (1822-1900). An English tenor, born at Woolwich. He studied under J. B. Cramer, T. Cooke, and other noted artists, and appeared in public as an operatic barytone at Newcastle in 1839. His debut was a success, and he acquired fresh fame in Scotland and Ireland. After further study in Paris he appeared at Milan in the tenor part of Edgardo in *Lucia di Lammermoor*, when his singing electrified the audience. At Drury Lane in 1847 as Edgardo, he was immediately recognized as the foremost living English tenor, and was engaged in 1848 at Her Majesty's Theatre. In 1851 he was equally successful as first tenor at the Italian opera in Paris. He retired from the stage and became a professor in the Guildhall School of Music in 1892, but on account of financial re-

verses returned to the concert platform and in 1896 made a successful tour in South Africa.

REFERENCE, REFEREE (from Lat. *referre*, to refer, bear back, from *re-*, back again, anew + *ferre*, to bear, carry). In law, the referring or sending of issues or questions arising in a legal proceeding to a competent attorney as referee, to be tried or examined by him in the place and stead of a judge and jury. A reference may be voluntary, or compulsory. It has been held in many States that compulsory references are constitutional. Actions involving long and complicated accounts, and divorce actions, where privacy and secrecy are desired by the parties, are the most frequently tried before referees. Referees are usually only appointed as the occasion arises, but under the United States Bankruptcy Act standing referees are appointed by the courts. The findings of a referee are contained in a report which is filed with the court ordering the reference, and on its confirmation by that court a judgment may be entered in accordance with the decision of the referee. This judgment may be reviewed on appeal by an appellate court. A referee may demand his fees as a condition of filing his report, and the successful party usually pays them in order to enter judgment. The fees and expenses of a reference are very large and litigants frequently oppose a motion to send a case to a referee, on that ground. Referees correspond to masters in chancery, appointed by courts of equity, but in code States, referees hear both legal and equitable actions. See ARBITRATION; COURT.

REFERENDUM (Neo-Lat. nom. sg. neu. of Lat. *referendus*, to be referred, gerundive of *referre*, to refer, bear back). The term applied to the practice of submitting laws to the electorate for approval or rejection. In the application of the referendum the law is first formulated by the legislative body or the constituent assembly and is then submitted to the electorate. The logical complement of the referendum is the *initiative*, by means of which the people are enabled to draw up their own measures and have them voted on without the intermediation of the Legislature. By this method a petition signed by a certain proportion of the voting constituency is presented to the Legislature requesting that a certain measure be submitted to the popular vote. This the Legislature is bound to do without change in the measure, although it may submit an alternative measure to be voted on at the same time. In Switzerland, in every canton of the Confederation except Freiburg, the referendum in one form or another is established by law. In about one-half of the cantons the referendum is 'optional' or 'facultative,' that is, the laws are submitted to the popular vote only when submission by petition of a certain per cent. of the voting constituency is demanded. In the others it is 'obligatory,' that is, the laws must be submitted without petition. It is always obligatory in the case of proposed constitutional changes, whether cantonal or Federal. In the domain of ordinary legislation it is usually employed only in the case of important measures of a general character. Since 1874 the referendum has been a feature of the government of the Confederation. The Constitution provides that upon the demand of eight cantons or 30,000 citizens any Federal law of general application

must be submitted to the people. During the first nineteen years after its adoption by the Federal Government 20 laws out of a total of 150 were thus submitted, 14 being ratified and 6 rejected. The *initiative* was adopted by the Federal Government in 1891 as a means of introducing proposals to revise the Constitution. See SWITZERLAND, section on *Government*.

In the United States the referendum is employed in one form or another in every State and municipality. Very early in our history it became an established principle of American law that all State Constitutions and proposed amendments should depend for their validity upon the ratification of the electorate at the polls. From this it was but a step to the position that propositions to call constitutional conventions should be made a subject for the referendum and this practice became in time well established. Not only has the referendum been employed in the United States for the adoption of organic laws, but it has been used quite as often or more often in the enactment of statutes. It was first employed to determine the question of incorporation of towns, the organization of school districts and counties, the incurring of loans, the undertaking of public improvements, etc. One of the most general uses of the referendum is the determination whether towns and cities shall permit the sale of intoxicating liquors. This method was first employed in Rhode Island in 1845. Another favorite subject of the referendum has been the question of the location of State capitals and county-seats. The referendum has never been employed by the Federal Government for general purposes, although an act of Congress of 1846 providing for a recession of a part of the District of Columbia to Virginia was submitted to a vote of the qualified voters of the district.

The question early arose as to whether the use of the referendum was permissible where not expressly authorized by the State Constitution. From 1826 to 1847 the courts of various States upheld the constitutionality of legislative acts providing for the use of the referendum on the ground that it was not a delegation of legislative power, but simply popular coöperation. Beginning with a decision of the Delaware Supreme Court in 1847, several opinions were given against this view which had the effect of inducing the incorporation of provisions in the constitutions authorizing the referendum. The most valuable work on the referendum is that by Oberholtzer (New York, 1900). Consult also Cleveland, *The Growth of Democracy in the United States* (Chicago, 1898).

REFINING OF METALS (from Lat. *re-*, back again, anew + Eng. *fine*, from OF. *fin*, probably from Lat. *finitus*, finished, p.p. of *finire*, to bound, limit, from *finis*, boundary). The final purifying process in the metallurgy of certain metals such as copper, lead, tin; the object of the process is to obtain the metal in as near as possible a chemically pure form. See COPPER; LEAD; GOLD; SILVER; TIN; NICKEL; IRON.

REFLECTION (Lat. *reflexio*, a bending back, from *reflectere*, to bend back, from *re-*, back again, anew + *flectere*, to bend). A general phenomenon observed in the case of all kinds of wave-motion. If there are two media separated by a bounding surface, in which the trains of waves of the particular kind have different ve-

locities, waves traveling in one medium and meeting this bounding surface will suffer reflection—either total or partial. This is illustrated in aerial waves by the phenomenon of echoes, and in ether-waves by the common use of mirrors of various kinds. The laws of regular reflection are that the incident and reflected rays make equal angles with the line drawn perpendicular to the surface of the point of incidence, and that the two rays and this line lie in a plane. (See LIGHT.) To reflect a train of waves the reflecting body must have a size larger than the wavelength of the waves; a pile rising above the surface of a lake may reflect ripples, but long waves pass around it; a pane of window-glass will reflect aerial waves characteristic of a shrill sound and allow others to pass; a small particle of matter floating in the air may reflect such short ether-waves as produce the sensation of blue light, but allow to pass those so long as to produce red. If the bounding surface between the two media is rough, that is, has inequalities which are comparable with the lengths of the waves, they will be scattered by these and diffusely reflected, e.g. ground-glass surfaces.

REFORMATION (Lat. *reformatio*, from *reformare*, to form anew, from *re-*, back again, anew + *formare*, to form, from *forma*, shape). In law, the rectification or amendment of contracts or other legal instruments pursuant to the judgment or decree of a court of equity. If a term is incorporated into a written instrument by mistake so that it does not represent the real intention of the parties, such intention, by reason of the parol-evidence rule (see EVIDENCE), cannot be shown in any proceeding at law founded upon the written instrument. Courts of equity, however, will give relief from the consequences of such a mistake by compelling the cancellation and surrender of the written instrument and the execution of a new instrument to conform to the actual intention of the parties when there is complete agreement between the parties. Justice then requires that the written instrument should conform to that intention and should be reformed if it does not. But if the terms of a contract were never agreed upon, there is nothing on which to base a decree of the court directing the execution of a new contract. The ordinary rules governing equitable proceedings apply in proceedings to reform written instruments; and the court will give such incidental relief as is necessary to carry out the main purposes of the proceeding. See CONTRACT; MISTAKE; EQUITY; COMMON LAW; EVIDENCE, etc.; and compare RESCISSION. Consult the authorities referred to under CONTRACT; EQUITY; EVIDENCE.

REFORMATION, THE PROTESTANT. The name applied to the great revolt in Europe in the sixteenth century against certain doctrines and practices of the Roman Catholic Church. Up to that time Western Christendom had been a religious unit, under the primacy of the Pope. The Reformation movement, therefore, inevitably affected the general polity of Western Europe and wrought an entire change in its religious and political constitution. The Reformation was thus, if the strict significance of the term is adhered to, a revolution rather than a reformation, while the latter term could properly be applied to the resulting movement within the Roman Catholic Church, which is known as the Catholic Counter-

Reformation. The present usage is, however, established, and is to be accepted with explanation of its actual significance. In its broad constitutional aspects the Reformation was a revolt against the universal supremacy of the Papacy and represented the German idea of separate ecclesiastical bodies on national lines, as opposed to a centralized Church government. In a large ethnic view it was a continuation of the old conflict between German individualism and Latin unity. Protestantism, indeed, the ultimate expression of the Reformation in organized sects, took root permanently only in Northern or Germanic Europe, while in Latin Europe after a sharp struggle between the tendency of individuals to the use of private judgment in spiritual matters and the demand of the established Church for uniformity, the old polity triumphed and Italy, Spain, France, and Austria remained in the Papal obedience.

BEGINNINGS OF THE REFORMATION. The Reformation is dated from the year 1517, when Martin Luther (q.v.) challenged the Papal authority in his famous ninety-five theses, but its true meaning is to be found by referring to great currents of thought and action that through the Middle Ages had been modifying society. Since the establishment of the new Western Empire by Charles the Great in 800 there had been an almost continual contest between the emperors, the temporal heads of Christendom, and the popes, the spiritual heads, over the limits of their respective authorities. The theory of the spiritual and the temporal powers, upon which Christian Europe was constituted, proved not to be a workable one, and every conflict between pope and emperor over the limits of temporal and spiritual jurisdiction sowed the seeds of future discord. The exercise of control by Otho I. (q.v.), the Investiture quarrel (see INVESTITURE), the losing battle of the Hohenstaufen emperors, all tended in this direction; and although the Church triumphed, it did so at the cost of rents in its own armor which made the Reformation possible.

The rise of the spirit of nationality and its resentment of Papal control in ecclesiastical affairs as shown in the contests between some of the French kings and the popes, and in the revolt against Roman influence of which Wiclif was the most notable exponent in England, worked to the same end. Wiclif's religious teachings, with their bearing upon the great political questions that were coming to the front in the fourteenth and fifteenth centuries, were carried from Oxford to Prague, where John Huss (q.v.) took them up and made Bohemia almost a Protestant country before Protestantism was known. Huss was condemned and executed at Constance in 1415, but the work he had done in Bohemia made that country prepared ground for the Reformation seed. Luther's principles were anticipated by Wiclif and Huss, but in their day conditions were not ripe for the great revolution. The universities were often potent factors in the spread of ideas which gradually sapped the foundation of traditional beliefs, and led to the questioning of the authority upon which the old beliefs rested. The migration of students from one university to another spread the doctrines of rationalistic teachers far beyond their own lecture rooms. Thus were the ideas and the writings of Wiclif carried to Prague.

(See UNIVERSITY.) When Dante (q.v.) headed the great revival of learning and letters, which, starting in Italy, spread over Europe, a new and more permanent shape was given to the growing controversy as to the relations of Church and State. Dante in the *De Monarchia* and Marsilius of Padua (q.v.), a partisan of the emperors, in the *Defensor Pacis*, attempted to find new bases for the relations of Church and State in Christendom; and the latter especially advanced political theories that were distinctly modern in their nature. The Renaissance (q.v.), by opening new fields of thought, gathered in all these currents and gave them new power. Devoted Catholics, like Dante and later Savonarola, demanded reform within the Church, reform 'in head and members,' as the University of Paris reformers put it. Skepticism became rife; while a few men who could not be skeptics, and would not accept a religious system of which the popes of the fifteenth century were the representatives, sought for another basis of faith. Many sects in different countries, the offspring of abortive attempts at a return to simpler primitive Christianity, or of mystical or heretical teaching, had also prepared the minds of the masses of the people, less accessible to the more intellectual currents of the age, for a new movement. Such were the Apostolic Brethren, Beghards, Beguins, Cathari, Flagellants, Fratitelli, and the Lollards. The earlier sects of the Albigenses (q.v.) and the Waldenses (q.v.) or Vaudois were also in a way a part of these earlier movements that formed the motley advance guard of the Reformation, but they lacked the intellectual strength and the political and social power that were necessary to make an abiding impression on feudal Europe.

GERMANY. Germany with its more than three hundred States, loosely held together in the Empire, and seeking blindly to realize German nationality, always pulling hard against the assertions of Papal authority and of the Emperor, who represented Hapsburg rather than German interests, was in the sixteenth century in a favorable condition for starting the new movement for which the centuries had thus been preparing. Strenuous efforts were being made by the Papacy to raise money to complete Saint Peter's and to carry on war with the Turks. Martin Luther, then a professor in the University of Wittenberg and a parish priest, was aroused against the system which connected the distribution of indulgences with these efforts, as carried on by Tetzel (q.v.). On October 31, 1517, Luther nailed to the church door at Wittenberg the ninety-five theses in which he challenged the abuses of the Church. He seemed unconscious of the tremendous revolution he was setting on foot, but events moved rapidly. He defended his position on historical grounds in public disputation and in writing, taking by degrees a more advanced position than at first. In his scheme, which rested on salvation by faith rather than by the formal works of the sacraments, he reduced the seven sacraments to three—baptism, the Lord's Supper, and penance. On the 10th of December, 1520, he publicly burned a copy of the Papal bull of excommunication which had been directed at him by Leo X. and also one of the canon law, thus symbolically breaking with the whole system upon which the Roman ecclesiastical structure rested. In 1521, sum-

moned by the new Emperor, Charles V., to the Diet at Worms, he refused to retract and was sequestered for a time in the Castle of Wartburg, under the protection of his friend the Elector Frederick of Saxony. He had now reached the point where he must begin a constructive movement. He translated the Bible into vigorous colloquial German, assisted by his friend and coworker, Melancthon, and entered into communication with the North German princes, many of whom gave him their support. At the Diet of Speyer in 1529 a majority of the princes and representatives of the cities issued the 'Protest' which gave to the adherents of the new movement the name of Protestants, and a year later at the Diet of Augsburg, when the Emperor was present, they set forth their views in the Augsburg Confession (q.v.), prepared by Melancthon, which it was hoped would be a means of mediation. The Protestants were then in a minority, however, and a decree of condemnation was passed, beginning the long and bitter struggle. The Protestants organized the League of Schmalkald for defense, but for some time the political difficulties with which Charles had to deal in his rivalry with France and the necessity of uniting Germany against the onslaughts of the Turks made him defer the execution of the decree of Augsburg. But in 1546, immediately after the death of Luther, the Emperor turned his attention to the Schmalkald League and in 1547 he defeated it with the aid of Duke Maurice (q.v.) of Saxony. (See MÜLLBERG.) The return of the latter to the Protestant side turned the tables and the Emperor concluded a treaty at Passau in 1552, in which the Protestants stipulated for the free exercise of their religion, until the meeting of a diet which should settle a permanent religious peace; and in return they agreed to lend assistance against the Turks, who were still menacing the frontiers of the Empire. The promised diet assembled at Augsburg in 1555 and framed articles for the religious pacification of Germany, according to which each prince might choose between Lutheranism and Catholicism, the religion of the prince to be that of his people. Any prelate on becoming Protestant was to resign his benefice, and subjects of ecclesiastical princes were to enjoy religious liberty. This peace gave recognition to the Lutherans. It established a *modus vivendi* between the adherents of the old and new creeds, which soon proved to be a precarious one, and finally the issues between Catholics and Protestants were fought out in the Thirty Years' War to a settlement in the Peace of Westphalia (1648).

DENMARK AND SWEDEN. In the neighboring countries of Denmark and Sweden the progress of reformed opinions had been more rapid than in Germany. In both these countries the sovereigns took the lead. In Sweden particularly Gustavus Vasa pursued a vigorous policy in favor of the Reformation. He invited Lutheran teachers into his dominions, and showed special zeal in the circulation of a Swedish version of the Scriptures, made by one of these teachers, named Olaus Petri, who occupies the most prominent place among the Swedish reformers. At an assembly of the States at Westerås in 1527 it was unanimously resolved that the Lutheran doctrines should be adopted in Sweden, and a Reformed Church, entirely independent of

Rome, established. The same result occurred in Denmark in 1539, when an assembly of the Danish States at Odense gave formal sanction to a plan of religious doctrine, worship, and discipline, drawn up by Bugenhagen, a disciple and friend of Luther, whom Christian III. had invited from Wittenberg for the purpose.

SWITZERLAND AND CALVIN. Parallel with the Lutheran movement in Germany a religious revolt on similar lines developed in the German cantons of Switzerland under the leadership of Ulrich Zwingli (q.v.), a Zurich pastor (1519). The causes of the Swiss movement were partly political, but the underlying principles involved were the same as in Germany, and the outbreak was finally due to the question of indulgences. The cantons surrounding Lake Lucerne remained, as they are to-day, strongly attached to the Catholic faith. Their resistance to the reformers led to a civil war, and Zwingli was killed in 1531 while accompanying the troops of Zurich on a disastrous expedition. Before Zwingli's death in 1529 an attempt was made by the friends of the two reform leaders to bring Luther and Zwingli into coöperation. Luther and Melancthon met Zwingli, Bucer, and Œcolampadius at Marburg on the invitation of Philip, Landgrave of Hesse, one of the earliest and wisest supporters of the Reformation. The meeting failed to accomplish anything, owing to their difference in regard to the Lord's Supper, which Zwingli held to be a memorial and a symbol, while Luther insisted on the acceptance of the doctrine of consubstantiation as a fundamental principle of Christian faith. Thus the division of Protestantism began on the very threshold. Zurich declared its ecclesiastical independence in 1524, Berne and Saint Gall followed in 1528, Basel and Schaffhausen in 1529. The movement was checked temporarily by the defeat of Zurich and the death of Zwingli, but the accession of Geneva to the Protestant cause in 1535 and the establishment there of John Calvin, the great organizer of the Reformation, gave a new impulse to the Swiss movement and speedily made Switzerland a centre for the promulgation of Reformation ideas. Calvin was the needed element to make the Reformation aggressive. Luther was too thoroughly a German to carry much weight except among Germanic peoples, and Lutheranism became a German State religion, settling in time into a rigid mold which prevented expansion. Calvin, on the other hand, was more of a jurist and administrator than a preacher. His theological creed was one that in those days most of the reformers could accept, and his *Institutes* became the constitution of Protestantism, outside of the North German and Scandinavian countries. The Swiss followers of Zwingli adhered to the new leader. Two great Protestant sects were thus formed at the very beginning—Lutherans and Calvinists or 'Reformed.' From the teachings of Calvin came the congregational idea of Church government with its far-reaching political consequences. The Protestants of France, Holland, and Scotland followed the guidance of Calvin, who maintained a constant correspondence with the leaders of the Reformed movement in these countries. A little later, when persecution began in England, English exiles came to the Continent, imbibed the lessons of Calvinism, and carried them back to become the marrow of English Puritanism.

FRANCE. The new doctrines took a strong hold among some of the upper and middle classes in France as early as 1523, among their supporters being Margaret, Queen of Navarre, the sister of Francis I. Most active in the propaganda at this stage were Lefèvre and Farel, the latter formerly a priest. But France had always been the stronghold of Catholicism, and the fact that the Protestant movement took on a class form was against it in a country where class lines were sharply drawn and sympathy between the orders was lacking. The peasantry opposed an immovable front to the new creed, and the vacillating policy of Francis I. and the fierce factional spirit engendered by the struggle prevented the Reformation from obtaining in that country the national standing that it gained in Germany and elsewhere. The most important contribution of France to the movement was in the person of John Calvin. Both Farrel and Calvin were driven into Switzerland. The latter settled for a time at Basel, where he published the first edition of the *Institutes*, the preface of which, dated August 1, 1535, was addressed to Francis I. In the following year Calvin was drawn to Geneva through the influence of Farel, and there entered upon his great career. A succession of civil wars, known as the Wars of Religion, convulsed France and threatened its ruin, but in the end the old Church triumphed and France retained its historic place as a chief pillar of the Roman Catholic Church. See HUGUENOTS.

SOUTHERN EUROPE. In Italy and Spain, as in France, the idea of the Reformation gained ground at first quite rapidly with the upper and intellectual classes, but did not appeal to the masses of the people. Many leading Catholics, such men as Caraffa and Contarini in the College of Cardinals, were desirous of the reform of existing ecclesiastical abuses, but had no sympathy with revolt against the Papacy. Protestantism obtained no footing in either Italy or Spain, and after the Council of Trent it practically disappeared. The Inquisition and the Index (qq.v.) were used as instruments in the suppression of heresy. The Inquisition had become active in Spain in the fifteenth century, but it was utilized to its fullest extent under Philip II.

THE NETHERLANDS. The Netherlands were Spanish provinces at the beginning of the Reformation period, but, as in other Germanic countries, the Reform doctrine found ready acceptance, and Charles, and after him Philip, attempted the same policy that was so effective in Spain. But the long and desperate struggle resulted in the erection of an independent Protestant State out of the northern Dutch provinces. See ALVA; EGMONT; HOORN; WILLIAM OF ORANGE.

EAST-CENTRAL EUROPE. As has already been said, John Huss had made Bohemia practically a Protestant country, and its inhabitants adopted the Reformation with great readiness and entire sincerity. They were severely punished for refusing to act against their Protestant brethren of the League of Schmalkald, but in 1609 they were able to extort from the Emperor Rudolph II. the so-called *Majestätsbrief*, an edict of toleration. Many followers of Huss, however, did not accept Lutheranism. The rising of the Bohemian Protestants in 1618 was the opening episode of its Thirty Years' War. They were crushed in 1620 and Protestantism was rooted out. In Po-

land, although it remained a strongly Catholic country, there were many Lutherans and Calvinists. In Hungary Bohemians, Germans, and Waldenses aided in spreading the Reformed doctrines, but the rivalries between Lutherans and Calvinists, intensified by the fact that the former were principally Germans and the latter Magyars, weakened the Protestant cause and enabled Catholicism to maintain the upper hand.

ENGLAND AND SCOTLAND. It has long been asserted that there was a strong popular support among the common people of these countries for the Reformation ideas, traceable mainly to the work set on foot by John Wiclif, and that as early as the beginning of Luther's activity there were indications of a revival of evangelical religious life among the tradesmen of London, and the peasantry in different parts of the country, particularly in Lincolnshire. The residence of Erasmus in England in the beginning of the reign of Henry VIII. stimulated a spirit among the educated classes which, while it remained for the most part faithful to the Roman Catholic Church, as in the case of More and others, yet helped to advance a dissenting movement. In 1529, a year before the meeting of the Diet of Augsburg in Germany, the usurpations of the clergy and the manifold ecclesiastical abuses prevailing in the country were the subject of Parliamentary legislation. But the most recent historical research has tended to show that the survival of Lollard ideas and the popular support of such a movement have been much overestimated. In both England and Scotland, the Reformation was closely bound up with political conditions. In Scotland the nobility made use of it as a trenchant instrument against royal authority; and in England Henry VIII. espoused its cause in furtherance of his own policies. The negotiations as to Henry's divorce from Catharine had been proceeding for some time, and the country was greatly excited by the course of events. In 1533 Henry was married to Anne Boleyn and his former marriage with Catharine was declared void. All appeals to Rome were forbidden. Henry found it helpful to his own plans to be free from ecclesiastical interference, and in the two following years the sovereign was declared to be the supreme head of the Church of England, with authority to redress all errors, heresies, and abuses in the Church; the monasteries were dissolved; and Parliament petitioned that a new translation of the Scriptures might be authorized and set up in churches. (See ENGLAND; HENRY VIII.) In all this course of reformation, however, there was but little religious impulse on Henry's part, for we find him again in 1539 passing the statute known as the Six Articles, which rendered it penal to deny the doctrine of transubstantiation, or to affirm that priests might marry. The King's move, however, fell in with the vigorous growing spirit of English nationality and hence received support. With the accession of Edward VI. in 1547 the Reformation greatly advanced. The statute of the Six Articles was repealed with other measures of the close of Henry's reign. The Parliament of 1548 established the use of the Book of Common Prayer; the clergy were permitted to marry; the cup was allowed to the laity; and in 1551 the 42 articles of religious belief, afterwards reduced to 39, were promulgated. The temporary restoration of Catholicism by Mary and the final es-

establishment of Protestantism under Elizabeth are well-known events, belonging to the special history of these reigns.

In Scotland the reforming impulses began with Patrick Hamilton. Hamilton was educated in Paris and in Germany, and learned there the doctrines which he introduced into his native country. There was something, indeed, of the same popular movement, known under the name of Lollardism in Scotland, as in England, and Hamilton's preaching may have served to kindle the dying embers of this movement. His early death in 1528 undoubtedly produced a great effect. After Hamilton George Wishart appears as the next champion (q.v.) of the Scottish Reformation; and in connection with him we first hear of John Knox, who became finally the leading spirit of the movement, by whose influence the Reformation was established in Scotland in 1560. The Scottish Reformation followed the type of the Calvinistic Reformation in Geneva, where Knox had taken refuge during the period of persecution in Scotland, and acted for some years as the companion of Calvin. Episcopacy was abolished, and the Reformed Church set up in every respect as far as possible in opposition to the Papal system.

For the efforts made by the authorities of the Roman Catholic Church to counteract the dissident movement, see COUNTER-REFORMATION; TRENT, COUNCIL OF.

BIBLIOGRAPHY. Among the best original sources for the Reformation are the works and correspondence of the noted men of the period. For certain aspects, however, the Papal archives furnish the most desirable material. For this the various collections of documents should be consulted, notable among which are: Tomasetus, *Bullarum, Diplomatum et Privilegiorum Sanctorum Romanorum pontificum*, vols. iv., v. (Tours, 1859-60); Chevalier, *Répertoire des sources historiques du moyen-âge* (Paris, 1877-83); *Collectio Bullarum*, vol. ii. (Rome, 1750). The decrees of the council are to be found in Labbé, *Sacrosancta Concilia* (Venice, 1728-33), while all the facts and documents relative to the Council of Constance have been separately collected and are to be found in the monumental work of Hardt, *Magnum Œcumenicum Constantiense Concilium* (Frankfort and Leipzig, 1697-1700). Among secondary works, which treat specifically of the Reformation and the conditions which produced it, three works are specially important: Ranke, *Deutsche Geschichte im Zeitalter der Reformation* (Berlin, 1847) represents the old, conservative view, now generally known as the Protestant presentation; Janssen, *Geschichte des deutschen Volkes seit dem Ausgange des Mittelalters* (Freiburg, 1877-94; Eng. trans., London, 1896-1903), and Pastor, *Geschichte der Päpste* (2d ed. Freiburg, 1891-95; Eng. trans., London, 1896-98) present ably and scientifically the views of the recent Catholic school of historians. Probably the best work in English, which covers this period is Creighton, *History of the Papacy During the Reformation* (London and Boston, 1882-94). Other works of value are Bezold, *Zur Geschichte des Husitentums* (Munich, 1874); Gebhardt, *Die Gramina der deutschen Nation gegen den römischen Hof* (Breslau, 1884); Gregorovius, *Geschichte der Stadt Rom* (3d ed., Berlin, 1879-

80); Hefele, *Conciliengeschichte* (Freiburg, 1867-74); Lorenz, *Papstwahl und Kaiserthum* (Berlin, 1874); Lindner, *Geschichte des deutschen Reiches* (Brunswick, 1875-80); Palacky, *Geschichte von Böhmen* (Prague, 1845-60); Reusch, *Der Index der verbotenen Bücher* (Bonn, 1883-85); Rossman, *Betrachtungen über das Zeitalter der Reformation* (Jena, 1858); Ullmann, *Reformation vor der Reformation* (Hamburg, 1841-42); Gasquet, *The Eve of the Reformation* (London, 1900). The various general Church histories, especially those of Baur, Gieseler, Hardwick, Ilase, Kurtz, Hergenröther, Darras, Alzog, and Riffel are also valuable. Seebohm, *The Protestant Revolution* (London, 1887; Häusser, *Period of the Reformation*, trans. from the German (ib., 1873); and Fischer, *History of the Reformation* (New York, 1890), are small works, valuable for a general aspect of the Reformation. The Reformation in the great institutions of learning may be best studied in Denifle, *Die Universitäten des Mittelalters* (Berlin, 1895). Consult also the principal works mentioned under RENAISSANCE.

REFORMATORIES. Penal institutions for young offenders where the object of punishment is subordinated to that of moral regeneration. It is difficult to fix definitely the time when it was recognized that juvenile offenders should not be merely punished for crime, but that efforts should be made to reform them.

The eighteenth century was fruitful in humanitarian movements and the condition of prisoners was not overlooked in the general effort to ameliorate suffering, and to awaken the sense of individual responsibility which was characteristic both of the religious revival under the Wesleyans, and of the political reforms led by the French and English radicals. The philanthropic efforts of John Howard and Elizabeth Fry, in particular, prepared the way for new views in penology. At the same time interest in the care of neglected children and of juvenile delinquents which had from the days of Elizabeth found expression in the English Poor Law (q.v.), was leading to many new experiments. The most valuable of these, however, was first tried in Germany, where, in 1833, the Rauhes Haus (q.v.) in Hamburg introduced the plan of having the children cared for in 'families' on the cottage plan. This principle was adopted at Mettray, France, in 1839, and has since become the favored method for juvenile reformatories, though the congregate plan still exists and has its adherents. Captain Brenton, of England, about 1830 urged that no child under sixteen should be sent to prison, but should be trained in some special institution. In accord with his ideas an industrial school for girls was started at Chiswick. In 1847 the institution at Saint George's restricted its care to boys charged with or convicted of crime. From this time the movement made progress in England. In 1854 the Reformatory Schools Act was passed, which took legal cognizance of the principles of the reformatories. France, in 1850, had already enacted similar legislation. Distinction must be made between the purely industrial schools which receive children who are destitute and the reformatory schools which receive those guilty of criminal acts. Sometimes, particularly in the earlier institutions, the two classes were mixed.

In 1898 there were in England 48 reformatories and 144 industrial schools; Prussia had 7 reformatories and 16 private institutions under Government supervision. In 1896 France had 6 public and 12 private reformatories for boys (one being in Algeria), and 4 public and 7 private for girls. In Holland juvenile delinquents under ten are sent to reformatories, of which there are four. Most of these schools are situated in the country.

The reformatory system has had its widest development in the United States. In 1824 the House of Refuge on Randall's Island, New York, was established by law. It was and still is conducted on the congregate plan. Other cities followed the example. Such houses of refuge were under private control, but the public shared in the expense. These early institutions were followed by State reform schools. The change in names is interesting. All indications that the boys were committed to the institution for breaches of the law were avoided, as for example in the title of the Lyman School for Boys (1848). Besides these institutions for delinquents there have sprung up many industrial schools for orphans and neglected children. Usually the two are separated and the sexes also are usually in separate schools. In 1900 there were 65 juvenile reformatories in the country, with a population of 19,410, while the total number of children they had sheltered was 209,600. In the earlier institutions the employment of the children was too often decided from a financial standpoint solely. It is now recognized that it should be not 'productive,' but 'instructive.'

It remained for the United States further to develop the reformatory system and make it applicable to young men and women. The principles introduced at Norfolk Island by Macdonochie, and in Ireland by Crofton, had found favor in the country. It was proposed to combine these with the principles of the reformatories and seek not merely to punish, but to bring to self-support and self-respect the younger criminals for whom there might yet be hope. The beginning of this movement dates from the National Prison Congress of 1870, at which Z. R. Brockway outlined a plan for a new class of institutions. In 1866 New York had enacted legislation establishing a reformatory. The plans were altered in 1869, but it was not opened until 1876, when Mr. Brockway was appointed superintendent of the Elmira Reformatory (q.v.). In 1877 the principle of the indeterminate sentence was legally adopted. The growth of the institution and its constant success won world-wide attention. In 1877 Massachusetts founded a reformatory for women at Sherborn, and in 1884 one for men at Concord. Many other States have followed the example of these two.

The fundamental idea of these reformatories is that instead of repressive and punitive measures there should be constant training along lines of industry, physical and mental development, to enable the prisoner to stand alone after his release. To make more effective this training, his self-interest is appealed to by the indeterminate sentence. This makes the length of his stay in the institution largely dependent upon his behavior and progress while there. He is thus stimulated to take advantage of his opportunity. His release is conditional, and if he violates the terms of his parole he may be returned to the

institution. The claim is made that fully eighty per cent. of young felons released from American reformatories have subsequently led upright lives. Unfortunately, the claim can be neither supported nor disproved, because no systematic trace and record is kept after the full term of the original sentence has expired.

The age limits within which first offenders are sentenced to reformatories vary. The lower limit is usually fifteen or sixteen years. The upper limit seldom exceeds thirty. In form of construction reformatories are like prisons with separate cells. The inmates are divided into grades, usually three. The Shelborn Reformatory for Women in Massachusetts has four. There are different privileges for the different grades, and release on parole is open only to those in the highest. Consult: Barrows, *The Reformatory System in the United States* (Washington, 1900). The best general sources are Drähms, *The Criminal* (New York, 1900), and Wines, *Punishment and Reformation* (ib., 1895). The Reports of the International and National Prison Congresses, and the Reports of the National Conference of Charities and Correction contain many papers on the general subject. See JUVENILE OFFENDERS; PENOLOGY; PRISONS.

REFORM BILLS. In English history, the name of several measures introduced into Parliament, chiefly during the nineteenth century. These bills, three of which were passed—namely, in 1832, 1867, and 1884-85—aimed to abolish the abuses which had grown up in regard to the representation in the House of Commons. The franchise was also widely extended, and in practice the House of Commons became all-powerful. For details regarding the struggle, which preceded the passing of the great Reform Bill of 1832, see GREY, CHARLES, second Earl Grey; for the provisions of the various acts, see PARLIAMENT. See also sections on *History and Government* under GREAT BRITAIN.

REFORMED CATHOLIC CHURCH. A movement begun in New York City between 1880 and 1885 among priests who had renounced the jurisdiction and doctrine of the Roman Catholic Church and engaged in evangelistic labors among the people. It has 6 ministers, 6 church organizations, and 1500 members, chiefly in New York, Massachusetts, Pennsylvania, and Illinois.

REFORMED CHURCH IN AMERICA. THE. A body of Christians in the United States composed originally of settlers from Holland, but now largely intermixed with elements from many other sources. Until 1867 it was known as the Reformed Protestant Dutch Church in North America. The history of the Church begins with that of the Reformation in the Netherlands, where the movement met with a hearty welcome.

Entering from Germany, it afterwards received its chief impetus from Switzerland and France. Hence its distinctive type of the Reformed doctrine and the more democratic Presbyterian polity. But in Holland, as elsewhere, there had been a great preparation made by reformers before the Reformation. The monks John Eseh and Henry Voes for their evangelical preaching were burned at Brussels (1523) and were perhaps the first martyrs of the Reformation. The Reformed Church of the Netherlands began her more formal existence in 1566, when the so-called 'League of Beggars' was formed.

Field preaching and the singing of evangelical hymns rapidly spread the Reformed doctrine. Conventions or synods of the Dutch Reformers during the next two decades formulated a liturgy and rules of Church government, and adopted standards of doctrine—the Belgic Confession and the Heidelberg Catechism (qq.v.). Because of Spanish persecution these synods were held outside of Dutch territory. In 1643 copies of these rules of Church government were sent to the Westminster Assembly as a specimen of Presbyterian polity. In 1618-19 the famous Synod of Dort (qq.v.), called to consider the controversy which had sprung up between the Calvinists and Arminians, formulated the Canons of the Synod of Dort.

The earliest Dutch Church organization in America was made in New York in 1628 by Rev. Jonas Michaëlius. This is now the strong and wealthy Collegiate Church, with its half-score of buildings and fourteen ministers. During the government of the West India Company down to 1664 thirteen Dutch churches were established in America and sixteen ministers in all had officiated. Then came the English conquest. Dutch immigration ceased. It was a question whether the Dutch Church could survive under the English Government. During the next half century there was an almost constant struggle with the English Governors, who naturally sought to establish the Church of England. During this same period there was also a considerable accession of Huguenots to the country, who largely fell into the fold of the Dutch Church. At first, however, during the reigns of Charles II. (1660-85) and James II. (1685-88), full liberty was ostensibly granted to all denominations. But with the accession of William III. (1688) the normal policy of the English Government was restored, and more persistent attempts were made to impose the Church of England on a population which was overwhelmingly Dutch. A Ministry Act was secured in 1693, but it had been so emasculated in its passage that it was found to be entirely unsectarian; yet it was often arbitrarily perverted by certain of the Governors in favor of the Church of England. Because of such perversion the Dutch Church of New York City managed in 1696 to extort a charter from Governor Fletcher, and this course was successfully followed by other Dutch churches, so that the Dutch Church really remained ecclesiastically independent. During this period of struggle the churches increased to forty, and about twenty-four new ministers were sent from Holland.

During the eighteenth century many Palatines arrived on the Hudson, making sooner or later about twenty German churches, which were also under the Classis of Amsterdam. Increasing desire for a general ecclesiastical organization and for institutions of learning now began to be expressed. There were some conflicts at first between the more revivalistic methods of Berthoff and Frelinghuysen, which were of a Labadistic character, and the more conservative methods of others. A church organization styled the Cætus was formed in 1747, but, owing to ecclesiastical interference from Holland, it found itself unable to ordain. Hence it declared itself an independent American Classis with full powers in 1754. Meantime, an effort was made to establish a Dutch divinity professorship in Kings College, New York City, which was accomplished in 1755,

but this split the Church more completely and led to the securing of a charter for Queen's College (New Brunswick, New Jersey) in 1766 and an amended charter in 1770. The two parties came together in 1771 upon articles of union, securing semi-independence from the Church of Holland, but the Revolution delayed the speedy development of the new plans. In 1784 a professor of theology was elected—Rev. Dr. John H. Livingston—and this was the beginning of a theological seminary, the first in the country.

In 1792 an Americanized constitution of Church government was adopted, which has gone through two revisions since—namely, in 1832 and 1874. The Church continued to grow slowly. In 1800 there were about 100 churches and forty ministers in service. The number of ministers did not equal the number of churches until 1845, when there were 375 of each. In 1846 began a new Dutch immigration which settled in the middle West, but is now penetrating even to the Pacific Coast. Many of these new-comers fell into the old Dutch Church, and there are now more than 200 churches from this source and as many ministers.

In doctrine the Reformed Church in America has ever adhered to the standards already referred to, adopted in Holland. She also indorsed the Westminster Catechism in 1837. Her form of government is of the so-called Presbyterian type, first proposed by Calvin, and was adopted in 1568. This enumerated four classes of officers in the Church, viz. ministers, teachers (or professors), elders, and deacons. Four grades of ecclesiastical bodies were also defined, viz. Consistories, Classes, Provincial Synods, and a General Synod. The Reformed Church has a liturgy, but this is obligatory only in the administration of the sacraments and ordinations. It has received some additions from time to time as necessity required. In all other respects her mode of worship is free. The General Synod is incorporated and holds all funds and endowments of the theological seminaries, and, in part, of the colleges and other agencies. The General Synod operates through a board of direction. The colleges are also incorporated, as well as the various boards, such as the board of education, the board of foreign missions, the board of domestic missions. The churches exist in New York, New Jersey, Pennsylvania, Maryland, Ohio, Michigan, Wisconsin, Indiana, Illinois, the Dakotas, Minnesota, Kansas, Nebraska, Montana, South Carolina, Oklahoma, and Washington.

In 1903 the Reformed Church in America reported 633 churches, 703 ministers, 61,000 families, and 113,000 communicants. There are also about 119,000 children in the Sabbath schools. Nearly \$400,000 was raised during the year for benevolent objects, and \$1,250,000 for congregational purposes. This Church has several flourishing institutions: Rutgers College (1766) and a theological seminary (1784) at New Brunswick, N. J.; Hope College (1866), and the Western Theological Seminary (1866) at Holland, Mich.; and incipient institutions in other States. The Church has been especially successful on the foreign field, having missions in India, China, Japan, and Arabia, having sent out more than 200 missionaries, male and female. In 1902 the wonderfully successful Classis of Arcot, India, with 25 regularly organized churches, many of them having native pas-

tors, was formally transferred in the interests of Church union to the Synod of South India, of the South Indian United Church. The missions in China and Japan are working in hearty union with missions of other denominations.

Livingston, D.D.* (ib., 1829; 2d ed. 1856); Demarest, *History and Characteristics of the Reformed Church* (ib., 1856; 2d ed. 1890); id., *Centennial Discourses* (ib., 1876; 2d ed. 1877); Corwin, *Manual of Reformed Church* (ib., 1859; 4th ed. 1902); id., *Centennial of the Theological Seminary at New Brunswick* (ib., 1885); id., *Ecclesiastical Records of the State of New York*, published by the State, under the supervision of Hugh Hastings, State Historian, 2 vols., 1620-1700 (Albany, 1901). These are the documents procured by Rev. Dr. Corwin in Holland (1897-98), with collateral material from other sources; to be followed by four more volumes (1701-1800).

REFORMED CHURCH IN THE UNITED STATES, THE (GERMAN REFORMED). A religious body founded by emigrants from the Palatinate and other districts of Germany. Their first minister was Rev. Samuel Guldin, who came in 1710; their first church was founded at Germantown, Va., 1714; and their first permanent pastor, who became the organizer of the Church, was Rev. J. P. Boehm, who organized the first congregation at Falkner Swamp, Pennsylvania, in 1725. Their organization as a denomination was completed by Rev. Michael Schlatter, who was sent by the Reformed Church of the Netherlands (1746) and organized their Synod (then called a Cetus) September 29, 1747. He revisited Europe in 1751, bringing back (1752) six young ministers who became the forerunners of others sent over by the Reformed Church of the Netherlands. The Church continued under the supervision of the Church in Holland till 1793, during which time that Church sent over 31 ministers and spent about \$20,000 on the Pennsylvania churches. When the Church in Pennsylvania became independent in 1793 it numbered 22 ministers, 78 congregations, and about 15,000 members. After it had become independent it had to face two serious difficulties. One was the change of language from German to English, which caused friction in congregations and the loss of many of the young people, who became English before the Church service did. The other difficulty was the lack of a theological seminary in which to train ministers. The old method had been for prominent ministers to train the young men privately, and three of them had founded what were virtually private theological seminaries; Rev. C. L. Becker, at Baltimore; Rev. S. Helffenstein, at Philadelphia; and Rev. F. L. Herman, at Falkner Swamp. But this method proved insufficient to supply the number required. So the Synod of 1820 determined to found a theological seminary of its own. This was opened (1825) at Carlisle, removed later to York and to Mercersburg, and is now located at Lancaster, Pennsylvania. After the seminary had been founded a classical school was connected with it which grew into Marshall College, later Franklin and Marshall College at Lancaster. This movement for the foundation

of a seminary, however, resulted in a division of the Church, as those who opposed the movement separated and formed a free synod in 1822, which in 1837 returned to the mother synod.

Meanwhile the denomination was spreading southward from Pennsylvania through Virginia to the Carolinas, and westward through Ohio, Indiana, and the Western States. Most of the German churches in New York State went into the Dutch Reformed Church. A missionary society was organized in 1826 which published (1828) the first Church paper, *The Magazine of the German Reformed Church* (later called *The Messenger*). The western part of the Church founded Heidelberg College and Theological Seminary (1850) at Tiffin, Ohio. A mission house to educate German ministers was opened at Franklin, Wisconsin (1860). The call of Rev. J. W. Nevin in 1840 and of Rev. Philip Schaff in 1844 prepared the way for the controversy about the Mercersburg theology (q.v.) and the liturgy. As the result of the liturgical movement the *Provisional Liturgy* was published (1757), the *Order of Worship* (1866), and the *Western Liturgy* (1867). The Low Church party in the East founded Ursinus College (1870) at Collegeville and a theological school (1871) (now at Philadelphia). The liturgical controversy continued till 1878, broken only by the observance of the tercentenary of the Heidelberg Catechism in 1863, which led to a union of the Eastern and Western sections of the Church in a General Synod. In 1878 that General Synod appointed a peace commission, which later drew up a new liturgy, the *Directory of Worship*, which was adopted by the Church. Since the peace movement has been completed the Church has been increasing rapidly, gradually centring its work in the boards of the General Synod. Missions were opened in Japan (1879), among the Indians in Wisconsin (1878), and in China (1900). Doctrinally the Church was eradled in Calvinism, as all its ministers sent by Holland were required to subscribe to the Calvinistic Confessions; but in 1844, under Dr. Nevin and Dr. Schaff, the mediating theology of Germany was introduced. The denomination numbered in 1902 8 synods, 58 classes, 1107 ministers, 248,929 members, and about 750,000 adherents. Its contributions in 1901 were \$270,288 for benevolent objects and \$1,303,000 for congregational purposes. Consult: Dubbs, *History of the German Reformed Church* (American Church History Series, vol. viii., New York, 1895); Good, *History of the Reformed Church in the United States, 1725-92* (Reading, 1899); id., *Historical Hand-Book* (Philadelphia, 1902); id., *Women of the Reformed Church* (ib., 1902).

REFORMED CHURCHES. A term employed in a conventional sense to designate those Protestant churches which follow the doctrines and polity of Zwingli and of Calvin (q.v.) rather than the Lutheran. (See LUTHERANISM.) The influence of Calvin proved more powerful than that of Zwingli, and on the Continent of Europe the Reformed churches are generally known as Calvinistic churches, the name Protestant Church in some countries being almost equivalent to Lutheran. One chief distinction of the Reformed churches is their doctrine of the Lord's Supper (q.v.); another is that concerning the divine sovereignty and election. (See CAL-

VINISM.) They also reject certain ceremonies which the Lutherans have seen fit to retain. The Church of Scotland, the Protestant Church of France, that of the Netherlands, some German churches, and the Protestant churches of Hungary, Bohemia, and Poland belong to the Reformed churches. Most of the Protestant churches in the United States have sprung from Reformed churches in Europe. See REFORMATION; PRESBYTERIANISM.

REFORMED EPISCOPAL CHURCH, THE. A religious body which was originated for such members of the Protestant Episcopal Church as were opposed to the growth of sacramentarianism and sacerdotalism in that communion, and for any others who, like-minded with them, desire to be associated with a Church evangelical in its teachings, liturgical in its worship, and episcopal in its government. It was organized in New York City, December 2, 1873, with eight clergymen and twenty laymen, all of whom had been or were at the time ministers and laymen in the Protestant Episcopal Church identified with the 'evangelical' or 'Low Church' party. One of them, George David Cummins, had been Assistant Bishop of the Diocese of Kentucky until November 10, 1873, when by letter to the presiding Bishop he resigned his office and withdrew from the denomination. He became the Bishop of the new organization; the Rev. Charles Edward Cheney of Chicago was also elected bishop, and consecrated on a subsequent day. The following statement, condensed from the declaration of principles adopted at the organization, explains in the briefest form possible the doctrines held: I. The Reformed Episcopal Church declares its belief in the Holy Scriptures of the Old and New Testaments as the word of God and the sole rule of faith and practice; in the Apostles' Creed; in the divine institution of the sacraments of baptism and the Lord's Supper; and in the doctrines of grace substantially as they are set forth in the 39 articles of religion. II. It recognizes and adheres to episcopacy, not as of divine right, but as a very ancient and desirable form of Church polity. III. Retaining a liturgy, not imperative or repressive of freedom in prayer, it accepts the Book of Common Prayer as it was revised, proposed, and recommended for use by the General Convention of the Protestant Episcopal Church (1785); reserving the right to make alterations in it, provided that the substance of faith be kept entire. IV. It condemns and rejects the following doctrines as contrary to the word of God: (1) That the Church of Christ exists only in one form of ecclesiastical polity. (2) That Christian ministers are 'priests' in another sense than that in which all believers 'are a royal priesthood.' (3) That the Lord's table is an altar on which an oblation of the body and blood of Christ is offered anew to the Father. (4) That the presence of Christ in the Lord's Supper is a presence in the elements of bread and wine. (5) That regeneration is inseparably connected with baptism.

At the sixteenth General Council, Baltimore, 1900, there were reported as belonging to the denomination in the United States and Canada: 7 bishops, 81 presbyters, 13 deacons, 94 parishes, 10,002 communicants, of whom 428 were added by confirmation, and 191 were otherwise received during the past three years, 876 Sunday school

teachers, and 10,106 scholars; total offerings of three years preceding, \$172,418; value of church and parish buildings and rectories, \$1,609,930. The Reformed Episcopal Church in England at the same date had 1 bishop, 24 presbyters, 1 deacon, and 3 lay readers, 21 parishes, with 1500 communicants, 2580 Sunday school scholars, and 256 teachers. The denomination is strongest in Philadelphia and Chicago, and has 11 parishes in Canada and British Columbia. It has a well-equipped theological seminary in Philadelphia, with a faculty of 5 professors, and a preparatory department; maintains 2 denominational papers, and supports a Woman's Foreign Missionary Society, with two effective stations in India. The trustees of its sustentation fund hold endowments of over \$125,000.

REFORMED MENNONITES, THE. See MENNONITES.

REFORMED PRESBYTERIANS. See CAMERONIANS; PRESBYTERIANISM.

REFRACTION (ML. *refractio*, breaking up, refraction, from Lat. *refringere*, to break up, from *re-*, back again, anew + *frangere*, to break). A phenomenon, like reflection, common to all kinds of wave-motion. If there are two media separated by a bounding surface in which the trains of waves of the particular kind travel with different velocity, a train of waves in one medium will, on reaching the bounding surface, produce similar waves in the other medium; these are called refracted waves, because in general each ray of the incident waves has its direction changed or broken at the surface. (See LIGHT.) Snell's laws for refraction are that the angles α_1 and α_2 made by the incident and refracted rays with a perpendicular to the refracting surface at the point of incidence are

connected by the relation: $\frac{\sin \alpha_1}{\sin \alpha_2} = n$, a constant

for the two media if the waves have a constant wave-number, and that the two rays and the perpendicular to the surface are in one plane. It is easily seen that the index of refraction is the ratio of the velocities of the waves in the two media, V_1 and V_2 ; viz., $\frac{\sin \alpha_1}{\sin \alpha_2} = \frac{V_1}{V_2}$.

Therefore this ratio, which is called the 'index of refraction,' is different for different media; and for any one case it varies with the wave-number if there is dispersion (q.v.). Refraction is illustrated in aerial waves by the effect on them of heated columns of air; and in the case of ether-waves by the action of prisms, etc. Certain crystals and strained isotropic bodies exhibit 'double refraction,' that is, if a ray of light falls upon them there are two refracted rays. See LIGHT.

REFRACTION, ASTRONOMICAL. The effect of refraction in the appearance of the heavenly bodies is to make them appear higher in the sky. Thus refraction increases the altitude, but it does not alter the azimuth. In the figure S is the true position of the star, and S' the apparent. The refraction is greatest at the horizon, where it is about 37'. This is evident since the angle of incidence is here the greatest. From the horizon to the zenith the refraction constantly decreases, very rapidly near the horizon and more slowly at greater elevations. It varies approxi-

mately as the tangent of the zenith distance down to a zenith distance of about 70° , and is entirely independent of the distance.

The effect of refraction upon the rising and setting of the heavenly bodies is to make them appear to rise earlier and set later than they would if there were no atmosphere. The horizontal refraction varies from $35'$ to $39'$.

Therefore when we see the sun's lower limb rising the whole disk is really below the horizon. In this way the refraction accelerates the sunrise in our latitudes from 2 to 4 minutes. At sunset the sun is delayed an equal amount. Thus the total effect of refraction is to increase the length of the day at the expense of the night from 4 to 8 minutes, according to the inclination of the sun's diurnal circle to the horizon.

Refraction also explains the elliptic appearance of the sun's and moon's disks when near the horizon. Owing to the rapid increase in the amount of refraction near the horizon, the lower limb appears more elevated than the upper, thus shortening the vertical diameter.

Another effect of refraction when the air is much disturbed is to make the stars 'dance,' especially when seen through a large telescope with high power. This is due to the constant displacement of the image by the varying refraction.

REFRIGERANTS (from Lat. *refrigerans*, pres. part. of *refrigerare*, to cool again, from *re-*, back again, anew + *frigerare*, to cool, from *frigus*, Gk. *ψῑγος*, *rhigos*, cold). A name given to a class of medicines which reduce the temperature of fevers, allay thirst, and cause a feeling of coolness and refreshment throughout the system. They lessen the force of the circulation by quieting the over-excited heart, and excite perspiration and an increased urinary flow. Most of these remedies belong to the class of the vegetable acids and their salts, but aconite and similar drugs, which act primarily on the circulation, may also be considered refrigerants. The vegetable acids used are tartaric, citric, acetic, and oxalic. Citric acid is most useful in the form of lemonade or orange juice; acetic acid in the form of vinegar. Oxalic acid is a dangerous drug and is only given in very dilute solutions and in very small doses. The *diaphoretic* refrigerants (those which excite perspiration) are aconite, veratrum viride, and potassium citrate. The latter is a favorite ingredient of fever mixtures. The *diuretic* refrigerants (those which stimulate the urinary flow) are the bicarbonate, citrate, acetate, bitartrate (cream of tartar), sulphate, chlorate, and nitrate of potassium. The latter is active particularly in the form of the ethereal spirits popularly known as 'sweet spirits of nitre.'

REFRIGERATING MACHINES. See REFRIGERATION.

REFRIGERATION (Lat. *refrigeratio*, from *refrigerare*, to cool again). The art of producing cold by artificial means. It has been practiced since very ancient times, but it is only in com-

paratively recent times that improved systems and apparatus have enabled such operations to be conducted profitably and on a commercial scale. Mechanical refrigeration is now employed in the manufacture of artificial ice; for the freezing and chilling of freshly killed meat in slaughter houses; for the cooling of stores for meat, fish, fowl, fruits, vegetables, and other perishable provisions; for cooling the atmosphere of dwellings and hospitals; for certain engineering operations; and for a variety of manufacturing processes. The number and variety of refrigerating devices available for these purposes are very great, but they all belong to one or the other of the following five classes: (1) Devices in which the more or less rapid liquefaction of a solid is utilized to abstract heat; (2) devices by which the abstraction of heat is effected by the evaporation of a portion of the liquid to be cooled; (3) devices in which the abstraction of heat is effected by the evaporation of a separate refrigerating agent of a more or less volatile nature, which agent is subsequently returned to its original condition by mechanical compression and cooling; (4) devices by which the abstraction of heat is effected by the evaporation of a separate refrigerating agent of more or less volatile nature under the direct action of heat, which agent again enters into solution with a liquid; (5) devices in which air or other gas is first compressed, then cooled, and afterwards permitted to expand while doing work. These five processes of refrigeration are termed, respectively, the liquefaction process, the vacuum process, the compression process, the absorption process, and the cold-air process.

LIQUEFACTION PROCESS. Liquefaction is one of the most ancient methods employed for artificial cooling. The reduction of the temperature of water by the melting of saltpetre is said to have been known in India at a very remote period. The Romans are said to have cooled wine by immersing the bottle containing it in a second vessel filled with cold water, into which saltpetre was gradually thrown, while at the same time the bottle was rapidly rotated. Freezing water by the use of a mixture of snow or powdered ice and saltpetre was mentioned by Latinus Tancredus in 1607, and wine by means of snow and common salt by Santorio in 1626. The best among the many forms of apparatus for making ice on this principle are probably those of Toselli and Siemens. In Toselli's machine the frigorific agent employed is a mixture of ammonium nitrate and water, which produces a reduction of temperature of about 40° F. The apparatus consists of a vessel in which the solution of the ammonium nitrate is effected, and of a can wherein are placed a number of circular molds of different sizes. These molds previously filled with water are inserted in the freezing mixture and a thin film of ice is formed round their edges; these tapered tubes of ice are then withdrawn from the molds and placed one inside the other, thus forming a small stick of ice. In Siemens's apparatus the frigorific agent is calcium chloride, whose dissolution in water produces a reduction of temperature of only 30° F., and to admit of this reduction being sufficient to produce ice with water at an initial temperature of 65° F., a heat interchanger is provided in which the spent liquor, which is at a temperature of about 30° F., is employed to cool the water

before it is mixed with the salt. The Siemens apparatus has been used in making artificial ice with much success, but, being less economical than more modern ice-machines, has never come into general use. When these devices or others of the same type are used for cooling purposes brine is cooled in them and then circulated in the usual manner through a system of circulating pipes. The general law governing the production of cold by frigerific mixtures is that during the liquefaction of a solid a certain amount of heat not indicated by or sensible to the thermometer is absorbed, which heat is abstracted from any surrounding bodies. The absorption of heat from the surrounding bodies is the greater the more rapidly the solid is liquefied.

VACUUM PROCESS. The cooling of liquids on this principle depends upon the conversion of the sensible heat into latent heat (see HEAT) during evaporation, and has been practiced in all ages. A primitive example of this process in its crudest form is the practice in India and other warm countries of placing earthen vessels of water in a natural or artificial draught so that the liquid may be cooled by surface evaporation. The first machine for the production of ice by the vacuum process appears to have been invented in 1755 by Dr. Cullen, who in that year made the discovery that the evaporation of water could be facilitated by the removal of the atmospheric pressure by means of an air pump, to such a degree as to enable him to freeze water even in summer. This apparatus was the parent of all those subsequently designed, but seems not to have been a commercial success. In 1777 Nairne found that by the introduction of sulphuric acid into the receiver for the exhaust the aqueous vapor could be absorbed from the rarefied air and the latter dried, thus preventing the formation of a permanent atmosphere over the water and hindering the continuity of the evaporation. Nairne was followed by other inventors, but it was not until the second quarter of the nineteenth century that Edmund Carré invented a commercially successful machine adapted to produce the *carafes frappes* commonly used in Parisian cafés and restaurants. This machine consisted of a cylindrical vessel intended to contain the charge of concentrated sulphuric acid, of an air pump so arranged that it could be connected to the mouth of the carafe, and of an agitator coupled to the air-pump lever for the purpose of keeping the sulphuric acid in motion. The Carré machine proved most successful for its purpose, and improved forms of the device are still manufactured, the largest of which are capable of producing 80 pounds of ice per day. In 1878 Franz Windhausen patented a vacuum machine, an improved form of which was installed in 1881 at the Aylesbury Dairy, London, England. This machine was nominally capable of producing from 12 to 15 tons of ice per 24 hours. The ice-forming vessels in this machine were six in number, circular in transverse section and slightly tapered. The mouths of these vessels were connected with the sulphuric-acid chamber and the vacuum pump, and water was admitted to them in fine streams, which offered extended surfaces for evaporation and almost instantly congealed into ice globules which fell to the bottoms of the molds and there froze together. To facilitate the release of the ice from the molds, they were surrounded with hollow

jackets into which steam could be forced until the ice was melted loose. Various other forms of vacuum machines have been devised, but the two described are typical examples and explain the process sufficiently. Like the liquefaction process, the vacuum process cannot compete in economy with the more strictly mechanical processes, and vacuum machines are now used only for domestic ice-making and similar small installations.

COMPRESSION PROCESS. The system of absorbing heat and thus producing cold partly by vaporization and subsequent liquefaction, and partly by compression and cooling, is in accordance with the well-known law of physics that all substances during the process of passing from a liquid to a gaseous state are bound to absorb a certain amount of heat, and while returning from a gaseous to a liquid state to give up or throw off the same amount of heat. Whatever the refrigerating or heat-absorbing agent that may be used, the following cycle of operations is obligatory in all machines working upon this principle: (1) Compression, that is the refrigerating agent in gaseous form is subjected to a pressure sufficient to reduce it to a liquid form, this pressure varying with the nature of the agent and the temperature of the condensing water. During this compression a degree of heat is developed in accordance with the amount of pressure to which the gas is subjected or to the volume to which it has to be reduced relatively to that of the gas in order to produce liquefaction. (2) Condensation, during which process the heat developed during the compression of the gas is carried away by forcing the latter through water-cooled pipes, the heat being transferred to the cooling water. At this point the gas is ready to assume the liquid form, in doing which an additional amount of heat is given off to the water. (3) Expansion, during which the liquefied gas is admitted to series of coils of pipe, and being suddenly relieved of pressure, instantly flushes or expands into gaseous form, in doing which, according to the above mentioned law of physics, it is forced to take a quantity of heat which it

FIG. 1. DIAGRAM ILLUSTRATING THE OPERATION OF A REFRIGERATING MACHINE ON THE COMPRESSION PRINCIPLE.

draws from the surrounding objects, first, of course, the pipes wherein it is confined, and second, such substances as may be in contact with the pipes and which it is desired to cool, as air, water, and brine. The amount of heat thus abstracted or absorbed is equal to that previously given up to the cooling water in the condenser. This cycle of compression, condensation, and expansion having been completed, the refrigerating agent is in its first state again and is ready for another cycle. The three operations described being essential, all machines operating according

cylinder, and the cycle of operations just described is again performed. Following now the course of the sealing and cooling oil, which, as previously mentioned, is heated with the gas during compression, this oil is passed from the compression cylinder mingled with ammonia gas into the pressure tank, where most of it separates from the gas and falls to the tank bottom. The heated oil is then conducted through a pipe to the lowermost pipe of the oil cooler, which is similar in construction and operation to the ammonia condenser. After being sufficiently reduced in temperature in the oil cooler the oil flows through the strainer into the oil pump, which is so constructed that it delivers the cooled oil into the compression cylinder, distributing it to either side of the piston or plunger during its compression stroke when it is being compressed and heated. From the compression cylinder the oil proceeds again through the cycle just described. Most of the oil separates from the ammonia gas in the tank, but any small amount that passes on is taken out when it reaches the separating tank. The three salient parts of the apparatus described are the compressor, the condenser, and the expansion coil.

There are numerous compressors of other makes, all of which differ structurally from the De La Vergne and from each other. Condensers

as will give a large amount of radiating surface. Their arrangement depends upon the purpose for which refrigeration is to be employed, whether for cold storage or ice-making or other purposes. Systems of refrigeration which use other refrigerating agents than ammonia differ from the ammonia system chiefly in the character and construction of the compressor. They all have the same cycle of operations—namely, compression, condensation, and expansion—which is constantly repeated. The advantages and disadvantages of ammonia and of the other cooling agents used in refrigeration by the compression system may be briefly summarized as follows: The chief advantages of anhydrous ammonia (see AMMONIA) are its possession of greater heat-absorbing power than that of any of the others, that it liquefies at a comparatively low temperature, and that it is not as explosive nor as inflammable as ether. The advantage of ether as a refrigerating agent is that it liquefies at low pressure and comparatively high temperature, which adapts it for hot climates. Its disadvantages are that an ether compressor is about seventeen times as large as an ammonia compressor of the same capacity, and that ether is a highly inflammable and explosive gas when mixed with air. The advantage of sulphuric acid or sulphur dioxide is that it liquefies at a low pressure—not so low as ether, but considerably lower than ammonia. Its chief disadvantage is that it is liable to form sulphuric acid on exposure to air, which acid rapidly destroys iron. Carbon dioxide has the advantages of being non-inflammable and having a high specific gravity, which renders its heat of vaporization for a given volume much higher than that of ammonia; it also has no corrosive action on copper. Its disadvantages are the high pressure required to liquefy it and its fatality to animal life when present in air in any quantity.

ABSORPTION PROCESS. The absorption process of refrigeration was invented by Ferdinand Carré about the year 1850. It is founded upon the fact of the great capacity possessed by water for absorbing a number of vapors having no boiling points, and of their being readily separable therefrom again by heating the combined liquid, hence it is commonly known as the absorption process. The process involves the continuous distillation of ammoniacal liquor and requires the use of three distinct sets of apparatus: (1) A set for distilling, condensing, and liquefying the ammonia; (2) a set for producing cold by means of a refrigerator and absorber, a condenser, a concentrator, and a rectifier; and (3) a pumping plant for forcing the liquor from the condenser into the generator for redistillation. The three operations are each distinct from the other, but when the plant is actually working they must be continuous and are dependent upon one another, forming separate stages of a closed cycle of operations. An advantage of the absorption process is that the bulk of the heat required for performing the work is applied direct without being transformed into mechanical power. The first machines constructed on this principle were, however, very imperfect in operation, by reason of the impossibility of securing an anhydrous product of distillation. This was owing to the distillation, which is the most important operation and has of necessity to be executed in a rapid manner, being, in the first machines, very imperfectly

FIG. 3. DIAGRAM SECTION OF CONDENSER FOR LIQUEFYING AMMONIA GAS IN COMPRESSION SYSTEM.

are of two general types, surface condensers and submerged condensers. In submerged condensers the pipe coils are submerged in the cooling water, and Fig. 3 shows a vertical section of such a construction. In surface condensers the cooling water is simply allowed to trickle from above onto the pipe coils, whence it falls into a basin and is conducted away. The condensers shown in Fig. 2 are of the surface type. Expansion coils are simply coils of pipe of such section

effected, and the liquor resulting therefrom being naturally much diluted with water. Another serious result of the above defect was the accumulation of weak liquor in the refrigerator and the consequent necessity for constant additions of ammonia. By subsequent improvements, however, made by Reece in 1867-70, by Mort in 1870, by Stanley in 1875, and by F. Carré in 1876, by Beck in 1886, and by Mackay and Christiansen, Tomkins, and Pontifax in 1887, the distillate has been rendered nearly anhydrous and the absorption machines have been brought to a very considerable degree of efficiency. The number of absorption machines which have been invented is large, and they can be described in detail only in special

but the same general process is followed by all machines.

COLD-AIR PROCESS. The cold-air process of refrigeration is based on the principle that the compression of air or other gas generates heat and the subsequent expansion thereof generates cold, and cold-air machines operate by first compressing air in a cylinder, passing it under pressure through cooler, and finally allowing it to expand again in an expansion cylinder. The advantage of cold-air machines are that no chemicals of any description are required, that very low temperatures can be obtained rapidly by their use, that their construction is comparatively simple and their application is easy, and that the en-

FIG. 4. DIAGRAM SECTION OF REFRIGERATING PLANT IN AMMONIA ABSORPTION SYSTEM.

treatises. For a general explanation of the absorption process the installation shown by Fig. 4 has been selected. Following first the course of the ammonia gas, we start with the generator and analyzer, which are filled with aqua-ammonia. This liquor is treated by the steam coil in the generator and the ammonia evaporates, the gas passing through the pipe A to the condenser, which is a cylindrical vessel containing a coil of pipe and filled with water. The upper coils of the condenser pipe are provided with drips, *a a*, in which the water vapor which is mingled with the ammonia gas is condensed and led back to the generator by the pipe B. The ammonia gas is cooled while passing down the condenser coil and finally liquefies at the bottom and runs through the pipe C into the receiver. From the receiver the liquid ammonia is led into the cooler, where it changes into gas and abstracts heat from the coil of brine pipe. The gas then passes to the absorber, where it meets the weak ammonia solution from the generator and is reabsorbed. The liquor is then pumped from the absorber back into the generator, where it is again heated. When the liquor in the generator is released of its ammonia it passes by the pipe D into the heater, and thence by the pipe E into the absorber, where it meets the ammonia gas from the cooler and reabsorbs it. The cooling or refrigerating is done by the brine which circulates through the cooler. The foregoing description applies in detail only to one make of machine,

the machine is situated externally to the chamber or store being cooled and is consequently accessible at all times. The invention of the cold-air machine is ascribed to Gorrie, who is said to have designed the first machine of this class in 1849, and improvements were made by Alexander Kirk in 1863, by Giffard in 1873, and by Windhausen, Bell-Coleman, and several others. By these successive improvements the trouble from moisture and freezing had with the early machines been largely overcome, and the present cold-air machine is a valuable and efficient device, particularly for small installations.

The purposes to which mechanical refrigeration is applied are, as already stated, numerous. It is possible to group them, however, under a few general heads, and for the present occasion the following heads are selected: Cold storage, ice-making, marine refrigeration, and manufacturing.

COLD STORAGE. Cold storage includes practically all applications of refrigeration to the preservation of foodstuffs. A cold-storage plant comprises a refrigerating plant of one of the forms previously described and a store which is kept cold by the refrigerating plant and in which all the provisions to be preserved are placed. Cold stores vary in size from the single-room store used by the hotels, larger residences, butcher shops, etc., to large buildings containing numerous rooms for the storage of all kinds of provisions.

The size of the refrigerating plant varies, of course, with the size of the store which it has to keep cold. The refrigerating processes most used for cooling stores are the cold-air, the compression, and the absorption processes. When the cold-air process is employed the air is as a rule admitted to the store, and after it has done its duty is conducted back to the compressor for recompression. When compression or absorption systems are used the refrigeration is effected in one of three ways: (1) By cooling a non-congealable brine and then pumping it through a system of pipes in the store; (2) by causing a current of air generated by means of a fan or otherwise to impinge against surfaces reduced to a low temperature by the expansion of the refrigerating agent itself; (3) by expanding the gas direct through pipes placed in the chambers. The agent employed in the *brine circulating system* consists of a solution of chloride of sodium (common salt), chloride of calcium, or chloride of magnesium, or any other suitable solution capable of standing very low temperatures without congealing. To extract the heat from the brine the method most commonly employed consists in passing it through a tank fitted with suitable coils of pipes through which the chilled liquefied ether, carbonic acid, ammonia, or other agent expands and forms gas. The cooled brine from this tank is then pumped through a system of circulating pipes in the refrigerating chamber. In the *direct expansion system* the pipes in which the ether, carbonic acid, or ammonia expands and makes gas are located directly in the refrigerating chamber. In the *cold-air blast system*, the expansion coils are placed in a separate chamber and the cold air from that chamber is blown by fans into the refrigerating chamber, sometimes being washed by passing through a shower of cold brine and then dried by passing through a mass of calcium chloride or other hygroscopic material.

The construction of refrigerating chambers varies with their purpose and the arrangement of piping adopted, but they are always tightly closed rooms with thick walls carefully insulated to prevent escape of cold and entrance of heat. Speaking generally, cold-storage rooms or chambers are maintained at a temperature of about 34° F., chilling rooms at about 30° F., and freezing rooms at anything from 0° F. to 10° F. The proper methods of storing and the temperatures for the cold storage of various articles, as meats, fish, butter, cheese, milk, eggs, fruits, and vegetables, are intricate problems, which different authorities solve in different ways; their full discussion can be attempted only in special treatises.

MARINE REFRIGERATION. Marine refrigeration embraces generally the operation of cold stores and ice-making plants on shipboard. These are merely modifications of the plants used on land to adapt them to the special conditions which prevail on shipboard. These conditions are chiefly limited space and the necessity of using a refrigerating agent which is not deleterious to persons or property. To meet the last condition, cold-air and carbonic-acid machines offer advantages which have caused them to be very largely adopted. Fig. 4 shows a carbonic-acid compression machine designed for use on shipboard. The main point to be noted is the compactness of the arrangement. Fig. 5 is a plan of a cold-storage room on a large passenger steamer. The following

is a description of the refrigerating rooms on the steamers *Campania* and *Lucania* which are fitted to carry cargoes of meat: The cargo holds of the steamships *Campania* and *Lucania* are refrigerated with machines of the Kilbourn type. The meat-carrying chambers in each of these vessels

FIG. 4. MARINE TYPE OF CARBONIC-ACID COMPRESSION REFRIGERATING MACHINE.

consist of three chambers situated forward on the orlop or lower deck, and having a total capacity of 20,000 cubic feet, which renders them able to carry 2700 quarters of beef. The chambers are very carefully insulated, the walls consisting, first, of a double thickness of tongued and grooved boards having a layer of waterproof paper between them; next, a two-inch

FIG. 5. ARRANGEMENT OF REFRIGERATING PLANT ON LARGE PASSENGER STEAMER.

layer of good quality hair felt and another double thickness of tongued and grooved boards, with a similar layer of paper between them; and finally an inch air space, between the latter and the inner or iron deck, the whole being well varnished. The brine-cooling pipes, which are of heavy two-inch galvanized tube with malleable cast return bends, are placed on the ceiling between the deck-beams, thus economizing head room, and the rails for the meat-hooks are 1½-inch galvanized round iron, firmly clipped to the beams supporting the decks. The meat-hooks which are placed upon the latter, for carrying the quarters of beef, are of steel galvanized. Thermometer tubes from the upper deck are provided to each chamber, so that the temperature may be ascertained in any part of the chamber when desired.

ICE-MAKING. One of the most important applications of refrigeration is the manufacture of artificial ice. There are several methods of ice

manufacture practiced commercially, and each of these will be briefly described, and, afterwards, a more detailed description will be presented of one of the most popular ammonia compression can systems employed in America. The great difficulty in manufacturing artificial ice is that of producing a clear, transparent material, for, unless special provisions are made to get rid of it, the air in the water fails to escape, because of the rapid freezing, and an opaque ice containing air bubbles and of inferior keeping qualities is produced. Five methods may be employed for preventing this opacity and forming clear crystal ice: (1) Freezing the water slowly at comparatively high temperatures; (2) agitating the water in cans, molds, or cases during the process of freezing so as to admit of the escape of the imprisoned air; (3) forming thin slabs of ice on what is known as the wall or plate system; (4) freezing the water in shallow stationary cells; and (5) de-aërating the water before placing it in the molds or cells. Freezing the water slowly at comparatively high temperatures is simply an imitation of the natural process, the water being exposed in well-insulated rooms to an atmosphere cooled below freezing point. The process is too slow to be successful commercially. In the can system, which is one of the most popular, metal cans are set in a tank containing chilled brine and these cans are filled with the water to be frozen. Extending down into these cans is a bar or rod of wood which is given a swinging motion by suitable mechanism,

boiling, or frozen in a vacuum, or distilled. The vacuum system is but little used. In the other systems the evaporated or distilled water is frozen either by the can system or plate system.

Turning now to a specific example of ice-making, Fig. 6 shows a plant for making ice on the ammonia compressor can system: The ammonia compressor plant has already been described in a preceding section and will be neglected here. To follow now the water from the well to the loading platform, where it is delivered as ice, we begin with the well-water pump in the boiler house. Water from this pump splits into two currents, one of which rises to the top of the building, and discharges into the water-storage tank. This water, as shown by the pipes leading from the tank, flows over the gas and oil cooler and also over the ammonia condenser. From the pans, or cemented floor, on which these stand it flows

FIG. 6. SECTIONAL DIAGRAM OF ARTIFICIAL ICE-MAKING PLANT; DE LA VERGNE SYSTEM.

thus agitating the water, and facilitating the escape of the contained air. In the plate or wall system the water to be frozen is placed in a large refrigerator tank which is divided into compartments by a series of parallel hollow partitions. In these hollow partitions brine is circulated, causing a sheet or plate of ice to freeze to both sides of each. When these ice plates have frozen to a thickness of 8 to 12 inches, the cold brine is drained from the partitions and replaced by warm brine, which causes the plates to melt loose, after which they are lifted from the tanks and sawed into blocks. The standard size of plate in the United States is 8 × 16 feet × 11 inches. As in the can system, agitators are employed to expel the air from the water during freezing. In the stationary cell system a tank, as in the plate system, is divided by both transverse and longitudinal hollow partitions, so that the ice is frozen in rectangular blocks instead of in long flat plates. The methods of freezing and freeing the ice and of agitating the water are the same as in the plate system. In the de-aërating system the water to be frozen is either evaporated by

to the floor below, where it enters the steam condenser. After traversing the condenser it passes through the next floor, runs along the ceiling, and empties into the vertical standpipe (seen to the extreme left) connecting with the sewer. Water from the water storage also flows by a pipe (hidden by the ammonia condenser) to the condensed-water cooler, from the base of which it passes through the floor, runs along the ceiling of the first floor, and empties into the sewer standpipe. This disposes of one current from the well-water pump; the other passes through the sand filter, whence it rises to the third floor and passes through the heater. From this heater it again descends to the feed-water collector in the boiler house, whence it is drawn off by the boiler-feed pump, and by it sent into the boilers. It leaves the boilers in the form of live steam. The pipe conveying this live steam has branches supplying the engine, the well-water pump, the boiler-feed pump, and is continued along the ceiling of the first floor, rising to the third floor, where it is connected with the reboiler and also the steam filter. The purpose of its connection with the

reboiler is apparent; the connection with the steam filter is utilized to automatically supply a small quantity of live steam to make up for any deficiency in exhaust steam. Other connections of the live-steam pipe to the various apparatus are shown, which are used for cleaning out. The exhaust steam from the engine, and also for the two water pumps, passes beneath the first floor and rises through the boiler-room and outside the main building to the third floor. Before it enters this it has a chance to escape through the pressure release valve if for any reason the various apparatus through which it passes should cause sufficient back pressure to impair the proper working of the engine. The exhaust steam passes first into the steam filter, thence into the heater, where it heats the water which as we have already seen passes through this same heater on its way to the boiler. From the heater it passes to the condenser, thence to the reboiler. From this it goes through the condensed-water cooler to the deodorizer on its way to the cold-storage tank. From the cold-storage tank water is fed by a hose in any can whose place may be rendered vacant by the withdrawal of a can of ice. There we must leave the now thoroughly purified and distilled water in repose for some sixty hours. After this interval of time the can is lifted by the ice crane suspended from the carriage on which it is run down the tank-room to the sprinkler. In the sprinkler the can receives a shower bath of warm water and the ice when loosened drops out of itself and glides into the ice-storage room, the sprinkler in the meantime automatically putting itself into position to receive another can, thereby shutting off the supply of warm water. The cake of transparent ice is allowed to remain in the ice-storage room until the time for the wagons to appear at the loading-platform approaches, when it and as many of its fellow blocks as are required are withdrawn into the anteroom. A block of ice may pass straight through the ice-storage room and the anteroom to the loading platform, or it may remain a week or two in the storage. This ice-storage room is seen to be supplied with refrigerating pipes, so that if the demand is fluctuating the blocks will be preserved intact, only so much being withdrawn into the anteroom as is necessary for immediate use. The following table shows the structural sizes and weights of blocks made by the can system:

WEIGHT OF BLOCKS	Size of can, inches	Time of freezing
50 pounds.....	6 X 12 X 26	20 hours
100 "	8 X 16 X 32	36 "
150 "	8 X 16 X 42	36 "
200 "	11 X 22 X 32	60 "
300 "	11 X 22 X 44	60 "
400 "	11 X 22 X 57	60 "

The time of freezing is with 18° F. brine.

MANUFACTURING. In general it may be said that refrigeration is applied to all processes of manufacturing where it is desirable or necessary to have at some period a temperature below the normal atmospheric temperature. Some of these processes are brewing, chocolate-making, dynamite manufacture, india-rubber manufacture, sugar-making, and chemical-making. The method of application varies with the process, but it is in general simply a modification of refrigerating processes as applied to cold storage and ice-mak-

ing. There are numerous books on refrigeration, but the general reader will find the subject amply treated in Wallis-Taylor's *Refrigeration, Cold Storage, and Ice-Making* (New York, 1903). See LIQUEFACTION OF GASES.

REFRIGERATION OF THE EARTH.

That the earth is radiating more heat into space than it receives is evidenced by the fact that the temperature rises as the crust of the earth is penetrated. The flow of heat is always from a higher to a lower temperature, and consequently there is a constant conduction of heat from the interior to the surface of the earth, and a loss into space. The rate of flow of heat is dependent upon the conductivity of the material and the rate of rise in temperature. A substance is said to have the unit of heat conductivity when it will conduct the unit of heat the unit of distance in the unit of time through the unit cross-section, the temperature rising one degree for the unit length. In the present system unit conductivity corresponds to the transfer of enough heat to raise one pound of water one degree Fahrenheit in one second through a bar of one square foot cross-section when the temperature falls one degree for one foot in the direction of flow. Determinations of the increase in temperature as the earth's crust is penetrated show that there is a marked variation from one locality to another, this variation depending upon the character of the rocks penetrated, the amount of disturbance they have undergone, and other local conditions. In the well at Wheeling, W. Va., which has a depth of 4,500 feet, the rise in temperature has been found to be 1° F. for each 75 feet of descent; in the well at Sperenberg, Prussia (depth 4,170 feet), the increase is 1° for 59 feet; and in the Schladabach well, near Leipzig (depth 5,740 feet), the increase is 1° for 65 feet. At other localities the rate varies from 15 to 200 feet for 1° F.

Various causes have been suggested for this interior heat of the earth, but considering all the related astronomical and physical considerations it is most probable that it is a remnant of the original nebular heat which has not yet been dissipated, and which has been prolonged by the results of the condensation from the nebulous state. Under the phrase 'age of the earth' is usually understood the time since the earth became practically solid and the present method of cooling by conduction commenced. From data as to the conductivity of the rock materials and the rise in temperature it is possible to make certain estimates as to the age of the earth, and the latest and perhaps best is that by King, who, after an exhaustive discussion, concludes that it is about twenty-four million years and that the temperature at the time when convection ceased was about 2000° C. (3600° F.). The amount of heat reaching the earth's surface from the interior in a year is sufficient to melt a layer of ice about one and a quarter inches thick, that is about one-thousandth of the amount reaching the earth from the sun. Consult article by King, in *American Journal of Science* (New Haven, 1893).

REFUGE, CITY OF. See CITY OF REFUGE.

REFUNDERS. See READJUSTERS.

REFUNDING (from *refund*, OF., Fr., *refondre*, to restore, pay back, remodel, from Lat. *re-*

fundere, to pour back, restore, from *re-*, back, again, anew + *fundere*, to pour). A financial operation by which a government or corporation changes the terms of an existing debt. In public finance the term is used synonymously with conversion. A government may refund its debts to secure better terms either with respect to rate of interest or with respect to time of payment of principal. Public debts are usually created at a time when public credit is low; accordingly a high rate of interest must be offered to tempt investors. With the restoration of credit, it becomes possible for the government to borrow money at a lower rate of interest; and if the terms of its original debt permit, it is good financial policy to pay off that debt with money borrowed at the lower rate. In practice, the holders of the old obligations usually exchange them for the new, so that a refunding operation changes neither the principal of the debt nor the creditors to whom it is due; although technically a new debt has taken the place of the old one.

Quite apart from improvements in public credit, the rate of interest at which a government can borrow money tends constantly to decline, owing to the general fall in the rate of interest. Most modern governments are burdened with a more or less permanent debt; accordingly their recent history shows a series of refunding operations, resulting in a steady decline of interest on public debentures. The policy of refunding of debts, while justly popular, naturally meets with the hostility of public creditors, who have at times been powerful enough to influence the action of the government, as in France, 1878-1883, when the government could have replaced obligations bearing interest at over six per cent. by obligations bearing interest at less than four. The public obligations were largely in the hands of small holders, whose political influence deterred the ministry from undertaking the operation.

Refunding can take place advantageously only when government debentures are above par on the market. It is therefore bad policy for a government in need of funds to sell low-interest bonds below par, since such a policy prevents it from taking advantage of a fall in the rate of interest. See DEBT, PUBLIC; FINANCE; Subhead FINANCE under the articles UNITED STATES, GREAT BRITAIN, GERMANY, etc.

REFUSE DISPOSAL. See GARBAGE AND REFUSE DISPOSAL.

REGAL (OF., Oit. *regale*, Fr. *régale*, from Lat. *regalis*, regal, from *rex*, king). A small portable finger-organ in use in the sixteenth and seventeenth centuries, and perhaps earlier. The pipes rested on the air-chest, which was filled by the bellows; the bellows were managed with one hand, and the keys with the other. The musical collection of Henry VIII. contained 13 regals. The name continued in use as late as 1770.

REGALBUTO, rā'gāl-bōō'tō. A town in Sicily, 26 miles west-northwest of Catania (Map: Italy, J 10). Salt and sulphur are mined, and there is a trade in cereals and wine. Population (commune), in 1901, 11,038.

REGALDI, rā'gāl'dē, GIUSEPPE (1809-83). An Italian poet, born at Novara. He studied law at Turin, but upon hearing Giustiniani, resolved to become like him, an *improvisatore*, and, from 1833 until 1836, traveled much

in that capacity, and with considerable success. His political opinions, expressed with fire and frankness, involved him in difficulties with the authorities of various Italian towns, and for a time he traveled in the East and in Greece. At the time of his death he was professor of history at the University of Bologna. His works include *La guerra* (1832), *Poesie estemporanee e pensate* (1839), *Canti* (1840), *Canti nazionali* (1841), *Canti e prose* (1861-65), and *Storia e letteratura* (1879), essays. Consult Orlando, *Giuseppe Regaldi* (1880).

REGALIA (ML., royal prerogatives), or REGALE, RIGHT OF. A right in ecclesiastical things, claimed by sovereigns in virtue of the royal prerogative, which has frequently been the subject of controversy between kings and popes. It involved several points as to presentation to benefices, most of which formed the object from time to time of negotiation by concordat; but the most serious conflict arose out of the claim made by the Crown to the revenues of vacant benefices, especially bishoprics, and the coordinate claim to keep the benefice or the see vacant for an indefinite period, in order to appropriate its revenue. (For the general history of the controversy, see INVESTITURE.) The specific term *Droit de régale*, however, recalls mainly the conflict in France between Louis XIV. and certain French bishops, notably those of Alet and Pamiers, who were supported by the Pope, Innocent XI. For a detailed history of this particular strife, consult: Phillips, *Das Regalienrecht in Frankreich* (Halle, 1873), Gérin, *Recherches historiques sur l'assemblée du clergé de France de 1682* (Paris, 1870).

REGARD'ANT (OF., looking). A term used in heraldry (q.v.) with reference to an animal whose head is turned backward.

REGEL, rā'gel, EDUARD VON (1815-92). A German-Russian botanist, born in Gotha, where he received his horticultural training. He was then employed in the botanical gardens of Bonn, Berlin, and Göttingen. In 1842 he became director of the botanical gardens in Zurich, and lecturer at the university there. In 1855 he was made director of the Imperial gardens in Saint Petersburg. He did much to promote culture of fruit in Russia. His numerous printed works on botany include *Flora Bonnensis* (1841), *Allgemeines Gartenbuch* (1855-58), *Descriptiones Plantarum Novarum in Regionibus Turkestanicis Collectarum* (1873-82), and *Aliorum Adhuc Cognitorum Monographia* (1877).

REGELATION (Lat. *regelatio*, a thawing, from *regelare*, to thaw, from *re-*, back again, anew + *gelare*, to freeze, from *gelu*, frost; connected with Lith. *geluma*, intense cold, Goth. *kalda*, OIIG. *kalt*, AS. *ceald*, Eng. *cold*). A term first applied by Faraday to describe the phenomena occurring when two pieces of ice are brought into contact under pressure. The ice melts at the plane of contact and the water thus formed freezes when the pressure is relieved, thus uniting the two pieces. That ice melts with pressure, and that its melting point is lowered as the pressure increases, was first shown by Professor James Thomson, and then demonstrated experimentally by his brother, Lord Kelvin, and this property serves to explain the phenomena involved in regelation. A wheel track in the snow

is generally covered with a thin film of ice for the reason that the snow melted by the pressure of the wheels freezes as soon as the pressure is removed. A snowball is made by the pressure of the hands causing the snow to melt, and then the water is solidified. Consequently if the snow is dry and cold and below the freezing point, the pressure of the hands will not suffice. If a press is used, the snow will be melted and cylindrical or other forms of transparent ice can be formed. The well-known experiment of looping a cord or wire around a block of ice and attaching a weight will also show regelation. Here the pressure on the cord melts the ice and allows the string to cut its way through the block, but at the same time the water thus formed is again frozen and the block left in its original solid condition. A union between two pieces of ice will take place when they are in contact under water, even if the temperature is considerably above that of the air. In such a case, however, the capillary action of the film of water between the two faces renders the internal pressure less than the external and acts to bring the two pieces together with pressure. The phenomenon of regelation is also quoted to explain the formation and movement of glaciers (q.v.). The glacier in its progressive movement acts much as a viscous solid, the top moving faster than the bottom and the middle faster than the sides. The pressure of the vast quantity of snow above melts the ice or snow at the bottom, and this, escaping and flowing down, freezes and solidifies, a gradual slipping away of the base occurring. As the foot of the glacier descends it reaches warmer regions, so that melting will take place with less pressure and the water will drain off. In this way it is possible to explain much of the formation and movement of glaciers, though of course the problem is very complex and other causes exert powerful influences. Consult Preston, *Theory of Heat* (New York, 1894). See HEAT.

REGENERATION (Lat. *regeneratio*, from *regenerare*, to generate anew, from *re-*, back again, anew + *generare*, to beget, from *genus*, family). Replacement of lost parts, renewal of organs, or completion of an organism from a part. In 1744 the Swiss naturalist Trembley found that on cutting hydras in two, or slicing them into thin rings, from each ring grew out a crown of tentacles; and in splitting them into longitudinal strips each portion became a well-shaped hydra. Finally he turned one inside out and in a few days the evaginated hydra swallowed pieces of meat, though its former stomach-lining had now become its skin. Bonnet found that from the same region of a worm, like the earthworm, a head or tail may arise according to whether that region happens to lie at the anterior or posterior end of the cut surface. Thus if a worm (*Lumbriculus*) be cut into two pieces, a new tail will develop from the posterior end of the anterior piece, and a new head from the front end of the posterior piece. In another species of fresh-water annelid Bonnet found that a new tail developed at the anterior end of the posterior piece, and not a head. As the result of recent experiments on the earthworm it is ascertained that if from one to five of the anterior segments be cut off, the same number come back; if more are cut off, the process of regeneration begins only after a longer interval, and only four or

five segments come back as a rule; if the cut be behind the middle, the time before regeneration begins is still longer, and fewer worms succeed in regenerating at all. Each end of the body can regenerate in its own direction only.

REGENERATION OF HYDRA.

1, Two anterior pieces of hydra united by their arboral ends; 2, hydra split in two, hanging vertically downward; 3, two posterior ends of hydra united by oral surfaces; 4, five pieces united as shown by arrows. (After Morgan.)

The effect produced by external factors in experiments on regeneration are noteworthy. A hydroid (*Eudendrium*) failed to develop new heads when kept in the dark, but when placed in the light the new heads quickly appeared, showing that light acts as a stimulus; and instead of a head a root will develop at the distal end of a piece if that end be brought into contact with some fixed object, and conversely a new head will appear at either the nearest or farthest end if the end be freely surrounded with water; in this case the external agent is the stimulus which determines the differentiation of the part; and experiments have produced some extremely curious manifestations of how this stimulus acts. For example, a piece cut from the stem of *Antenularia* and suspended vertically in the water will develop a new stem at the upper end, and roots at the lower end, regardless of the normal position. Here gravity alone determines that the upper end shall grow into a new stem and the lower end into a new root. In the one case, where the upper end corresponds to the proximal end of the original hydroid, the new part (a stem) replaces the lost root-end, and this change Loeb calls 'heteromorphosis.' In the other case, says Morgan, where the upper end corresponds to the distal end of the original hydroid, the new part (a stem) replaces the lost part of the stem. This is what is usually meant by 'regeneration.'

It is of some theoretical interest to know whether the old cells directly form the new tissue or whether reserve cells are present that bring about the result. From experiments thus far made Morgan thinks that this may vary with different forms. In *Planaria*, a flatworm, a new head forms on the anterior end of the posterior half of the worm, but the entire anterior half is never replaced by new tissue. In this same planarian Randolph has discovered a most important relation existing between the old and new parts. If a planarian be cut in two longitudinally in the median plane, the right half regenerates a new left half of the same size as the part removed, and the left half also develops a new right half

of corresponding size. If, however, the worm be cut longitudinally into a larger and smaller strip, the former replaces as much as was contained in the smaller part removed, but the smaller part does not develop the lost larger part, but forms only as much new tissue at its cut side as is about equivalent to its own breadth.

ANIMAL GRAFTING. Although this subject is not one of practical importance as regards animals, it is a matter of interest connected with the regeneration of the grafted parts, and in the case of the lower animals may lead, if portions of different species or genera are grafted upon each other, to results bearing on heredity. The first experiments in animal grafting are the famous experiments with the hydras by Trembley. He found that if a hydra is cut in two, the pieces can be reunited by their cut surfaces, the result being a complete animal. He also successfully united the head end of one hydra with the posterior half of another; but he failed to obtain a permanent union between individuals of different species. Lately Wetzel has cut two hydras in two and found that the two anterior pieces united by the aboral cut surfaces, so that each end bore a head with tentacles; he succeeded in a variety of similar experiments. King and others in the same way produced double-headed hydras, and wrought a number of variations on this theme. Lateral grafts were found to differ from lateral buds, the latter after four or five days separating by constricting at the base. Peebles succeeded in grafting in *Tubularia*, *Hydractinia*, etc. Joest has succeeded in grafting earthworms, producing double-headed and double-tailed specimens, also in splicing, making a long worm out of three separate pieces; he grafted or spliced together with such success worms of

graft, such as the muscles of the legs with those of the stock. 'Tandem' unions were more successful, a pupa deprived of the head and part of the thorax being joined to another deprived of its abdomen back of the fourth segment. The moths thus resulting had a long body with two sets of wings and legs, yet there was no internal fusion of organs, only the skin and appendages and wings sharing in the fusion. 'Twin' unions were produced by aboral and oral poles, also lateral 'twin' unions; these experiments were easily performed because only a little of each component was cut away.

The grafting of tadpoles by Born (1896-97) has excited much interest. If the anterior half of one tadpole was fused with the hinder half of the same or another tadpole, a single individual was formed which was kept alive in several cases until the time of metamorphosis. If the head of a tadpole is cut off and grafted upon the side of the body of another tadpole, the head will remain alive and continue to develop in its new position, and may grow to the size of that of the

GRAFTING A FROG.

A combination in which the anterior part of *Rana esculenta* was united to the posterior part of *Rana larvalis*. The blood of the posterior component was driven through the vessels by the action of the heart of the anterior component. The animal lived for 17 days. (After Morgan.)

stock. He succeeded in uniting tadpoles of different species in several different ways, i. e. by their heads, or by their ventral surfaces, or longer and shorter tadpoles were made by using pieces longer or shorter than a half. In all these cases there was no regeneration (says Morgan) at the place of union, and the internal organs, the digestive tract, nervous system, and blood-vessels unite when brought into contact. When like organs are brought together the substance of one unites directly with the substance of the other, and if the organ is a hollow one, as is the digestive tract or the nerve-cord, their cavities also become continuous. Born succeeded in grafting tadpoles even of different genera. It should be observed that in all these and other combinations each developing part retains its specific characters, "and although in several cases one part received its nourishment from the other through the common circulation, yet no influence of one component on the other could be observed." Morgan states that in the mammals it is impossible to carry out grafting experiments on the same scale as those described in lower forms. Thus we could not graft an arm of a man upon another. While the tissue might have the power to unite, the difficulty would be in supplying the grafted arm with nourishment, etc., during the long time required for the union to take place. Yet smaller parts of the body may be successfully grafted, and there are, he says, several recorded instances in which parts of a finger, or of the nose, are said to have been cut off and to have reunited after being quickly put back in place. As regards cases of grafting, Hunter and also Dubamel grafted the spur of a young cock upon the comb, where it continued to

REGENERATION OF WORMS.

1. Union of two pieces of *Allobophora terrestris* in normal position 22 months after operation. Piece of *Lumbricus rubellus* grafted on side of body of another individual to produce a double-tailed worm. 3. Union of two worms (by anterior ends) from each of which eight anterior segments had been removed. (After Morgan.)

different species, and even of different genera (*Lumbricus rubellus* and *Allobophora terrestris*), though it was a more difficult undertaking; but the new worm "reacted as a single individual, and lived for eight months." As to more specialized animals, as insects and vertebrates, it appears that as in Crampton's experiments with grafting the pupae of silkmoths (*Philosamia Cynthia*, *Samia Cecropia*, etc.), like tissues of two components fuse with like, while unlike tissues become organically united by connective tissues. He grafted small pieces upon entire pupae, *Philosamia Cynthia* upon *Samia Cecropia*, *Callosamia Promethea* upon *Samia Cecropia*, but the fusion was entirely a superficial one, there being no internal connection between the organs of the

grow to its normal size. Other similar experiments have met with varying success.

TRANSPLANTATION OF SKIN. Cases of this sort of plastic surgery are becoming frequent. Morgan states that pieces of human skin may be without great difficulty grafted upon an exposed surface, "and it has been said that small pieces succeed better than large ones, owing, most probably, to their being able to absorb sufficient oxygen, etc., and keep alive until new blood-vessels have grown into the grafted piece." The skin of the negro has been transplanted upon a white man. In many cases the transplanted skin has remained alive for a time, yet later it was thrown off by new skin growing under it and replacing it. Even grafting of internal organs is now attempted with more or less success in operative surgery. The results of grafting bone, etc., show, adds Morgan, that all kinds of tissue may continue to live, and the cells multiply in different parts of the body, but there seems to be nothing in these cases comparable to a regeneration of the entire organ. In the new situation the cells often assume an entirely new arrangement. After a period of activity, a process of degeneration commences and the piece atrophies.

BIBLIOGRAPHY. Morgan, *Regeneration* (New York, 1901), contains a full bibliography; Crampton, "An Experimental Study upon Lepidoptera," in *Archiv für Entwicklungsmechanik der Organismen*, vol. ix. (1899).

REGENERATION. A term used in theology, to indicate either the entire spiritual change which passes upon men when they become Christians, or the divine agency in eliciting the act of faith in distinction from conversion, which is the part of man, and comprises repentance and faith. The words of Christ to Nicodemus, "Verily, verily, I say unto thee, except a man be born again, he cannot see the kingdom of God," are accepted as the expression of the universal necessity of regeneration by the Christian Church. In the view of the Roman Catholic and Eastern Churches, and of the High Church school among Anglicans, the change is inseparably connected with baptism, always in the case of infants, and of those adults who interpose no obstacle to divine grace. In this view baptism constitutes always a real point of transition from the natural to the spiritual life, so that every baptized person—or at least every rightly baptized person—has already become a Christian, although he may fall away from the grace that he has received. According to most Protestants regeneration (including conversion) is a special, conscious process, which takes place independently of baptism, or of any other outward fact or ceremony. It implies a sensible experience—an awakening whereby men come to see the evil of sin, and the divine displeasure against sin, and, through the Holy Spirit, are born again, put away their former evil life, and begin to live a new divine life. The controversy as to the meaning and method of regeneration was especially acute in the Anglican communion in the nineteenth century. The Gorham Judgment (see **GORHAM CONTROVERSY**) agitated the entire Church of England in the forties, and a protest against what were called sacramentarian views on this question led more than any other cause to the secession of the Reformed Episcopal Church in the United States.

REGENSBURG, rä'gëns-böörk, or Ratisbon. A city of Bavaria, Germany, capital of the Upper Palatinate, situated on the Danube opposite the mouth of the Regen, 65 miles northeast of Munich (Map: Germany, E 4). It is distinctly mediæval in appearance, with narrow, crooked streets, and ancient houses, with loop-holed towers and coats-of-arms. A stone bridge dating from the twelfth century connects Regensburg with the suburb of Stadthof on the opposite bank of the Danube. The cathedral, begun in 1275 and completed in 1534 with the exception of the towers, is pure German Gothic. It contains many fine monuments and other objects of art. The Rathaus, dating partly from the fifteenth century, is interesting as the seat of the Imperial Diet from 1663 to 1806. Another building of historical interest is the inn Zum Goldenen Kreuz where Charles V. lodged during the Diet of 1547 and where he met Barbara von Blomberg, the mother of Don John of Austria. The villa of the King of Bavaria is a magnificent building in the Gothic style, commanding a fine view of the surrounding country. There are a number of seminaries, and schools of religious music, glass-painting, and agriculture. Interesting collections are owned by the local historical and natural history societies. There are manufactures of paints, porcelain ware and pottery, machinery and other iron and steel products, knit goods and cloth, musical instruments, rifles, spirits, etc. Boat-building and book printing and binding are also industries of importance. Population, in 1900, 45,426, principally Roman Catholics. Near Regensburg is the German 'Temple of Fame,' called the Valhalla (q.v.).

Regensburg was the Celtic settlement of *Rad-asbona*, called by the Romans *Castra Regina*. It was the residence of the early dukes of Bavaria and became the seat of the bishopric of Regensburg in the eighth century. From the eleventh century to the close of the Middle Ages Regensburg was one of the most important cities of Southern Germany and carried on a flourishing trade with the East. It was early raised to the position of a free Imperial city. As the frequent residence of the German emperors Regensburg was the scene of many important diets, and became the permanent seat of the Diet in 1663. In the territorial changes following the Treaty of Lunéville in 1801, it was assigned to Dalberg (q.v.). In 1810 it passed to Bavaria. Consult: Gemeiner, *Chronik der Stadt und des Hochstifts Regensburg* (Regensburg, 1800-24); Gumpelzhaimer, *Regensburger Geschichte, Sagen und Merkwürdigkeiten* (ib., 1830-38); *Chroniken der deutschen Städte*, vol. xv. (Leipzig, 1878); Küsser, *Alt- und Jung-Regensburg* (Regensburg, 1895); Walderdorff, *Regensburg in seiner Vergangenheit und Gegenwart* (ib., 1896); Fink, *Regensburg in seiner Vorzeit und Gegenwart* (ib., 1900).

REGENT-BIRD. See **BOWER-BIRD**.

REGENT DIAMOND. See **PITT DIAMOND**.

REGENT'S PARK. One of the largest London parks, covering 472 acres, and containing the Zoölogical and Botanical gardens. It was laid out in the time of George III. on the site of the earlier Marylebone Park, once filled with game, subsequently cleared for a pasture, again replanted, and named for the Prince Regent (George IV.).

REGENT STREET. A noted London street, a mile in length, laid out in 1813 to connect Carlton House, the Prince Regent's residence, with Regent's Park. It contains the finest shops of the city.

REGGIO DI CALABRIA, rād'jō dē kā-lā'-brē-á. The capital of the Province of Reggio di Calabria, Italy, situated on the Strait of Messina, 8 miles southeast of Messina, in Sicily (Map: Italy, K 9). The climate of Reggio is salubrious, and the scenery beautiful. Behind the city rises Aspromonte, where Garibaldi was taken prisoner in 1862. The city has a modern cathedral, an old castle, a statue of Garibaldi, a museum of antiquities, a public library, a lyceum, a technical school, and a seminary. There are manufactures of linens, silks, perfumes, olive oil, etc. The trade is chiefly in wine, fruit, grain, and fish. Population (commune), in 1881, 39,296; in 1901, 44,415.

Reggio is the ancient *Rhegium*, founded by fugitives from Messina about B.C. 723. In B.C. 387 it was destroyed by Dionysius of Syracuse, but became a prosperous city again under the Romans. During the Middle Ages it was plundered by Goths, Saracens, and Turks. It was almost totally destroyed by the great earthquake of 1783, but has since been rebuilt on modern lines.

REGGIO NELL' EMILIA, nēl'lá-mē'lyá. The capital of the Province of Reggio nell' Emilia, Italy, situated on a branch of the Po, and on the Piacenza-Bologna and other railroads, 16 miles west-northwest of Modena (Map: Italy, E 3). It is surrounded by walls and has broad and regular streets. The fifteenth-century cathedral is embellished with statues and monuments. Some of the churches, notably Madonna della Ghiara, contain famous frescoes. The theatre is one of the finest in Italy. There are a museum with a natural history collection, and a library with 55,000 volumes and many valuable manuscripts; also a lyceum, a technical institute, and a seminary. The city lies in a fertile district, and trades in wine, rice, and flax. There are manufactures of cotton and silk stuffs, brooms, leather, and cement. Population (commune), in 1881, 50,651; in 1901, 58,490. Reggio, the ancient *Regium Lepidi*, was a flourishing city under the Romans. It was made the seat of a bishopric in 450. In the twelfth century it became a republic, but passed into the possession of the Este family in 1290. It was repeatedly wrested from them, but was permanently secured early in the sixteenth century, and afterwards shared the fortunes of Modena. Reggio is the birthplace of Ariosto.

REGIA (Lat., royal house). The official residence of the Pontifex Maximus at Rome, situated on the Sacred Way, in the space between the Temple of Faustina and the Temple of Vesta. In it were chapels to Mars and Ops, a hall for religious conventions, and the archives of the priesthood. On its walls were engraved the *Fasti consulares* and *triumphales*, fragments of which were discovered in 1543, when the building was demolished and its material used in the construction of Saint Peter's. The Regia was burnt four times.

REGICIDES (from Lat. *rex*, king + *-cida*, assassin, from *cadere*, to kill). A name given in English history to those persons most active

in bringing about the death of Charles I., and especially to those members of the High Court of Justice, sixty-seven in number, who on January 27, 1649, voted for his execution. Fifty-eight of the sixty-seven, besides Ingoldsby, who was not present when sentence was pronounced, ultimately signed the death-warrant. In 1660, preparatory to his return, Charles II. issued the Declaration of Breda, whereby pardon was granted to all, excepting such as Parliament might afterwards except. The Convention Parliament later passed an act of indemnity, but with many exceptions. Nineteen regicides, who had surrendered voluntarily, were kept in prison, together with six others, till their death, as far as is known, though they were never tried. Ten were executed immediately and three others were caught in Holland, brought to England, and executed. Many lived in exile for the rest of their lives, Goffe, Whalley, and Dixwell (qq.v.) in the American colonies. But even the dead were not spared, the bodies of some being exhumed, dragged to Tyburn, and there burnt, after having been exposed on the gallows. Consult: Régis, *Les Régicides dans l'histoire et dans le présent* (Paris, 1890); Noble, *The Lives of the English Regicides* (London, 1798).

REGICIDES' CAVE. A cavern near the top of West Rock, a cliff at New Haven, Connecticut. It was the place of concealment of the regicides Goffe and Whalley in 1661.

REGILL'US, LAKE. Anciently a small lake of Latium, to the southeast of Rome somewhere about the foot of the Tusculan hills, probably occupying an extinct volcanic crater at a place called Cornufelle, near the modern Frascati. Lake Regillus is celebrated in the semi-legendary history of Rome as the scene (B.C. 496) of a great battle between the Romans under Aulus Postumius and the Latins, on behalf of the banished Tarquin, under O. Mamilius.

REGIMENT (Lat. *regimentum*, government, from *regere*, to govern). A military organization consisting of from two to four battalions (according to the army organizations of the various nations). For purposes of military administration the regiment is the administrative unit, and in large operations requiring great numbers of troops it would be practically the tactical unit. See ARMY ORGANIZATION; BATTALION; COMPANY.

REGIMENTAL COURT-MARTIAL. See COURTS, MILITARY, paragraph *The Regimental Court-Martial*.

REGINA. The capital of the District of Assiniboia and of the Northwest Territories, Canada, 357 miles by rail west of Winnipeg, on the Canadian Pacific Railroad (Map: Northwest Territories, H 4). It is the military headquarters of the Northwest Mounted Police. An important trade in the products of the region is carried on. Population, 1901, 2645.

REGIOMONTANUS (1436-76). A German mathematician and astronomer, whose real name was Johannes Müller. He was born near Königsberg (whence his Latin name), was educated at Vienna, and was a pupil of Georg Peurbach (qq.v.). He collected numerous Greek MSS. and translated many of them, especially the works of Ptolemy, Apollonius, Archimedes, and Hero of Alexandria. He also brought the al-

gebra of Diophantus to the notice of Europeans. Regiomontanus was the author of a treatise on plane and spherical trigonometry, *De Triangulis Omnimodis* (1533), which contained the sine and cosine. Adopting the half chord of the Arabs, he constructed tables of sines and tangents. His work on arithmetic and algebra, entitled *Algorithmus Demonstratus* (1534), was among the first containing symbolic algebra. He established an observatory and printing press in Nuremberg, and produced tables of eclipses, and works on astronomy and astrology. He was called to Rome by Sixtus IV. to revise the calendar, but died there the following year, and was buried in the Pantheon. His works include: *Ephemerides ab Anno 1475-1506* (1474); *Calendarium Norum* (1473); *De Quadratura Circuli* (1463); *Disputationes Dialogus contra Gerhardi Cremonensis in Planetarum Theorias Deliramenta* (1475); *De Reformatione Calendarii* (1484); *De Cometæ Magnitudine Longitudineque* (1531); *Tabulæ Directionum Profectionumque* (1575); *De Doctrina Triangulorum* (1463). Consult Ziegler, *Regiomontanus* (Dresden, 1874). A collection of his letters was edited by Murr (Nuremberg, 1786).

REGISTER (ML. *register, registra, registrum*, variants of *registum*, register, books of record, from Lat. *registus*, p.p. of *regerere*, to record, from *re-*, back again, anew + *gerere*, to carry). In music, the compass of a voice or instrument; specifically, a series of tones produced by the same mechanism and having the same quality. Generally considered, there are three registers in the female voice and two in the male voice. Those notes which proceed naturally and freely from the voice constitute the so-called *chest-register*. The *head-register* embraces those notes which are produced by a somewhat strained contraction of the glottis, while the *falsetto* register is that midway between the two. See ALTO; BARYTONE; BASS; MEZZO; SOPRANO; TENOR; PHONETICS; SINGING; VOICE.

REGISTRATION, OF CHATTEL MORTGAGES. The statutes of several of the United States provide for the registration of chattel mortgages in addition to filing the instruments. This system is designed solely to give notice to the public, and does not combine the guaranty of validity secured by registration of titles to land in some States. The names of the parties, the amount secured, and date of execution, are usually the only facts registered, and, therefore, it practically only amounts to an index of the mortgages on file. See TITLE, REGISTRATION OF.

RE'GIUS. See RHIGIUS.

REGIUS PROFESSOR (Lat., royal professor). The name given to the professors the patronage of whose chairs is vested in the Crown. In the English universities the term is especially applied to those professorships founded by Henry VIII. See UNIVERSITY.

REGLA, rā'glā. A town of Cuba in the Province of La Habana, situated on the east shore of Havana Harbor, opposite the capital (Map: Cuba, C 3). It is connected with the latter by ferry, and with Guanabacoa, 3 miles to the east, by a street railroad. It is also the terminus of a railroad to Matanzas, has sugar warehouses, foundries, and shipyards, and receives a consider-

able part of the shipping of the harbor. Population, in 1899, 11,363.

REGNARD, re-nyār', JEAN FRANÇOIS (1655-1709). A French dramatist. In 1678 he was captured by corsairs on his way from Italy to France and held as a slave at Algiers. This event occasioned his novel *La Provençale*. Later he traveled very widely, from Scandinavia to Turkey, returning finally to France (1683), dividing the time between Paris and his estate at Grillon. Regnard wrote several prose dramas (1688-93); then short plays in verse, and in 1696 produced his first great comedy, *Le joueur*, which with that that followed, *Le distrait* (1697), *Démocrite* (1700), *Les folies amoureuses* (1704), *Les Ménechmes* (1705), and *Le legataire universel* (1708), made him second only to Molière in contemporary esteem. He continued also to write dramas in prose, of which *La foire de Saint-Germain* is most noteworthy, and in *La suite de la foire* he combined prose and verse. Regnard died at Grillon September 4, 1709. He sought to combine the qualities of La Bruyère and Molière, but for this he lacked depth, strength, and seriousness. He shows to best advantage in plot, action, and dialogue, not in analysis and portrayal of character. Regnard's works were collected in 5 vols. in 1731, and in 2 vols. in 1854. Everything of primary importance is in the *Collection Didot* (Paris, 1820). The latest edition is by Moland (ib., 1875). There is a *Bibliography* by Marchéville (ib., 1877), and a critical study by Mahrenholtz (Oppeln, 1887).

REGNAULT, re-nyô', HENRI (1843-71). A French figure and genre painter. He was born in Paris October 30, 1843. After a brilliant record in classical studies, he entered the atelier of Lamothe, and afterwards that of Cabanel, won the Prix de Rome in 1866, and during the two years spent at Rome he designed, among other illustrations, those for Wey's *Rome*. Among his paintings executed at the same time was "La dame en rouge." In 1868 he went to Spain, and while at Madrid he devoted himself especially to the study of Velazquez, whose influence appears in his equestrian portrait of Marshal Prim, one of the finest of the century. Refused by the sitter, it was taken by the artist to Paris, where it created a great sensation in the Salon of 1869, and is now hung in the Louvre. From the same year dates his "Judith," and in 1870 he exhibited "Salome," a symphony in yellow—an incarnation of sensual cruelty. In that year he went to Morocco, whence he sent his famous symphony in red, the "Moorish Headman"—a type of the dreamy cruelty of Oriental fatalism. But hearing of the disastrous opening of the Franco-German War, he hastened back to Paris, and, enlisting in a regiment, was killed at the sortie of Buzenval, January 19, 1871. In the following year the pupils of the Ecole des Beaux-Arts erected a monument to him in the chief court of that school. Regnault was the greatest of the followers of Delacroix (q.v.), whose worthy heir he was, both as regards temperament and technique. He resembled him in brush work and in color, and his drawing is even surer. Consult: Regnault's *Correspondance*, edited by Duparc (Paris, 1872), and his biography by Baillièze (ib., 1871-72), Cazalis (ib., 1872), Timbal (ib.,

1872), Larroumet (ib., 1886), and Roger Marx, in *Les artistes célèbres* (ib., 1886).

REGNAULT, HENRI VICTOR (1810-78). A distinguished French chemist and physicist, born at Aix-la-Chapelle, Germany. When a mere boy he went to Paris and found employment in a drapery establishment. In this manner he was able to provide for himself and his sister, while devoting his leisure hours to study. In 1830, at the age of scarcely twenty years, he was admitted to the Ecole Polytechnique, and two years later, on completing his course of study, engaged in mining engineering. After filling for some time the chair of chemistry at Lyons, he was elected a member of the Academy of Sciences, and became, in 1840, professor of chemistry at the Ecole Polytechnique. In the following year he succeeded Dulong as professor of physics at the Collège de France. In 1847 he was made chief engineer of mines, and in 1854 director of the porcelain manufactory at Sèvres. Regnault was distinguished for extreme skill and patience in experimental work, more than for brilliance or novelty in discovery, or the philosophical interpretation of empirical data. He devoted himself especially to the careful measurement of the constants of nature, laying the foundation on which important chapters in theoretical and physical chemistry have since been worked out by other investigators. His greatest work is that on the numerical data bearing on the working of steam-engines, for which the Royal Society of London awarded him their Rumford medal. This work forms vol. xxi. of the *Mémoires* of the Academy of Sciences. A few of his contributions may be mentioned here. He measured with great care the specific heats of various substances, and his determinations showed that the specific heat of solid chemical compounds is very nearly equal to the sum of the products of the specific heats and the numbers of atoms of the ingredient elements. He similarly showed that the specific heat of a solid alloy can be calculated directly from the specific heats of the component metals. He determined precisely the values of the vapor-tension of water corresponding to various temperatures, and measured the vapor-tensions of mixtures such as those of sulphuric acid and water. He determined the densities of the so-called permanent gases and investigated the true relations between the pressure and volume of gases. According to the law of Boyle and Mariotte, the pressure of a gas kept at constant temperature is inversely proportional to its volume. Regnault showed that this important law, while applicable in ideal cases, and hence interesting to the theoretical engineer, is in reality only approximately correct; that for most gases the pressure is somewhat smaller than that required by the law, while for hydrogen, which he called a more than perfect gas, the pressure is greater than that required by the law. Regnault's data have led to important developments in the kinetic theory of gases and to more correct views concerning the relations between the gaseous and liquid states of aggregation. Among his contributions to organic chemistry deserves mention the discovery of a number of interesting compounds, including derivatives of the unsaturated hydrocarbons. He published his observations in the *Annales de Chimie et de Physique* and the *Comptes Rendus* of the Academy of Sciences. He also wrote: *Cours élémentaire de*

chimie (1849-50, and several later editions), and an abridgment of this work, entitled *Premiers éléments de chimie* (1850; 6th ed. 1874). A collection in 3 volumes of most of his papers on gases and vapors appeared under the title, *Relation des expériences entreprises pour déterminer les lois et les données physiques nécessaires au calcul des machines à feu* (1847-70). Consult Dumas, *Eloge historique de Henri Victor Regnault* (1881).

REGNAULT, JEAN BAPTISTE, Baron (1754-1829). A French painter, of the classical school. He was born in Paris and studied under Bardin; took the Prix de Rome in 1776; was elected to the Academy in 1783 and made professor in the Ecole des Beaux Arts in 1795. His works are in the cold correct style of the pupils of David; the best known are the "Baptism of Christ," much praised by Raphael Mengs, and his masterpiece, the "Education of Achilles," both of which, along with other works are in the Louvre. Among his pupils were Guérin, Hersent, Blondel, and Richehomme.

REGNIER, re-nyá', CLAUDE AMBROISE, Duke of Massa (1736-1814). A French statesman, born at Blamont, Meurthe-et-Moselle. An advocate by profession, he was a deputy to the States General (1789), took a prominent part in establishing the Republican judiciary, but retired during the Reign of Terror. In 1795 he was elected to the Council of the Ancients. He became president of that body in 1798, shared in the coup d'état of the following year, and, as Councillor of State under Bonaparte, was intrusted with the revision of the civil code. He was Minister of Police in 1802-04 and Minister of Justice in 1802-12, when he was made president of the Legislative Assembly.

REGNIER, HENRI DE (1864-). A French poet, born in Honfleur (Calvados), and educated in Paris at the Collège Stanislas. The series of sonnets, entitled *Siles* (1887), which first brought the poet to public notice, were essentially classic and correct. A new manner, new metres, and the sparing use of the *vers libre* in the volumes which immediately followed, marked him as a leader among the Symbolists or Decadents and a pupil of Mallarmé and Verlaine. In this period mention should be made of *Episodes* (1888), less personal or analytical than any preceding volume, and but little more than a series of voluptuously beautiful pictures; of *Poèmes anciens et romanesques* (1890), in which symbolic meaning is given to many old stories; of *Tel qu'en songe* (1892), with its mystic and reflective fancy of double personality; and of *Arcthuse* (1895), his most finished work, an admixture of Hellenic myth and beauty with Celtic melancholy. *La corbeille des heures* reverts to the theme of the earlier poems with an added beauty of treatment. And in *Médailles d'argile* (1900) the poet returns to his earlier exactness of metre. In his fiction, *La canne de jaspé* (1895), *Le trèfle blanc* (1899), and *La double maîtresse* (1900) he shows the same fondness for the unreal or for the chronologically remote, and the same melodious command of words. In 1900 Regnier received the Vitet prize from the French Academy. His ability as a critic was shown in his lectures to the American Cercle Français in 1900, and by an essay on Mallarmé in the *Revue de Paris* for 1898.

REGNIER, MATHURIN (1573-1613). A French satirist, the nephew of Desportes, the poet. He was born at Chartres; took orders as a youth, and went in 1593 as secretary with the Cardinal de Joyeuse to Rome. He returned in 1604, and in 1609 was made a canon in the Chartres Cathedral. He died in the prime of his talent, as the result of his excesses. His sixteen satires include: *Le goût décide de tout*; *L'honneur l'ennemi de la vie*; *L'amour qu'on ne peut dompter*; *Regnier apologiste de lui-même*; *La folie est générale*; and *Le mauvais lieu*. The ninth attacks Malherbe. Dowden says: "His satires are those of a painter whose eye is on his object, and who handles his brush with a vigorous discretion; they are criticisms of society, and its types of folly or of vice, full of force and color, yet general in their intention, for, except at the poet who had affronted his uncle, le bon Regnier struck at no individual." The only work printed during the poet's lifetime was *Satires et autres poésies de Mathurin Regnier* (1608 and 1613). The best editions of his work are those of Viollet-le-Duc (1853), Barthélemy (1862), and Courbet (1869 and 1875). Consult Vianey, *Mathurin Regnier* (Paris, 1896).

REGRATING. An old common-law offense, consisting of buying 'corn and other victuals' and scheming to enhance the price artificially. The offense was early made a matter of statute in England, and probably is not recognized as a common-law offense in the United States. The ancient crimes known as *forestalling* (q.v.) and *engrossing* (q.v.) were quite similar in nature.

REG'ULA (Lat., rule). A band under a triglyph (q.v.) in the Doric style. It has the shape of a narrow stripe of marble, and on the lower side has six *guttæ* (q.v.). It seems to represent an original wooden cleat secured by nails.

REGULA FAL'SI (Lat., rule of the false). The Latin name for the method of false position (q. v.). This method was largely used in the Middle Ages in the solution of equations. E.g., the simple equation $ax + b = 0$ was solved thus: If z_1 and z_2 are any two numbers, and $az_1 + b = c_1$, $az_2 + b = c_2$, then $x = \frac{z_2c_1 - z_1c_2}{c_1 - c_2}$.

REGULAR ARMY AND NAVY UNION OF THE UNITED STATES OF AMERICA. A patriotic society founded in Washington, D. C., on November 4, 1897. It has for its principal objects to provide for comrades when sick or in need; to assist in the burial of its dead; to keep alive old friendships formed in the service; to suggest and encourage the enactment of necessary laws for the benefit of soldiers, sailors, or marines; and to keep before the people and the officials of the Government the necessity and justice of giving employment in the Government service to men honorably discharged or retired who have rendered faithful military service to the Government, and who are trustworthy and competent. It admits to membership members of the regular army, navy, or marine corps of the United States, or those who have been honorably discharged or retired if they have served for five years in either branch of the service. Its insignia consists of a badge pendant from a ribbon, which is the national flag, with a clasp at the top formed of a spread eagle,

while the badge itself consists of a cross with the emblems of the different branches of the service in the points, and in the centre a triangle, with the letters A, N, and M, signifying Army, Navy, and Marine, surrounded by the legend "Trinitas Protego, R. A. and N. U., U. S." It has a membership of upward of 6,000, divided among garrisons and sub-garrisons in the United States and the Philippines.

REGULATED COMPANIES. Associations of merchants formed in early modern times to exploit monopolies of special branches of foreign trade. Each member of the company embarked his capital in the monopolized trade, managing his own business, but subject to the regulations of the company. These companies were formed on the model of the mediæval guild (q.v.). They made rules for admission to the company, decided how great a volume of business each member should transact, and sometimes fixed prices. The company as a body possessed property, as, for example, factories in the country with which they traded; but there was no idea of making profits to be distributed to the company as a whole. Through their regulation active competition among members was obviated, and coöperation against foreign competitors assured. Thus it became possible to carry on trade which an isolated trader would not have ventured upon.

The earliest regulated companies were those formed by the merchants of the Hanseatic League (q.v.) for trading in England. The plan was adopted by the English merchants who first engaged in foreign trade, the Merchants of the Staple, and the Merchants Adventurers (q.v.). The regulated company was the form of organization of the Levant Company, incorporated in 1581, to carry on trade in the Eastern Mediterranean; the Muscovy Company (1554), of merchants trading in Russia; the Eastland Company, incorporated under Elizabeth, to carry on trade with the Baltic countries. The East India Company, as originally constituted, formed a transition from the regulated to the joint-stock company. In the last named company individual members were not given a right to carry on trade on private account, but were required to trade through sub-companies, under the control of the parent company.

This form of organization was in its time distinctly superior to unregulated private trading, but it proved inadequate for carrying on so hazardous and extensive a trade as that with the East Indies, and was gradually supplanted by the joint-stock company. After 1612 the East India Company had abandoned the principle of the regulated company. The other companies mentioned continued to exist in their original form until the eighteenth century. In the seventeenth century they showed a tendency toward monopoly, excluding, through excessive entrance fees, traders who desired to gain membership. Hence arose a class of 'interlopers,' who traded in the monopolized region in defiance of the company. The minute regulations imposed upon members proved to be vexatious in the more enterprising trade of the seventeenth century, and were in large measure responsible for the decline of the companies.

REGULATORS, THE. The name given to those who actively opposed excessive taxes, dishonest sheriffs, and extortionate fees, in North

Carolina, in 1765-71. Practically all authority was at this time centred in the royal Governor; the taxes were levied exclusively upon the poll; there was little money in the western counties and no market for the products of these counties. The court officials, moreover, were accused of exacting illegal fees. Disturbances in Mecklenburg and Granville Counties in 1765, and in Orange County in 1766, were easily put down. The Regulation proper began in Orange County in the spring of 1768, the 'Regulators' agreeing to pay no more taxes until they were satisfied that such taxes were according to law, and to pay no more than the legal fees. The news that the Assembly had appropriated £15,000 to build a house for the Governor increased the dissatisfaction. Minor disturbances occurred in the county, and the county militia was ordered out. William Butler and two other Regulators were fined and imprisoned. Edward Fanning, register of the county, was found guilty of extortion in office on five counts and was fined a penny and costs on each. The Assembly in 1769 was in sympathy with the Regulators. Petitions from Anson, Rowan, and Orange Counties demanded among other things salaries for officers instead of fees, a property tax, and that ministers of any denomination should be allowed to perform the marriage ceremony. This Assembly was dissolved by the Governor November 6th, after a session of two weeks. In September, 1770, renewed disturbances occurred in Orange County. The Assembly thereupon expelled Herman Husband, one of the leaders of the Regulators, passed a Riot Act, voted £500 for the defense of the town, but proceeded to pass much legislation demanded by Regulators. In May, 1771, Governor Tryon (q.v.), at the head of a large force, proceeded to Hillsboro. On May 16th he met about 2,000 Regulators, of whom hardly half were armed, at Alamance Creek. A sharp contest ensued for two hours. Of the Loyalists 70 were killed and wounded, while 9 of the Regulators were killed, a "great number" wounded, and 15 taken prisoners, one of whom was hanged on the spot. Six of the prisoners were tried and executed. By July 4th more than 6,000 men had taken the oath of allegiance, and the Regulator leaders were pardoned by the King before the Revolution. In 1772 it was estimated that 1,500 had emigrated to the West, and the excitement was over. During the Revolution most of the Regulators adhered to the King. Consult Bassett, "The Regulators of North Carolina," in the *Report of the American Historical Association for 1894* (Washington, 1895).

REGULUS, MARCUS ATILIUS. A Roman general. He was consul for the first time in B.C. 267, and, for his successes against the Sallentini, obtained the honor of a triumph. Chosen consul a second time (B.C. 256), he was sent along with his colleague, L. Manlius Vulso, at the head of a navy of 330 ships (with a land army on board) against the Carthaginians, it being the ninth year of the First Punic War, and encountering the enemy's fleet off Heraclea Minor, he totally defeated it. The Romans then landed near Clypea, where they established their headquarters, and ravaged the surrounding Carthaginian territory with fire and sword, but Manlius being recalled to Rome with one-half of the land forces, Regulus was left to carry on the war

with the remainder. For some time he was victorious in every encounter, but at last (B.C. 255) suffered a total defeat; 30,000 Romans were left dead on the field, about 2,000 fled and took shelter in Clypea, and Regulus, with 500 more, was taken prisoner. Regulus remained in captivity for five years, but when fresh reverses induced the Carthaginians to solicit peace, he was released on parole and sent to Rome in company with the Punic envoys. The rest of his history is one of the most favorite of Roman tales. According to these legends, Regulus at first refused to enter Rome, since he was no longer a citizen; after this conscientious scruple was overcome, he declined to give his opinion in the senate until he was commanded to do so; he then earnestly dissuaded them from agreeing to any of the Carthaginian proposals, even to an exchange of prisoners, and after he had succeeded, by his earnest appeals, in obtaining the rejection of the Carthaginian offers, he resisted all persuasions to break his parole, though conscious of the fate that awaited him, and, refusing even to see his family, returned with the ambassadors to Carthage, where the rulers put him to death with the most horrible tortures. The common story is that he was placed in a cask or chest stuck full of nails with the points projecting inward, and rolled about till he expired; and on the news of this event reaching Rome, retaliations equally atrocious were committed on two of the noblest Carthaginian prisoners. This story, however, is not mentioned by Polybius (about B.C. 200), who details at great length the achievements of Regulus.

REHAN, re'an (originally CREHAN), ADA (1860—). An American actress. She was born in Limerick, Ireland, April 22, 1860, and was brought to the United States when about six years old. While still at school she appeared upon the stage, but she virtually began her career by a two years' engagement at Mrs. Drew's theatre, in Philadelphia, during 1873-75. Subsequently she was with John W. Albaugh's company, playing leading juvenile parts, often with well-known stars, in Baltimore, Albany, and elsewhere. When Augustin Daly opened his theatre in New York in 1879, she joined his company, with which she continued till his death. As leading woman in the company, and after 1894 as a recognized 'star,' she played the heroines in a long series of successful comedies, for which Daly's management was noted. Both in the delicate art of high comedy and in more farcical characters she won for herself before 1890 a place in the front rank of American actors. Her two greatest rôles are those of Rosalind in *As You Like It* and Katharine in *The Taming of the Shrew*, while her Viola and her Lady Teazle have also been much admired. Among her parts in Mr. Daly's lighter productions were those of Valentine Osprey in *The Railroad of Love*, Peggy in *The Country Girl*, Kate Verity in *The Squire*, Nancy Brasher in *Nancy and Company*. She was Maid Marian in Tennyson's *Foresters*, and Roxane in Daly's presentation of *Cyrano de Bergerac*. Miss Rehan had great success in Germany in 1886, as also in Paris; and in London in 1888 and on frequent subsequent visits her popularity became almost as great as in this country. Consult: Winter, *Ada Rehan, A Study* (limited ed., New York, 1891); McKay and Wingate, *Famous American Actors of To-day* (New York, 1896);

Strang, *Famous Actresses of the Day in America* (Boston, 1899); Hapgood, *The Stage in America, 1897-1900* (New York, 1901).

REHATSEK, rá'hát-shek, EDUARD (1819-91). An Orientalist, born at Illach, in Slavonia, and educated in Budapest. He lived for several years in the United States—mostly in New Orleans—and in 1847 settled in Bombay, where he became professor in the Wilson College. About 1871 he became examiner to Bombay University in Latin, Arabic, and Persian, but in 1881 he resigned from this post, and spent the last decade of his life as a Hindu pundit. He contributed to the *Calcutta Review*, to the *Indian Antiquary*, to the *Journal of the Royal Asiatic Society, Bombay Branch*, and to the *Zeitschrift der deutschen Morgenländischen Gesellschaft*. His published works include a valuable catalogue of the Arabic, Persian, Turkish, and Hindustani manuscripts in the Mulla Firuz (1873); *Amusing Stories* (1870), *Fortune and Misfortune* (1871), both from the Persian; a version of Mirchond's *Universal History* (1893); and a translation of Mir Khwänd's *Garden of Purity* (1891-94).

REHEARSAL, THE. A burlesque by George Villiers, Duke of Buckingham, produced in 1671, ridiculing D'Avenant, Dryden, Sir Robert Howard, and other writers of the heroic dramas of the Restoration. It was long popular, and was imitated by Fielding in *Tom Thumb the Great* and by Sheridan in *The Critic*.

RE'HOBO'AM (Gk. Ῥοβοᾶμ, *Rhoboam*, Heb. *Rēhūb'ām*, probably the [divine] kinsman is, or makes, wide). The son of King Solomon by his wife, Naamah, princess of the royal house of Ammon, and his successor, in early youth, to the throne of all Israel (c.937-920 B.C.). The hereditary jealousy of the northern tribes toward Judah, aggravated by Solomon's tyrannical exactions, came to a head at once upon the son's accession. He proceeded to Shechem to receive the homage of the north, and arrogantly rejected the demand of his subjects that he lessen their burdens (I. Kings xi. 43; xii. 15). The leadership of the discontented tribes by Jeroboam, who already in Solomon's reign had been exiled for conspiracy (I. Kings xi. 26-40), and who had returned upon the death of Solomon, indicates a well-defined plan of revolt. The temper of northern Israel is further shown by the murder of Adoram, the aged minister of public works. Rehoboam, taken unawares, had to flee to Jerusalem; he made a show of compulsion by force of arms, but Judah had no forces commensurate with those of the north, and hostilities were confined to border warfare; according to the narrative he was forbidden to prosecute the war by the prophet Shemaiah (I. Kings xii. 16-24). From this time the so-called Kingdom of Judah consisted only of the tribe of Judah, and half of Benjamin, with remains of Dan and Simeon. During the reign of Rehoboam Palestine was invaded (c.733 B.C.) by Shishak, or Sheshonk, the founder of the Twenty-second Egyptian Dynasty. The narrative relates his spoliation of Jerusalem, where the temple suffered heavily (I. Kings xiv. 25-28). (See SHISHAK.) Rehoboam reaped the fruits of his father's vainglorious policy, and personally doubtless deserves the biblical condemnation (I. Kings xiv. 21-24), while his wife, probably a descendant of Absalom, exerted

a powerful and evil influence in the government. He was succeeded by his son Abijam (Abijah). See JEROBOAM I.

REHO'BOTH (Heb. pl. of *rēchōb*, wide, particularly the plaza by a city gate, the market and forum of an Oriental town, hence a common place-name). (1) The name of a well dug by Isaac (Gen. xxvi. 22). As it is associated with Beer-sheba, the identification with the name of Wady el-Rubeibe, eight miles southwest of Beer-sheba, is plausible. Here Robinson discovered ruins of a large town, to whose origin the biblical tradition may refer. The name may appear in an Egyptian geographical list, and also in the Tell-el-Amarna Tablets. Consult: Robinson, *Biblical Researches*, vol. i. (Boston, 1841); Palmer, *Desert of the Exodus* (Cambridge, 1871). (2) Rehoboth by the River, properly River-town, the home of an Edomite king (Gen. xxxvi. 37; I. Chron. i. 48). As 'The River' is *par excellence* the Euphrates, the place has been assigned to Mesopotamia; but it can only be located in Edom.

REICHA, rīk'á, ANTON (1770-1836). An Austrian musical theorist and composer, born at Prague. He was nephew and pupil of the musician Joseph Reicha. From 1794 to 1799 he was piano teacher in Hamburg, where he wrote an opera, *Obaldi ou les Français en Egypte*, which he took to Paris for production. He was unsuccessful with this, but two symphonies obtained for him a reception as instrumental composer. He lived in Vienna from 1801 to 1808, where he became intimate with Beethoven and was on friendly terms with Haydn, Albrechtsberger, and Salieri. In 1808 he returned to Paris, and brought out the operas *Cagliostro* (1810), *Natalie* (1816), and *Sapho* (1822). These were only fairly successful. His Italian opera, *Argina, regina di Granata*, had previously failed in Vienna. He gained, however, a high reputation as theorist teacher and instrumental composer. In 1818 he succeeded Méhul as professor of counterpoint and fugue at the Conservatory, was naturalized in 1829, and succeeded to Boieldieu's chair in the Académie in 1835. Among his works are many instrumental pieces, especially string quartets and quintets for wind instruments, and the treatises: *Etudes ou théories pour le pianoforte dirigées d'une manière nouvelle* (1800); *Traité de haute composition musicale* (1824 to 1826); and *L'art du compositeur dramatique* (1833). He was not an inventor, but his theoretical works are of practical value and still stand in high repute.

REICHARDT, rīk'art, GUSTAV (1797-1884). A German song writer, born at Schmarsow, near Demmin. He received his first musical training from his father, and studied theology at the universities of Greifswald and Berlin, where he also continued his musical studies. After 1819 he devoted himself entirely to music. He was a piano and violin virtuoso, and published several technical treatises. He also wrote numerous popular songs with piano accompaniment, the most familiar of which are *Das Bild der Rose* and *Was ist des Deutschen Vaterland?*

REICHARDT, JOHANN FRIEDRICH (1752-1814). A German composer, conductor, and writer on music, born at Königsberg. He had good musical training, and studied philosophy at Königsberg and Leipzig. In 1775, upon the death

of Agricola, he obtained the position of Kapellmeister at Berlin. During an extended leave of absence in London and Paris (1785 to 1786) he brought out his Passion music (after Metastasio) in both cities. He was commissioned to write two operas, *Tamerlan* and *Panthée*, for the Grand Opéra; but the death of Frederick II. made it necessary for him to return at once to Berlin and the operas were not produced. Under Frederick William II., he was permitted to increase the orchestra and obtain new singers from Italy, but later was suspended for three years and finally dismissed in 1794, on account of his sympathy with the French Revolution. Upon the death of the King he returned to Berlin, but the French occupation, in 1806, drove him back to Königsberg. Jerome Napoleon, however, forced him to return, and appointed him Kapellmeister at Cassel. He composed numerous German and Italian operas, incidental music to plays, and *Singspiele* which had considerable influence on the development of German opera. As a song composer he ranks high. He set about 60 of Goethe's lyrics to music. He published: *Ueber die deutsche komische Oper Briefe eines aufmerksamen Reisenden, die Musik betreffend* (1774-76); *Studien für Tonkünstler und Musikfreunde* (1793); *Vertraute Briefe aus Paris* (1804-05); and *Vertraute Briefe, geschrieben auf einer Reise nach Wien* (1810), all of which are of permanent value. For his life consult Schletterer (Augsburg, 1865-68).

REICHENBACH, rī'ken-bāc. A town in Silesia, Prussia, 32 miles southwest of Breslau (Map: Prussia, G 3). It has an old castle, and a Realgymnasium. It manufactures cotton and woolen fabrics, wagons, and sausages. A convention was concluded here between Austria and Prussia in 1790 by which the two powers agreed to respect the integrity of Turkey and Poland respectively. Population, in 1900, 15,052.

REICHENBACH. A town in the Kingdom of Saxony, Germany, 56 miles by rail south of Leipzig (Map: Germany, E 3). It has a new town hall, a commercial school, and a Realschule. There are wool mills, dye works, and machine shops. Population, in 1900, 24,498.

REICHENBACH, KARL, Baron von (1788-1869). A German naturalist and technologist, born at Stuttgart. He was educated at the University of Tübingen. He established iron works at Villingen and kilns for the production of charcoal at Hausach. His researches in connection with the manufacture of charcoal led him to study the products of destructive distillation of organic bodies in general, and he was the first to obtain creosote and paraffin. In 1821, in connection with Count Hugo zu Salm, he founded the iron works at Blansko, in Moravia, and took charge personally of their superintendence. This position afforded him valuable opportunities for original research, and his numerous observations and inventions have proved of great value to science and art. His name is also connected with what he thought to be the discovery of a new force of nature, an account of which may be found under *Op*. His principal publications include: *Geologische Mitteilungen aus Mähren* (1834); *Physikalisch-physiologische Untersuchungen über die Dynamide des Magnetismus, der Electricität, etc., in ihren Beziehungen zur Lebenskraft* (1849; trans. into English). Consult Schrötter, *Karl Freiherr von Reichenbach* (Vienna, 1869).

REICHENBERG, rī'ken-bērck. An important industrial town in the Crownland of Bohemia, Austria, situated on the Neisse, 52 miles north-east of Prague (Map: Austria, D 1). It is a well-built town with a number of interesting churches, of which the *Kreuzkirche*, built at the end of the seventeenth century, contains an altar-piece by Albert Dürer, a sixteenth-century palace, belonging to the counts of Clam-Gallas, a new Rathaus, and a number of monuments. The educational institutions of the town comprise a technical school, a higher gymnasium, a seminary for teachers, a textile school, a municipal theatre, and an industrial museum. The textile industry—of which Reichenberg is one of the principal centres in Austria-Hungary—was introduced into the town as early as the beginning of the fifteenth century, and Reichenberg, together with a number of adjacent villages, produces now cloth, carpets, and various kinds of woolen and cotton goods on a very large scale. Reichenberg contains also the immense meat and malt extract works of Liebig & Co. Population, in 1890, 30,890; in 1900, 34,204, chiefly Germans.

REICHENHALL, rī'ken-hāl. A town and watering-place in the Kingdom of Bavaria, Germany, picturesquely situated amid lofty mountains, on the Sallach, eight and a half miles southwest of Salzburg (Map: Germany, E 5). It is the centre of the Bavarian salt works (the largest in Germany). The saline baths, famous since the eighth century, are the most important in the German Alps. Population, in 1895, 4193.

REICHERSBERG, rīk'ers-bērck, GERHON VON. See GERHON or GERHOCH VON REICHERSBERG.

REICHMANN, rīk'mān, THEODOR (1849-1903). A German dramatic barytone, born at Rostock. He was educated musically under Elsler, Mantius, Röss, and Lamperti, and soon became famous for his voice, which was of a very dramatic quality. He sang in several important theatres of Germany and Austria, and from 1882 to 1889 he was a member of the Vienna Court opera. One of his most famous achievements was his creation of the part of Amfortas at the Bayreuth festival. In 1899-90 he sang in German opera in New York, after which he returned to Vienna.

REICHSRAT, rīks'rāt. (1) The national legislative assembly of the Austrian (Cisleithan) half of the Austro-Hungarian monarchy. See AUSTRIA-HUNGARY. (2) The Upper House of the Bavarian Parliament (Landtag). See BAVARIA.

REICHSTADT, rīk'stāt, NAPOLÉON FRANÇOIS CHARLES JOSEPH BONAPARTE, Duke of (1811-32). The only child of Napoleon I. and the Empress Maria Louisa, sometimes known as Napoleon II. He was born in Paris, March 20, 1811. The infant prince was proclaimed King of Rome and baptized on June 9 in the Cathedral of Notre Dame, by Cardinal Fesch. After the battle of Waterloo Napoleon abdicated in favor of his son, but the Senate took no notice of Napoleon II., and called Louis XVIII. to occupy the French throne, whereupon Maria Louisa and her child removed to the palace of Schönbrunn, near Vienna, where they remained till the Treaty of Vienna had rearranged the affairs of Europe. Maria Louisa then proceeded to take possession of the Duchy of Parma, while her son continued to reside at the Austrian Court with his grandfather, Francis I. By an Imperial patent, dated

July 22, 1818, he was created Duke of Reichstadt, with the rank of an Austrian prince. He received a liberal education, but never enjoyed robust health, nor did he exhibit energy of character. He died at Schönbrunn, July 22, 1832. His body was interred in the Imperial tomb at Vienna. Consult Welschinger, *Le roi de Rome, 1811-32* (Paris, 1897).

REICHSTAG, rik's'täg. See GERMANY.

REID, rēd, Sir GEORGE (1841—). A Scotch painter, born in Aberdeen. He was a pupil of the Trustees Academy in Edinburgh, and also studied under Mollinger, Israels, and Yvon. He succeeded Douglass as president of the Royal Scottish Academy in 1891, and was knighted in the same year. He is noted as a delicate painter of flowers and landscape, and as a fine portraitist. His works in this latter line include portraits of Lord President Inglis, in the Scottish Parliament House, of John Mackenzie, and of H. Wellwood Maxwell.

REID, GEORGE AGNEW (1861—). A Canadian artist, born near Wingham, Ontario. He began to study art in Toronto under Robert Harris, continued it in Philadelphia with Thomas Eakins, and then went to Paris, where he studied with Constant, Lefebvre, Dagnan-Bouveret, and others. A frequent exhibitor at the Salon, his oil paintings were also displayed at the leading exhibitions in Canada and the United States, and he won a World's Fair Columbian medal for his large canvas, "The Foreclosure of the Mortgage" (1893). Some of his other important pictures are "Drawing Lots," "Dreaming," "The Other Side of the Question," "Mortgaging the Homestead," "The Berry Pickers," "A Story, Adagio," "A Modern Madonna," "Lullaby," and "Twilight," while he was also particularly successful in panels for mural decoration. The series of these in the entrance hall of the municipal buildings, Toronto, was presented to the city by Mr. Reid and placed there at his own expense. In 1898 he was elected president of the Ontario Society of Artists.

REID, JAMES SMITH (1846—). An English classicist, born at Sorn, Ayrshire, Scotland, and educated at the City of London School and Christ's College, Cambridge. He was Fellow of Christ's College from 1870 to 1872 and classical lecturer of Pembroke College (1873-78 and 1880-85), and tutor of Gonville and Caius College 1885—. In 1899 he was made professor of Ancient History. His publications include editions of many of Cicero's philosophical works and orations and numerous philological papers.

REID (THOMAS) MAYNE (1818-83). A British writer of hunting romances and tales of adventure, born at Ballyronee, County Down, Ireland, April 4, 1818. His father was a Presbyterian minister and Mayne Reid was educated for the same profession, but the thirst of adventure led him to emigrate to the United States. In 1840 he arrived at New Orleans, where he worked as a storekeeper, negro-overseer, and actor. As a hunter and trader among the Indians, he gained that knowledge of scenery, manners, and characteristics which he afterwards used to advantage in his *Scalp Hunters*, *White Chief*, and many other romances. He devoted five years to travel in the United States. In 1846 he obtained a commission, and served with

distinction in the Mexican War. In 1849 he sailed for Europe to take part in the struggle for independence in Hungary, but got no farther than France. He then went to England, and began his long series of romances. In 1867 he returned to New York, and founded the unsuccessful *Omnard Magazine*. In 1870 he went back to England, where he died October 22, 1883. Among his many tales of adventure on land and on sea are: *The Rifle Rangers* (1850); *The Desert Home* (1851); *The Free Lances* (1851); *The War Trail* (1857); *The Boy Tar* (1859); *Afloat in the Forest* (1865); *The Castaways* (1870). Most of Reid's stories were translated into French, and many of them into German. Consult the *Memoir* by his widow, Elizabeth Reid (London, 1890).

REID, ROBERT (1863—). An American figure painter, born in Stockbridge, Mass. He was a pupil of Boulanger and Lefebvre, in Paris, and was strongly influenced by the Impressionists. His figure pieces are usually girls surrounded by flowers, out of doors, and his treatment is essentially energetic and bold. He is better known by his purely decorative works, which include "America Unveiling Her Natural Strength," in the United States Building at the Paris Exposition of 1900. There were also frescoes by him in the Liberal Arts Building at Chicago in 1893. He received the Hallgarten Prize in 1898, and a silver medal, and special gold medal for mural decoration, at Paris in 1900.

REID, ROBERT GILLESPIE (?—). A Canadian railway contractor, born at Coupar Angus (Perthshire), Scotland. In 1865 he went to Australia, where he was interested in gold-mining and other ventures, and in 1871 he emigrated to America, and had charge of the construction of the international bridge across the Niagara River, the international railway bridge over the Rio Grande, the Lachine Bridge over the Saint Lawrence, three-quarters of a mile in length, and much other important bridge work in the West. In 1893 he made a contract with the Government of Newfoundland colony whereby he was to construct a trans-insular railway from Saint John's to Port-aux-Basques, to be paid for at the rate of \$15,600 a mile and completed in three years. It was likewise arranged that he was to maintain and operate the line for a period of ten years in consideration of a grant of 5000 acres of land in alternate blocks for each mile of railway constructed. In 1898 he contracted with the Government to operate all trunk and branch railways in the island for a period of fifty years, on condition that these railways should, at the termination of the time specified, become his property. He was also to receive from the Government 2,500,000 acres of land on terms similar to those described in the previous contract; to obtain the Government telegraph lines; to build and operate seven steamers; to build and operate a street-railway in Saint John's; to buy and operate the Saint John's dry dock; to pave a designated portion of Saint John's; and to pay \$1,000,000 in cash to the Government within one year from the signing of the contract. Much opposition to this transaction was aroused in the colony and finally resulted in the resignation of the Governor, Sir James Winter, and his Cabinet, and the election of the Liberal Robert Bond. Reid then agreed

to transfer his property to the Reid Newfoundland Company, capitalized at \$25,000,000, with the understanding that the telegraphs were immediately to revert to the Government, that the land grants should be so rearranged as to protect the rights of private owners whose property had been included therein, and that at the end of fifty years the colony might take over all railways, on payment of \$1,000,000 with interest thereon, and an additional sum, to be determined by arbitration, as reimbursement for all improvements made within that time.

REID, SAMUEL CHESTER (1783-1861). An American naval officer, born in Norwich, Conn. He went to sea at the age of eleven, and on his first voyage was captured by a French frigate and confined for six months in Guadalupe. Subsequently he entered the United States Navy and served on the *Baltimore* under Commodore Truxton in the West Indies. During the War of 1812 he commanded the privateer *General Armstrong*. On September 26-27, 1814, in the neutral harbor of Fayal, Azores, the *General Armstrong* was attacked by three British vessels of much superior strength. Reid and his men defended themselves bravely in one of the most heroic conflicts of the entire war and on the second day, after having disabled one of the British ships, and inflicted a loss of 120 killed and 180 wounded on the enemy, scuttled their ship, and retreated to the shore. The entire American loss was 2 killed and 7 wounded. The violation of the neutrality of Fayal, a Portuguese port, resulted in a protracted diplomatic correspondence, and the final submission of the question at issue to Louis Napoleon, who decided against the American contention. Subsequently, however, the British Government apologized for the breach of neutrality. After the war Reid became a sailing-master in the navy, and was for many years warden of the port of New York, in which capacity he introduced many reforms, established the light-ship at Sandy Hook, perfected the signal telegraph, and reorganized the pilot system. He planned the present United States flag, adopted in 1818, providing for thirteen permanent stripes, and stars increasing with the admission of new States.

REID, THOMAS (1710-96). A leading philosopher of the Scottish school. He was born April 26, 1710, at Strachan, Kincardineshire, began his education in the parish school of Kincardine, and at the age of twelve became a student at Marischal College in Aberdeen. He took his degree of M.A. in 1726, and continued to reside in Aberdeen as college librarian, his chief studies being mathematics and the philosophy of Newton. In 1737 he was presented by the senatus of King's College to the parish church of New Machar in Aberdeenshire. The parishioners were bitterly opposed to his appointment, but his conduct and manner gradually won them over. In 1739 Hume's *Treatise of Human Nature* appeared, the perusal of which gave the impulse that determined his future philosophical career. He had fully adopted the idealism of Berkeley, but was now revolted by the conclusions drawn from it by Hume, and in consequence was led to seek a new foundation for the common notions as to a material world. In 1748 he contributed to the Royal Society of London a short essay on *Quantity*, occasioned by what he considered an abusive application by Hutcheson of the forms of mathe-

matical reasoning to ethics. In 1752 he was appointed one of the professors of philosophy in King's College, Aberdeen. Here he taught mathematics, natural philosophy, and moral philosophy. In 1763 he was chosen to succeed Adam Smith as professor of moral philosophy in the University of Glasgow. He now confined himself to teaching metaphysics and psychology. In 1764 he published his *Inquiry into the Human Mind on the Principles of Common Sense*. He continued in the duties of his chair till 1781, when he devoted his remaining strength to the publication of his works on the mind. In 1785 the *Essays on the Intellectual Powers* appeared; and in 1788 *Essays on the Active Powers*. The publication of the latter was the close of his career as an author, although to the end of his life he kept up his bodily and mental vigor, and his interest in science. He died October 7, 1796. The distinguishing feature of his philosophy was the assertion of certain irresistible convictions which are due to intuitions. Among them are the conviction as to the real existence of an external world, as to the causal connection of phenomena, as to the moral character of actions and the existence of the soul. These convictions are called axioms, self-evident truths, principles of common sense. The existence of these convictions is proved, so Reid maintains, by the testimony of experience. See COMMON SENSE. Reid's works were edited by Dugald Stewart (Edinburgh, 1804), with a *Life* by Stewart; and by Hamilton very elaborately (8th ed., ib., 1880). Consult: McCosh, *Scottish Philosophy from Hutcheson to Hamilton* (New York, 1875); A. Seth (Pringle Pattison), *Scottish Philosophy* (2d ed., Edinburgh, 1890); Sneath, *The Philosophy of Reid* (New York, 1892); Fraser, *Reid* (Edinburgh, 1898).

REID, SIR THOMAS WEMYSS (1842-). An English journalist and author, born at Newcastle-on-Tyne and educated there. Having begun journalism in 1861, he edited the *Leeds Mercury* for seventeen years. In 1887 he resigned to become manager of Cassell and Company, a well-known London publishing house. In 1890 he was appointed the first editor of the *Speaker*, founded as a Radical organ. This weekly periodical he ably conducted till his resignation (1899). Reid has made solid contribution to recent history in *Cabinet Portraits* (1872); *Politicians of To-Day* (1879); *The Land of the Bey*, an account of a visit to Tunis (1882); and especially in his *Life of the Rt. Hon. W. E. Forster* (1888); *Life of Richard Mouckton Milnes* (1891); *Life of Lord Playfair* (1899); and *Life of W. E. Gladstone* (1899), of which he was editor. His biography of *Charlotte Brontë* (1877) served as an excellent corrective to the somewhat imaginary portraits of the Brontës by Mrs. Gaskell. His novels *Gladys Fane* (1883) and *Mauleverer's Millions* (1885) were successful.

REID, WHITELAW (1837-). An American journalist and statesman, born in Xenia, Ohio, October 27, 1837. He graduated at Miami University (1856) and immediately entered into journalism and politics, making political speeches and editing the *Xenia News*. He was a captain and volunteer aide on the staff of Major-General Thomas A. Morris and afterwards on that of Rosecrans. He served as correspondent of the

Cincinnati *Gazette* during the Civil War, was present at Shiloh, Gettysburg, and elsewhere, and was afterwards chosen Librarian of the House of Representatives (1863-66). He then tried cotton planting in Louisiana and wrote *After the War* (1866). Returning to Ohio, he wrote *Ohio in the War* (1868), an elaborate and important work. He next joined the staff of the *New York Tribune*, and, succeeding Horace Greeley in 1872, became its editor and principal owner. He twice declined appointment as Minister to Germany, but he accepted the nomination for Vice-President (1892) and the appointment of Minister to France (1889-92) and Special Ambassador to Queen Victoria's Jubilee (1897). He was a member of the Peace Commission that terminated the Spanish War (1898), and Special Ambassador to Great Britain for the coronation of Edward VII. (1902). Among his collected writings are: *Schools of Journalism* (1871); *The Scholar in Politics* (1873); *Some Newspaper Tendencies* (1879); and *Town Hall Suggestions* (1881).

REID, Sir WILLIAM (1791-1858). A British soldier and meteorologist, born at Kinglassie, Scotland. He was educated at the Royal Military Academy, Woolwich, was commissioned lieutenant of engineers in 1809, and was later sent to the theatre of war in Spain. In 1815 he participated in Sir Edward Pakenham's unsuccessful attack on New Orleans. The next year he took part in Lord Exmouth's expedition against Algiers. In 1835 he commanded a brigade in the British Legion raised by the Queen Regent of Spain. In 1839 he was appointed Governor of the Bermudas, where he remained until 1846, when he was transferred to Barbadoes as Governor-in-Chief of the Windward Islands. In 1849 he was made commanding royal engineer at Woolwich. He was Governor of Malta from 1851 until 1858, and in 1856 was raised to the rank of major-general. He published several books, including *An Attempt to Develop the Law of Storms* (1838) and *The Progress of the Development of the Law of Storms* (1849).

REIFFERSCHIED, rī'fēr-shīt, AUGUST (1835-87). A German archaeologist and classical philologist, born and educated in Bonn. He received a traveling fellowship in archaeology from the University of Bonn; spent 1861-66 mostly in Italy, being part of the time charged by the Vienna Academy to make archival research for the Latin *Corpus Scriptorum Ecclesiasticorum Latinorum*; and was professor at Breslau (1868-85), and from 1885 at Strassburg. His works include *Suctoni præter Cæsarum Libros Reliquia* (1860), the standard edition of these fragments; *Bibliotheca Patrum Latinorum Italica* (1865-72); *Arnobius* (1875); an edition of Anna Comnena's *Alexias* (1878); and a partial edition of Tertullian (edited by Wissowa, 1890).

REIGATE, rī'get. A municipal borough and market town in Surrey, England, at the base of the North Downs, 23 miles south of London (Map: England, F 5). The town was incorporated in 1863; it owns a sewage farm, provides isolation for infectious diseases, and contributes to technical instruction. From early times it was considered a place of strength; and after the Conquest it was granted to the earls of Warrenne. Of the castle built by these earls only vestiges remain. The parish church is in

various styles of architecture, the oldest portions dating from the twelfth century. Trade is chiefly agricultural; Reigate has neighboring quarries of freestone and hearthstone and supplies of fullers' earth, and of silver sand for manufacturing glass. Population, in 1891, 22,646; in 1901, 25,993.

REIGHARD, JACOB ELLSWORTH (1861—). An American zoölogist, born at Laporte, Ind. He graduated at the University of Michigan in 1882, pursued graduate studies at Harvard and Freiburg, and after six years as instructor and assistant in zoölogy became in 1892 professor in the University of Michigan. He was in charge of the Michigan Fish Commission in 1890-94, and in 1898 was appointed director of the biological survey of the Great Lakes under the auspices of the United States Fish Commission. Reighard contributed to many technical journals, and in 1901 published in collaboration with Jennings *The Anatomy of the Cat*.

REIGN OF TERROR. The name commonly given to that period of the French Revolution beginning with the fall of the Girondists (q.v.) in June, 1793, and terminating with the overthrow of Robespierre (q.v.), July 27, 1794. See FRENCH REVOLUTION.

REIMARUS, ri-mä'ryus, HERMANN SAMUEL (1694-1768). A German naturalistic philosopher. He was born in Hamburg, December 22, 1694, studied at the universities at Jena and Wittenberg, traveled afterwards in Holland and England, and on his return was elected rector at Wismar (1723) and in 1728 professor of Hebrew and mathematics at the Gymnasium of Hamburg. He died there March 1, 1768. He is the author of the so-called *Wolfenbüttelsche Fragmente eines Unbekannten*, first published by Lessing in his *Beiträge zur Geschichte und Litteratur aus den Schätzen der Wolfenbüttelschen Bibliothek* (1774, 1777-78). These *Fragmente*, up to that time only known in manuscript by a few of Reimarus's most intimate friends, produced a sensation throughout Germany, since the author, in the boldest and most trenchant manner, denied the supernatural origin of Christianity. They were partially translated, as *Fragments from Reimarus* (London, 1879). Another work in the same direction is his *Vornehmste Wahrheiten der natürlichen Religion* (1754). His edition of Dio Cassius is one of the most valuable contributions to classical philology (1750). Consult his biography by Strauss (Bonn, 1862; 2d ed. 1877).

REIMS, rēms, *Fr. pron.* räns. A city of France. See RHEIMS.

REIN, rīn, JOHANNES JUSTUS (1835—). A German geographer, born at Raunheim-on-the-Main, and educated in mathematics and science at the University of Giessen. He made various scientific journeys in Europe, Asia, and America, and in 1876 was appointed professor of geography at the University of Marburg. Afterwards he held a similar appointment in Bonn. His publications include *Japan, nach Reisen und Studien* (1881-86), which was translated into English, under the title *Japan, Travels and Researches* (1884), as was also his book on the industries of Japan (1889); and *Columbus und seine vier Reisen nach Westen* (1892).

REIN, WILHELM (1847—). A German educator and author, born at Eisenach. He studied at Heidelberg, Leipzig, and Jena, for several years was teacher at Weimar, and from 1876 to 1886 was principal of a school in Eisenach. In 1886 he was appointed professor of pedagogy at the University of Jena. Rein's system of education resembles Herbart's. He ranks among the foremost of educational theorists, and has exerted great influence on the educational institutions of his country. His principal works are *Theorie und Praxis des Volksschulunterrichts* (1879-93) and *Pädagogik im Grundriss* (1892). He edited Niemeyer's *Grundsätze der Erziehung* (1878-79), and founded the educational journal *Pädagogische Studien* in 1880.

REINACH, rá'ná', JOSEPH (1856—). A French publicist, born in Paris. He studied at the Lycée Condorcet and in the faculty of law of the University of Paris, was admitted to the bar in 1877, wrote for the *Dix-neuvième Siècle* and Gambetta's *République Française*, and in 1881-82 was private secretary to Gambetta, then president of the Cabinet council. Having reëntered journalism, in 1886 he became proprietor with Deynarouse of the *République Française*, in which he supported the Union-Republican group. In 1889 he was elected as Liberal-Republican Deputy for Digne (Basses-Alpes), in 1893 was re-elected, but in 1898 failed of reelection because of opposition to his attitude in the Dreyfus case. In the Chamber of Deputies he was a member of the committees on the budget and on the army, and took a prominent part in the legislative debates. He became departmental councillor of Basses-Alpes for the Canton of Moustiers in 1896. He appeared prominently in connection with the Dreyfus case, denounced the introduction of secret documents into the trial of 1894, the forgeries of Paty du Clam and Henry, and the complicity of the latter with Esterházy, and was associated with Scheurer-Kestner in the movement for revision. He published on the case several pamphlets, including *La voix de l'isle* (1898), *Les enseignements de l'histoire* (1898), *A l'isle du diable* (1898), *Vers la justice par la vérité* (1898), *Le crépuscule des traitres* (1899), and *Les faits nouveaux* (1899), and the volumes *Les blés d'hiver* (1901), *Histoire de l'affaire Dreyfus*, *Le procès de 1894*, and *Histoire de l'affaire Dreyfus*. Esterházy (1903). The brochure *Les enseignements de l'histoire* originally appeared in the *Siècle*, and caused Reinach to be expelled from his captaincy in the territorial army for "a gross offense against discipline" and to be deprived of the decoration of the Legion of Honor. Among his further publications are: *La Serbie et le Monténégro* (1876); *Voyage en Orient* (1879); *Le ministère Gambetta* (1884); *Etudes de littérature et d'histoire* (1888-89); and *Les petites Catilinaires* (1888-89), collected articles against Boulanger. He also edited the *Discours et plaidoyers politiques de Gambetta* (11 vols., 1881-85), and *Dépêches, circulaires, décrets, proclamations et discours de Gambetta* (1886).

REINACH, SALOMON (1858—). A French archaeologist, brother of the preceding, born at Saint-Germain-en-Laye (Seine-et-Oise). He studied at the Lycée Fontanes and the Ecole Normale Supérieure, was appointed to the French Classical School of Athens (Ecole Française d'Athènes), and made interesting excavation and discoveries

at Myrina, near Smyrna, and elsewhere (1880-82). In 1886 he became attaché in the Museum of National Antiquities at St. Germain-en-Laye, in 1890-92 held the chair of assistant professor of national archaeology at the Ecole du Louvre, and in 1893 was appointed associate curator of the National Museums. He was elected to the Académie des Inscriptions et Belles-Lettres in 1896. He reviewed works on archaeology for the *Revue Critique*, edited a careful text (1877) of Saint Augustine's *De Civitate Dei*, and published among his original volumes a *Chronique d'Orient* (1885-91), cataloguing all discoveries made in Greece to that date; *La nécropole de Myrina* (with Pottier, 1887); *Description raisonnée du musée de Saint-Germain* (1890); *Les Celtes dans les vallées du Pô et du Danube* (1894); *Répertoire de la statuaire grecque et romaine* (1897-98); and *Guide illustré du musée national de Saint-Germain* (1899).

REINAUD, rá'nó', JOSEPH TOUSSAINT (1795-1867). A French Orientalist, born at Lambesc (Bouches-du-Rhône). He was a pupil of Sylvestre de Sacy, became connected with the Royal Library, and was appointed conservator of that institution in 1834. He was also president and (1838 et seq.) De Sacy's successor as professor of Arabic at the Ecole des Langues Orientales Vivantes (1838-67). He published: *Monuments arabes, persans, et turcs du cabinet de M. le duc de Blacas et d'autres cabinets* (1828), a work of great value, especially in the province of epigraphy; a version of Raymond Lully's *Livre de la loi au Sarrazin* (1831, with Michel); *Extraits des historiens arabes relatifs aux guerres des croisades* (1829); *Invasions des Sarrazins en France* (1836); the text and a French version of Abulfeda's geography (with Slane, 1840-48); *Fragments arabes et persans relatifs à l'Inde* (1834); *Relation des voyages faits par les Arabes et les Persans dans l'Inde et Chine* (1845); and *Relations politiques et commerciales de l'empire romain avec l'Asie orientale* (1863). From 1847 to his death he was president of the Société Asiatique.

REINDEER (Icel. *hreinn*, AS. *hrán*, reindeer, from Lapp *reino*, pasturage + *deer*, AS. *dēor*, Goth. *dius*, wild beast, animal, Ger. *Thier*, animal). An Arctic deer (*Rangifer tarandus*) which has long been domesticated and used as a draught animal and a beast of burden in Northern Europe. The wild race still exists in varying abundance almost everywhere from Northern Scandinavia to Eastern Siberia, wandering to the Arctic coast and throughout Spitzbergen, Nova Zembla, and the Phipps and Parry islands. They are not known much south of Lapland in the west, nor below the northern margin of the great forest region in Siberia, but in the Ural region they wander southward to the borders of Perm. Whether the caribou (q.v.) of Greenland and Canada are to be regarded as merely geographical races of the European form, thus considered as a circumpolar species, is a matter of opinion. European zoologists generally do so regard it, and assert that the differences between European and American examples are not sufficient to be deemed specific. Merriam and other recent American zoologists think otherwise and set apart no less than six 'species' in the New World. Within historic times reindeer lived in the islands north of Scotland, but became extinct there before the

twelfth century; they were much more recently numerous throughout Scandinavia. The habits of the American species are outlined under CARIBOU. Those of the plains and islands of subarctic Europe and Asia wander about the tundras and desolate treeless mountains, making periodical migrations from one feeding-ground to another. In early summer the Spitzbergen herds betake themselves to the grassy valleys of the interior, whence they return in the autumn to the coast to feed upon seaweed. The coming of the winter ice cuts off this resource, compelling them to go into the mountains, where they subsist upon the rock-lichens, which they uncover by shoveling away several feet of snow with their flat horns, or pawing it aside with their feet. The alternate thawing and freezing of spring, by forming a hard crust on the snow, interferes sadly with their welfare, and great numbers sometimes starve at this season. In Siberia, as in North America, migrations in scattered herds regularly take place from the barren coast plains southward to the less inclement region along the borders of the forest area, where food may be obtained. Not much is known of the breeding habits of the wild reindeer except that the fawns are born in the spring.

The reindeer has long been domesticated among the Laplanders and the tribes along the coast of Siberia, and used for drawing sledges and as a riding and burden animal, besides furnishing skins for tents, clothing and harness, flesh and milk for food, and horns and hoofs for various utilities. It has remarkable endurance, strength, and speed in drawing sledges, and without this animal much of Lapland and Siberia could not be permanently inhabited. These qualities led the Government of the United States to endeavor to naturalize reindeer among the Eskimos of the north coast of Alaska, who were in danger of starving through the loss of food and uneconomical habits, following the pursuit of excessive whaling and walrus-hunting by white men off that coast. The experiment was conducted under the direction of the Commissioner of Education and the personal care of the Rev. Sheldon Jackson. Agents procured a small herd of Siberian reindeer which, with Lapp attendants, were landed in Northern Alaska in 1889. The training of Alaskan attendants and drivers was begun, and more herds were annually imported. Up to 1898 550 deer had been brought from Siberia, and the stock with its increase amounted to about 5000 in 1903. Several stations were established where the deer were bred, and where Eskimos were trained in their care and use. The history of the attempt is contained in Jackson's *Annual Reports* to the Department of the Interior, from 1890 onward.

The wild reindeer is much larger than the domesticated races. It is as large as the stag, but heavier and more clumsy in appearance. It has a dark coat in summer and a lighter one in winter, with a growth of long whitish hair under the neck, while the region about the short goat-like tail and the outlines of the hoofs are nearly white. It constitutes a genus (*Rangifer*), differing from that of ordinary deer in the important particular that both sexes have horns, although those of the bucks are larger. These antlers are peculiar in their long, slender, unequally branching beams, and especially in the fact that the brow-tines are greatly produced and palmated, and one is usually aborted to allow the other to

push forward into a formidable weapon, overhanging the face.

During Pleistocene time the reindeer was more widely distributed over Europe than it is at the present day, for its fossil remains have been found as far as the Alps and the Pyrenees.

Consult: Lydekker, *Deer of All Lands* (London, 1898); id., *Royal Natural History*, vol. ii. (London, 1896); Nordenskiöld, *Voyage of the Vega* (New York, 1881); Boyd Dawkins, *Cave Life* (London, 1875); and the works of travelers and explorers in the Arctic regions and the countries where reindeer are used. For the American forms, consult: Stone and Cram, *American Animals* (New York 1902); Roosevelt, *The Deer Family* (ib., 1902); Preble, "Biological Investigation of the Hudson Bay Region," in *North American Fauna* No. 22 (Department of Agriculture, Washington, 1902); and books cited under DEER.

REINDEER MOSS (*Cladonia rangiferina*). A lichen of great importance to inhabitants of the northernmost regions of the Northern Hemisphere, where it covers great areas and furnishes the chief winter food of the reindeer. It is found in almost all parts of the world, but is most abundant and luxuriant in arctic and sub-arctic regions, often occupying the ground in pine and spruce forests. When such forests are destroyed by fire it soon reappears. It is a variable plant, but always consists of a much-branched, erect, cylindrical, tubular thallus, with small perforations in the axils, and attains a height of two inches or more. Its importance was first brought into notice by Linnæus in his *Flora Laponica*. It is sometimes used for human food. Its taste is pleasant, although attended with a slight pungency or acidity. It is generally boiled in reindeer milk. Its nutritious qualities depend chiefly on a form of starch, lichenin, which it contains.

REINECKE, rī'nĕk-e, KARL (1824—). A German pianist, born at Altona. He studied with his father, Johann Peter Rudolph Reinecke, a musical composer and director. He was Court pianist to Christian VIII. at Copenhagen from 1846 to 1848. He became teacher at the Cologne Conservatory in 1851, and occupied at later times the positions of musical director at Barmen, academie musical director and conductor of the Singakademie at Breslau, conductor of the Gewandhaus Concerts at Leipzig, and teacher at the Conservatory. His compositions are both refined and classic throughout, but possess here and there a marked touch of the romantic. Among his works are: *Serenade*, *Aus der Jugendzeit*, *Neues Notenbuch für kleine Leute*; *Nocturne*; studies, sonatas, quartets, quintets, and trios. The five-act grand opera *König Manfred* was produced in 1867; the opera *Ein Abenteuer Händel's*, in 1874; two three-act comic operas, *Auf hohen Befehl* and *Der Gouverneur von Tours*, in 1886 and 1891 respectively. He also wrote the funeral march for Emperor William I. He became widely known as an excellent conductor, and as a pianist for his interpretations of Mozart.

REINEKE VOS. See REYNARD THE FOX.

REINHART, rīn'härt, CHARLES STANLEY (1844-96). An American genre painter and illustrator. He was born in Pittsburg, Pa. From

1868 to 1870 he studied at the Atelier Suisse, Paris, and at the Royal Academy, Munich, under Streyhüber and Otto. Upon his return to the United States he illustrated for various foreign and American magazines, and frequently exhibited works in oil, water-colors, and black-and-white at the National Academy. From 1881 to 1891 he resided in Paris, exhibiting regularly at the Salon, afterwards becoming a member of the Society of American Artists, New York. Reinhart excelled in black-and-white, his oils and water-colors being mostly marine views, painted in sombre but delicate colors. In oil are: the "Old Life Boat" (1880); "Mussel Fishermen" (1886); "Washed Ashore" (1887), which won the gold medal (Philadelphia, 1888); and the "Rising Tide" (1888), purchased by the Government at the Paris Exposition, 1889. His water-colors include "Gathering Wood" (1877), "At the Ferry" (1878), and the "Spanish Barber" (1884). Among his chief series in black-and-white are the "Reichstag Sketches," "A Little Swiss Sojourn," and "Americans Abroad." Reinhart died in New York City, August 30, 1896.

REINHART, CHRISTIAN (1761-1847). A German landscape painter and etcher, born at Hof, Bavaria. First instructed by Cöser in Leipzig, he studied at the Dresden Academy under Klengel, but chiefly after the Dutch masters, and in 1789 went to Rome, where he settled permanently and under the influence of Carstens and Koch became a conspicuous exponent of the historic landscape. His best work is represented by the "Eight Historic Landscapes" (1825), in the Palazzo Massimi, Rome, and "Four Views from Villa Malta," in tempera, painted for King Louis I. of Bavaria. The New Pinakothek in Munich contains "Four Views Near Rome" (two dated 1836, 1846), the Leipzig Museum a "Wood on Seashore in a Storm" (1824) and "Landscape with Psyche" (1829), the Städels Institute, Frankfurt, a landscape with "Cain and Abel," and the Cologne Museum a "View from Tivoli." To a collection of seventy-two etchings of prospects in Italy, published conjointly with Dies and Mechau under the title *Malerisch radirte Prospective aus Italien* (1792-98) Reinhart contributed twenty-four plates, the best of the series. Besides these he etched many other Italian landscapes, and thirty-eight animal studies, in all 170 plates. Consult: Baisch, *Reinhart und seine Kreise* (Leipzig, 1882); and Andersen, *Die Deutschen Maler-Radire*, i. (ib., 1866).

REINHART VON GRÜNINGEN, fón grü'ning-en. See GRÜNINGER, JOHANN.

REINHOLD, rīn'hölt, CHRISTIAN ERNST (1793-1855). A German philosopher, son of Karl Leonhard Reinhold, born at Jena. He at first lectured on philosophy at the University of Kiel, and afterwards was appointed professor of logic and metaphysics at the University of Jena. His philosophical system resembles Kant's. He published: *Geschichte der Philosophie nach den Hauptmomenten ihrer Entwicklung* (4th ed. 1884); *Theorie des menschlichen Erkenntnisvermögens und Metaphysik* (1832-34); *Lehrbuch der Geschichte der Philosophie* (3d. ed. 1849) a work of much value; and *System der Metaphysik* (3d ed. 1854). Consult Apelt, *Ernst Reinhold und die Kantsche Philosophie* (Leipzig, 1840).

REINHOLD, KARL LEONHARD (1758-1823). A German philosopher, born in Vienna. In 1772 he entered the Jesuit College of Saint Anna, but upon the suppression of this Order in 1774 he joined the Barnabites, and was for some years an inmate of their College of Saint Michael. His religious zeal in the meantime had cooled considerably, and in 1783 he left the Order and went to Leipzig, where he devoted himself to philosophy. Afterwards he settled in Weimar. His contributions to the *Deutscher Merkur* attracted much attention, and in 1787 his *Briefe über Kantsche Philosophie* appeared in this periodical. His clear and eloquent exposition of Kant's doctrines, which at that time were being combated, resulted in his being appointed to a professorship of philosophy in Jena. In 1789 he published his chief work, *Versuch einer neuen Theorie des menschlichen Vorstellungsvermögens*, in which he attempts to broaden the teachings of Kant. He then for a time identified himself with Fichte's doctrines and even tried afterwards in his *Paradozien der neuesten Philosophie* to find a middle way between Fichte and Jacobi in order to satisfy his religious sentiments, but when Bardili's logic appeared he deserted both and joined the latter's rational idealism. The reason for this change he gives us in his treatise *Wahrheit* (1820).

REINICK, rī'nik, ROBERT (1805-52). A German painter, etcher, and poet, born and educated in Danzig. He studied painting under Begas in Berlin and at the Düsseldorf Academy, and settled at Dresden in 1844. Several pleasing pictures, either historical or romantic in subject, had come from his brush after 1830—for example, "Rachael and Jacob at the Well" (Stettin Museum), "Well Near Olevano," and several others (Danzig Museum)—but his most interesting productions are those in which his pictorial and poetic talents are blended, such as "Drei Umrisse nach Holzschnitten von Dürer mit erläuterndem Text und Gesängen" (1830). With Kugler he published the *Liederbuch für deutsche Künstler* (1833), with woodcuts by Gubitz, and then the *Lieder eines Malers mit Randzeichnungen seiner Freunde* (1838), with thirty-one etchings by himself and other Düsseldorf artists. He supplied the poetical text to Retbel's "Dance of Death," and was associated with Ludwig Richter in editing Hebel's *Allemannische Gedichte* (1851), of which he gave a High-German version. A sixth edition of his collected *Lieder*, with a biography by Auerbach, was published in Berlin in 1873. His natural ability as a juvenile poet is well exemplified by the *Lieder und Fabeln für die Jugend* (2d ed. 1849), the *Illustriertes ABC-Buch für kleine und grosse Kinder* (4th ed. 1876), and the fairy-tale *Die Wurzelprinzessin* (1848). The poetical works for young people appeared collected under the title *Märchen-, Lieder- und Geschichtenbuch* (11th ed., Leipzig, 1895).

REINICKE, rī'nik-e, PAUL RENÉ (1860—). A German painter and draftsman, born at Strenz-naundorf, near Halle. He studied at Weimar under Struys, at Düsseldorf under Gebhardt, and at Munich under Pügelheim, whom he accompanied to Palestine. Settled afterwards in Munich, he found the true field for his talent in drawing sketches for the *Fliegende Blätter*, in which his masterly delineations from the social life of the upper classes in its various aspects soon became an eagerly looked-for specialty. A selection of

his drawings was published in Munich (1890) under the title "Spiegelbilder aus dem Leben." His "Waiting Room of the First Class in the Munich Railway Station" is in the National Gallery, Berlin. He was awarded a gold medal in 1882.

REINKENS, rin'këns, JOSEPH HUBERT (1821-96). The first Old Catholic bishop. He was born at Burtscheid, near Aix-la-Chapelle; studied theology at Bonn; was ordained priest of the Roman Catholic Church; and in 1853 was appointed professor of Church history at Breslau. In 1870 he united with Döllinger in the Old Catholic movement, was suspended by the Bishop of Breslau, and the students were forbidden to attend his lectures. In 1873 he was consecrated Bishop at Rotterdam by the Jansenist Bishop of Deventer. He soon took the oath of allegiance to the Government, and was recognized by Prussia as a Catholic bishop, with his residence at Bonn, and remained there in this capacity till his death. His publications include: *Hilarius von Poitiers* (1864); *Martin von Tours* (1866); *Revolution und Kirche* (1876); *Melchior von Diepenbroek* (1881); *Lessing über Tolcranz* (1883). See OLD CATHOLICS.

REINMAR VON HAGENAU, rin'mär fôn hä'ge-nou (?-c.1210). A German poet, one of the first of the minnesingers, usually called Reinmar the Old. From Hagenau he went to Vienna and there taught Walther von der Vogelweide, with whom he may have made the Crusade of 1190. His poetry, artificial, sad, and 'pale-hued,' won him the title of the 'Nightingale of Hagenau' from Gottfried von Strassburg, a panegyric from his pupil Walther, and from Uhland high praise for its sentiment and diction. It is published in Lachmann and Haupt's *Des Minnesangs Frühling*. Consult: Schmidt, *Reinmar von Hagenau* (Strassburg, 1874); and Burdach, *Reinmar der Alte und Walther von der Vogelweide* (Leipzig, 1880).

REINSCH, rinsh, PAUL SAMUEL (1869-). An American historical writer. He was born in Milwaukee, Wis., of German-American parents. He graduated at the University of Wisconsin in 1892, at the law school of the same institution in 1894, and after being admitted to the bar practiced for some time in Milwaukee. Returning to the State University in 1895, he became an instructor and extension lecturer in history, pursuing graduate studies at the same time, and taking the degree of Ph.D. in history in 1898. In 1899 he was appointed assistant professor of political science, and in 1901 professor of political science. His publications include *The Common Law in the Early American Colonies* (1899), *World Politics at the End of the Nineteenth Century* (1900), and *Colonial Government* (1901).

REINTHALER, rin'tä-lër, KARL MARTIN (1822-96). A German composer, born at Erfurt. He studied music under A. B. Marx, and, later, in both Paris and Rome. In 1853 he was appointed teacher at the Cologne Conservatory, and in 1858 became municipal music director and cathedral organist at Bremen, where he also conducted the cathedral choir, the Singakademie, and the concert society. He retired in 1893. His best known works are the oratorio *Jephtha*, the *Bismarck-Hymne*, the choral works *In der Wüste*, and *Das Mädchen von Kolah*, and the operas

Edda (1875) and *Kätchen von Heilbronn*, which gained a prize at Frankfurt in 1881.

REIS, ris, PHILIPP (1834-74). A German physicist, born at Gelnhausen. In 1858 he became a teacher in the Garnier Institute, near Homburg, and there, after two or three years of research, in 1860 he produced the first telephone. It transmitted musical tone, but not the intelligible utterances of the voice. Reis gained no benefit from his invention. In 1885 a monument was erected to him in his native town. Consult Thomson's English version of the biographical sketch by Schenk (London, 1883).

REISEBILDER, ri'ze-bil'dër (Ger., pictures of travel). A work by Heinrich Heine in four volumes (1826-31), in which poetic descriptions of nature and powerful delineations of character are mingled with scoffs at the institutions of the age, political, religious, and social. The wit and irreverence of these attacks, which respected nothing, together with the real beauties of the work, won for it an immediate success and brought the author into popular favor. Some of the poems interspersed through the work were published later with others under the title of *Buch der Lieder*.

REIS EFFENDI, rä'is ëf-fën'di (Turk., presiding official). A title formerly given to an officer of State in the Ottoman Empire. He was the Chancellor of the Empire, and Minister of Foreign Affairs. His duties in the first-mentioned capacity was to confer with the Grand Vizier regarding the orders and instructions to be sent to the different provinces and regarding the proper decision on any subject affecting the Empire, whether internal or external; and in the latter capacity he had the sole and exclusive charge of the relations of the Porte with foreign courts.

REISKE, ri'ske, JOHANN JAKOB (1716-74). A celebrated German philologist and Oriental scholar. He was born at Zörbig, Prussian Saxony, and was educated at the University of Leipzig, where he devoted much attention to the study of the Semitic languages, especially Arabic. In 1758, after living in abject indigence, he obtained the rectorship of the Nikolai Gymnasium, in Leipzig, and he retained the post till his death. From 1758 he devoted his attention chiefly to Greek literature, in which he became a recognized authority. His works, which are very numerous and are remarkable for their learning, include his *Animadversiones in Græcos Auctores* (1757-66), and editions of Theocritus (1765-66); of the Greek orators (1770-75); of Maximus Tyrius (1774-75); of Dionysius of Halicarnassus (1774-77); of Plutarch, with notes and translations (12 vols., 1774-82); Dio Chrysostom (1784-98); and Libanius (1791-94). Reiske was also the first to call attention to the historical and æsthetic value of Arabic literature. His chief work in this field was his Latin translation of the *Annales Moslemici* of Abulfeda (1754; frequently reëdited). Some of these works, and his correspondence with Moses Mendelssohn and Lessing, were published after his death, by his wife, Ernestine Christine Reiske (1735-98). Consult: Morus, *Vita Reiskii* (Leipzig, 1777); Reiske, *Selbstbiographie* (Leipzig, 1793); and Haupt's *Opuscula* (Leipzig, 1875-76).

REISS, ris, WILHELM (1838-). A German traveler and naturalist, born at Mannheim. He

traveled in the Azores, Madeira, and Canary Islands in 1858-60, in Greece in 1866, and with Stübel in 1868-76 explored South America. In particular he visited Ecuador, Colombia, Peru, and Bolivia, and he and Stübel were the first to ascend Mount Cotopaxi. The scientific results of this journey were of much value. Reiss was president of the Berlin Gesellschaft für Erdkunde in 1885-87, and of the Anthropological Society in 1888. In addition to contributions to the publications of the Gesellschaft für Erdkunde and various scientific journals, he wrote: *Das Totenfeld von Ancon in Peru* (1880-86); *Geologische Studien in der Republik Columbia* (1892-99); and *Das Hochgebirge der Republik Ecuador* (1892-1902).

REISSIGER, rīś'sīg-ēr, KARL GOTTLIEB (1798-1859). A German musician, born at Wittenberg. He studied under Schicht at the Thomasschule at Leipzig, and dramatic composition under Winter at Munich. He taught at the Berlin Royal Institute, and in 1826 went to The Hague, where he organized a conservatory which is still prosperous. This same year he succeeded Marschner as musical director of the German Opera at Dresden, and later was appointed Kapellmeister, as Weber's successor. He wrote: *Didone abbandonata* (1823); *Die Felsenmühle von Etalières* (1829), the overture of which is still played at concerts; *Turandot* (1835); *Adèle de Foix* (1841); masses, psalms, symphonies, overtures, sonatas for violin and cello, and the oratorio *David*. *Weber's Last Thought*, a waltz, is his most popular piece.

REISSMANN, rīś'mán, AUGUST (1825—). A German writer on music, born at Frankenstein, Silesia. He studied at Breslau under Mosewius, Baumgart, Richter, Lüstner, and Kahl. From 1866 to 1874 he lectured on the history of music at the Stern Conservatory in Berlin. From 1880 at Leipzig, and later at Wiesbaden. *Das deutsche Lied in seiner historischen Entwicklung* (1861) is his best and most original work. His other historical works, mostly clever collections or extracts from original studies made by others, include: *Von Bach bis Wagner* (1861); *Allgemeine Geschichte der Musik* (1863-65); *Illustrierte Geschichte der deutschen Musik* (2d ed. 1892); and the biographies of various composers. He also composed an oratorio, *Wittekind*, two operas, symphonies, chamber music, and songs.

REITBOK (from Dutch *rietbok*, reed-duck, from *riet*, reed + *bok*, buck). One of the small antelopes, called by English sportsmen in Africa 'reedbucks.' See REEDBUCK.

REJ, rē'y', MIKOLAJ (1505-69). A Polish poet and prose writer, born in the Ukraine. He was more than sixty years of age before he produced his principal poem, *Zwierzciadlo* ("The Mirror," 1567, reprinted in 1829). Nine years previously his *Wizerunek własny zycota elowieka poczciwego* ("Picture of an Honorable Man," 1558, reprinted at Warsaw, 1881-88) had appeared, and besides metrical Polish translations of the Psalms (1533), *Postylla Polska* (Gospel Commentaries, 1556), and a catechism, he published *Zycot Józefa* (1545), *Zwierzyniec* (1562), and *Figliki* (1568). A stout Calvinist, he wrote much in defense of his chosen creed and was one of the first to use Polish as a literary language. His prose shows the language in its

purity, before the introduction of foreign words and forms.

RÉJANE, rá'zhān', MADAME (1857—). The stage name of Gabrielle Réju, a French actress, born in Paris. She made her début at the Vaudeville in 1875, and soon gained a reputation for her witty impersonations. In 1892 she married M. Porel, then her manager. In 1893 she created her best-known rôle of *Madame Sans Gêne*, written for her by Sardou. She appeared with it in London in 1894, and in the United States in 1895. Afterwards she appeared in *La douloureuse* and *Zaza*.

REJECTED ADDRESSES. Burlesque poems by James and Horace Smith, published anonymously in 1812. Ostensibly unsuccessful efforts in the competition for the opening of the new Drury Lane Theatre at that time, they were amusing parodies on the poems of Wordsworth, Southey, Coleridge, Byron, Scott and others.

REJOINER (OF., F. *rejoindre*, to rejoin, from Lat. *re*, back again, anew + *jungere*, to join). In common-law pleading, the answer of a defendant to a plaintiff's replication to his (defendant's) plea. See PLEADING.

REJUVENATION, or REJUVENESCENCE. It is supposed by Maupas and others that the process of conjugation in the Infusoria (q.v.) results in increased vigor and vitality, and is thus advantageous to those organisms in which the most primitive form of reproduction is by simple self-division. Indeed it has been observed that conjugation results in increased activity in multiplication by fission. So also sexual reproduction is a rejuvenizing process, and tends to prevent both the individual and the species from deteriorating or running out. It may be said to correspond in its effects to cross-fertilization, which is the antidote to too close in-breeding and tends to enhance the vitality of the species and prevent degeneration. In botany, a transformation of one cell into another, i.e. into a primordial cell, which afterwards secretes a new cell-wall, and forms the starting-point of the life of a new individual. Examples occur in numerous algae (*Ectogonium*), and also in certain diatoms. See GROWTH.

RELAPSE, THE; OR VIRTUE IN DANGER. A comedy by Sir John Vanbrugh, produced in 1697. It was written as a sequel to Cibber's *Love's Last Shift*, and was very popular throughout the eighteenth century. It was imitated by Lee in *A Man of Quality* (1776), and recast by Sheridan as *A Trip to Scarborough* (1777). Voltaire used it as the basis of *Le Comte de Boursoufle* (1734). Later versions were made by Hollingshead in *Man of Quality* (1870) and Buchanan in *Miss Tomboy* (1890).

RELAPSING FEVER (from Lat. *relapsus*, p.p. of *relabi*, to fall back, from *re*, back again, anew + *labi*, to slip), FAMINE FEVER, or FEBRIS RECURRENS. A specific infectious and contagious disease, generally occurring in epidemics, and due to a micro-organism, the *spirochaeta Obermeieri*. This organism is a spirillum, about $\frac{1}{10}$ of an inch in length, and undergoing constant movements of a rotary or lashing character. The disease occurs in times of famine and flourishes under conditions of overcrowding, dirt, and poverty. Individuals in constant contact with the disease, as physicians, nurses, and clergymen, are often

attacked. The peculiar nature of the malady was pointed out by Henderson in 1842 and by Sir W. Jenner, 1849 to 1851. Their views have since been confirmed by the discovery of the specific micro-organism by Obermeier.

The period of incubation of relapsing fever averages from 4 to 10 days. The fever begins suddenly with a chill or rigor, accompanied by frontal headache, and pains in the back and limbs. The temperature may be 103° or 104° F., and mounts on the succeeding days to 105° or even 108°. The general condition remains much the same for about a week, except that the symptoms increase in severity. Little sleep is obtained, but the mind remains clear until near the end of the paroxysm, when delirium supervenes. When all the symptoms are at the height, crisis suddenly occurs in 5 to 7 days, with profuse perspiration and a rapid abatement of suffering. Convalescence now sets in and is permanent in many cases. In others the patient feels comparatively well, but very weak until about fourteen days from the initial attack or seven days after the crisis, when he is again seized with chills and fever, and the whole series of phenomena is repeated. This relapse is usually shorter than the first paroxysm, and permanent recovery follows it in the majority of cases.

The spirilla are always present in the blood during the paroxysms and increase in number as the fever progresses. They disappear at the crisis and remain absent until near the advent of the relapse. During this period they may be found in the spleen and bone marrow (as proved by experiments on monkeys), where they probably break down and leave spores which germinate and thus produce the organisms which determine the relapse.

No treatment has succeeded in shortening the paroxysms or preventing the recurrence of a relapse; and although certain drugs, such as quinine, carbolic acid, and iodine, arrest the movements of the spirillum outside the body, they have no influence when given as remedies. Treatment must be symptomatic. Sponging with tepid water or packing in wet sheets will give temporary relief when the fever is very high, and headache may be relieved by cold applications. During the severe perspiration of the crisis the patient must be kept as dry as possible, and the tendency to collapse must be met by additional coverings, hot bottles, and diffusible stimulants. For the severe pains opium or morphine is given. Cooling drinks and gentle saline laxatives increase the comfort of the patient. During convalescence, fresh air, good food, and tonic medicines are indicated. The disease is rare in this country, no epidemics having appeared since 1869, when it prevailed extensively in New York and Philadelphia. It is common in India, where favorable conditions for its development seem always to be present.

RELATIONS (Lat. *relatio*, relation, reference, report, restoration, from *re-*, back again, anew + *latus*, p.p. assigned to, *ferre*, to bear, carry). In law, technically, such kindred of a person as may be entitled to share in his personal estate under the statute of distributions in force in the jurisdiction in which the meaning of the word is called in question. The word, therefore, is employed in a wider sense in some jurisdictions than in others, and the classes of persons

included vary according to the jurisdiction. It is popularly employed to describe all family connections by blood or marriage, and the law will recognize this use of the word where it is evident, a person so intended to employ it. See **AFFINITY**; **CONSANGUINITY**; **LINEAL**. See also Blackstone's *Commentaries*.

RELATIONSHIP. The exact degree of affinity existing between keys, chords, and tones. See **TEMPERAMENT**.

RELATIVITY (from Lat. *relativus*, having reference or relation), **LAW OF**. In its most general form, the law, as given by Stumpf, is that the relation of sensations to one another is essential to their very existence; so that black, e.g. can be sensed only in opposition to white, or at least only in distinction from a grayer or blacker black; a tone or noise only as alternating with other tones or noises, or with complete silence, and so on—while every sensation will disappear under the operation of uniform and continuous stimulation. Simple as this statement looks, it is capable of many interpretations, none of which can be regarded as unexceptionable.

The grain of truth which Stumpf finds in the doctrine is that the presence of sensation in the adult consciousness is almost without exception connected with certain judgments of its relation to other ideas. And these judgments (apprehensions, apperceptions), if they cannot alter the content of sensation, can at least render it confusable with other contents not now sensed. Wundt, on the other hand, has consistently maintained that our mental life is governed by a law of relativity, such that every phase of present experience is conditioned not only by other phases of the same experience, but also by the whole past history of consciousness. The laws of mind at large are of two classes: laws of relativity and laws of development. Under the heading of relativity we have (1) the law of psychical resultants, which affirms that every mental complex shows properties which, once given, can be understood from the attributes of its elements, but which cannot be regarded as a mere sum of those attributes. (2) The law of relations asserts that every dissection of a conscious whole into its constituent terms is an act of relating analysis. Finally, (3) the law of psychical contrasts maintains that mental processes of opposed direction mutually reinforce one another. The laws of mental development are (1) the law of mental growth, the application of the law of resultants; (2) the law of heterogony of ends, based upon the laws of resultants and of relations; and (3) the law of development by opposites, which applies the law of contrasts. Consult: Stumpf, *Tonpsychologie* (Leipzig, 1883); Riehl, *Der philosophische Kriticismus*, vol. ii. (ib., 1879-87); Preyer, *Elemente der reinen Empfindungslehre* (1877); Wundt, *Outlines of Psychology* (trans. Leipzig, 1897); id., *Physiologische Psychologie* (4th ed., ib., 1893); Höfding, *Outlines of Psychology*; Spencer, *Principles of Psychology* (London, 1881); Bain, *The Senses and the Intellect* (ib., 1868).

RELEASE. In the most general sense, any act, event, or instrument by which a legal right is discharged. In this sense of the term a right of action based upon a personal tort may be re-

leased by the death of the tortfeasor, or a debt released by the discharge in bankruptcy of the debtor, as well as a bond or a right of entry upon land released by the deed of the person claiming the right. Lord Coke, in his commentary upon Littleton, enumerates a considerable number and variety of releases in vogue in his day, most of which have, in the growing simplification of the law of real property, become obsolete. We may, perhaps, conveniently distinguish two separate and distinct types of releases as still existing, viz. the ordinary release of a debt or obligation and the release of an interest in or claim to land.

The former of these may be effected by act of the parties, or by operation of law—as where a contract for personal services is terminated by the death of a party thereto. At common law, however, the forgiveness of a debt, whether complete or partial, is not legally binding if made by parol or simple contract, but requires a release under seal to render it effectual and irrevocable.

The second form of release above referred to is best described as a form of conveyance of real property at common law. Its distinguishing characteristic is the fact that it is in and by itself not available for effecting a conveyance to a stranger, i.e. to one having no interest in the land in question (for which purpose the feoffment or the grant must be resorted to), but only to one in privity of estate, i.e. having an interest with the releasor in the same parcel of land, as a wife to the husband's grantee, or a landlord, remainderman, or person asserting any other claim in relation to the premises to a tenant in possession. The act of the tenant in giving up his estate to the landlord is not a release, but, involving as it does a transfer of the possession, is conceived of as of a totally different character, and is effected by a distinct form of conveyance, called a surrender.

In this form of a conveyance of the landlord's estate to his tenant in possession the release played a distinguished part in the history of conveyancing. In the effort to attain to a simpler and less notorious method of conveying freehold estates than the ancient and cumbrous process of livery of seisin, the lease and release were ingeniously combined in a single transaction. Thus, if the land to be sold by A to B was first leased to B for a year, B would by taking possession of the land come into the requisite privity of estate with A to enable the latter to complete the transfer of title by releasing his reversion to B. See Blackstone and Kent, *Commentaries*; and the authorities referred to under PROPERTY; LEASE AND RELEASE; CONVEYANCE; DEED; GRANT.

Analogous to the first form of release above described, but still operating as a common-law conveyance, is its use to convey doubtful or precarious interests in land or rights in land which do not rise to the dignity of estates, as a contingent remainder to the freeholder who was seized of the land, or the right of a disseisee to the disseisor or other person seized of the land. See DISSEISIN; ENTRY, RIGHT OF; REMAINDER.

In form the deed of release is substantially reproduced in the modern quitclaim deed. See QUITCLAIM.

RELIANCE. An American racing yacht, and the successful defender of the America's Cup in

the International yacht races of 1903. She was built by Herreshoff, for a syndicate of American yachtmen, represented by C. Oliver Iselin. Her measurements were: Length over all, 143.69; water line, 89.66; sail area as per rule, 16,159.45; sail area, 127.12. Owing to her large sail area she was required to give the challenger Shamrock III. (q.v.) a time allowance of one minute and fifty-seven seconds. She was sailed by Captain Barr, the skipper of the old Columbia, and defeated her opponent in the first three races of the series as follows: August 22d, by 7 minutes and 3 seconds, corrected time; August 26th, by 1 minute and 19 seconds, corrected time; September 3, the challenger got lost in the fog and did not finish the race. Reliance alone completed the course.

RELICS (OF., Fr. *relique*, from Lat. *reliquia*, remains, from *relinquere*, to leave behind, from *re-*, back again, anew + *linquere*, to leave, Gk. *λείπειν*, *leipein*, Skt. *ric*, to leave). In ecclesiastical usage, the remains of the bodies of saints; more loosely, objects connected with the earthly life of Christ or of the saints. At an early period miracles are described as connected with relics, as in the Old Testament (II. Kings xiii. 21). Saint Ambrose tells of a blind man's sight being restored by his touching the bodies of the martyrs Gervasius and Protasius, and similar wonders are detailed by other saints. Altars were early erected over the tombs of the martyrs, and the present practice of the Roman Catholic Church requires the inclusion of some relic or relics within every altar to be consecrated.

The veneration of relics found no important early adversary. One of the treatises of Saint Jerome, indeed, is directed against the objections of Vigilantius on this point; but even the Iconoclasts, while vehemently repudiating the use of images, admitted the veneration of relics, and, with the exception of the Waldenses, Wiclif, and some others, it was practically unchallenged until the sixteenth century, when Protestants generally repudiated it entirely as superstitious. The decree of the Council of Trent connects the question with the general one of the veneration to be paid to the saints, and regards the relics of the saints not as possessing any intrinsic virtue, but as instruments through which God bestows benefits on men. Various alleged relics of Mohammed and other Moslem worthies are preserved at Mecca, Medina, Constantinople, and other places; and several sanctuaries in India are supposed to be the resting-places of relics of Buddha. See SAINT; CROSS; HOLY COAT; PILGRIM.

RELICT PLANTS (OF. *relict*, from Lat. *relictus*, p.p. of *relinquere*, to leave behind). Plants of very restricted distribution, but formerly more widespread. For example, the big trees of California are the remnants of a former widely distributed group. The term may also be applied locally to species which belong to a former topographic condition when they were abundant. Naturally or artificially reclaimed swamps may yet retain isolated relict plants.

RELIEF (Lat. *relevamentum*). An incident of the feudal tenure of lands. It consisted in the obligation of the heir to redeem the land from the lord of whom it was held, in order to make good his right of inheritance. Unlike the

more burdensome incidents of wardship and marriage, it attached not only to lands held by knight's service, but was levied equally on the heir of socage lands. Originally of indefinite amount and depending largely on the arbitrary will of the lord, it was at an early period fixed and regulated by statute. Of all the incidents of feudal tenure, it had the longest life, not only surviving the gradual disappearance of military tenures, but being expressly saved in the statute of 12 Charles II. (1660), which abolished tenure in chivalry and relieved all tenures of their more burdensome incidents. The right of relief was never expressly abrogated, but it has fallen into desuetude in England, and there is no evidence that it was ever exercised in the United States. See FEUDAL TENURE; INCIDENT.

RELIEF SCULPTURE. That form of sculpture in which the objects represented project from the surface or background. In the fine arts the term relief is used to signify any projection of figures from the surface; it is so used in painting for the apparent projection of forms and masses from the background, in architecture for projection of decoration, and in a similar manner in ceramics, goldsmith's work, etc. The term is, however, mostly employed in reference to sculpture. Relief sculpture differs from sculpture in the round in that it is attached to the background, from which the latter stands free, being visible from all sides. It is not always possible, however, to distinguish the boundaries between these two chief classes of sculpture. See SCULPTURE.

The two principal varieties of relief sculpture are: high relief, usually known by the Italian name *alto-relievo* (q.v.), in which the objects project strongly from the background; and low relief (Italian, *basso-relievo*; French, *bas-relievo*), a surface ornamentation in which the projection is very slight. Midway between the two is semi-relief (Italian, *mezzo-relievo*; French, *demi-relief*), in which the figures are fully rounded, but without detached portions. *Stacciato* (Italian, crushed, flattened) is the slightest form of relief, being little more than scratchings upon the surface, while in the hollow relief (*cavo-relievo*) (q.v.) the contours of the figures are carved below the surface of the background. In nearly all relief work figures and background are of the same material, though there are some examples to the contrary in best Greek art, and in Chinese and Japanese decorative work. The materials generally used in larger relief work are marble, bronze and sometimes terra cotta, and in smaller decorative work the precious metal and stones, enamel, ivory, wood, etc., are more common. Reliefs were almost universally colored by the Egyptians and in classical antiquity and partly in early Christian art. This practice prevailed in wood, terra cotta and stucco work during the Gothic and Renaissance periods, while marble and stone were not usually colored.

HISTORY. Relief is that form of sculpture which most resembles painting, with which it has composition and perspective in common. In the history of relief work, therefore, the practice has swayed between purely plastic and pictorial principles. Relief was practiced contemporaneously with sculpture in the round by the early culture peoples, like the Babylonians, Assyrians, and Hittites. The Egyptians made a very wide use of *cavo-relievo*. The Greeks con-

ceived relief in a purely plastic sense and achieved the highest mastery of it. Distinguishing strictly between high and low relief, they used the former between the triglyphs, and in the tympana of the temples, but the latter in friezes, grave stones, and the like. Purely decorative principles were strictly followed, the space being adequately filled, the background never carved, and the heads of the figures at the same height. (See ISOCEPHOLY.) During the Hellenistic period a more picturesque and dramatic composition was practiced, and subjects were carved in the backgrounds—a practice which in Roman times degenerated into the use of several different planes of reliefs. Picturesque relief attained its most perfect development at Florence during the Renaissance, in such works as the Baptistery doors of Ghiberti and the marble pulpit of Santa Croce by Benedetto da Majano. In these works all the qualities of painting except color were reproduced. Donatello, Luca della Robbia and other sculptors of the Renaissance followed plastic laws more strictly, but during the entire Baroque period, picturesque principles prevailed to such an extent as to preclude any real style of relief. At the beginning of the nineteenth century Thorvaldsen, inspired by the study of Attic grave monuments, brought back reliefs to its proper plastic function. Since that time excellent relief work has been done in Europe by modern German sculptors like Rauch and Rietschel and by Frenchmen, like Jules Dalou, and also in the United States. The present tendency, however, is to neglect the distinction between high and low relief and to give rather undue emphasis to pictorial qualities.

RELIEF SYNOD. See PRESBYTERIANISM.

RELIGIO MEDICI (Lat., A Physician's Religion). A prose work by Sir Thomas Browne (1643). Written about 1635, but not for publication, which was necessitated by an unauthorized edition in 1642, this prose poem is the devout musing of a scholar and man of science, and withal a mystic, who sought a Divine presence in nature and in all conditions of his own life. The first part treats of Faith and Hope. The second, on Charity, shows a tolerance unusual in that day.

RELIGION (Lat. *religio*, probably from *re-ligare*, to bind fast, from *re-*, back again, anew + *ligare*, to bind), COMPARATIVE. The science which treats of religions from an historical and comparative point of view. Its methods are first descriptive, then historical, and finally comparative. The descriptive part of comparative religion discusses in detail the actual phenomena, or any particular phenomenon, presented by religions, and includes treatments of individual religions. Even in such an individual discussion, the comparative method must be employed if the phenomena presented by the religion in question are to be correctly interpreted. While the descriptive part of the science is confined, strictly speaking, to the statics of religion, that is, to the phenomena observable at any specified time, the historical aspect considers the development of a single faith from its origin or from its earliest ascertainable manifestation to its extinction, or absorption into other religions, or the latest development which it has attained. The historical side of comparative religion, therefore, is evolutionary in character. The com-

parative study in the strict sense of the term may, technically, be static. The value of such an investigation is, however, so much inferior scientifically to evolutionary comparison that it may practically be ignored. By far the greater number of investigations make their studies of comparative religion historical or evolutionary. Such discussions alone lead to the final object of the science. This object is to investigate the nature and development of religious beliefs and to discover if possible the origin of religion itself. Comparative religion therefore ranks as one of the historical sciences.

DEFINITION OF RELIGION. Nowhere is definition more difficult than in the sphere of religion. The manifestations are so varied, and the causes, where they can be traced, are so complex, that almost no definition of religion can be given which is altogether free from objection. The definition which seems on the whole least open to adverse criticism is as follows: Religion is the view held by man of an intelligent being or beings which is or are, or which he conceives to be, superhuman, and of the relation, modifiable by his own agency in certain respects and by certain means, which he sustains toward the being or beings in question. This definition recognizes the two-fold aspect of religion, which accounts for part of the complexity of religious phenomena, the theoretical and the practical. The theoretical side of religion is the view held by man regarding the nature and character of the superhuman being or beings in which he believes. The practical side is the power which such being or beings exert over him and the power which he has or may acquire over them.

UNIVERSALITY OF RELIGION. The statement which is still made, though with decreasing frequency, that there are races or tribes without religion is almost certainly false. It may be true that many peoples seem to possess no religion, either because these religions are so obscure as to pass unnoticed, or because they are contemptuously rejected as false. Yet even the scientific investigator may be misled in this matter. In the first place, the person questioned as to his religion may not, and in the case of savages often does not, understand the questions which are asked him. His answers, therefore, are misleading. It must also be remembered that one questioned concerning his religion will sometimes willfully give a false answer, either because he regards the inquiry as foolish, impertinent, or tiresome, or because he does not dare to reveal his religion. In giving a knowledge of his religion, one gives a part of himself, and the power thus gained by another may be used to his own detriment. If these obstacles to an accurate knowledge of a religion exist in the case of living faiths, they hold to a far greater degree in the study of extinct religions or extinct phases of them. The ancient writers who describe foreign religions were either little acquainted with them and unscientifically trained, as were even Herodotus and Plutarch, or were contemptuous and unsympathetic, as was Tacitus. Moreover, the sacred books of religions give us only a partial view of their own faiths. They represent only the officially sanctioned religion, while the popular deviations from these book-religions are either ignored altogether, or mentioned with disparagement and hostility, or must be partially reconstructed

from chance allusions scattered through the canonical works. There is also a marked tendency both in ancient and in modern investigators of religion to interpret foreign religions in terms of their own, thus leading to false identifications and to attributions of concepts to religions which they may not contain. The student of religion must also guard against mistaking an idea previously imported into a religion from a foreign source for an integral part of the faith which he studies.

CLASSIFICATION OF RELIGIONS. Still more difficult than definition of religions is classification. While one may make rough distinctions between various religions, hard and fast lines of demarcation can seldom be drawn, for religions often overlap one another in attributes common to both. Nor is it easy to classify a religion according to its salient feature. To say that Greek religion is the cult of the beautiful, or that Roman religion is legalistic, or that American religions are animistic, does not adequately describe them, for they represent the culminations of long evolutions, in which many factors from many sources have coöperated. Animism, totemism, ghost-worship, nature-worship, and other factors, all combine in different proportions. Several classifications, however, have been proposed. Of them all, the most simple and the most worthless divides religions into true and false, the first class holding the single religion adopted by him who makes the classification, the latter class containing all the rest. There are a number of other classifications which are equally unsatisfactory. Among these may be enumerated the division of religions on a linguistic basis into Indo-Germanic, Semitic, and Turanian. This classification, proposed by Max Müller, proceeds on the false premise that religion and linguistic affinity are one. A religion may indeed originate in a certain race, but it may spread with equal facility to other races, and even to other climates and entirely different systems of civilization. The division into national and universal or international religions, advocated by Kuenen, is also objectionable, since there is no real line of demarcation between the two. Comparatively primitive religions may be international, on account both of their catholicity and of the absence of any national idea, while very advanced religions, as Zoroastrianism, may be strictly national, although apparently intended to be international in scope. Hegel attempted a classification, in four divisions. The most primitive faiths, or nature religions, he regarded as spontaneous. To them he opposed the religions of spiritual individuality, which was differentiated from nature religions by the presence of reason and meditation. Within the religions of spiritual individualities there are three divisions: First, the religion of majesty, where the divine overwhelms the human; second, the religion of beauty, where the divine blends with the human; and third, the religion of design, where a divine purpose in the universe is recognized. The increased knowledge of the evolution of religion since Hegel's time has rendered this view of his useless. A marked advance was the classification of Hartmann, who made a broad division into naturalism and supernaturalism. Naturalism is characterized by a belief that deities rule in the world and require material representations, while in supra-

naturalism the deities rule over the world, and are freed from the necessity of representation. In the former class are primitive religions and such advanced ones as the Greek, Roman, Teutonic, and Egyptian, while in the second category come, among others, Buddhism, Judaism, and Mohammedanism. The final stage is a monism where the absolute spirit is a unity which is the absolute source and being of the universe. The chief weakness of the system is the tendency already noted to characterize religions only by salient features, without taking into account phases equally important though less obtrusive. A classification which combines the historical and philosophical points of view was prepared by Réville. Making a broad division into polytheistic and monotheistic religions, he included in the first category primitive nature religions, animism, and fetishism. These were followed by national mythological religions, such as the Chinese, Egyptian, Babylonian, Teutonic, Celtic, Greek, and Roman. The fourth stage is characterized by the legal element, as seen in Brahmanism, and here he also reckoned the Chinese systems of Confucius and Lao Tse. The highest point of polytheism was reached in his opinion by Buddhism. The monotheistic religions, which compose his second main division, are Judaism, Mohammedanism, and Christianity. Against this classification may be alleged that (1) there is no such sharp dividing line between animism, fetishism, and mythology as is here implied, and (2) the demarcation between polytheism and monotheism is evanescent. In the religions of Egypt, Babylonia, India, and Greece, which were admittedly polytheistic, a monotheistic trend, especially among philosophers, was marked, and conversely, in religions essentially monotheistic, such as Zoroastrianism, there is a tendency toward reversion to or survival of polytheistic cults. The important step in advance in Réville's classification is his recognition of the importance of the legal factor. Tiele set up a scale of primitive, naturalistic, animistic, national, polytheistic, nomistic, and universal religions. This scheme later was somewhat modified by him, and he finally favored a division into nature religions and ethical religions. Still another classification was proposed by Jastrow. Its division is fourfold, into the religions of savages, of primitive culture, of advanced culture, and those religions whose conscious ideal is the coextensiveness of religion with life and complete harmony between the doctrines and the practices of religion. This classification, like the others, is unclear in the distinction between the first two divisions, while the third and fourth in like manner are somewhat arbitrary. It seems, however, superior on the whole to all its predecessors, despite the credit which the classifications of Tiele and Réville deserve. Adopting this system of Jastrow's, then, with the modification of combining his first two divisions, the broad outlines of the principal forms of religion may be sketched, while the detailed treatment both of individual religions and of numerous special phases of comparative religion will be found under separate titles.

THE RELIGIONS OF SAVAGES AND OF PRIMITIVE CULTURE. The religion of the savage, connoting by this term man in the pre-cultural stage, is almost impossible to determine. The difficulties already enumerated oppose the solution of this

problem. It is, moreover, a question whether pre-cultural man, uninfluenced by cultural races, however primitive, now exists. Only within comparatively recent times has the intercommunication of ideas between the less civilized races both of ancient and modern times received due recognition. Even the most primitive religions known, such as the Australian, belong to tribes which have begun the cultural stage. We are reduced, therefore, for our knowledge of savage religions to deductions which may be made from more advanced cults, especially those of primitive peoples. This uncertainty is the more unfortunate, since it is here if anywhere, from a scientific point of view, that we are to seek the origin or origins of religion. The most that can be said of this most primitive stage seems to be that there was probably an innate germ of religious thought, a vague personification of the powers of nature, and the first beginnings of a belief in ghosts.

Turning to the religions of primitive culture, we find a wide range of cults in all parts of the world, of most varied grades. Among the most important may be mentioned the Polynesian and Australian, the diverse native religions of Africa, the Finno-Tataric, many phases of Hindu religion, especially among the Dravidians, the Mongolian Shamanism, the ancient Teutonic religions, and the American religions, including those of Mexico and Peru. The diversity of the primitive cults is evident, ranging from the rude religions of the Hottentots and Blackfellows to the elaborate mythology of Polynesia and the developed ritual and priesthood of Mexico. The religions of primitive culture, however, may all be characterized by at least four points in common: animism in belief, magic in practice, and in worship nature-worship and ancestor-worship. Of these the most primitive seems to be animism. This may be defined as a belief which ascribes conscious life to every natural object which manifests vitality or force in any way. It is the theory evolved by primitive man to account for the various natural phenomena by which he is surrounded. The ascription of life analogous to his own to trees, rivers, fire, and the like is not necessarily religious in itself, but the transition from animism in theory to animism in cult seems to involve a recognition of their superhuman powers. If a river is endowed with life as is a man, it has power to benefit, as in irrigation, or to injure, as in flood, and it becomes necessary either to propitiate the river that it may be bounteous in its waters, or to induce it to refrain from destructive floods. The primitive means of controlling the powers of nature is by magic. If the desired results do not follow the performance of magic, the fault is not with the magic itself. Either wrong magic has been employed for the end in view, or there is a strong counter-magic at work, which must first be overcome if possible. For magic is, in its last analysis, the science of primitive man, the cause, real or supposed, of a given result, which must, by its performance, produce again the desired result, and this fact accounts for its early importance and its extreme tenacity.

Within the sphere of religion proper we have, as common to all religions of primitive culture, nature-worship and ancestor-worship, the developed forms of the beliefs in animism with magic and ghosts with magic respectively. To

this same stage of development belong some of the most important aspects of religion. As an evolution of ghost-worship comes the belief in totemism, which derives whole tribes or families from an animal or plant. This animal or plant is consequently regarded as a blood-relative of the tribe or family in question, and therefore becomes sacrosanct, so that it is neither eaten, killed, nor harmed in any way by one whose totem it is. Another mixture of magic and animism is seen in fetishism, which ascribes superhuman properties to material objects. Developments of magic are seen in the important phenomena of taboo and Shamanism. To this same period belongs the evolution of the priest. While the savage was able to perform his own religious rites, the increase both in number and complexity of sacrifices and magic rites rendered necessary the presence of a body of men who stood in especially close relations with the superhuman beings, and who came in course of time to have entire control both of cult and religion. As intermediaries between the gods and men, the priests naturally came to be regarded as healers of disease by their magic arts, and the knowledge of medicine was, consequently, practically in their possession alone throughout this period and at least the earlier portion of the succeeding one.

THE RELIGIONS OF ADVANCED CULTURE. In the religions of advanced culture, which, as has already been said, are closely connected with those of primitive culture, are contained the religions of Egypt, Babylonia and Assyria, China, India (excluding Buddhism), Greece, and Rome. It is at once obvious how varied are the spirits of these religions, yet there is one common factor which may serve to characterize them all, and which may, at the same time, be made a line of demarcation between the faiths of advanced and of primitive culture. This factor is the predominance of mythology over animism and magic. While the mythological element is of importance in many of the religions of primitive culture, and while it is seen at a comparatively early stage, it is overshadowed by animism and magic, and plays relatively little part. Even in the most highly developed religions of this class, such as the Polynesian, which has a mythology almost rivaling that of the Greeks, this statement holds good. On the other hand, while the religions of advanced culture, especially the more ancient ones of Egypt and Mesopotamia, contain abundant traces and instances of animism and of magic, even in their early epochs the mythology is the most striking feature. Mythology in itself is a process and a proof of higher culture. Based in part on early tribal history and ancestor-worship, as may clearly be seen in the case of Greece and Rome, and in part on nature-worship, as is evident in India, it involves a power of abstract thought beyond the capability of primitive culture in its early stages. But, on the other hand, mythology is a check on religious growth. As the people progresses in religious life and thought, while mythology, like ritual, remains stationary or moves much more slowly than the actual popular religious faith, a constantly widening gap appears between religion and mythology. As in the religions of primitive culture the animism and magic which characterize them in their earlier stages become relatively less important

in their later developments, so in the religions of advanced culture the mythology which is at first their leading feature becomes more and more secondary in course of time. In many instances in a more refined community the old myths are felt to be immoral. Attempts are, therefore, made to explain away this immorality, to which the masses still cling tenaciously, by poetical, allegorical or esoteric interpretations as in the explanations of the erotic Krishna myths in India as mystic portrayals of divine love. Yet these explanations are in the nature of the case, inadequate, and there is thus created a division between religion and ethics, which it is the task of the next and final stage of religion to bridge over.

The priesthood undergoes a marked change in the religion of advanced culture. In the previous stage the priests had been little more than go-betweens between men and gods. With the fuller development of religions ideality, however, their place became more truly spiritual. Not alone did they conserve the rites and doctrines of religion, but they became the censors of morals as well, and in the course of time they made the important step of giving a legalistic form to religion as distinguished from its merely ritualistic aspect. Yet side by side with the religions thus officially recognized which prevailed in Babylonia and Assyria, Egypt, Greece, and Rome, and which still prevail in China and India, there was, and is, a vast amount of religion officially unrecognized. This, expressed both in belief and custom, is regarded by the religion which is formally acknowledged as superstitious. The attitude toward it, however, is one rather of contempt than of hostility. Gradually the feeling seems to have gained ground that such a distinction between religion and superstition was distinctly injurious. More and more it became evident that religion, which was outgrowing the beliefs of animism and even of the more tenacious magic, could and must progress still further. The next step marks the transition to the religions of the last type, the highest that has thus far been evolved.

RELIGIONS COEXTENSIVE WITH LIFE. Within this class fall the religions of Judaism, Buddhism, Zoroastrianism, Mohammedanism, and Christianity, with a few minor representatives, such as Mormonism. These represent, as already stated, the conscious attempt to render religion and life coextensive, whereas the religions of primitive culture had assumed them to be one, and the religions of advanced culture had finally divorced them. They thus attempt to create final harmony between religious doctrine and religious practice. There is no longer a tacit admission of the usefulness of superstition, such as exists in the religions of advanced culture, but since everything in the spiritual world not with religion is now seen to be against it, there is a deliberate resolve to annihilate all such extrareligious forces. More than this, not alone are the lower forms of religion existing within itself regarded as hostile, but all other religions are considered as lower, and therefore to be suppressed. It is an important fact that each of the five religions in this class regards itself as true and the other four, together with all lower religions of whatever sort, as false. Herein lies one of the chief characteristics of the class. The religions coextensive with life are exclusive, all

others are inclusive. Another distinction between the two types lies in the fact that if the earlier is ethical and legalistic, the latter is spiritual. The religions coextensive with life lay more weight on the spirit of man in its relation with the divine, and less, relatively speaking, on cult and ritual. A striking example of this is seen in the origin of Buddhism, which is essentially a revolt from the excessive rituality of Brahmanical Hinduism toward a deep spirituality with, in its pure form, almost no cult. As the maintenance of a priesthood is conditioned in a great measure by an elaborate cult, it is obvious that in this final type, conspicuous for simplicity of ritual, the priest occupies a far less important position than in the religions either of primitive or advanced culture. This affords in part the explanation of the fact that the reforms which have resulted in religions of the highest type have been made in every case by individuals outside the priestly code, by the Hebrew Prophets, by Buddha, Zoroaster, Mohammed, and Jesus. Nor is this in any way a reproach to the priest. For he is in the nature of things a conserver, not an inaugurator, and rightly so, and if in some instances he is shown by the results to have been over-cautious, he is not thereby to be convicted either of dishonesty or of ignorance. Finally, religions of this class go further than the individual or than the State, herein contrasting sharply even with the religions of advanced culture. They aspire to be world-religions, and three of them, Buddhism, Mohammedanism, and Christianity, are in fact the leading religions in numbers and extent. We have in this aspiration yet another characteristic distinction between the religions coextensive with life and all other forms of religious cult.

HISTORY OF THE STUDY OF COMPARATIVE RELIGION. The study of comparative religion is of modern origin. It is indeed true that we find in the histories of Herodotus, in the *De Iside et Osiride* of Plutarch, in the *De Dea Syria*, generally ascribed to Lucian, in the *Germania* of Tacitus, and in brief mention in numerous other classical authors accounts of religions other than Greek or Roman. Yet here, as might be expected, the historic knowledge was too slight to render the philosophical part of the work anything but superficial, although the descriptive part is still of value. The general attitude of the Greeks and Romans, who alone of the ancient world touched the subject of comparative religion, is one of contempt. This was succeeded by a not unnatural intolerance in the attitude of the Church Fathers and mediæval theologians. This attitude remained practically unchanged until the rise of skepticism in the eighteenth century. Yet there was no real progress in the study of religion, for dogmatism was succeeded by superficiality. It is noteworthy that the first real impulse to an historical study of religions came with the sixteenth and seventeenth centuries. To this early period belong such books as the *Pantheia*, or *View of All Religions in the World*, of Ross (London, 1653), and the *Ceremonies and Religious Customs of the World*, of Picart and Bernard (ib., 1733). This latter work is in a sense the forerunner of the historical method of religions study, and is far superior to one of its most important successors, the *Origine de tous les cultes ou religion universelle* of Dupuis

(Paris, 1795). The real founder of the historical school, however, was Herder, who outlined the history of religion, so far as it was then possible, in his *Ideen zur Philosophie der Geschichte der Menschheit*, published in 1784, although his previous writings indicate that many of his ideas on this subject had been formulated much earlier. The year after Herder's *Ideen* saw the publication of Meiners's *Grundriss der Geschichte aller Religionen*, followed twenty-one years later by his *Allgemeine kritische Geschichte der Religionen*. In the decade 1821-31 the foundations of a scientific philosophy of religion were laid by Hegel in his *Vorlesungen über die Philosophie der Religion* (not published, however, until 1832). The credit of inaugurating the study of comparative religion in a truly scientific spirit and method, however, must be given to Max Müller, even though his views are now in great part rejected in the light of later investigations. In a long series of volumes, including *Lectures on the Science of Religion* (London, 1872), *Natural Religion* (2d ed., ib., 1892), *Physical Religion* (ib., 1890), *Anthropological Religion* (ib. 1891), and *Theosophy or Psychological Religion* (2d ed., ib., 1899) he developed his system. He also aided in the establishment of the Hibbert Lectures on the Origin and Growth of Religion in 1878, and above all founded in 1879 the epoch-making series of translations entitled *The Sacred Books of the East*. A still greater name than Max Müller's is that of Tiele, of Leyden, whose *Outlines of the History of Religion* (translated from his Dutch *Hoofdtrekken der Godsdienstwetenschap* into English by Carpenter, London, 1877, 3d German ed. by Weber and Söderblom, Breslau, 1903) is by all odds the best general survey of religions from an historical and descriptive point of view, while his *Elements of the Science of Religion* (Edinburgh, 1897-99) and his *Geschiedenis van den Godsdienst in de oudheid tot op Alexander den Groote* (Amsterdam, 1891-97) are no less authoritative. In France the study of comparative religion received a powerful impetus in the establishment in 1888 of the Musée Guimet. In America there is as yet little general interest in this science, although signs are not lacking that comparative religion will receive here also the attention which it merits both from a theoretical, an historical, and a practical point of view. The activity in the science, despite the lack of recognition on the part of many universities and the unfounded suspicion with which it is viewed by certain classes even of the educated, is most promising, among the eminent investigators being Réville, of France; Saussaye, of Holland; Achelis and Edmund Hardy, of Germany; Tylor and Frazer, of England; and Toy and Jastrow, of America.

BIBLIOGRAPHY. The bibliography of comparative religion is very extensive. Among general works some of the most important are, in addition to those already mentioned: Lichtenberger, *Encyclopédie des sciences religieuses* (12 vols., Paris, 1877-83); Saussaye, *Lehrbuch der Religionsgeschichte* (2d ed., Freiburg, 1897, contains also bibliographies); Orelli, *Allgemeine Religionsgeschichte* (ib., 1899); Jastrow, *The Study of Religion* (New York, 1901, contains an excellent bibliography); Tiele, *Kompendium der Religionsgeschichte* (3d German ed., Breslau, 1903, containing abundant bibliographies). For

the philosophy of religion reference may be made to Caird, *Introduction to the Philosophy of Religion* (2d ed., London, 1889); Hartmann, *Religionsphilosophie* (Leipzig, 1888); Lotze, *Grundzüge der Religionsphilosophie* (ib., 1882, Eng. trans. by Ladd, Boston, 1885); Pfeleiderer, *Philosophy and Development of Religion* (Eng. trans., Edinburgh, 1899); Sabatier, *Esquisse d'une philosophie de la religion d'après la psychologie et l'histoire* (6th ed., Paris, 1901, Eng. trans., London, 1897); Siebeck, *Lehrbuch der Religionsphilosophie* (Freiburg, 1897). As additional general manuals may be mentioned: D'Alviella, *Introduction à l'histoire générale des religions* (Brussels, 1886); Jevons, *Introduction to the History of Religion* (London, 1896); Réville, *Prologomènes de l'histoire des religions* (Paris, 1881, Eng. trans. by Squire, London, 1884). Special topics of importance are treated in Frazer, *Totemism* (London, 1887); id., *The Golden Bough* (2d ed., ib., 1900); Hartland, *Legend of Perseus* (ib., 1894-96); Lang, *Myth, Ritual, and Religion* (2d ed., ib., 1899); id., *Magic and Religion* (ib., 1901); Taylor, *Ancient Ideals* (New York, 1896); Réville, *Les religions des peuples non civilisés* (Paris, 1883, with bibliographies); Tylor, *Primitive Culture* (2d ed., London, 1878); Roskoff, *Religionswesen der rohesten Naturvölker* (Leipzig, 1880). The two most important periodicals devoted to comparative religion are the *Revue de l'histoire des religions* (Paris, 1880 et seq.), and the *Archiv für Religionswissenschaft* (Freiburg, 1898 et seq.). Discussions of individual religions not treated under special titles are contained in Réville, *Religions du Mexique, de l'Amérique centrale et du Pérou* (Paris, 1885); Abeghian, *Armenischer Volksglaube* (Leipzig, 1899); Leger, *Mythologie slave* (Paris, 1901); D'Arbois de Jubainville, *Le cercle mythologique irlandais et la mythologie celtique* (ib., 1884); Rhys, *Celtic Heathendom* (London, 1886). See also BUDDHISM; CHINESE EMPIRE, section on *Religion*; CONFUCIUS; DEMONOLOGY; DRUID; EGYPT, section on *Religion*; FETISHISM; GHOSTS; GREEK RELIGION; INDIA, section on *Ancient Religion*; JAINISM; MAGIC; MEXICAN ARCHÆOLOGY; MOHAMMEDANISM; MYTHOLOGY; NATURE WORSHIP; PERSIAN MYTHOLOGY; PERUVIAN ANTIQUITIES; PHALLCISM; PRIEST; ROMAN RELIGION; SACRIFICE; SHAMANISM; SHINTO; SUPERSTITION; SWASTIKA; TABOO; TAOISM; TEUTONIC AND SCANDINAVIAN MYTHOLOGY; TOTEMISM; ZOROASTRIANISM; and the bibliographies and cross-references under these titles.

RELIGIOUS EDUCATION. See SCHOOLS.

RELIGIOUS ORDERS. See ORDERS; MONASTICISM.

RELIGIOUS SOCIETIES. In a legal sense, those corporations formed for the advancement of religion or the administration of church property for religious purposes. To the efforts of religious corporations in the Middle Ages to acquire vast holdings of land was due the enactment of the various Statutes of Mortmain (q.v.). Most of the States of the United States now have general laws governing the formation of religious corporations and defining their powers. Generally there is no limit to their power of acquiring land for church purposes and all their property used directly for church or religious purposes is exempt from taxation. See COR-

PORATIONS; CANON LAW; and compare CIVIL CHURCH LAW and CLUB.

RELIQUARY (ML. *reliquare*, *reliquarium*, from Lat. *reliquia*, remains). A case or box to contain relics. Reliquaries are made of all kinds of materials, such as wood, iron, stone, ivory, silver, enamel, gold, and crystal, and are frequently ornamented with costly jewels. Shrines are of the same description, but are on a larger scale and are permanent. As a class they are the most consummate masterpieces of mediæval minor artists, especially among the metal-workers. Some of the cathedral and church treasuries still possess numerous mediæval reliquaries, for example, San Marco at Venice, and the cathedrals of Aix-la-Chapelle and Cologne. The reliquary in the form of a church at the Cathedral of Orvieto is one of the most wonderful pieces of thirteenth-century goldsmith work, with exquisite details. The Romanesque and Gothic periods were the golden age of such work (eleventh to fifteenth centuries). At first the Rhenish and Flemish schools were easily pre-eminent, but in the thirteenth century Italy and France surpassed the northern schools. Reliquaries were of many shapes. They often took the form of the relic they contained, such as a hand, a foot, or a head. They were nearly always decorated with minute figures in relief or even statuettes, or with colored enamels and ornamental designs. The Renaissance led to a complete decadence.

RELIQUES OF ANCIENT ENGLISH POETRY. A collection of old ballads and lyrics (1765), taken by Thomas Percy from an old manuscript of the early seventeenth century, which he found at a friend's house in Shiffnal, Shropshire. These ballads he altered and polished to suit the taste of his age, for which he was severely criticised. Ritson charged Percy with forged and garbled versions of many ballads, and even questioned the existence of the manuscript. This, however, was proved by an edition from the original in 1868 by Hales and Furnivall. In spite of Percy's inaccurate and unscholarly work, the *Reliques* has been a source of pleasure for generations and marks the revival of taste for romantic poetry.

RELY, JAMES' (c.1722-78). A Universalist minister. He was born at Jeffreston, Pembrokeshire, Wales, was converted under Whitefield in 1741, and became an itinerant Methodist preacher. Being convinced that Universalism was true, he parted company with the Methodists, and preached independently in various places. In 1761 he settled in London and preached there, without much success. It was, however, under him that John Murray (q.v.), the Apostle of Universalism in the United States, was converted.

REMAINDER (OE. *remaindre*, remain, from Lat. *remanere*, to remain, from *re*, back + *manere*, to stay). The fee tail, the life estate, and the term of years are conceived of as being less in quantity than a fee simple (see ESTATE), and the gift of such an estate leaves something—some part of the fee simple—undisposed of, which may remain, or revert back, to the grantor (in which case it is called a *reversion*), or may be given by the same deed which creates the lesser estate to a third person as a *remainder*. There may, indeed, be any number of remainders, one

after the other, until the entire fee simple has been disposed of, as, for example, after a present, or 'particular,' estate to A for life, remainder to B for life, remainder to C for life, remainder to D in fee tail, leaving still a fee simple to be given to E as a final remainder, or to come back to the grantor as a reversion. A remainder thus given to an ascertained person, ready to go into effect upon the determination of the precedent estate, is said to be *vested*. If given to an unborn or unascertained person, or upon a further contingency (as, when B shall return from abroad), it is a *contingent* remainder. Such a remainder was at common law scarcely of sufficient importance to be regarded as an estate at all. It was incapable of alienation to a stranger and was liable to be extinguished by the accidental or deliberate determination of the precedent estate before the contingency had happened on which the remainder was to vest. But modern legislation has given the contingent remainder much of the definiteness and permanence of the vested remainder by freeing it from this dependence upon the precedent estate.

Though classified as a future estate, a remainder is conceived of as a present interest and as capable of being dealt with as such by the owner thereof. It may thus be alienated like any other property (though, being 'incorporeal,' it has always required a deed of grant to convey it), and, being real property, it will, if a remainder in fee, descend to the heirs of the owner. Although efforts have been made in some of the United States to wipe out by legislation the distinction between remainders and other future estates, these have not completely succeeded, and the distinction is still of fundamental importance in this country as well as in England. See ESTATE; FUTURE ESTATE; PROPERTY.

Consult: Digby, *History of the Law of Real Property* (Oxford, 1875); Fearne, *The Law of Remainders*; Leake, *Law of Property in Land* (London, 1874); Blackstone and Kent, *Commentaries*.

REMAINDER THEOREM. An algebraic principle of great service in factoring. The theorem may be stated thus: If $f(x)$ is a rational integral algebraic function of x , then the remainder arising from dividing $f(x)$ by $x - a$ is $f(a)$. Since the dividend equals the product of the quotient and the divisor plus the remainder, we have $f(x) = q(x - a) + r$, and if $x = a$, the equation becomes $f(a) = r$. Similarly the remainder arising from dividing $f(x)$ by $x + a$ is $f(-a)$. When the remainder is zero the division is exact, hence the divisor is a factor of the given function. E.g. $x^n + y^n$ is divisible by $x + y$ when n is odd, since the remainder $(-y^n + y^n) = 0$. The rational binomial factors of functions above the second degree are readily determined by use of the remainder theorem and synthetic division. E.g. to factor $a^3 - 6a^2 + 11a - 6$, it is only necessary to substitute, for a , factors of the absolute term -6 . Using detached coefficients (see COEFFICIENT), the division by $a - 1$ may be performed thus:

$$\begin{array}{r} 1 - 6 + 11 - 6 \\ \underline{1 - 5 \quad 6} \\ 1 - 5 + 6; 0 \end{array}$$

Whence the factors are $(a - 1)(a^2 - 5a + 6)$ or $(a - 1)(a - 2)(a - 3)$.

REMAK, rā'māk, ROBERT (1815-65). A distinguished German physiologist and embryologist, born at Posen. He studied at Berlin; in 1847 was privat-docent at Berlin, and was elected professor extraordinary in 1859. Besides important work on the physiology of the nerves, he, with Koelliker, further elaborated the germ-layer theory. His chief embryological work was *Untersuchungen über die Entwicklung der Wirbeltiere* (1851-53).

REMBRANDT, rēm'bránt, properly REMBRANDT HARMENSZ VAN RIJN, hār'mēns vān rīn (1606-69). The chief master in painting and etching of the Dutch school. The date of his birth is disputed, the most probable conclusion being that he was born at Leyden, July 15, 1606. His father, Harmen Geritsz van Rijn, a well-to-do miller, sent him to a Latin school, preparatory to the university, but finally permitted him to follow his inclinations for painting. After studying with his relative, Jacob van Swanenburgh, at Leyden, he was for six months a pupil of Pieter Lastmann at Amsterdam, from whom he learned the technique of etching, and whose influence was decisive upon his art. He was a very precocious genius, and upon his return to Leyden he soon acquired a high reputation. About 1631 he removed to Amsterdam, where he speedily became the most fashionable portrait painter, and had many pupils. Among his patrons were Frederick William, the Prince of Orange, and Burgomaster Jan Six; the foremost men of the day, like the poet Jeremiah Decker and Constantin Huygens, were his friends and associates. He bought a fine house in the Breedstraat, which he equipped with quaint costumes, weapons, and the like, and which contained his remarkable art collection, especially rich in old Netherlandish prints. He possessed paintings of Giorgione, Raphael, Michelangelo, and even antique sculptures.

A very important event in Rembrandt's life was his marriage in 1634 with Saskia Uylenburgh, a young lady of wealthy and influential Amsterdam family. Their happy married life was the inspiration of many of his best works. After her death in 1642, he drew back even more from the world, especially after his financial misfortunes, which censorious biographers have ascribed to dissipation and extravagance. But although it is true that he expended a large sum upon his art collection, his misfortunes are rather to be ascribed to the hard times then prevailing in Holland, and to the change in public taste. In 1657 his creditors sold his wonderful collection, including several of his own paintings, for the pitiful sum of 5000 florins, and in 1658 his house for 11,000. But Titus, Saskia's son, and Hendrickje Stoffels (or Jaghers), a young woman who had become his housekeeper in 1649, formed a partnership for the disposal of Rembrandt's pictures, and rented a house in the Rozengracht, paying the artist a stated yearly salary. After ten years of toil the old artist satisfied his creditors. The stories of his dissipation and low associates in later life are unfounded. His chief associates were artists and he was interested in the inhabitants of the Ghetto; but he also had more influential friends, like Jan Six. Hendrickje died in 1664, leaving a daughter Cornelia, and Titus in 1668. Rembrandt himself was buried in the Westerkerk, Amsterdam, on October 8, 1669.

REMBRANDT
"THE SYNDICS OF THE DRAPERS," FROM THE PAINTING IN THE RYKS MUSEUM, AMSTERDAM

The world has never produced a more original artist than Rembrandt. In theory and in practice he was the great antipode of what was considered the standard art of his day—the Italian. He knew no model, except nature. His conception of nature was essentially poetic and picturesque, but at the same time virile. The most prominent technical characteristic of his work is a marvelous rendition of light, through which he emphasized the important part, leaving the rest in luminous shadows. At first he painted in full light, but after 1633 he preferred the inclosed light of the studio. Everything appears in subtle harmonies of gold and brown. His early pictures are painted with detailed execution and light color; but he increasingly uses a broader brush and richer color, and later in life his painting becomes highly impasto, almost decorative in character. He exercised great influence upon the art of his day, and a more lasting one upon the art of the nineteenth century. Among his many pupils were Gerard Dou, Govaert Flinck, and Ferdinand Bol.

Rembrandt was preëminent in portraiture, and no artist has succeeded better in rendering the head in a realistic, characteristic, and at the same time in a picturesque manner. Among his numerous portraits, perhaps the most interesting are those of himself and of his wife, Saskia. A charming picture is that of the young couple in an affectionate position at breakfast. The best known examples of Rembrandt's portraits are those of 1633, 1634, and 1637 in the Louvre; of 1635 in the Liechtenstein Gallery, Vienna, and in the National Gallery, London; of 1641 in Buckingham Palace. In later life he painted those in Munich (1658), National Gallery (London), and several in English private possession. The best known portraits of Saskia are at Dresden and Cassel; of Hendrickje Stoffels at Berlin; of his mother in Windsor Castle; of his son Titus and of his sister in the Imperial and Liechtenstein galleries, Vienna. Among other famous portraits are: a "Money Changer" (1627, Berlin); the "Polish Nobleman" (1631, Saint Petersburg); the poet Krul (1633, Cassel); the "Mennonite Preacher Aanslow Consoling a Woman" (Berlin Museum); the so-called "Frame-Maker" (Havemeyer Collection, New York, 1640); "Burgomaster Paneras and His Wife" (1645, Buckingham Palace); "Jan Six" (1654, Amsterdam); the "Ship Architect and His Wife" (in possession of the King of England); the so-called "Jewish Bride" (Amsterdam); and the "Architect" (1656, Cassel). Of his "Rabbis" a fine example is in Buckingham Palace; of his numerous "Old Women," the best known are in London and Saint Petersburg. Examples of his work may be seen in this country in the Metropolitan Museum, New York.

Rembrandt's most ambitious efforts in portraiture were groups similar in character to those of Hals. The masterpiece of his earlier full-light treatment is the well-known "Anatomical Lecture" (1632, The Hague). It represents the anatomist Nicholas Tulp, who ordered the picture, making a post-mortem examination before a group of his associates. The heads are wonderfully expressive, and the dead body is treated in a manner at once realistic and delicate. On a still larger scale is his masterpiece of the second period, painted for the Town Hall and now in

the Amsterdam Museum. The fine treatment of *chiaro-obscur* created the erroneous opinion that it represented a "Night Watch," by which title it is generally known, but it is, in reality, a portion of the civic guard issuing forth in broad daylight. His third chief work of this character is "De Stallmeesters" (1662), a representation of the presidents of the clothiers' guild, in the same museum—simple and harmonious in treatment, and showing the more sombre coloring of his last period.

Like the Italians of the fifteenth century, Rembrandt depicted religious subjects in apparel of the day, and chose especially the inhabitants of the Ghetto in their picturesque Oriental costumes. They are characterized by high dramatic power, and by deep religious feeling, of that homely and effective kind typical of the Dutch Calvinistic Church. Among the principal examples are the "Presentation of Christ in the Temple" (1631, The Hague); the "Descent from the Cross" (1633, Munich); "Samson Threatening His Step-Father" (1635, Berlin); the "Angel Leaving Tobias" (1637, Louvre); "Samson's Wedding" (1638, Dresden); the "Sacrifice of Manoh" (1641, ib.); "Reconciliation of Jacob and Esau" (1642, Louvre); "The Disciples of Emmaus" (1648, Louvre); "Jacob Blessing His Grandsons" (1656, Cassel); and "Return of the Prodigal Son" (Saint Petersburg). His mythological pictures make no endeavor to attain classic form or beauty, but strive for pure pictorial effects. Some of them, like the "Rape of Ganymede" (Dresden), even seem to burlesque the subjects. More serious examples are "Diana and Endymion" (Liechtenstein Gallery, Vienna); the "Rape of Proserpina" (Berlin); and "Danaë" (Saint Petersburg). The dozen landscapes which Rembrandt painted display the same poetic feeling and technical skill as his figure subjects. With emphasis of the essentials he has portrayed the beauty of the flat country about Amsterdam. The best known example is "The Mill," in possession of Lord Lansdowne (London); other examples are at Brunswick, Cassel, Dublin, etc.

Rembrandt was probably the most consummate etcher of all times, and held his rank on purely technical as well as artistic grounds. His etchings possess the harmony, tone, and poetry of his pictures, and whether sketchy or highly finished they are always masterpieces. Among his best known prints are the "Descent from the Cross" (1637); "Christ Healing the Sick;" "Christ Preaching;" "Burgomaster Jan Six;" and the well-known "Landscape with Three Trees." Examples of his prints, as well as of his admirable drawings, may be found in the Louvre, Albertina (Vienna), and British Museum, in the museums of Berlin, Dresden, Munich, Holland, and in several private collections.

BIBLIOGRAPHY. Consult the biographies by Scheltema (Amsterdam, 1853); Vosmaer (Paris, 1877), the standard authority; Lemeke, in *Dohme: Kunst und Künstler* (Leipzig, 1877); Graul (ib., 1892); Michel (Paris, 1893); Knaekfuss (Bielefeld, 1899); Malcolm Bell (London, 1899); Neumann (Stuttgart, 1900). For his etchings consult: Blanc (Paris, 1880); Seidlitz (Leipzig, 1896); and especially the reproductions of Rovinsky (Saint Petersburg, 1890 et seq.); for his drawings, Pippmann, Bode et al. (Berlin and London, 1888-90, 1902); and for reproductions of all his works, Bode (8 vols., Paris, 1897).

REMEDIOS, rá-má'dé-ós, or **SAN JUAN DE LOS REMEDIOS**. A town in the Province of Santa Clara, Cuba. It is situated 30 miles northeast of Santa Clara, and 5 miles from the port of Caibarién, with which it is connected by rail, as it is with all the important towns of the island (Map: Cuba, F 4). Population, in 1899, 6633.

REMEDY (from Lat. *remedium*, cure, from *re*, back again, anew + *mederi*, Av. *mad*, to heal). In law, the means by which the violation or invasion of a legal right is either prevented, redressed, or compensated. The term in fact is the correlative of the term legal right, there being in general no right without a corresponding remedy for its violation. The term remedy, however, does not include punishment, and therefore has no application in the criminal law.

The various forms of remedy afforded by the law may be classified as: (1) Remedy by act of the injured party, or self-help; (2) remedy by operation of law; (3) remedy by action or suit.

(1) Remedy by the act of the injured party includes all those rights conferred by law on private persons to protect themselves or their property from injury, and in certain cases to redress wrongs done, without recourse to legal proceedings. In general, remedy by act of the party, or self-help, is permitted by law whenever the remedy afforded by action would be less effective and when the privilege thus accorded to the individual to take the law into his own hands is not inconsistent with sound public policy. Thus, in general, one may defend his person and property from unlawful attacks provided he use no more force than is necessary to accomplish that result. (See SELF-DEFENSE.) One who has been unlawfully deprived of his property may upon fresh pursuit forcibly retake the property, but if the pursuit is not made immediately following the wrongful taking, or if the property has passed into the hands of an innocent holder, his only remedy is by action to recover the property or damages for its conversion. Other forms of remedy by act of the injured party are distress, right of entry, and abatement of a nuisance.

(2) There is perhaps but a single true example of remedy by operation of law, and that is the ancient doctrine of *remitter*, which may briefly be stated as follows: At common law one who was dispossessed of his real estate under certain circumstances had a mere right of action to recover his property; he had no right to reënter upon the property and thus acquire possession, his sole remedy being by action. If, however, he became entitled to the property by inheritance or purchase through the person wrongfully in possession, he was entitled to possession of the property, and upon taking possession under his new but defective title, he might then retain possession by virtue of his valid title. He was then said to be remitted to his rights under the valid title. The doctrine is of slight importance in modern practice.

(3) Remedy by action is the relief or redress afforded to one whose legal right has been invaded, by means of a legal proceeding carried on in a court having jurisdiction over the subject of the suit and the parties to it. See PROCEDURE and ACTION.

For the discussion of the varied forms of remedies, see such titles as DISTRESS; FORCIBLE ENTRY AND DETAINER; NUISANCE; EQUITY; CHAN-

CERY; COMMON LAW, etc., and consult the authorities referred to under some of these titles.

REMEDY OF LOVE, THE. (1) A poem of the sixteenth century wrongly ascribed to Chaucer, and printed in the edition of 1532. (2) A paraphrase of Ovid's *Remedy of Love* by Sir Thomas Overbury, printed in 1620.

REM'ENSNY'DER, JUNIUS BENJAMIN (1843—). An American Lutheran (General Synod) clergyman, born in Staunton, Va., and educated at Pennsylvania College, Gettysburg (class of 1861), and at Gettysburg Theological Seminary (1865). He held pastoral charges in Philadelphia, in Savannah, Ga., and in New York City; labored for the union of Lutheran sects, which was largely accomplished through his service, and published *Doom Eternal* (1880), *Luther, His Work and Personality* (1883), *Six Days of Creation* (1886), and a *Lutheran Manual* (1892), which came into common use.

REMÉNYI, RÉMÁN-YÉ, EDUARD (1830-98). An Hungarian violin virtuoso. He was born at Heves, and studied the violin under Joseph Böhm at the Vienna Conservatory, 1842 to 1845. He took part in the insurrection against Austria in 1848 and fled from Hungary. He came to the United States in 1849, but in 1853 went to Weimar, and thence to England, where he was appointed solo violinist to Queen Victoria. In 1860 he was pardoned by the Austrian Government and returned to Hungary. He afterwards traveled extensively and visited Canada, Mexico, China, Japan, France, and Germany. He ranked among the foremost musical artists of his day, although his style was frequently so exaggerated as to mar the high standard of his work. In technique he has had few rivals. He died while on an American concert tour.

REMI. A powerful people of Belgic Gaul, who alone of the Belgæ formed an alliance with Cæsar in his campaign of B.C. 57. Their capital became the modern Rheims.

REMIGIUS, RÉ-MIJ'ÛS. See REMY.

REMINGTON, FRIEDERICK (1861—). An American sculptor, artist, and author, born at Canton, N. Y. He was educated at the Vermont Episcopal Institute, the Yale Art School, and the Art Students' League, New York City. Afterwards he lived on a ranch in the West. His pictures of Western subjects, especially cowboys and soldiers, soon became very popular. His statuettes include "The Broncho Buster" and "The Wounded Bunkie." They are spirited bronzes, executed with much technical skill, and his horses are notably fine. His stories also deal with Western life, and are illustrated by himself. They include *Pony Tracks* (1895), *Crooked Trails* (1898), and *Sundown Leflare* (1899).

REMINGTON, PHIL (1816-89). An American manufacturer and inventor, born at Litchfield, N. Y. He studied at the Cazenovia Seminary and then entered his father's arms factory at Ilion, N. Y. During the Civil War the Remingtons supplied small arms to the Federal Government, and at its close they formed a corporation under the title E. Remington & Sons. Soon afterwards they began to manufacture the breech-loading rifle which bears their name. In 1873 the firm secured the right to one of the first typewriters, but subsequently the manufacture both

of typewriters and of rifles passed into other hands.

REMINGTON RIFLE. See SMALL ARMS.

REMIREMONT, re-mêr'môn'. A town in the Department of Vosges, France, on the left bank of the Moselle (Map: France, N 3). An old abbey founded in 620 is now used as the hôtel de ville. There is a trade in Vosges cheese. Cotton goods, embroideries, and ironware are manufactured. Population, in 1901, 10,322.

REMITTENT FEVER (from Lat. *remittens*, pres. part. of *remittere*, to send back, from *re-*, back again, anew + *mittere*, to send). A form of malarial fever characterized by a regular lowering of the temperature, which, however, always remains above the normal point. In this respect it differs from intermittent malaria, in which there is an interval of entire absence of fever (apyrexia); and from the continuous variety, in which the body heat remains continuously elevated. The causative agent in remittent fever is the estivo-autumnal variety of the *plasmodium malariae* of Laveran. (See MALARIA.) The severer forms of remittent fever prevail in the Southern States and in tropical countries. They are found in Southern Asia, Western Africa, Central America, and the West Indies. The disease is sometimes, though improperly, called bilious remittent fever. The symptoms of this type are very severe and characterized by typhoid or cachectic features such as occur in the worst cases of intermittent fever, viz. coma, delirium, vomiting, collapse, and hemorrhages from various parts of the body. In certain localities cases occur in which hæmoglobinuria (the presence of altered blood in the urine) is a prominent symptom. The urine assumes a port-wine color, or becomes almost black, the patient is jaundiced, and in fatal cases death takes place from suppression of urine with coma, or from collapse or syncope.

A milder type of remittent fever is seen in temperate climates, especially in the late summer and fall. The symptoms are much less pronounced than those of typical intermittent fever, and consist of loss of appetite, nausea, chill, slight jaundice, and a colorless diarrhœa. The chill is not severe and may appear only once in the course of an attack, which lasts from a few days to two or three weeks. The temperature is not unlike that of a mild typhoid fever (q.v.), and the disease is not infrequently mistaken for typhoid.

The treatment of remittent fever is the same as that of other forms of malarial fever. Quinine in doses proportioned to the severity of the attack acts as a specific. Tonics must also be given and attention paid to the general health. See INTERMITTENT FEVER.

REMONSTRANTS. See ARMINIANISM.

REMORA (Neo-Lat., from Lat. *remora*, delay, from *re-*, back again, anew + *mora*, delay), or SUCKING-FISH. A fish of the family Echeneididæ, interesting because of its commensal habit. The remoras attach themselves to sharks and other large fishes by a sucking-disk on the top of the head. They have an elongated body, covered with very small scales; one soft-rayed dorsal fin, situated above the anal fin; the head flattened and covered with an elongated disk extending back beyond it, which exhibits numer-

ous transverse cartilaginous laminae directed backward, and has a free flexible broad margin. These laminae are formed by modification of the spinous processes of a first dorsal fin, and when

THE WEST INDIAN REMORA (*Rhombochirus osteochir*).

they are raised after the margin of the disk has been closely applied to a smooth surface, a vacuum is created; and so powerful is this apparatus that great weights may be dragged by a remora, while it obstinately refuses to let go its hold. A remora thus attached to a shark or turtle may be carried about for weeks, leaving its host only to secure food, injuring the shark in no way save, perhaps, by the slight check its presence gives to the shark's speed in swimming. In Madag-

SUCKING-DISK OF A REMORA.

ascar native turtle-catchers put a ring about the narrow caudal end of the remora's body, attach a line to this ring, and thus use the fish for catching turtles. Several species of the family are known, dwelling in all the warmer seas. They are mostly small fishes, one or two feet in length, and of plain colors, or striped lengthwise in brown and white. One (*Remora brachyptera*) is occasionally caught as far north as Cape Cod. A rarer form is *Rhombochirus osteochir*, which attaches itself to spearfishes (*Tetrapturus*). More numerous is the closely related species called 'shark-sucker' (*Echineis naucrates*). (See SHARK-SUCKER.) Consult Jordan and Evermann, *Fishes of North and Middle America* (Washington, 1898).

REMPHAN. A word which occurs in Acts vii. 43 in a passage quoted from the Septuagint text of Amos v. 26. In Amos the reading is Chiun, which is evidently intended either as the name of a heathen deity or as a symbol of idolatrous worship, and is generally explained as the Babylonian name of the planet Saturn (see CHU'N). Why Remphan (Raiphon, Rephan in some texts) should be substituted in the Septuagint is hard to explain. The attempt to connect it with an Egyptian name for Saturn is not satisfactory. A plausible suggestion is that it represents a misreading or alteration of the Hebrew.

REMSCHIED, rêm'shit. A city in the Rhine Province Prussia, 19 miles northeast of Cologne (Map: Prussia, B 3). It has several fine technical schools. Remscheid's manufactures are mainly small steel and iron wares (tools, scythes, skates, etc.), in which industry it ranks first in Germany. There are also machine shops, rolling mills, and manufactures of silk ribbons. The city carries on a large export trade chiefly with America, Russia, and the Orient. Remscheid is first mentioned in 1132. Its industries were stimulated by Protestant refugees from Holland and France. Population (commune), in 1890, 40,371; in 1900, 58,108.

REM'SEN, IRA (1846—). An American chemist, born in New York City. He graduated from the College of the City of New York in 1865, from the College of Physicians and Surgeons, New York, in 1867, and received his Ph.D. from the University of Göttingen, Germany, in 1870. From 1870 to 1872 he was assistant in chemistry at the universities of Tübingen, Munich, and Göttingen, Germany; and from 1872 to 1876, professor of chemistry and physics in Williams College. In 1876 he was made professor of chemistry in Johns Hopkins University, and in 1901 succeeded Dr. Gilman as president of the university. Dr. Remsen has carried out a number of important investigations in both inorganic and organic chemistry. He is editor of the *American Chemical Journal*, founded by him in 1879. His book-form publications include the *Principles of Theoretical Chemistry* (4th ed. 1892); *Organic Chemistry* (latest edition 1899); *Introduction to the Study of Chemistry* (1885); and the *Elements of Chemistry* (1887). Remsen's text-books have passed through many editions in this country and have been republished in England and translated into several foreign languages. They form a remarkably clear exposition of the fundamental principles of the science and are well known among students of chemistry both in this country and abroad.

RE'MUS. The brother of Romulus and co-founder of Rome.

REMUS, UNCLE. A character invented by Joel Chandler Harris in *Uncle Remus; His Songs and Sayings* (1880), and other stories. He is an old plantation dandy, who entertains the son of his mistress with quaint stories of the doings of Bre'r Fox, Bre'r Rabbit, and other animals, illustrating their various traits and interspersed with shrewd philosophy. The author used the folk tales current among negroes in the southern part of the United States, and several of his stories aroused the curiosity of those interested in folklore.

RÉMUSAT, rà'my'zà', CHARLES FRANÇOIS MARIE, Count de (1797-1875). A French politician and philo-sophie historian, born March 14, 1797, in Paris. He was the son of Claire Elisabeth Jeanne Rémusat (q.v.). Rémusat studied with brilliant success, and in 1818 began his career as a journalist and supporter of Guizot. He contributed constantly to *Le Globe* from its establishment in 1824. From 1830 to 1848 he was Deputy, and for brief periods Under-Secretary of State (1836) and Minister of the Interior (1840). After the revolution of February, 1848, he was elected to the Constituent and Legislative Assemblies, and became an opponent of Louis Napoleon, by whom he was exiled after the coup d'état. He was amnestied in 1859 and devoted himself to literature and science. From 1871 to 1873 he was Minister of Foreign Affairs. The most noteworthy of his writings are *Essais de philosophie* (1842), *Abélard* (1845), *Passé et présent* (1847), *L'Angleterre au XVIII. siècle* (1856), *Bacon* (1858), *Hartley* (1874), *Histoire de la philosophie en Angleterre depuis Bacon jusqu'à Locke* (1875). After his death were published six volumes of *Correspondance pendant les premières années de la Restauration* (1883-90).

RÉMUSAT, CLAIRE ELISABETH JEANNE GRAVIER DE VERGENNES, Countess de (1780-1821). A writer of memoirs, born in Paris. She was a

grand-niece of Vergennes, Prime Minister under Louis XVI., a noted beauty of the Court of Napoleon I., and an intimate friend of Josephine. As wife of Count Augustin Laurent de Rémusat, chamberlain of Napoleon, and as *dame de palais*, she was acquainted with the intimate life of the Napoleonic Court, of which she left an account in her *Mémoires* published long after her death (1879). She was also the author of an *Essai sur l'éducation des femmes* (1824).

RÉMUSAT, JEAN PIERRE ABEL (1788-1832). A French Orientalist, born in Paris; the son of a surgeon. His father taught him Latin, which he wrote and spoke with great ease. He took up Chinese and unaided brought out in 1811 his *Essai sur la langue et la littérature chinoises*. He received his degree as a physician at twenty-five, and served in the military hospitals. A chair of Chinese having been established at the Collège de France in 1814, Rémusat was appointed to it. He was made a member of the Academy in 1816, and in 1818 succeeded Visconti as editor of the *Journal des Savants*. He was one of the principal founders of the Société Asiatique de Paris in 1822, and was long its secretary. He translated and wrote a good deal, many of his shorter productions appearing in the *Moniteur* and other periodicals, as well as in the *Journal of the Asiatic Society*. He died of cholera in Paris. His principal works are: *Livre des récompenses et des peines* (the Chinese *Kanying-pien*), with notes and illustrations (Paris, 1816); *L'invariable milieu of Tsz'-tse* (1817); *Description du royaume de Camboge* (1819); *Histoire de la ville de Khotan*, to which is appended a treatise in which he endeavors to show that jade is the jaspis of the ancients (1820); *Eléments de la grammaire chinoise* (1822); *Mémoire sur la vie et les opinions de Lao-tse* (1823); *Mélanges asiatiques* (1825); *Iu-Kiao-li*, or "The Two Cousins" (1826); *Recherches sur les langues tartares* (1829); *Nouveaux mélanges asiatiques* (1829); and *Foë Koué Ki, ou relations des royaumes bouddiques* (a translation of the travels of the Buddhist pilgrim Fa-hien, unfinished at the time of his death, but revised, completed, and supplemented by Klaproth and Landresse, and brought out in 1836). Consult Silvestre de Sacy, *Notice sur la vie et les ouvrages de Rémusat* (Paris, 1834).

RÉMY, rà'mé', CAROLINE (1855—). A French journalist, best known by her pseudonym of Séverine. She was born in Paris, and in 1880 met in Brussels the communalist Jules Vallès, with whom she wrote for Paris papers, and, after 1883, for his *Cri du Peuple*. On Vallès's death Mlle. Remy married Guebbard, a co-editor of the *Cri du Peuple*, which for several years was carried on under her supervision, in the meantime turning from socialism to philanthropic sentimentalism. Besides she appealed for many charities in the columns of the *Figaro*, *Gil Blas*, *Gaulois*, and *Petit Journal*. In the nineties she made herself famous by publishing an interview with Leo XIII., and in 1896 by a bitter personal warfare with Rochefort.

REMY, or **REMI**, SAINT. (1) The apostle of the Franks (437-c.533). He was born of noble family at Leon. He was appointed in 459, against his will, to the Bishopric of Rheims, and his episcopate is memorable for the conversion

of Clovis, who was baptized by Remy on December 24, 496. Remy lived to see Gaul almost entirely Christianized, and died in 532 or 533. Some of his letters are preserved in Migne, *Patrologia Latina*, lxxv., as also two documents under the title of *Testamenta*, the genuineness of which has been disputed. Consult his *Life*, by Aubert (Paris, 1849). (2) An Archbishop of Lyons (853-875), who sided with Gottschalk (q.v.) and whose works are in Migne, *Patrologia Latina*, cxxi. (3) A Benedictine monk, head of the episcopal school at Rheims (882-908), whose works, which are commentaries and an allegorical interpretation of the mass, are in Migne, *Patrologia Latina*, cxxxii.

RENAISSANCE (Fr., new birth), or **REVIVAL OF LEARNING**. A name usually applied to the transition from mediæval to modern methods of study and thought. As to its origin and the time at which this is to be set, literature is full of misinformation. The most common error, still repeated in text-books, is that through the capture of Constantinople by the Turks in 1453 Greek manuscripts and Greek scholars were brought into Europe in such numbers that a complete revolution in the intellectual life was thereby and at once produced. This notion takes no account of the condition of European culture which must have existed to make such a reception possible. In fact, the revival of interest in learning for its own sake followed a long and natural process. It is clearly discernible more than a century before the capture of Constantinople, and by that time had completely established itself in Italy and made great progress in other countries. The actual importation of manuscripts and teachers, doubtless stimulated by this event, had long been going on, and it had already become an established custom for Western youths to seek in Athens or in Constantinople satisfaction for the intellectual curiosity aroused by their studies at home.

It is again a popular error to suppose that we can reach a clear understanding of the great transition by undervaluing the culture of the Middle Ages. The difference is not merely or primarily in the mental power of individuals nor in the volume or range of their learning. It is in the spirit in which they approached the study of the past and applied it to the conditions of the present. Mediæval learning had been pursued almost entirely by clergymen and had been valued chiefly for its service in making clear to the increasing mental acuteness of the West the mysteries of the faith. During this period the European mind had lain under the spell of the philosophy of Realism, with its inevitable indifference to the phenomena of everyday experience and its contempt for the idea of the individual as compared with the authority of traditional institutions. With the beginning of the fourteenth century a reaction makes itself clearly felt. A new philosophy, that of Nominalism, finds expression in the Englishman William of Ockham and becomes a vital force in the political theories of Marsiglio of Padua and his school. The essence of this new way of looking at things is the importance of the individual, and hence his right to think and organize as may seem best to him. In religious affairs we see the application of this principle in the fearless criticism of the prevailing conditions by Wiclif in Eng-

land, Huss in Bohemia, and all their sympathizers, organized or not, throughout Europe. This central idea is that the most important fact of Christianity is the membership of the individual Christian in a community of which Christ alone is the head, and that consequently all organized forms of human authority in religion are non-essential and may be totally wrong. The only necessary authority is that of Scripture, and the inevitable result of this is the right of individual interpretation with all its consequences. From Wiclif on through the whole period of the Reformation, the Bible is the common source of appeal for the most diverse forms of opposition to the Roman system. Naturally men found in its infinite variety a thousand serviceable things that were not there.

Precisely parallel with this development in religion is the intellectual process we call the Revival of Learning. Wiclif's Italian contemporary Petrarca subjected to a sweeping criticism all the existing forms of the science of his day: the scholastic philosophy, the science of astrology, the study of the law and of medicine, the practice of teaching, all seemed to him to be governed by a set of conventional rules having no foundation in fact. To this mass of tradition Petrarca opposed the principle of individual study and observation of things as they were. Yet, he, too, like the religious reformers, must have his authority, and he found it in the classic literature. The 'ancients' stood to him for types of a higher manhood, with larger, freer, and truer conceptions of life. They seemed to him free from the superstitious slavery to traditions which he saw around him. His own struggling individualism found its justification in what he imagined to be the perfected individualism of the ancient world. His own poetic gift found its chief satisfaction in the poetic charm of ancient literature; even the prose of Cicero seemed to him to have a wonderful rhythm long before he could understand it. Then, precisely as the religious reformers insisted that the Bible should be studied without restraint of doctrine or tradition, so Petrarca found his chief mission in collecting, collating, copying, and publishing the texts of the classical authors. Still further, as the translations of Wiclif and others were made, not from the original tongues, but from the imperfect Latin authorized version (Vulgate), so Petrarca had to be content with Latin versions of the Greek authors. In both cases the authority they revered came to men in an imperfect form, but in both the spirit of a new time is perfectly evident. Wiclif is the first apostle of the Protestant Reformation, and Petrarca is the first great teacher of the Revival of Learning. To conclude, the Humanist was as much inclined to discover non-existent things in his classics as was ever the Reformer in his Bible.

Petrarca was at once the defender of rational thought, and, after Dante, the chief creator of the modern Italian language. The literary use of the modern tongues, the natural utterance of the free layman, is, equally with the more sympathetic study of the ancient world, an element in the great reaction against a purely clerical and Latinized culture.

This double intellectual life of Petrarca is shared by all his humanistic contemporaries and

immediate followers. Giovanni Boccaccio is known to posterity chiefly through his Italian prose tales, but his own special pride was in the service he rendered to classical learning by his laborious encyclopedic works—the *Genealogy of the Gods*, a dictionary of mythology, and his *Dictionary of Classical Geography*. These books served as a groundwork of classical studies for the youth of two centuries to come. Boccaccio died as professor of the *Divine Comedy* at the University of Florence, another illustration of the equality of the modern and ancient literatures in the estimation of Renaissance Italy.

Petrarca applied to learning for the first time what we have learned to call the 'collector's instinct.' Much of the classic literature was already known, but until Petrarca no one had thought of searching for more. Through his widely extended personal relations in all the countries of Europe he was able to employ willing hands to bring the long-forgotten manuscripts out of their hiding-places, to have them sent to him, procure copies of them, compare these with the originals, and thus learn wherein they needed correction. Many indications in already known writings pointed to others not yet discovered, and thus made possible intelligent search after these lost treasures. All this work was carried on by Petrarca and his contemporaries with the fresh enthusiasm that belongs only to an interest freed from any professional quality, but it soon became the serious pursuit of men who gave their lives to it, and thus laid the foundations for a new profession, unknown to the Middle Ages, the profession of the scholar, pure and simple. These men were devoted to learning for its own sake, and ready to leave to others the application to practical things.

The same instinct of discovery appears also in the field of archaeology. The Middle Ages had pitilessly despoiled the remains of ancient buildings to gain material for their own constructions, and had destroyed without scruple the choicest works of antique sculpture. Now, following the indications of what remained above ground, Petrarca and his followers began to seek for what was hidden. They gave the first feeble impulse to the vast activities of modern research. To them we owe the beginnings of both the libraries and the museums of modern Europe.

In the generation following Petrarca the influence of the new learning makes itself widely felt in many forms of activity. Men whose early training had been chiefly as scholars came to be sought for services of every kind. Coluccio Salutati, one of Petrarca's most ardent admirers and imitators, spent his life as secretary of the Republic of Florence, at a time when the little State was involved in the most complicated relations with all the powers of Europe. It was his duty to write the elaborate Latin essays which were then the chief medium of diplomacy, and his fame rests upon the elegance and purity of this imitated classicism. Poggio Bracciolini filled for life a similar place in the Papal chancery, and was no less approved and applauded because his caustic humor reveled in ribald obscenities. Niccolò Niccoli was the business centre of the Florentine group of scholars, the earliest type of the modern book-collector and publisher. Ambrogio Traversari, general of the Order of Camaldoli, devoted much time to studying and editing the works of the

ancients. Francesco Filelfo was the earliest specimen of the haughty pedant, learned beyond others in all the detail of scholarship, but without the creative power that had marked the pioneers. He touched the schoolmasterly stage of the Revival when the work of discovery had largely been done, and when the chief distinction of the scholar was to be gained by a kind of technical skill quite independent of any largeness of mental equipment.

It is at this stage that we begin to see the results of the great expansion of interest due to the study of Greek. Petrarca had deeply felt the importance of this study, and had bemoaned his incapacity to engage in it. Greek was still a living tongue in parts of Southern Italy, and communication with the East was frequent enough, but Boccaccio, who seems really to have made the effort, found it impossible to procure suitable instruction. The men of the next generation, however, set themselves more earnestly to work; Greek teachers began to hear of the golden opportunities in the rich Italian towns, and Italian youths sought instruction at the ancient school of Athens. The earliest and most influential of these Greek teachers was Mamei Chrysoloras, a man of distinction in the public service at Constantinople, brought over to Italy by his duties in this capacity, and then employed as teacher of Greek at Florence. He died on his way to attend the Council of Constantine in 1415. Another Greek of later influence was John Argyropulos (died c.1489), who was successively rector of Padua and professor at Florence and finally at Rome. Of Italians who illustrated the highest application of ancient culture to the development both of Italian literature and the perfection of classic learning, we may mention Guarino (d.1460), Poliziano (d.1494), and Lorenzo de' Medici (d.1492). The inherent charm of the Greek language and literature worked at once upon the highly sensitive Italian mind, revealing a new world of beauty and of meaning.

Circumstances favored a rapid spread of the new culture. The Italian cities, grown rich under democracy, but having tired somewhat of its responsibilities, had been passing into the control of that extraordinary series of despotic rulers who united with a brutal unscrupulousness of character a taste for the best in literature and art without a parallel. It was one of the chief claims to power for a new-made tyrant like Cosimo de' Medici that he provided the means of existence for talent of every sort. Even the bloody ruffians who, one after another, held power in Milan, made places for scholars and artists, maintained libraries, and encouraged learned research. The ancient universities of Bologna, Padua, and Salerno were reinvigorated by the healthful breath of the new learning and stimulated by the rivalry of the new schools founded by the younger republics. The Papacy, with a free hand after the Council of Basel (1431-49), passed into the control of a series of men like Nicholas V., Pius II., and Leo X., in whom the interest in learning and art was an absorbing passion. In fact, learning, under the Italian humanistic impulse, may be said to have taken on the form of a fine art and thus to have concealed much of its serious import. Under all these favoring conditions it is not strange that a certain flippancy of character

came to be associated with the cleverness of the fifteenth-century scholars. The lightness of Boccaccio had seeded the natural expression of exuberant joy in the natural things of human life. A century later this sincerity had largely given way to an over-refinement that knew no limits. Everything was permissible in the name of æsthetic experiment. Without in any formal way renouncing their allegiance to Christianity, many became more really interested in philosophy than in doctrine, and became increasingly lax in following the ordinary forms of devotion.

It is here that we may best notice a distinction insisted upon by recent Roman Catholic scholars—notably by Ludwig Pastor in his *History of the Popes*—between a 'true' and a 'false' Renaissance. By the former is meant the enlargement of scope and the clearing of the mental vision possible to men without departure from the traditions or the institutions of the Church. By a 'false' Renaissance is meant the exaggeration of the æsthetic and critical side of learning to a point where it must lead to indifference or even hostility to the clerical traditions.

A great change came over the spirit of the New Learning when it passed to the more serious, less artistic, and more deeply religious peoples of the North. The impulse which led young Germans and especially young Englishmen to cross the Alps and study the ancient classics under Italian teachers was largely the desire to find the very best means to acquire such training as would help them in the regular professions. There is in the North but little of the affected æstheticism of the later Italians. Such men as those whom Erasmus found in England at the end of the fifteenth century, John Colet, later Dean of Saint Paul's, founder of the most important boys' school in England and interpreter of Christianity by the method of a rational criticism; Groeyn, the most important agent in introducing the teaching of Greek into England; Thomas Linaere, founder of the London College of Physicians; and Thomas More, a busy lawyer, King's counselor, and social reformer, suggest a type of man totally different from the members of the Florentine 'Academy.' Yet all these men drew their intellectual inspiration from Italy, and were free to acknowledge their debt. Erasmus himself, with all his biting satire and his ready criticism of many serious things, was primarily the preacher of a sane rationalism based upon sound learning, and by this he always meant the learning of the New Method. 'Art for art's sake' never held the same place in the intellectual code of the North as in that of Italy, but the appreciation of learning was there none the less keen, and proved to be more lasting in its effect upon national character. One of the great services of the northern Humanism was the revival of the study of Hebrew on a scientific basis. What we have said of the mediæval study of Latin applies equally to that of Hebrew. It had been pursued by Jewish scholars with a view to the perpetuation of their racial institutions, but it had not been in any sense an instrument of culture. Johann Reuchlin, an elder contemporary of Luther and Erasmus, was the first to call attention to the importance of Hebrew in a complete scheme of Christian scholarship. He aroused a storm of opposition from the same obscurantist elements that had always been ready to persecute Jews as inevitably hostile to

all that bore the Christian name. He found his support wholly in the circle of enlightenment that had spread itself outward from the study of the Greek and Latin classics as a means of civilization. The party of the 'Reuchlinists' included all the forward-looking elements of German society and attracted the sympathy of the men of enlightenment everywhere. Its most characteristic expression is found in the *Epistolæ Obscurorum Virorum* (Letters of the Men of Darkness), the most galling satire of the Reformation period, in which the old scholastic method was held up to the derision of people who were quite ready to join in the laugh and to carry out the suggestion of reform.

The first quarter of the sixteenth century saw the capture of most of the great universities of the North by the new spirit. Even at Paris, the theological school, the Sorbonne, still defended the ancient faith, and largely by the ancient methods, while the Collège de France, founded by Francis I., became a seat of enlightened instruction. So at Louvain, one of the most solid bulwarks of the scholastic theology, a new school, established with the help of Erasmus, kept up the balance with success.

The great importance of the New Learning in its effect upon the Protestant Reformation is sufficiently shown by the studies of Luther, Calvin, Zwingli, and other leaders of the movement. No doubt the immediate effect of the Reformation was once more to turn men's minds away from purely æsthetic considerations, but the work of the New Learning had been done and could not be undone.

BIBLIOGRAPHY. The most important work on the general history of the Renaissance is Voigt, *Die Wiederbelebung des klassischen Altertums* (3d ed., Berlin, 1893). Consult also: Müntz, *Precursori e propugnatori del rinascimento* (Florence, 1902); Burekhardt, *Geschichte der Renaissance in Italien* (Stuttgart, 1890-91); id., *Kultur der Renaissance in Italien* (8th ed., Leipzig, 1901); Symonds, *The Renaissance in Italy* (London, 1877); Pater, *Studies in the History of the Renaissance* (ib., 1873); Biese, *Die Entwicklung des Naturgefühls im Mittelalter und der Neuzeit* (Leipzig, 1887); Robinson and Rolfe, *Petrarch* (New York, 1892); Seeböhm, *Three Oxford Reformers*, (3d ed., London, 1887); and the lives of Erasmus by Froude (ib., 1894), Drummond (ib., 1873), and Emerton (New York, 1899).

RENAISSANCE ART (OF., Fr. *renaissance*, from Lat. *renascens*, pres. part. of *renasci*, to be born again, from *re*, back again, anew + *nasci*, to be born). During the last decades of the fourteenth century and the first decades of the fifteenth a new spirit invaded the domain of art, asserting itself in a new enthusiasm for the study of man and the study of the antique. To the humanists in literature corresponded the realists, naturalists, and classicists in art. Antique art was rediscovered, but while the classical element preponderated in architecture and decoration, it was the element of realism that took possession of the arts of sculpture and painting. The flowering of the Renaissance into these new impulses was chiefly due to a few leading artists of Tuscany between 1390 and 1430; to the architect Brunelleschi, the sculptors Donatello, Quercia, and Ghiberti, and the painters Masolino, Masaccio, and others. Northern critics, however, have

shown that a strongly realistic school had previously developed in Burgundy, Northern France, and Flanders, especially in the sculpture of such artists as Chaux Sluter, Beauneven, and Jean de Cambrai. The age of the Renaissance, though it practically closes before 1600, was not superseded by a Græco-classical revival until about the period of the French Revolution.

Painting was the typical art of the Renaissance because it best expressed its realism. In architecture the style was far less original, its character being less constructive than decorative. The preponderance of the secular spirit led to a decadence of religious art in all forms. The previous tendency toward general types in art gave way before a new individualistic tendency, each artist creating his own personal style. Only in painting were the peculiarities of local schools very prominent.

Tuscany was followed by Lombardy in the development of the Renaissance about 1460, and shortly afterwards by Venice. Rome and Naples were simply meeting places for Tuscan and Lombard artists. France was the first foreign country to follow the example of Italy, with whom its relations of all kinds had long been of the closest. Spain, in some parts, then followed quite early in the sixteenth century. Not till the middle of the century did Germany and England accept the new style to any large extent, and even then with less of pure beauty and classic precision than in Italy and France.

Renaissance sculpture and painting are of such importance in the history of the general development of these arts that it is most convenient to treat them under the general articles.

ARCHITECTURE—ITALY. Gothic architecture had never acquired a deep-rooted hold in Italy and Italian architects had been seeking for a new style ever since the decline of the Romanesque. This they found in a study of the Roman ruins, out of whose columns, entablatures, and arches they developed a style which, sharing the pagan spirit of Roman art, was more successful in secular than in religious buildings. Coming at a time of individualism, it developed personal and local phases of style, and its history is the history of the works of individuals, not of a national style. It developed into a system of decoration and composition rather than of construction, although it made effective use of the dome and vault. Several periods of Italian Renaissance can be distinguished: (1) Early or Free Renaissance, c. 1420-1500; (2) High or Classic Renaissance, c. 1500-1580; (3) the Decline of Barocco, c. 1580-1780. The founder of the style was the Florentine Brunelleschi, the greatest designer of the early Renaissance and equaled only by Michelangelo and Bramante among later men. In the Pazzi Chapel (1425) and the two great basilican churches of Santo Spirito and San Lorenzo he revived the moldings and details of classic architecture, but neither he nor his followers, Michelozzi and Giuliano da Majano, attempted any close imitation of Roman buildings. The two great palaces of this first period in Florence, viz. the Riccardi by Michelozzo (1430) and the Pitti (1435), though Roman in scale and in minor details, were of a thoroughly modern and Florentine type. Alberti was the first to attempt strictly Roman and classic exterior design in both religious and secular architecture by the use of

superposed orders, pilasters, entablatures, and Roman arches. Florentine architects of later date, Rossellino and Francesco di Giorgio, carried the new style to Pienza, Siena, and Cortona, and others, like the Majani, Laurana, and Giuliano di San Gallo, to Naples, Urbino, and Rome. The ducal palace at Urbino is one of the most imposing masterpieces of the Early Renaissance. In Lombardy the new style developed a prolific school of design which, retaining the use of terra-cotta ornament, open arcades, and some mediæval details, was more varied and picturesque than the Florentine. Its influence was carried to Venice by the Lombards, and there gave rise to the most richly decorative of all the local Renaissance styles, through the free use of marble incrustations and surface carving. To Lombardy belongs also the most highly decorated façade of the Renaissance, that of the Certosa at Pavia; and from Lombardy came Bramante, the genius who inaugurated the Middle Renaissance, after his establishment in Rome in 1499.

While most of his predecessors had been primarily goldsmiths or decorators, Bramante was a master-builder, and became an architect in the true modern sense. He was the first to embody the genuine Roman spirit in modern design, as in his *Tempietto*, and in his designs for the Vatican and Saint Peter's (1503-06). Henceforth both the Lombard and early Tuscan systems of ornament were abandoned for plain surfaces and colossal details; the new style was severe and grandiose; only in the interiors was decoration still abundant. The design that embodied its best features was Bramante's plan for Saint Peter's. The Roman school under him now succeeded the Tuscan in the leadership, and the study of Vitruvius and the measuring and drawing of Roman ruins became an accepted part of every architect's training. Raphael, Peruzzi, and Antonio da San Gallo were among Bramante's foremost pupils; the Farnesina, Massimi, and Farnese palaces embody their ideas, the last named being the most imposing in Rome. But meanwhile the Venetian school had not lost the individual charm (see *VENICE*) of its civic and palace architecture under Guglielmo Bergamasco and his rivals and then under the neo-classic leader Sansovino, whose *Libreria di San Marco* and *Palazzo Comaro* marked an epoch in Venetian architecture.

This middle period closes with Michelangelo, whose genius, like Bramante's, also ushered in a new period, that of the scientifically developed Renaissance, based upon the deepest study of classical monuments. Remodeled by Michelangelo, Saint Peter's remained even more the type for Renaissance churches. The dome, either single or grouped, the tunnel vault and cross vault, often coffered, continued the orthodox forms of covering. Internal piers became heavier, while columns often took the place of pilasters outside. The single order after the colossal example of it given at Saint Peter's by Michelangelo reigned supreme. Vignola's works present this style under a more refined aspect and mark the beginning of the villa architecture of the Roman school. (See *LANTE, VILLA*.) In the palaces of Alessi and others at Genoa monumental staircases and vestibules are the central point for grandiose and original treatment, rather than the façades. The progressive domination of classic formulæ is observed alike in the writings and

the buildings (especially at Vicenza) of Palladio. The term Palladian is generally used for this scientific-theoretical style, whose side lights were Vignola, Serlio, and Scamozzi. Its first great embodiment in Palladio's work was the arcade around the basilica at Vicenza, which was followed by other remarkable works, such as the Palazzo Chiericati, the Palazzo Tiene, and the Teatro Olimpico. He created his highest types of religious architecture in Venice with San Giorgio Maggiore and the Redentore, and through them produced a revolution.

Hard on his footsteps came the Barocco style (q.v.) (c.1575-1780). It was a reaction from Palladian severity and reveled in broken lines, vagaries of proportions and form, defiance of tradition. Domenico Fontana, Maderna, Bernini, and Borromini were its greatest representatives. Its masters produced sometimes a grandiose work like Bernini's colonnades of Saint Peter or a logical church façade, though Maderna failed utterly in that of Saint Peter's and succeeded better only in smaller buildings such as Santa Susanna. The works of Longhena (q.v.) at Venice were exceptions to the general rule of extravagance and bad taste. As in every final style of an architectural period, the picturesque predominated over the monumental. Rich colored marbles, heavy details of cupids, scrollwork, and architectural motives, even imitations in metal and marble of stuffs, as in Bernini's famous baldachin, are prominent.

FRANCE. The close political relations of Italy with France and the habit of calling in Italian artists, consequent upon the campaigns in Italy of Charles VIII., Louis XII., and Francis I., led to the introduction of Renaissance forms into France sooner than elsewhere; at the same time the strength of French Gothic traditions not only retarded the prevalence of Renaissance forms, but led to an internal reform rather than to the adoption of an Italian style. Religious architecture had been for some time on the wane and palace architecture in the ascendant. The first indications are most evident in decoration, where Lombard models prevail. The transitional period illustrated in the Château de Gaillon and in the older part of that of Blois (q.v.) is still prevalingly mediæval; but with Francis I. Gothic outlines tend to disappear and the classic orders to prevail. But it was not the foreign but the native artists to whom the fundamental changes were now due; first to the men of North France, like Fain and Biart; then to those of the Royal Domain, like Le Breton and Lemercier, while others, like Chambige in his unique Château of Saint Germain, remain outside of the Renaissance orbit even toward the middle of the seventeenth century. The greatest achievement was the transformation of the feudal castle into a superb and artistic residence, totally unlike anything known in Italy: such were Amboise, Blois (q.v.), Fontainebleau (q.v.), and especially Chambord (q.v.), with its great corner bastions and its forest of dormer windows, chimneys, and towers, a characteristic feature in which French differs so fundamentally from Italian Renaissance. These royal residences were almost rivaled by those of the nobility like Azay-le-Rideau and Chenonceaux (q.v.).

The closing years of Francis I. (died 1547) usher in a more classic style. Some of its leaders, like Jean Bullant, Du Cerceau, and Phil-

bert de l'Orme, studied in Italy; others, like Pierre Lescot, were undoubtedly familiar, through drawings, with Italian buildings. Lescot's creation of the Louvre (q.v.) (1546) is the classical example of the new style of royal palace without a trace of mediævalism, and is if anything superior to the contemporary work of San Gallo, Vignola, and Sansovino in Italy. One of its great charms lies in the magnificent sculptures of Jean Goujon and others, which make it unique in its decorative scheme. De l'Orme's Tuileries (q.v.) and Château of Anet were his masterpieces. Under Francis I., Henry II., and Charles IX. France was covered, especially in the region of the Loire, with châteaux of similar types, with civic structures like the town halls of Beaugency and Paris, and with innumerable city houses of the nobility and bourgeoisie. The changes brought about by a further influx of Italian ideas under Maria de' Medici involved loss of charm, as well as force in later works. Additions were made to the royal palaces such as the Tuileries, the Louvre, and Fontainebleau and a new palace, the Luxembourg (q.v.), was built by one of the leaders of the new school, Salomon de Brosse, who improved upon his Italian model, the Pitti Palace. Lemercier was very successful in his additions to the Louvre and in the Sorbonne. Through all this middle period there is a constant struggle between Italian classic and barocco tendencies and the French love of the picturesque, but French architects did not go to the extreme either of scientific frigidity or lawless eccentricity.

Under Louis XIV. a more fanciful decoration mingled with the formal Palladian architecture. Mansart showed in his colossal palace of Versailles the chilling effects of this formal classicism, but he achieved greater success in his dome of the Invalides. The masterpiece of the time was, however, the superb Corinthian colonnade of the east front of the Louvre, by which the palace was completed, from the designs of Perrault. The interior decorative work of this period in France has an originality and delicacy that places it as much above contemporary work in Italy as the early decoration had been inferior. Under Louis XV. Italian ideas obtained complete possession of exterior design and of church architecture both exterior and interior, though in domestic architecture the interior decoration and furniture display a remarkable fantastic originality. The Paris Pantheon by Soufflot (q.v.) represents the formal Roman classicism that prevailed in the latter part of the eighteenth century.

GERMANY. The Renaissance as a style in art and especially in architecture made its way more slowly in Germany than elsewhere, except in England; partly, no doubt, because the movement was so largely concerned with religious questions. When the new style entered Germany it was from Carinthia, Bohemia, and Tyrol, rather than from Italy, and Italian architects were employed in Prague, Cracow, Graun, and Vienna, long before the creation of the earliest examples of the style even in South Germany, while the northern States were still slower in receiving it. The real transformation of German architecture began after the Peace of Augsburg (1555), and is to be seen in the castles of the princes and barons, the houses of wealthy burghers, and guilds, and the *Rathäuser* of the town

councils, rather than in royal palaces or in religious buildings. Indeed, Saint Michael's, Munich, is the only really important church edifice of the sixteenth century in all Germany (1582). Until the Palladian or rather the Italian Baroque style invaded Germany, late in the seventeenth century, the Germans retained in their Renaissance buildings unchanged many of their national and mediæval features—high roofs, vast stepped gables of fanciful outline, dormers running through two or three stories, spiral stair-towers, oriels, the irregular plans of the feudal castles, and a predilection for old, fantastic, and picturesque combinations of form and detail. The orders appear rarely except in portals or in pilasters, and then treated with utter disregard of classic canons, and court arcades of the classic type are not to be found, the Germans preferring stumpy columns with segmental arches to the Italian type. The style appears, therefore, at its best in the smaller street fronts of narrow houses, or the picturesque masses of castles on the hillsides, as at Torgau, or in the highly ornate Otto Heinrichsbau (1554) and Friedrichsbau (1601) of the great castle at Heidelberg, which are generally considered the masterpieces of the first period. The town halls of Altenburg, Danzig, Augsburg, Rothenburg, and Bremen (from 1562 to 1612) and others of less importance form another interesting group of examples of the style. In the later or Baroque period there were many palaces erected or enlarged of moderate architectural interest, except in the case of the Zwinger at Dresden (1711), which is one of the finest and most consistent examples of the Rococo extant; and there were also a number of interesting churches in this style (e.g. Marienkirche at Dresden). Landscape architecture after the style of Versailles was highly developed in this period.

BELGIUM AND HOLLAND. In these closely related countries Renaissance architecture developed very differently, though late in both. Belgium was strongly affected by both French and Spanish influences, as in the fantastic semi-Spanish episcopal palace at Liège by Borset (1508), and produced but one monumental edifice of classic type, the Antwerp town hall (1564). As in Germany, many of the most characteristic Renaissance works are guild halls and narrow street fronts, as on the great square at Brussels, the Boatmen's houses at Ghent, etc. Even more successful were many sumptuous choir screens, altars, and pulpits, both in Belgium and Holland. In the latter country the Renaissance produced almost no works of real importance, though some of the Dutch town halls are worthy of notice, as at The Hague (1565), Amsterdam (1655), and Leyden (1597). With these may be classed also the Amsterdam Bourse, and in Denmark the Exchange at Copenhagen. The use of brick, of stepped gables, and of a simple and naïf style of design gives a certain charm to many less important Dutch buildings.

SPAIN. Although the Renaissance in architecture entered Spain largely through the work of Flemish artists, it developed more rapidly and produced more important works than in Flanders. The exuberant decorative spirit of Spanish late Gothic and Moresque art appears in the elegant detail of the Plateresque, as the early phase of the Renaissance in Spain is called, in such structures as the Santa Cruz Hospital at

Toledo, the College at Alcañ de Henares, and the Ayuntamiento at Seville, all between 1500 and 1520. About 1525 church architecture was radically modified by the new style, as shown in the cathedrals of Jaén (1525) and Granada (1529) and San Domingo at Salamanca. But hardly had this begun when Berruguete returned from Italy and brought with him the High Renaissance in the Palladian form, which was further developed by Herrera. This second phase of Spanish Renaissance is called the Greco-Roman, and it ruled until the close of the seventeenth century. The palace of Charles V. at Granada is a noble structure by Machuca and Berruguete, rusticated below, colonnaded above, of good proportions and well planned. One building especially corresponds in its vastness to the greatness and character of Spanish power, viz. the Esocrial (q.v.), a huge rectangle, simple and uninteresting except in its domical church, which is an impressive edifice of classic style. In such works as these Italian ideas are reproduced with greater fidelity and absence of local national traits than in any other country. On the other hand, when under the leadership of Churriguera an extreme form of Baroque or Rococo pervaded Spain, the national leaning toward elaborate detail and over-decoration of surfaces ran riot as never before. Some of the royal palaces (Madrid and San Ildefonso) built in the eighteenth century escape it, but with few exceptions it prevailed.

PORTUGAL hardly holds any independent position. Its masterpiece of the sixteenth century, the group of monuments at Belem, is the *comble* of luxuriant expression of the mixed late Gothic and pseudo-Renaissance design.

ENGLAND. Latest of all countries to employ the Renaissance style was England. Under Elizabeth and James I. (1558-1625) there were sporadic examples and a sprinkling of the new style of decoration in Tudor work. There were some Italian artists like Torrigiano and Giovanni of Padua, but they had to adapt themselves to Tudor requirements, except in a few cases such as the Caius Gate at Cambridge. Inigo Jones changed the trend of architecture and led to the universal adoption of the pure Italian High Renaissance of the Palladian type before the middle of the seventeenth century, his happiest effort being the palace at Whitehall (q.v.). His work was carried forward by Wren, whose masterpiece, Saint Paul's Cathedral (q.v.), is one of the great buildings of Europe. It combined the Renaissance groups of domes with the typical ground plan of an English Gothic cathedral. Wren's sobriety and consistency gave a character of good taste to all contemporary English architecture, which continued throughout the eighteenth century under the leadership of men like Van Brugh, the designer of Blenheim, Hawksmoor, and Gibbs, who built Saint Martins-in-the-Fields and the Radcliffe Library, Oxford. These men and their successors, Chambers, Adams, Taylor, and Dance, show a progressive degeneration in point of originality up to the close of the century, when the wave of purely Greek Renaissance struck England and was embodied in buildings like the Bank of England (see SOANE), the British Museum (q.v.), the Fitzwilliam Museum, Cambridge, and the fine Saint George's Hall, Liverpool (q.v.).

RENAIX, re-nâ'. A town of Belgium, in the Province of East Flanders, picturesquely situated, 24 miles by railway south of Ghent (Map: Belgium, B 4). It manufactures principally fine linen and damasks, woolen fabrics, tobacco, and pottery. Population, in 1900, 20,090.

RENAL DISEASE. See BRIGHT'S DISEASE; CIRRHOSIS.

RENAN, re-nân', ERNEST (1823-92). A French religious historian and Semitic philologist, born at Tréguier, in Brittany, February 27, 1823. Of his childhood he told in *Souvenirs d'enfance* (1883). He lost his father in youth and owed it to a devoted sister that he could begin with neighboring priests the studies for which his frail health seemed to designate him. He was soon summoned to Paris and promoted to Saint-Sulpice, the chief training school of the French priesthood. His belief in the Catholic teaching soon began to leave him, but not his love for its beauty, nor his regard for its worthy professors. At twenty-two he abandoned his study for orders and taught Latin in a clerical school, still aided by his sister's savings, till at twenty-five he won his doctorate with such distinction as to assure a position that was already recognized by an academic prize for an essay *Sur les langues sémitiques*. He won a second prize in 1850 for an essay *Sur l'étude du grec dans l'occident au moyen-âge*, was sent by the Academy to Italy, where he prepared an epoch-making work on Arab philosophy, *Acréolo-*

et l'arabisme (1852), and to Syria (1860), where he found inspiration for his *Vie de Jésus* (1863), the first of seven volumes that occupied him from 1867 to 1881, dealing with the origins of Christianity to the death of Marcus Aurelius. To this he added as an introduction *L'histoire du peuple d'Israël* (1888-94). Though elected professor of Hebrew in the Collège de France (1862), he was not allowed to lecture, because of his expressed unorthodoxy. This gave wide popularity to his ideas and allowed him more leisure to propagate his enthusiastic belief that politics, education, and ethics itself would be regenerated by the progress of science, especially of history and philology. The *Vie de Jésus* was widely translated; 300,000 copies were sold in France alone, and for every later work of Renan there was a popular as well as a scholarly demand. *Les apôtres* (1866) and *Saint Paul* (1869) were followed by a volume of essays on contemporary questions (1868). Then came the Franco-German war, which evoked from Renan two remarkable letters to David Strauss, the radical biblical critic of Tübingen, showing a patriotism free from every taint of Chauvinism. The Republic restored his professorship and he now published *L'Antéchrist* (1873), *Les évangiles et la seconde génération chrétienne* (1877), *L'église chrétienne* (1879), *Marc-Aurèle et la fin du monde antique* (1881). Volumes of essays with the titles *Etudes* (1857), *Essais* (1859), *Mélanges* (1878), *Nouvelles études* (1884), *Discours* (1887), accompanied or followed his more connected work. His *Drames philosophiques* were first collected in 1888. A vision of *L'avenir de la science*, written in 1848, was given to the world as a sort of parting gift in 1890. During his last years Renan enjoyed all the honors, public and private, that Paris could give to a favorite scholar. He was made grand officer of the Legion of Honor and administrator of the Collège de France, dying as he had wished, at his post, October 2, 1892. Renan saw so many sides of his subject that he was never as sure of any of them as he was of his own critical wit. He was by turns hazy, cautious, mythical, ironic, idealistic, skeptic, all with a romantic sentiment and a rosy optimism that regarded the nineteenth as "the most amusing of centuries," to be contemplated with "benevolent and universal irony." He had a lofty conception of moral duty, and held that "few persons have a right not to believe in Christianity." He knew that he himself was "a tissue of contradictions, one half fated to be employed in destroying the other," and he said this fact gave him "the keenest intellectual pleasure that man can enjoy." The clew to this psychic paradox is perhaps that Renan united two races, the Breton and the Norman, and two cultures, the ecclesiastical and the scientific, neither overcoming the other, and both possessing his mind. It is this, joined to a uniquely subtle, sensuous charm, that has made his influence a powerful one in the literature of the present generation. He typifies the skepticism of modern France, its awakening religious curiosity, its dilettante shrinking from the horrible mania of certainty, its Protean inconsistency and its easy tolerance, born of a conviction that no faith is worth a struggle, much less a martyrdom. Of Renan's works there is no uniform edition. To the writings named above may be added many linguistic studies in the *Mémoires* of the Academy and in the *Journal Asiatique*, important con-

tributions to the monumental *Histoire littéraire de la France* (vols. 24-30), translations of *Job* (1858), *The Song of Songs* (1860), *Ecclesiastes* (1881), and many lesser essays. The titles and dates of the *Philosophic Dramas* are *Caliban* (1878), *L'eau de jouvence* (1880), *Le prêtre de Nemi* (1885), *1802, Dialogue des morts* (1886), *L'abbesse de Jouarre* (1887). There are English translations of the whole *Histoire du peuple d'Israël* and of the *Origines du christianisme*, of the *Etudes* and *Nouvelles études*, of *Job* and the *Song of Songs*, and of the *Souvenirs*. For Renan's life and character consult his own *Souvenirs d'enfance et de jeunesse* (1833), his *Feuilles détachées* (1892), and *Lettres intimes* (1896); also the monographs by Bourget, in *Essais de psychologie contemporaine* (Paris, 1883); Reinach (ib., 1893); Abbé d'Hulst (ib., 1894); Scailles (ib., 1895); and Mountstuart Duff (London, 1893); also Lemaitre, *Les contemporains* (Paris, 1890-92); and Monod, *Les maîtres d'histoire* (ib., 1894).

His son **ARY** (1858—), born in Paris, became known as a landscape and figure painter and artist, and was a pupil of Delaunay and of Puvis de Chavannes. He began to exhibit in the Salon in 1880, contributed many critical essays to the *Gazette des Beaux-Arts*, of which he afterwards became secretary, and in 1900 published an interesting monograph on Gustave Moreau (q.v.).

RENDSBURG, рѣнтс'бѳрк. A town in the Province of Schleswig-Holstein, Prussia, situated on the Eider and the Kaiser-Wilhelm Canal, about 15 miles south of Schleswig (Map: Germany, D 1). It has a thirteenth-century church, a gymnasium, a Realschule, and manufactures of woollens, pianos, fertilizers, meat products, leather, and artificial stone. It carries on a considerable trade in lumber and cattle. Rendsburg is first mentioned in the twelfth century. Population, in 1900, 14,757, chiefly Protestants.

RENÉ, re-nā', surnamed 'The Good' (1409-80). Count of Provence, Duke of Anjou and Lorraine, and titular King of Naples. He was born at Angers, January 16, 1409, being the second son of Louis II, of Anjou and Provence. He married Isabella of Lorraine and claimed the succession to the Duchy of Lorraine in 1431, after the death of his father-in-law, Duke Charles. Being opposed by another claimant, the Count of Vaudemont, René was defeated and taken prisoner, remaining a captive for several years. In 1434 he inherited Provence and Anjou on the death of his brother, Louis III. In 1437 he purchased his liberty and the possession of Lorraine by the payment of an immense sum. He now led an army into Italy to secure the Kingdom of Naples, the title to the succession to which had been left to him by Louis III., who had been adopted as her successor by Queen Joanna II., by whom René had been declared heir on the death of his brother. (See JOANNA II.) He had a powerful rival in Alfonso V. (q.v.). King of Aragon, who succeeded in capturing Naples in 1442. Weary of the vain struggle, René abandoned the kingdom and returned to Provence, where his Court at Aix became a famous resort for artists and poets. He sought to revive the poetry of old Provence, and his devotion to the forms of a rapidly disappearing chivalry gained him the name of the last of the Troubadours. Agriculture and manufactures

were also encouraged and he earned his title of 'the Good.' He refused the crown of Aragon when offered to him, but allowed his son to accept it. His daughter, Margaret, married Henry VI. of England. After a long and prosperous rule, René died at Aix. He had no direct heirs and his possessions, therefore, reverted to the French Crown. For his literary productions see *Œuvres du roi René*, edited by Quatrebarbes (4 vols., Angers, 1844-46); and for his life, Leroy de la Marche, *Le roi René, sa vie et ses travaux* (Paris, 1875); Villeneuve-Bargemont, *Histoire de René d'Anjou, roi de Naples* (ib., 1825); Champollion-Figeac, *Les tournois du roi René* (ib., 1826).

RENÉE (re-nā') OF FRANCE (It. *Renata*) (1510-c.1574). A French princess, daughter of Louis XII., born at Blois, and married in 1527 to Ereole II., of the House of Este (q.v.), Duke of Ferrara. With him she differed greatly on religious matters, being a zealous patron of the Reformation, of Calvin, to whom she gave refuge in 1535, and of Bruccioli, who dedicated to her his version of the Bible in Italian. Ereole's Catholicism made his wife a subject for the Inquisition. She was imprisoned in 1554, confessed and attended mass, but after her liberation resumed her allegiance to Protestantism. After her husband's death (1559) she returned to France, and there attempted to unify the forces of Reform. Calvin wrote her many letters of counsel. Consult: Fontana, *Renata di Francia duchessa di Ferrara* (Rome, 1888-93); and Rodocanachi, *Renée de France* (Paris, 1896).

RENEVIER, рѣн'вѳа', EUGÈNE (1831—). A Swiss geologist, born and educated in Lausanne. There he became professor of geology, paleontology, and mineralogy in 1857, curator of the Vaudois Geological Museum in 1864, and a founder of the Swiss Geological Society and of the Paleontological Association (1874). Besides many important contributions to periodicals and work on the international geological chart of Europe, he wrote *Description des fossiles du terrain aptien* (1854-58, with Pietet); *Notices sur les Alpes vaudoises* (1864-79); *Carte géologique des Alpes vaudoises* (1875-77); *Orographie des Hautes Alpes* (3d ed. 1881); and *Chronographie géologique* (1896).

RENFREW. A southwestern county of Scotland, bounded on the north and west by the River and Firth of Clyde, on the south by Ayrshire, and east and north by Lanarkshire (Map: Scotland, D 4). Area, 245 square miles. Renfrew is very uneven in its surface, and consequently in the nature and quality of its soil. At the Hill of Stake, on the Ayrshire border, the land rises to 1711 feet. Over two-thirds of the arable land is devoted to dairy farming. There are extensive mineral deposits in the county, and the exportation of coal, oil, and ironstone employs a large number of people. Chief towns, Renfrew, the capital, Greenock, Port Glasgow, and Paisley (qq.v.). Population, in 1801, 78,500; in 1851, 161,100; in 1891, 230,812; in 1901, 268,900.

RENFREW. A royal, Parliamentary, and municipal burgh, capital of Renfrewshire, Scotland, on the Clyde, six miles west-northwest of Glasgow (Map: Scotland, D 4). The Renfrew Grammar School and Blythswood Testimonial, originally endowed by charter of Robert III., is

GUIDO RENI

"AURORA," FROM THE FRESCO IN THE ROSPIGLIOSI PALACE, ROME

here. The inhabitants are employed in iron-works and in ship-building. Population, in 1901, 9297.

RENI, rá'né, GUIDO (1575-1642). An Italian painter, one of the chief masters of the Eclectic School (Bolognese). Born at Calvenzano, near Bologna, November 4, 1575, the son of a musician, he was apprenticed at an early age to Denys Calvaert. He then studied under the Carracci, especially under Lodovico, but aroused their jealousy, and soon parted company with them, and applied himself to the technique of fresco painting under Ferrantini. His first short visit to Rome in 1599, in company with Francesco Albani, a friend and fellow student, was given chiefly to the study of Raphael, and after some years of further study at Bologna of nature and of classic models, we find him again at Rome in 1605. His development was marked by works very dissimilar in style, those of his early years partaking of the manner of Caravaggio, as, for example, the "Crucifixion of Saint Peter" (1606, Vatican); the "Madonna della Pietà" (Pinacoteca, Bologna); and "The Hermits Saint Paul and Saint Anthony" (Berlin Museum). From this influence, however, he soon freed himself, forming a style of his own, tinged with refined idealism, in strong contrast to the coarse realism of Caravaggio, and exemplified by the "Concert of Angels" (1608), a charming fresco in the Chapel of Santa Silvia (San Gregorio, Rome), and the world-famed "Triumph of Phœbus," generally known as "Aurora" (1609, fresco in the Palazzo Rospiglioso, ib.)—his great masterpiece of this period, unequaled in nobility of line and poetry of color.

In 1610 Pope Paul V. commissioned Guido to decorate the chapel in the Quirinal and other private chapels, which works increased his reputation, as well as the number of his enemies, even the friendship of Albani turning into antagonism. After his return to Bologna in 1612, Guido painted "Saint Paul Reproaching Saint Peter" (Brera Gallery, Milan), quite Venetian in conception; the "Massacre of the Innocents" (Pinacoteca, Bologna), a work full of vigor and resplendent in that warm golden tone characteristic of the artist's middle period; the "Apotheosis of Saint Dominic," an imposing fresco in San Domenico, Bologna; and "Four Episodes from the Myth of Hercules" (Louvre). In 1620 he decorated a chapel in the cathedral at Ravenna, and in 1621 he went to Naples, commissioned to execute frescoes in the cathedral, but was compelled by the murderous jealousy of the Neapolitan painters to flee to Rome without accomplishing his task. Forced by intrigues to leave Rome, too, in 1622, he returned to Bologna, where he became the acknowledged head of the Eclectic School, and resided until his death, August 18, 1642. The tone of his pictures gradually changed to a pale silvery gray, and in the later part of his life his manner became slight and sketchy, his constant pecuniary difficulties, caused by his inveterate passion for gambling, inducing him to paint with careless haste to retrieve his heavy losses.

The most important works of the next decade were the "Triumph of Samson Over the Philistines" (Pinacoteca, Bologna), still in his purest golden tone; a "Judith" (Palazzo Adorno, Genoa); "Fortuna" (Accademia San Luca, Rome), one of his finest treatments of female

form; and, above all, the "Rape of Helen" (c.1630, Louvre). Masterpieces in his silvery manner include the famous representations of "Saint Sebastian" (the finest in the Pinacoteca, Bologna; others in the Capitol, Rome, and in the Louvre), and the "Nativity" (Lichtenstein Gallery, Vienna, an unfinished replica in San Martino, Naples), pronounced by some authorities the artist's finest creation. Favorite subjects with him and his school were the "Ecce Homo," the most celebrated specimens of which are those in the Vienna (two), London, Bologna, and Dresden galleries; the "Cleopatra," best in the Madrid Museum and the Palazzo Pitti, Florence; and the "Penitent Magdalen," of which the Louvre and the Lichtenstein Gallery, Vienna, contain each two examples, the Madrid Museum, the National Gallery, London, and the Pinakothek in Munich, each one. The type of melancholy beauty, familiar through the supposed portrait of "Beatrice Cenci" (1599) in the Palazzo Barberini, Rome, frequently recurs in his paintings. In his art, Guido is an Eclectic, lacking in originality. From a technical standpoint his works are good, both as to color, composition, and drawing; but they are full of sentimentality, and he was one of the first to introduce the soft style so disastrous to the development of art. Consult: Bolognini-Amorini, *Vita del celebre pittore Guido Reni* (Bologna, 1839); Lanzi (Roscoe), *History of Painting in Italy*, iii. (London, 1847); Janitschek, in Dohme, *Kunst und Künstler Italiens*, iii. (Leipzig, 1879); and the authorities referred to under BOLOGNESE SCHOOL OF PAINTING.

RENIER, re-nyá', LÉON (1809-85). A French archaeologist, born in Charleville (Ardennes), and educated at Rheims. For a time he was a proof-reader and then became instructor and principal in the College of Nesle in Picardy. Then he went to Paris, taught Latin and Greek for several years, collaborated with Philip Le Bas on the *Dictionnaire encyclopédique de la France* (1840-45), and on Didot's *Encyclopédie*, and was an editor of Courtin's *Encyclopédie moderne* (1845-51). In 1860, after thirteen years in the Sorbonne Library, he became its director and in 1861 became professor of epigraphy at the Collège de France. His great educational work was the foundation of the Ecole des Hautes Etudes with Duruy in 1868. A part of Borghesi's works was edited under his care, and he took a prominent part in the excavations of the Farnesi Gardens, and in the purchase of the Campana collections. His work on the inscriptions of Gaul was not completed; his most important publication was *Inscriptions romaines de l'Algérie* (1855-58).

RENNELL, JAMES (1742-1830). An eminent British geographer and explorer, born at Upcot. He early lost his father, but found a home in the family of Mr. Burrington, vicar of Chudleigh, from whom he received his early education. When fourteen years old he joined the frigate *Brilliant* as midshipman, and five years later was an officer in the British Navy. He had already developed a love for geography by study and his many opportunities for surveying harbors and drawing charts. He made such a reputation by his harbor charts that soon after he left the navy in 1763, to take service with the East India Company, he was appointed Surveyor-General of Bengal. For the next fif-

teen years he spent most of his time in the jungle and on the plains of Bengal. The large amount of map material he collected was used in the preparation of the *Bengal Atlas*, which appeared in 1779, a work of the first importance for strategical and administrative purposes. His map of Hindustan, accompanied by about 200 pages of letterpress, appeared in 1783, and marked the time when Rennell ceased to be merely a surveyor and map-maker and became a geographer in the more extended sense. Rennell lived for the remainder of his life in London, and for fifty years, from 1780 to 1830, he was one of the leading geographers of Europe, and the great critic of geographical work and elucidator of geographical problems. Comfortably established with his wife and children in London, he began the construction of the first approximately correct map of India, and many years elapsed before it was superseded by the more accurate trigonometrical survey. He then turned his attention to Western Asia between India and the Mediterranean. He had conceived a scheme for a great work on the comparative geography of Western Asia, but he never completely carried it out, his *Geography of Herodotus*, which formed only a part of the whole project, occupying him for many years. This work has been of permanent value to geographical students.

Rennell's studies of Herodotus made him a very high authority on all matters relating to African geography, and he became the coadjutor of the African Association when that body inaugurated the modern era of the exploration of that continent. His map of Northern Africa, prepared for the use of the association, was the result of immense research combined with sagacious reasoning. He elucidated the reports of explorers, and his maps illustrated their travels. He worked up, for example, the rough notes of Mungo Park, examined his daily routes with great care, compared them critically with previous work in West Africa, and brought all the materials into harmony as far as possible. He constructed the map of the discoveries of Mungo Park. As a hydrographer, also, Rennell made important advances in the study of winds and currents, and was the founder of that branch of geography which is now called oceanography. Rennell's volume on winds and currents is based upon an enormous mass of material which he collected to illustrate the subjects. The current now known as Rennell's current, a stream in the ocean moving northward athwart the mouth of the English and Irish channels, was revealed by his study of a great number of facts collected by seamen. His wind and current charts, published only after his death, contained a large amount of information of service to mariners. His body was buried in Westminster Abbey.

RENNES, rĕn. The capital of the Department of Ille-et-Vilaine, France, at the confluence of the rivers Ille and Vilaine, 155 miles east of Brest by rail (Map: France, E 3). It is divided into the upper or new town and the lower or old town. It has remains of its mediæval walls, towers, and gates, beyond which lie extensive suburbs. Bridges unite the two divisions of the town, the older portions of which lie on the left bank of the quay-lined Vilaine. The most noteworthy buildings are the modern cathedral, whose interior is a spacious hall of Grecian architecture, the stately Palais de Justice, the

Hôtel de Ville, the Lycée, the Palais Universitaire with its fine art museum, and the handsome modern university. Tree-lined boulevards, the spacious Champ-de-Mars with a war monument commemorating 1870-71, and the Jardin des Plantes, add to the town's attractions. It carries on an active trade and has manufactures of agricultural implements, stockings, lace, sail-cloths, and earthenware. The town is the seat of an archbishopric and of a university, which has an attendance of about 1150. It was almost totally destroyed by a great fire in 1720, and was rebuilt on a modern plan. Rennes is the Celtic Condate, the capital of the Gallic tribe of the Redones, whence the modern name. Under the Romans it was an important station. In the Middle Ages it was the capital of the Duchy of Brittany (q.v.). Population, in 1901, 74,676.

RENNET (from ME. *rennen*, *rinnen*, AS. *rinnan*, *yrnan*, Goth., OHG. *rinnan*, Ger. *rinnen*, to run; connected with Lat. *rivus*, stream, Skt. *ar*, to move). A substance obtained from the fourth or digestive stomach of calves living upon milk, and also from the stomachs of puppies and pigs. The active principle is obtained from the folds of the membrane lining the stomach, and is prepared commercially by soaking this lining in warm slightly salted water, filtering the resulting extract, and adding a little salt and salt-petre to preserve it. These extracts are generally used in place of the home-made preparations formerly in use. They are of uniform strength, free from taints, and retain their strength and purity for a considerable time. The active principle, rennin, an enzyme or ferment, has the power of coagulating or curdling the casein of milk. The extracts also contain more or less pepsin, the digestive ferment of the stomach. The action of rennet is impaired by heat, and the ferment is destroyed by high heat. The principal use of rennet or rennet extract is in making cheese, where it is employed to curdle the milk, and thus form the curd. See CHEESE-MAKING.

RENNIE, GEORGE (1791-1866). An English civil engineer. He was born in Surrey, the eldest son of John Rennie (q.v.), and at the age of sixteen entered Edinburgh University. He returned to London in 1811, and began the practical study of engineering under his father. In 1818 he was appointed superintendent of the machinery of the mint, and at the same time aided his father in the planning and designing of several of his later works. After his father's death, in 1821, Rennie entered into partnership with his younger brother, John (afterwards Sir John Rennie), as engineer and machinery constructor. Their operations included the construction of bridges, harbors, docks, ship-yards, and dredging machinery, steam factories, both in Great Britain and on the Continent, and the furnishing of engines for warships of England, Russia, France, Italy, Mexico, etc. Rennie in addition was engaged in the drainage of large tracts in the midland counties of England and the construction of several Continental railways. He was greatly interested in the development of the screw propeller, and after building the engines for the *Archimedes* boat with a novel form of screw, constructed the *Dwarf*, the first screw vessel in the British Navy. He was the author of various papers published in the *Philosophical Transactions*.

RENNIE, JOHN (1761-1821). A British civil engineer. He was born at Phantassie, in Haddingtonshire, and obtained his preliminary education at the Parish school of Prestonkirk, and supplemented it by two years at Dunbar, where he studied pure mathematics. After serving as a workman he studied at Edinburgh, and in 1780 secured employment at the works of Boulton & Watt at Soho, near Birmingham. Here his mechanical genius soon displayed itself; and so highly did Watt esteem Rennie that he gave him, in 1789, the sole direction of the construction and fitting up of the machinery of the Albion Mills, London; and the ingenious improvements effected in the wheel-work, shafting, and frames were so striking that Rennie at once rose into general notice as an engineer of great promise. To this mill engineering he added, about 1799, the construction of bridges; and in this branch also his talent and ingenuity were manifest. The elegance and solidity of his constructions, the chief examples of which were at Kelso, Leeds, Musselburg, Newton-Stewart, Boston, and New Galloway, were universally admired; Rennie's greatest work of this kind was the Waterloo Bridge over the Thames. Another of his works was the Southwark Bridge, which was built on a new principle, with cast-iron arches resting on stone piers. He also drew up the plan for the London Bridge, which, however, was not commenced until after his death. He superintended the execution of the Grand Western Canal in Somerset, the Polbrook Canal in Cornwall, the canal joining the Don and Dee in Aberdeen, that between Arundel and Portsmouth, and, chief of all, the Kennet and Avon Canal between Newbury and Bath. The London Docks, the East and West India docks (see DOCKS) at Blackwall with their freight sheds, the Hull Docks, the Prince's Docks at Liverpool, and those of Dublin, Greenock, and Leith, were all designed and wholly or partially executed under his superintendence. He also planned many improvements of harbors and on the dock yards of Portsmouth, Chatham, Sheerness, and Plymouth, executing at the last-mentioned port the most remarkable of all his naval works, the celebrated breakwater. (See BREAKWATER.) Rennie died October 16, 1821, and was buried in Saint Paul's Cathedral, London. Consult Smiles, *Lives of the Engineers* (London, 1861-62; rev. ed. 1874).

RENNIE, Sir JOHN (1794-1874). An English civil engineer. He was born in London of a great engineering family, being a son of John Rennie (1761-1821), with whom he studied until 1813, when he became Hollingsworth's assistant on the Waterloo Bridge. With his father he worked on the Southwark Bridge in 1815, and after studying abroad went into partnership with his brother. John Rennie was knighted in 1831 on the completion of the London Bridge after his father's plans. He also finished his father's work as engineer to the Admiralty, building the Plymouth breakwater, and draining the Lincolnshire fens. The Whitehaven and Cardiff docks and the restoration of Boston harbor are the most important of his original works. Rennie was an able hydraulic engineer and author of *Theory, Formation, and Construction of British and Foreign Harbors* (1851-54). Consult his autobiography (London, 1875).

RENO. The largest city of Nevada and the county-seat of Washoe County, 31 miles south

of Carson City; on the Truckee River, and on the Southern Pacific, the Virginia and Truckee, and the Nevada, California and Oregon railroads (Map: Nevada, D 2). It is the seat of the Nevada State University, opened in 1886; and among other features are the United States Government Agricultural Experiment Station and the Nevada State Hospital for Mental Diseases. Reno is situated in a section devoted to farming, mining, and stock-raising, and is the most important business and industrial centre in the State. Settled in 1868, Reno was incorporated in 1897, but was disincorporated two years later. It received its present city charter in 1903. Population, in 1890, 3563; in 1900, 4500.

RENO, JESSE LEE (1823-62). An American soldier, born at Wheeling, Va. (now W. Va.). He graduated at West Point in 1846; was brevetted second lieutenant of ordnance; and soon afterwards was ordered to the front in Mexico, where he fought under General Scott from Vera Cruz to the City of Mexico. From that time until 1861 he was employed in various routine duties and advanced to be captain. On the outbreak of the Civil War he was commissioned brigadier-general of volunteers and was assigned to a brigade in General Burnside's North Carolina expedition (December 20, 1861-April, 1862), with which he participated in the capture of Roanoke Island, and the actions of New Berne and Camden. For these services he was promoted to be major-general of volunteers, and in August was ordered north to Virginia, where he fought in the second battle of Bull Run and at Chantilly. During the succeeding Maryland campaign he commanded the Ninth Corps, and was killed leading his men at the battle of South Mountain.

RENOIR, re-nwâr', AUGUSTE (1841-). A French figure and landscape painter, born in Limoges. He studied in the atelier of Gleyre and with Monet and the other Impressionists, and exhibited in 1874 at the first Impressionist Salon. Renoir is one of the most distinctive of the group, and, like Degas, devoted himself principally to figures, especially portraits of young women and children, in which he renders the texture of flesh and the most fleeting shades of expression with astonishing adroitness. His figures are painted out of doors, and are subject to every variation of light and reflection. He also painted landscape, fruit, and flower subjects, and groups of figures. His paintings include: "La loge;" "La danse;" "Danse à la ville;" "Le déjeuner à Bougival;" "La balançoire;" "Le pont de Chatou;" and "Jeunes filles au piano." Among his portraits are those of Wagner and Claude Monet. Consult: Duret, *Les peintres impressionnistes* . . . (Paris, 1879), and Alexandre, *Catalogue de l'Exposition de A. Renoir* (Paris, 1892).

RENOUF, re-nōōf', EMILE (1845-94). A French landscape, marine, and genre painter, born in Paris. He was a pupil of Boulanger, Lefebvre, and Carolus Duran. His works usually represent scenes in the lives of fisherfolk or purely marine subjects. "The Helping Hand" (in the Corcoran Gallery at Washington, D. C.), a boatman rowing while his child holds the oar, is one of his best-known works. He also painted several views near Honfleur, and a picture of the

Brooklyn Bridge (in the Havre Museum), done while he was in New York City in 1887-88. He received a medal of the first class at Munich in 1883 and the Legion of Honor in 1889.

RENOUF, Sir PETER LE PAGE (1822-97). An English Egyptologist, born in the island of Guernsey, August 23, 1822. He received his early education at Elizabeth College and went later to Oxford, where he formed a lasting friendship with the Rev. John Henry, afterwards Cardinal, Newman. He took an active part in the Tractarian controversy, and in 1842 was received into the Roman Catholic Church at Saint Mary's College, Oscott, where he began the study of Oriental languages together with theology and philosophy. In 1846 he undertook the tuition of the young Marquis de Vaulehier, and until 1855 resided on the Continent, where he formed the acquaintance of many of the most distinguished scholars of the time. From 1855 to 1864 he was professor in the Catholic University at Dublin, lecturing at first upon French literature and the history of philosophy, and later upon ancient history and Oriental languages. It was during this time that he took up the study of Egyptian, and he soon became one of the foremost as well as one of the most conscientious and reliable Egyptologists of his day. In 1864 he left the university to accept an appointment from the Government as one of the chief inspectors of schools, a position which he held for over twenty years. He visited Egypt in 1875 and spent some time there studying the monuments. From March, 1886, until the end of 1891 he was keeper of the Egyptian and Assyrian antiquities in the British Museum, and in 1896 he was knighted in recognition of his distinguished scholarship. From 1887 until his death he was president of the Society of Biblical Archaeology. He died in London, October 14, 1897. Renouf was a versatile scholar, and in addition to his Egyptological attainments he possessed a knowledge of most of the ancient and modern Semitic, Indo-European, Berber, and Finnic languages. In his later years he also became a student of Chinese. He was a very prolific writer and contributed a large number of valuable articles to *Atlantis*, *Proceedings of the Society of Biblical Archaeology*, *Zeitschrift für ägyptische Sprache*, and other periodicals. He also translated a number of Egyptian texts for *Records of the Past*. In 1879 he delivered the second course of the Hibbert Lectures, and the following year he published his *Lectures on the Origin and Growth of Religion, as Illustrated by the Religion of Ancient Egypt* (1880; 2d ed. 1884). Renouf's great work was his masterly translation of the Egyptian Book of the Dead (q.v.), the study of which formed his chief occupation for nearly forty years. The translation, accompanied by a valuable commentary, was published serially in the *Proceedings of the Society of Biblical Archaeology* (vol. xiv., 1892, et seq.) and was unfinished at his death, but was completed from the author's manuscript notes by E. Naville (q.v.). A biography of Renouf and a full bibliography of his writings are to be found in *Proceedings of the Society of Biblical Archaeology* (vol. xix., London, 1897).

RENOUVIER, re-nōō'vyá'. CHARLES BERNARD (1815—). A French philosopher and politician. He became known through his *Manuel de*

philosophie moderne (1842) and his *Manuel de philosophie ancienne* (1844). After the Revolution of 1848 he published a *Manuel républicain de l'homme et du citoyen* (1848), which was condemned for its socialistic propositions. He retired from public life after the coup d'état of 1851. From 1872 until 1900 he was associate editor of *La Critique philosophique*, and he published *Essais de critique générale* (1854), *Science de morale* (1869), and *Esquisse d'une classification systématique des doctrines philosophiques* (2 vols., 1885).

RENOVO. A borough in Clinton County, Pennsylvania, 28 miles northwest of Lock Haven, on the Philadelphia and Erie division of the Pennsylvania Railroad (Map: Pennsylvania, D 2). It is of some importance as a summer resort, being situated near the Alleghany Mountains, in a picturesque region. There are valuable deposits of bituminous coal and fire clay, and manufactories of fire brick; shops of the Pennsylvania Railroad are here. Population, in 1900, 4082.

RENSELAER, rēn'se-lēr. A city in Rensselaer County, New York, on the Hudson River, directly opposite Albany, with which it is connected by three bridges, and on the New York Central and Hudson River and the Boston and Albany railroads (Map: New York, G 3). It is situated in an agricultural and dairying region, and manufactures felt, leather, ice tools, chains, shirt waists, and lumber products; but is important chiefly as a railroad town, having shops, round-houses, freight yards, etc. Rensselaer was chartered as a city in 1897, having been known formerly as Greenbush, which was incorporated as a village in 1815. In 1902 the village of Bath, with a population in 1900 of 2504, was annexed to Rensselaer. Population, in 1890, 7301; in 1900, 7466.

RENSELAER POLYTECHNIC INSTITUTE. A school of engineering and science at Troy, New York, founded by Stephen Van Rensselaer in 1824 as Rensselaer School and reorganized in 1850 under the present name on the basis of a general polytechnic institute. It was the first school of science and the first school of engineering established in any English-speaking country, and has long been famous for its engineering courses. Opportunities for investigation and research are offered by the many well-known engineering works within reach of the school. In 1902 the electrical and chemical laboratories were destroyed by fire, but were rebuilt, and with the other laboratories are equipped with machinery and appliances of the most modern type. The students in 1903 numbered 309 and the faculty 20. The Institute owns valuable collections and a scientific library of 6700 volumes and 3500 pamphlets.

RENT (OF., Fr. *rente*, It. *rendita*, income, from ML. *rendere*, nasalized form of Lat. *reddere*, to restore, return). In political economy, the term rent, when used without a qualifying phrase, refers to the payment which is made for the use of land. In the payments popularly known as rent are usually included two elements, one of which may be classed as interest on buildings and other improvements, the other as economic rent. The economic rent of any given piece of land is measured by the difference between the prices which its products obtain and the cost of

the labor and capital employed in producing them.

Assuming the conditions of a new community with an abundance of accessible land, good and bad, it is obvious that so long as the produce of the best land is more than sufficient to satisfy the community's wants there will be no rent. Producers will be on an equality, and if any difference exists between the value of the product and the costs of production in labor and capital, it will be the same for all. As population increases the product of the best grade of lands no longer suffices to satisfy the want for food. Prices of food will rise until it will pay to bring inferior lands under cultivation. Permanent prices will have to be sufficient to cover costs in labor and capital upon these inferior lands. Since the cost of production on the better land does not increase, a surplus value will emerge in the produce of these lands. This surplus value is rent. If the owner of the better land cultivate the ground not in person, but by tenants, this surplus is what the latter can afford to pay the landlord for the use of his land. If the favored producers are themselves cultivators, they receive the rent directly in the increased returns of their husbandry.

This simple illustration suffices to explain the law of rent, which may be briefly stated as follows: Rent of land is the difference between the cost of the product and its value, the latter being determined by the cost of production upon the poorest land cultivated. In an isolated community the increase of population and the resulting pressure upon the food supply must always enhance rent, as cultivation must be extended from better to poorer soils. In other words, the pressure of population upon the means of subsistence creates rent on those lands where the means of subsistence can most easily be produced. Again we may assume all the available land of the community to be in cultivation and yet the pressure upon the means of subsistence increases. Now even if all the land were uniform in quality but deficient in quantity rent must appear. No increase of product can be obtained without application of additional labor and capital to the soil. This will not be so fruitful as the first application, and hence the latter must yield a rent. In this phase the law of rent may be stated as follows: The rent of land is the difference between the value of the product and its costs, value being determined by the costs of production for the product due to the least fruitful increment of capital and labor employed in cultivation. It follows that rent is a result, not a cause of price. This principle was demonstrated by Ricardo and until recent decades was thought to establish a perfectly clear distinction between rent and other economic incomes. The rise of the Austrian school of economists (see *POLITICAL ECONOMY*) has, however, tended to break down this distinction in incomes. Labor and capital, like land, receive their value from their product. While it is true that no form of goods will long be produced which does not pay the prevailing rates of interest and wages, it is no less true that an agricultural product will not be produced unless it pays the ordinary rate of rent.

One of the most important practical principles that have been deduced from the demonstration of the law of rent is that a tax levied upon rent

or upon the value of land, which represents merely the capitalization of the rental value, cannot raise the price to the consumer of the product of the land. This principle has served as a basis for the plan of social reform of Henry George. (See *SINGLE TAX*.) The fact that every increase in population or in capital increases the return to the landlord quite without his own efforts served as an ethical justification for a plan of appropriation to the State of ground rents. Recent economic theory has widely extended the application of the theory of rent. Since the time of Senior (q.v.) the term has been frequently applied to the net income from monopoly advantages, whether natural or legal. Profits (q.v.) are frequently classed as a form of rent; and Clark applies the term to any form of income which may be described differentially.

In the language of Marshall, "the rent of land is no unique fact, but simply the chief species of a large genus of economic phenomena; the theory of the rent of land is no isolated economic doctrine, but merely one of the chief applications of a particular corollary from the general theory of demand and supply." The theory of the rent of land occupies a large space in all systematic presentations of political economy. A compact statement is found in Walker, *Land and Its Rent* (Boston, 1883).

RENT. In its most ancient as well as its modern sense, compensation payable by a tenant to his landlord for the land held of him. Rent has never been an incident of tenure, but even under the feudal system of land-holding and when due from tenant in fee simple to his lord, rent was due only as matter of contract. It was, indeed, the service agreed by the feudal tenant to be performed (*servitium redditum*), which might or might not include a money payment, and which varied according to the tenure upon which the land was held, according to the custom of the manor of which it formed a part, or according to the will of the parties.

In much the same way the obligation of the modern tenant for life or years to pay rent to his landlord is based entirely on agreement expressed in the lease or implied from the acts of the parties as to the time and manner as well as the duty of payment. This being so, a failure to pay rent does not ordinarily affect the relation of landlord and tenant so as to enable the landlord to enter and terminate the lease, nor can a tenant by terminating the relation of tenure between himself and his landlord (as by assigning his entire estate to a third person) relieve himself of the obligation to pay the rent agreed. Rent is equally independent of any other violations of duty by either party, excepting only the breach of the covenant for quiet enjoyment implied in every letting of lands.

As already indicated, a failure to pay rent does not in and of itself involve a forfeiture of the tenant's estate. The landlord's proper remedy is an action at law for the rent due. At common law, however, he was provided with a more efficacious remedy in the process known as levying a distress. See *DISTRESS*.

The rents described by Blackstone in his famous chapter on incorporeal hereditaments (Blackstone II. 41-43), as "certain profits issuing yearly out of lands and tenements corporeal," are obviously a very different thing from those which have just been described. The rent here

referred to is a right in the nature of an easement, or more accurately a profit à prendre, in the land of another, and it comes into existence, not by agreement or in connection with a lease, but, as such incorporeal rights always do, by grant or prescription. The right to take the rent is a species of real property which may be held, like any other estate, for life or years or in fee, and which is capable of alienation, and, if held in fee, of transmission by inheritance. The common law distinguished three kinds of such rents, viz. rent service, rent charge, and rent seck. The *rent service* was merely the old feudal rent surviving into a period which had forgotten its origin. It existed only when lands were held by one of another in fee, and where, accordingly, the rent due was in the nature of a feudal service. The *rent charge* is the rent just described as arising by grant of the owner of the land on which it is charged. The distinguishing characteristic of this was the fact that it was enforceable by distress. The *rent seck* was merely the rent charge without the power of distress annexed. Of these three forms of rent the rent service is obsolete, excepting, perhaps, in a few manors in England (see QUIT-RENT); rent charge survives unchanged except where distress has been abolished, and there all rents charged on land by deed or will are properly rents seck. It is to the class of rents charge, rather than of contract rents, that we must refer the so-called *fee-farm rents*. See FEE.

Consult the *Commentaries* of Blackstone and Kent; Williams, *Law of Real Property* (19th ed., London, 1901); Maine, *Early History of Institutions* (Amer. ed., New York, 1895). See INCORPOREAL; HEREDITAMENTS; LANDLORD AND TENANT; LEASE.

RENUNCIATION. In law, the disavowal or abandonment of an official or property right. Of the latter class are the renunciation by an heir, devisee, or legatee of the property, real or personal, to which by operation of law or under the will of his testator he is entitled. Of the former class is the more frequent case of the refusal by an executor, administrator, or trustee of the office conferred upon him. The formality of renunciation is in either case of the simplest character, a letter or other written expression of intention being the usual form. In Scotland the term renunciation is employed to denote the surrender (q.v.) of an estate for life or years to the landlord.

REN'WICK, JAMES (1662-88). A Scottish Covenanter, born at Moniaive, Dumfriesshire. He was a student at Edinburgh University, but received no degree there, because of his refusal to acknowledge Charles II. as head of the Church, and therefore finished his theological education at Groningen, Holland. In 1683 he returned to Scotland and began preaching at conventicles. He was outlawed for his collaboration with Alexander Shields in *An Informatory Vindication of the Covenanters* (1684). In 1687 he had become the virtual leader of the Cameronians, who were excluded from the Act of Toleration, and was finally captured and executed at Edinburgh.

RENWICK, JAMES (1818-95). An American architect. He was born in New York and educated at Columbia College. He constructed the

distributing reservoir of the Croton Aqueduct in New York City and was for some years an architect on the Erie Railroad. Among the buildings designed by him are Vassar College, Poughkeepsie, New York; Saint Patrick's Cathedral, Grace, and Calvary Church, New York; and the Smithsonian Institution and Corcoran Gallery at Washington. He left a valuable art collection to the Metropolitan Museum.

REPAIRS. In the law of real property, such acts of construction and amendment as are necessary to keep the buildings of an estate from deterioration and decay. By the common law of England and America the obligation to repair rests on the tenant in possession, whether his estate be for life or years. It is, in fact, an incident of such a tenancy and flows from the doctrine of waste, and this includes the wholesale restoration of premises destroyed by fire, as well as current repairs called for by ordinary uses or mere lapse of time, excepting where (as now generally in the United States) this harsh rule of the common law has been modified by statute. The obligation to repair does not extend to a tenant at will or at sufferance, nor to a joint tenant or tenant in common (whether in possession of the premises or not), nor generally to a mortgagee in possession.

This common-law obligation of the tenant to keep the premises in repair is sometimes varied by local custom and more frequently by agreement of the parties. See EVICTION; LANDLORD AND TENANT; LEASE; WASTE.

REPARATION (Lat. *reparatio*, from *reparare*, to restore, repair, from *re-*, back again, anew + *parare*, to prepare). In law, the redress of an injury by making compensation therefor, or by restoring something which has been unlawfully taken from one entitled to its possession. See DAMAGES.

REPEAL (OF. *rapeler*, Fr. *rappeler*, to recall, revoke, repeal, from *re-*, back + OF. *apeler*, Fr. *appeler*, to call, appeal, from Lat. *appellare*, to address, appeal, to call, summon). The obliteration or abrogation of a statute by another act of a legislative body. Where an act declares in positive terms that another shall be abrogated, it is said to be an *express* repeal, but where a statute contains absolutely inconsistent provisions with a prior one, and does not refer to it directly, it is said to repeal the latter by *implication*. It is in the latter class of cases that the greatest difficulty arises. The provisions of the subsequent act must be absolutely contrary or repugnant to those of the former, so that it is clear that they must have been intended to supersede the former, in order to work out a repeal by implication. An act may repeal only portions of another, and the provisions not thus expressly repealed will continue in force. The same is true where a subsequent statute is only inconsistent with a former one in some provisions. Where it is desired to alter some of the provisions of an act, it is usually *amended*, by striking out some part of it and substituting new provisions. An amendment, therefore, is a change or alteration, whereas a repealing act abrogates or wipes out the provisions of the statute to which it applies. Under the common law the subsequent repeal of an express repealing act has the effect of restoring or reviving the statute which had been abrogated by the latter, but this

rule has been abolished in England and many of the United States.

REPEATING RIFLE. See SMALL ARMS.

REPENTANCE (OF., Fr. *repentance*, from ML. *repentens*, repentant, from Lat. *re-*, back again, anew + *pœnitere*, to repent, frequentative of *pœnire*, *pœnire*, to punish, from *pœna*, punishment, expiation, pain, from Gk. *ποινή*, *poinë*, punishment; connected with Gk. *τίωαι*, *tinēin*, Skt. *ci*, to avenge). Sorrow for sin and renunciation of the same. It is intimately connected with faith (q.v.), since faith is the turning of the soul toward God, and repentance is the same act considered as a turning away from sin. It is synonymous with conversion when used of the original and decisive abandonment of sin which marks the beginning of the Christian life; but, unlike conversion, which occurs but once, daily repentance should follow daily sins. It is a consequent of regeneration (q.v.), which is God's act calling forth repentance and conversion. Adequate repentance embraces all sin as such, known or forgotten, and involves the condemning sentence of conscience and the voluntary activity of the will in forsaking it, and both choosing and executing acts of holiness in its place. The motive leading to an evangelical repentance must be nothing short of a perception of the evil of sin in itself, as violating the law of conscience and of God. Any lesser motive, as sense of danger or fear of the wrath of God, is not sufficient to produce a true repentance, which must embrace the love of God and sincere submission to His holy will. Every act of repentance involves a new girding up of the soul to new resistance to temptation. Such repentance is always accepted of God and followed by the divine forgiveness.

REPHAIM, *rêf'â'im* or *rê-fâ'im* (Heb. *rêph-âim*). (1) A popular name of the prehistoric inhabitants of Palestine, especially to the east of the Arabah (q.v.). The Hebrew *râphâ* means 'weak,' and hence is used of the shades of the dead (e.g. Is. xiv. 9). The term appears to have been applied to the early legendary inhabitants, whose ghosts were supposed still to haunt their ancient homes. But the myth-making process magnified them into giants, and the word received this connotation. In this sense the word may be used in II. Sam. xxi. 16 et seq. Most definite are the interesting antiquarian notes in Deut. ii. 10, 20, where reference is made to the predecessors of Moab and Ammon, and they are described as a gigantic folk; compare the tradition concerning the Anakim, whom Israel encountered in South Palestine (Num. xiii. 33). In Deut. iii. 11, Og, the King of Bashan, is recorded as a descendant of this gigantic race, and the proof of his stature is given in an enormous bedstead of iron. These notes are paralleled by the ethnology of Gen. xiv. Consult Driver, *Commentary on Deuteronomy*, p. 40 (London, 1895). (2) *The Valley of Rephaim*. The scene of the two battles in which David broke the power of the Philistines (II. Sam. v. 18, 22; xxiii. 13; I. Chron. xiv. 9 et seq.); also famous for fertility (Is. xvii. 5). The location is given in Josh. xv. 8, 9; xviii. 16, as contiguous to the Valley of Hinnom, and is identified with the broad valley running for two miles southwest from Jerusalem, a strategic vantage-point for the invaders, and also afford-

ing coöperation with the non-Israelitish city of Jerusalem. Some would associate the name with the race of the Rephaim.

REPH'IDIM (Heb. *Rêphidim*, probably refreshments, from *râphad*, to support, succor). A station in the route of Israel through the peninsula of Sinai (Exod. xvii. 1, 8; xix. 2; Num. xxxiii. 14 et seq.). It was the scene of a rebellion of the people for lack of water, which Moses supplied by a miracle, whence, according to tradition, the names Massah (tempting) and Meribah (striving) were given to the place. Here Israel routed Amalek by miraculous interposition, an account of which was recorded in writing. Here Jethro, Moses's father-in-law, paid him a visit. But, as in the case of most of the Sinaitic stations, no local tradition of the name survives. It has often been identified with the oasis of Feiran, north of Mount Serbal; it would be a fitting prize of war between Amalek and Israel, but, on the other hand, the lack of water does not agree with the nature of the oasis. The modern theory, which takes the Exodus through the northern part of the peninsula, finds there no tradition of the name. Consult: Robinson, *Biblical Researches*, vol. i. (Boston, 1841); Palmer, *Desert of the Exodus* (Cambridge, 1871).

REPIN, *ryâ'pîn*, ILIA YEFIMOVITCH (1844—). A noted Russian painter, born in the Government of Kharkov. The son of a poor Cossack officer, he was first instructed by an obscure painter in his native place, and soon earned a living by painting saints' images until enabled, in 1865, to attend the Academy at Saint Petersburg, where his "Raising of Jairus's Daughter" (1871) brought him the great gold medal, accompanied by a stipend entitling him to study abroad for six years. His real master, however, had been Ivan Kramskoy (1837-87). Before starting on his travels, he painted (1872) at Moscow a series of life-size portraits of Russian, Polish, and Czech composers for a concert hall, and in 1873 he exhibited in Vienna the "Burlaki" (Barge-men on the Tow-path), a remarkable work. His best picture, dating from his foreign sojourn, was "Szadko in the Wondrous Realm of the Sea," based upon a national legend. For this he was elected a member of the Academy (1876), where he subsequently became professor. Among a series of historical and legendary subjects and genre scenes which followed, the best known are: "The Czarevna Sofia at the Chapel-Window" (1879); "Return of the Dying Soldier" (1883); "Back from Siberia" (1884); "Ivan the Terrible and His Slain Son" (1885), and "Saint Nicholas Staying an Execution" (1889), the last two in the Alexander Museum, Saint Petersburg. After 1886 he devoted himself almost exclusively to portraiture, his subjects including Liszt, Rubinstein, Garshin, Pissemski, and Tolstoy. Characteristic of Repin's earlier work is the element of gloom and oppressiveness. He interpreted what he saw of the dumb, patient suffering around him, and, like Tolstoy, had the profoundest compassion for humanity. A happier atmosphere pervades some of his later pictures, and technically all his works exhibit great power and freedom of treatment, subsiding occasionally even into impressionism. A humorous note—unusual in this artist—is sounded in the "Holiday

Evening" (1881) and "Country Life in the Crimea" (1888). The Tretyakoff Gallery in Moscow preserves more than fifty of his paintings. Consult the monograph by Norden (Vienna, 1894); Haggood, "A Russian National Artist," in *The Century Magazine*, xxiii. (New York, 1892); and Muther, *A History of Modern Painting*, iii. (ib., 1896).

REPLEVIN (OF. *replevin*, from *replevir*, from ML. *replivire*, to warrant, pledge, from *re-*, back again, anew + *plivire*, *plegiare*, to pledge). An action brought to recover the possession of goods and chattels unlawfully taken, or wrongfully detained. Under the old common law practice it was only employed to recover back goods which had been unlawfully taken from the owner, as by the ancient proceeding of distress for rent, and *detinue* was used for the recovery of chattels unlawfully detained. To-day in most jurisdictions *replevin*, or some action of like nature, is employed for the recovery of chattels wrongfully withheld. In the action a writ is issued for the seizure of the goods, and the plaintiff is required to file a sufficient bond to cover damages which may result to the defendant. The defendant may by statute in some States give a bond and retain possession until the action is determined. Any person who is entitled to the possession of property may maintain the action, and the defendant must rely on the strength of his own rights rather than on the weakness of the plaintiff's title. The plaintiff should allege in his complaint or declaration the value of the chattels, and what damage he has sustained, and in such case is entitled to an alternative verdict and judgment commanding the return of the goods, and if that is not possible, the payment of their value, and in each case damages for their detention. The defendant must return the goods if possible, and he does not have the option of paying their assessed value instead. If the defendant is successful he is entitled to recover such damages as he has sustained, and may sue on the plaintiff's bond. *Replevin* is a possessory action and corresponds to ejectment (q.v.) as to real estate. See CHATTEL; DETINUE; TROVER; PROPERTY.

REPLICA. See COPY.

REPORT. A written or printed account of a case which has been judicially determined. Such an account, in the most complete and accurate reports, is usually composed of a brief statement of the facts of the case prepared by the editor or the reporter, a brief summary of the arguments of counsel, including a statement of the authorities cited by them on the argument or in their briefs, and the opinion of the court. The opinion also frequently contains a statement of the facts, a statement of the court's decision of the case, and the reasoning and the authorities upon which the decision is based. The report of the case may also include dissenting opinions. The value and use of precedents in the English common law (see PRECEDENT) make the careful preparation and preservation of reports of decided cases of the highest importance. Beginning with the reports of cases contained in the Year Books (Edw. II. to Henry VIII.) there is a complete series of reports of cases decided in the higher English courts down to the present time. In each of the United States there are published reports of all cases decided by the courts having appellate jurisdiction, going back to the date

of their organization; and there are also complete reports of the cases decided in the United States Supreme Court and the inferior Federal courts having appellate jurisdiction since their creation under the United States Constitution.

The Year Books were prepared at public expense by scribes of court or reporters who were appointed to that duty, a function which unfortunately was abandoned at the close of the reign of Henry VIII. After that time the reports were the work of private lawyers, and they sometimes bear evidences of hasty and inaccurate preparation. Some of them, however, prepared by lawyers of great learning, are of the highest value as authorities. The various editors of English reports number in all about one hundred. The following are a few of the more important early law reports following the Year Books: Dyer (1513-82), Coke (1572-1618), Hobart (1603-25), Croke (1582-1641), Yelverton (1603-13), Saunders (1678-84), Vaughan (1665-74), Raymond (1694-1734), Salkeld (1689-1712), Strange (1716-49), East (1800-12). The first chancery reports were published after the Restoration, although West's *Symbology*, published in the latter part of the reign of Elizabeth, contained some precedents of process, bills, and answers in chancery. The first chancery reports, entitled "Reports of Cases Taken and Adjudged in Chancery in the Reign of Charles I., Charles II., James II., William III., and Queen Anne," were inaccurate and of little value. Of the other early chancery reports the following are the more important: Vernon (1680-1719), Peer Williamson (1700-35), Vesey, Sr. (1746-1856), Vesey, Jr. (1789-1817), and Atkyns (1736-54).

In the United States generally, reports of cases are now published by public officials appointed for that purpose by the court, and in those States in which the law and equity systems have been merged, law and equity cases are published together. The increase in volume of litigation has resulted in recent years in an enormous increase in the number of reports, and has led to the consideration of various plans for curtailing their number.

Consult: Wallace, *The Reporters Chronologically Arranged with Occasional Remarks on Their Respective Merits*; Daniel, *History and Origin of Law Reports* (London, 1884); Wambaugh, *Study of Cases* (Boston, 1884). For a complete list of reports, see Soule, *Lawyers' Reference Manual of Law Books and Citations* (Boston, 1884).

REPOUSSÉ (Fr., beaten back). A process of ornamenting thin metal by producing a pattern or design with a hammer. The finest existing specimens of this work are those of Benvenuto Cellini (q.v.), made in the sixteenth century. The art was extensively practiced by the early Egyptians and Etruscans.

In repoussé work a hammer with an elastic handle is used, which is screwed to a permanent support. Many adjustable heads are provided to suit the different parts of the work. After the pattern is roughly hammered up from the inside the design is perfected on the outside with chasing tools. In order to make this possible, a bed of some soft but resisting material is used to furnish a support for the thin, pliant metal. If the work is a hollow vessel it may be filled with melted pitch, which is permitted to harden.

This art is most successfully applied to such malleable metals as gold, silver, copper, tin, and lead. A similar effect, though lacking in artistic merit and in individuality, is produced by stamping with dies. See DIES AND DIE-SINKING; EM-BOSSEING.

REPPLIER, AGNES (1855—). An American essayist of French descent, born in Philadelphia, Pa., April 1, 1855. Miss Repplier was educated at the Convent of the Sacred Heart at Torresdale, Pa. She is known for her travels and for many articles in such magazines as *Scribner's* and the *Atlantic Monthly*. Her lively essay style often deals with serious subjects in a vein of light, humorous banter, sometimes tinged with extravagant and witty irony. Her published volumes include: *Books and Men* (1888); *Points of View* (1892); *Essays in Miniature* (1892); a *Book of Famous Verse* (edited, 1892); *Essays in Idleness* (1893), perhaps her most popular work; *In the Dozy Hours, and Other Papers* (1894); *Varia* (1897); *Philadelphia: The Place and the People* (1898); *The Fireside Sphinx* (1901).

REPRESENTATION (Lat. *representatio*, from *repræsentare*, to represent, from *re-*, back again, anew + *præsentare*, to present, from *præ-sens*, present, pres. part. of *præesse*, to be at hand, to be before, from *præ*, before + *esse*, to be). In political science, the agency through which the collective will of the people is exercised. In the city States of Greece and Italy, where pure democracies prevailed, all the citizens, in theory at least, attended the public assemblies. The comparatively small geographical area of the city State and the relatively small number of persons vested with the full rights of citizenship made it possible to govern without resort to the agency of representation. Besides, government was a simple matter then as compared with the government of a modern community, and hence the body of citizens meeting at intervals could without difficulty frame the few police regulations that were necessary and administer justice among the inhabitants. The agency of representation was first extensively employed by the Church in the ecumenical councils which it called from time to time, and this may have led to its more general employment for purposes of civil government. The idea of political representation, like many other political institutions, was a contribution of the Teutonic nations, by whom it was employed in a rude way in their popular assemblies. The first European legislature founded on the principle of representation was the Parliament of England. (See PARLIAMENT.) In 1302 Philip the Fair, King of France, summoned representatives of the three estates, nobility, clergy, and commons, to form the States-General (q.v.). In Aragon the Cortes (q.v.) acquired a very important share in the government, and grew to be powerful enough to impose its will upon the monarch. In other countries of Europe about the same time national representative bodies were summoned by royal authority. The mediæval idea of representation was representation of classes and interests rather than of numbers, which is the basis of the modern idea. Each order had its own representatives, who sat apart and carried on their work independently, one class thus being able to neutralize the action of the others. A distinction was made in Eng-

land between rural and urban constituencies, each having its own representatives, and this is still perpetuated.

With regard to the principle of representation it may be said that the civilized nations have reached a consensus that the distribution of representatives, in one branch of the legislature at least, should be on the basis of the whole population, though some regard is frequently paid to permanent administrative or local divisions, partly for historical reasons and partly as a concession to local consciousness. Thus it is a common provision in national constitutions that each State or other division shall have at least one representative in the national legislature, although on the basis of population alone it would not be so entitled. (See section on *Government*, under the various countries.) In the upper chambers of lawmaking bodies throughout the world there is considerable diversity in the principle of representation. See LEGISLATURE.

As regards the relation of the representative to his constituency, a popular view is that the representative is the mouthpiece of his constituency and subject to their instructions. According to this view he has no independent judgment, and cannot follow the convictions which he may have reached from the most exhaustive study and reflection, if the will of his constituency be otherwise. Moreover, their own local interests are to be preferred to those of the country at large, and it is his first and foremost duty to champion those interests in preference to the national interests. A sounder view regards the representative as the interpreter of the common consciousness of right and reason. According to this view the representative is not bound by the will of his constituency, but by research and reason endeavors to discover what the general good requires. The question has been much discussed as to whether a system of representation based on mere numbers is an ideal one or even a just one. By many it is contended that an equitable system of representation would take into consideration various interests, economic, industrial, social, and religious as well as political. They insist that provision should be made for special representation of such classes as free-traders, single-tax adherents, labor organizations, civic federations, business leagues, chambers of commerce, the advocates of temperance and prohibition, socialists, etc. The tremendous tendency toward class differentiation and the growing popularity of independent movements in politics, it is said, make a reform of the present system of representation highly desirable so as to harmonize conflicting interests, to enable each class to show the people what its interests are, and to defend them against attack.

By the present system, the political party having a minority of voters in a given electoral district is generally unrepresented in the government, notwithstanding the fact that its numerical strength may lack but a few votes of equaling the party which secures the entire representation. As a result of this system, it frequently happens that the minority party in a State is inadequately represented in the State legislature or in Congress. To remedy these inequalities various methods have been proposed, and in some cases attempted. Of the more important of these the first to be mentioned

is the so-called 'limited vote,' according to which each voter in an electoral area is allowed to vote for a certain number of the candidates, usually one less than the number to be elected, so that if three members are to be elected from the district the minority is reasonably sure of electing one member. This method may be employed only in elections in which three or more representatives are to be chosen from the district. The chief objection to this method is that it does not allow the minority party proportional representation, but only limited representation. Moreover, it allows representation only to a very large minority and makes no provision for third parties and independent movements. Another method is the so-called 'cumulative vote,' which allows the elector as many votes as there are representatives to be chosen from the district, and which permits him to distribute them among the different candidates as he pleases, or cumulate them on one or more candidates. The advantage of this method over the first mentioned is that it enables a small minority to elect at least one member by cumulating their votes. Since 1870 it has been employed in Illinois for the election of representatives in the Legislature. The chief objection to this method is that it frequently involves a waste of votes, since a popular candidate may receive many more votes than actually necessary to elect him. As a result of this it may happen that the minority party actually succeeds in electing two representatives out of three.

What is known as the Hare or André system, so called because proposed by an Englishman named Hare, and introduced into Denmark by André, provides for the election of representatives by general ticket, and allows each elector to vote for one candidate or for a limited number, but permits him to indicate his second and third choices, etc. The total number of votes cast is divided by the number of representatives to be chosen, and the quotient is taken as the amount necessary to elect any candidate. In counting the ballots only the first choices are counted, and as soon as a candidate has received a number of votes equal to the electoral quotient he is declared elected, and no more votes are counted for him. The remaining ballots which designate him as first choice are then counted for the candidate having second choice, and so on down the list until the necessary number of persons have been declared elected. Under this system the waste of votes is insignificant, but its complexity is an objection, and the element of chance enters into the scheme. Finally there is the 'free list' system, according to which a certain number of voters may nominate a number of candidates not exceeding the number of places to be filled. Each voter casts as many votes as there are representatives to be chosen, distributing them at will, but not cumulating them on any one candidate. The number of votes necessary to elect is determined by dividing the total vote cast by the number of places to be filled. The total vote cast by each party is then divided by the electoral quotient and the result is the number of representatives to which each party is entitled. Any deficiency is supplied from those parties having the largest fractional quotas. This plan possesses the advantage of economy and secures proportional representation.

REPRESENTATION. In law, a statement or assertion as to some matter of fact. Representations have significance in a legal sense when they are acted upon. Such representations may be made as the basis of numerous legal transactions. See DECEIT; FRAUD; CAVEAT EMPTOR; CONDITION; SALE; WARRANTY, etc.

In the law of inheritance the term representation is also used to denote the principle upon which the issue of a deceased person take or inherit the share of an estate which their immediate ancestor would have inherited had he been living. Thus if one dies leaving two children and the children of a deceased child surviving him, the children will each inherit one-third of the real estate of the deceased and the other third will go to the children of the deceased child who are said to take by representation. See ADMINISTRATION (in Law).

REPRESENTATIVES, HOUSE OF. The Lower House of the Congress of the United States. See UNITED STATES; CONGRESS; COMMITTEES.

REPRIEVE (doublet of *reprove*, from OF. *reprover*, *reprover*, Fr. *réprouver*, to reprove, reject, from Lat. *reprobare*, to condemn, reject, from *re-*, back again, anew + *probare*, to test, prove, from *probus*, good). The temporary suspension of a sentence for a crime, granted by the pardoning power, which is usually the chief magistrate of a State or nation. The term is most commonly employed to denote a stay of execution of a person convicted of a capital crime. Reprieves are usually granted in order to allow an investigation into the legality of the conviction, or into alleged 'newly discovered evidence' in favor of the condemned person. They are also granted in case of pregnancy of a woman condemned to death, in cases of alleged insanity after condemnation to death, and often pending an investigation of facts urged in an application for a pardon. See PARDON.

REPRISAL (OF. *represaille*, Fr. *représaille*, from *reprise*, prize, a taking, from *repris*, p.p. of *reprendre*, to retake, from Lat. *reprehendere*, *reprehendere*, to recover back, blame, from *re-*, back again, anew + *prehendere*, *prehendere*, to take). In international law, a means of securing redress without resort to war, but at the same time with the use of force. It consists in forcibly seizing from an offending nation property or its equivalent belonging to the aggrieved nation, or in detaining the property of an adversary with the intention of compelling it to afford the necessary redress. Reprisal is resorted to when a specific wrong has been committed and the seizure is by way of compensation in value for the wrong. The things seized are held subject to the termination of the controversy and are restored if the controversy is amicably settled. Reprisal is an act of retaliation and consists in applying to the subjects of an offending State treatment analogous to that which the subjects of the offended State have received. A reprisal, though an act of war in fact, is not such in intent, and, indeed, is resorted to as a means of avoiding war by securing redress without resort to the graver alternative, although it may constitute a sufficient cause of war. The forms of reprisal most commonly employed in recent times consist in placing an embargo on such ships of the offending State as may be lying in the harbors of the aggrieved State, or in the seizure of its ships

at sea or of any property within the jurisdiction of the State, whether belonging to the State or to private citizens. Bluntschli mentions in addition the following acts of reprisal as permissible by the law of nations: interruption of means of communication, detention of subjects of the offending State as hostages, the expulsion or imprisonment of its subjects, refusal to be bound by treaty stipulations or other international agreements, and the withdrawal of privileges and protection to the subjects of the offending State. See RETORSION.

REPRODUCTION (from Lat. *re*, back again, anew + *producere*, to produce, from *pro*, before + *ducere*, to lead). The fundamental property of the organic world essential in repairing losses by death and in maintaining the earth's population. Although at the outset the result of unknown causes, it consists in a separation of a part of the body of an individual from the parent body; division of a one-celled organism into two; or a giving off of an egg-cell or sperm-cell from the parent. (See CELL; MITOSIS.) Reproduction and growth are inseparable, and the former is the result of growth. As Verworn states, the general process that constitutes growth is an increase of living substance, and the essence of reproduction likewise consists merely in an increase of living substance. Reproduction differs from growth in that a part of the substance separates from the original organism. If the quantity of the living substance increases further by growth, this results in a "growth beyond the measure of the individual," and the cell must divide, i.e. reproduce. The different forms of reproduction are: (1) Self-division, secondary forms of which are (a) fission, and (b) budding or gemmation; (2) conjugation; (3) sexual reproduction.

REPRODUCTION BY CELL DIVISION. This is the primary mode of reproduction. While that of plant and animal cells is called 'cell division,' that of the entire one-celled plant or animal is called 'self-division.' This has been observed in the amœba and other Protozoa, as well as in the white corpuscles of the blood (leucocytes). See AMŒBA.

FSSION. Many of the lower invertebrate animals multiply by fission or budding. In fission the body, as in certain planarian and annelid worms, after having reached a certain size but not sexual maturity by ordinary cell division, is constricted into two or more parts. Each of these several parts separate and regenerate themselves into independent perfect worms. Fission or self-division occurs in fully grown examples of many-celled animals, as in certain polyps and starfish.

BUDDING OR GEMMATION. The process of reproducing the persons of a compound individual or colony. Buds are outgrowths of a parent person that enlarge while in connection with the parent to form a new person. In the case of budding the products are unequal. All the higher plants are produced by budding and are colonies. Among animals the process occurs in Protozoa, sponges, cœlenterates, polyzoans, and tunicates. According to one view the tapeworm is a colony whose parts are produced by budding; even segments or rings of an annelid have been considered as produced by budding. Indeed, as there is no sharp line drawn between growth of the simple individual and growth of a compound

individual, so no sharp line exists between ordinary development and budding; nor is there any definite distinction between cell division and division in the amœba, and budding. This is seen in examples of terminal budding, when the buds appear at the end of the main axis of the parent organism, as in plants and certain Protozoa and low multicellular animals.

CONJUGATION. Though an anticipation of sexual reproduction, conjugation radically differs from it in the fact that two conjugating bodies are each an entire plant or animal. It occurs in the unicellular plants, such as diatoms and desmids, and in the Infusoria. Thus in the act of conjugation of a monad-like form (Heteromita) a free-swimming individual approaches an anchored form, the posterior ends coming in contact; they then fuse like two drops of syrup, the nuclei sharing in the fusion. The product swims around freely, then rests, loses its flagella, and becomes encysted, then bursts open at three angles of the cyst, pouring out a swarm of spores as the result of multiple internal fission. It is usually among the Infusoria a temporary process, but in *Vorticella* the fusion is permanent. The result of conjugation upon the species is to prevent its deterioration. It is a process of rejuvenation, comparable with the intercrossing of higher plants and animals.

SEXUAL REPRODUCTION. In the process, sometimes called 'amphigony,' of reproduction by means of sexual cells, two animals, the male and female, secrete in reproductive glands, one eggs, the other spermatozoa, the result being their union and the formation of a new individual. Here still more than in conjugation sexual reproduction results in a complete renewal or rejuvenescence of the organism. In those plants and animals which also reproduce by budding sexual reproduction arrests degeneration by the introduction of new blood. Sexual reproduction in animals is essentially the same in all classes above the Protozoa. There is a series of developmental processes embraced under the following heads: (1) Maturation of the egg; (2) the process of fertilization; (3) a process of cleavage or segmentation of the yolk (see MITOSIS); and (4) formation of the three germ layers. (See EMBRYOLOGY.) The essential phenomenon in the reproduction of the many-celled animals, i.e. all above the Protozoa, is the act of fertilization or impregnation of the egg. This is effected by the entrance of a single spermatozoön into the egg. After the spermatozoön has entered the egg the head and middle portion, which contains the body called the *centrosome*, can still be recognized as the chromatic and achromatic parts of the spermatozoön or sperm nucleus (male pronucleus). In the protoplasm of the egg (that enveloping the nucleus and called *cytoplasm*) the centrosome of the sperm nucleus gives rise to rays forming 'asters.' (See MITOSIS.) Preceded by these rays, the sperm nucleus travels toward the egg nucleus until it reaches and fuses with it to form a single cleavage nucleus. Then the centrosome divides into two, which migrate to opposite poles of the nucleus, while the cleavage nucleus changes to a cleavage spindle, which divides and thus initiates the embryonic development, the process being called cleavage or segmentation. At this point fertilization is complete (Hertwig). It also appears that of the chromatin particles

(chromosomes) in the newly formed nucleus of the fertilized egg, exactly one-half of the number are furnished by the egg nucleus and the other half by the sperm nucleus. These chromosomes are regarded as the bearers of heredity, forming the physical basis of heredity. See HEREDITY.

ASEXUAL AND UNUSUAL MODES OF REPRODUCTION. Budding and its various forms are examples of asexual reproduction. In certain insects and other animals the egg develops and gives rise to a mature individual without fertilization. (See ALTERNATION OF GENERATIONS; PARTHENOGENESIS.) Hertwig calls this sexual reproduction with degenerated fertilization. Different modes of reproduction (asexual, sexual, parthenogenesis, paedogenesis) may occur in the same species. The alternation of parthenogenesis with pronounced sexual reproduction is called 'alternation of generations,' or heterogony.

Consult: Hertwig, *The Cell* (New York, 1895); id., *Zoölogy* (ib., 1902); Wilson, *The Cell in Development and Inheritance* (ib., 1897).

REPRODUCTION (in plants). Although reproduction is a physiological phenomenon, it

in animals; the morphological aspect, however, deals with structures peculiar to plants. Two types of reproduction are recognized among plants, namely, *vegetative multiplication and reproduction by spores.*

(1) **VEGETATIVE MULTIPLICATION.** In this case the ordinary vegetative cells are used in reproduction. (Figs. 1, 2.) In the simplest plants the adult body consists of a single vegetative cell, and when this cell divides two new

is also a prominent morphological phenomenon in so far as it involves important structures. The physiological aspects are essentially the same as

FIG. 3. ASEXUAL REPRODUCTION.

plants are produced. The same power of cell division persists in all plants, but in the complex (many-celled) plants much of it results, not in reproduction, but in the growth of the body. In such plants, however, the power of vegetative multiplication continues, as when

new potato plants come from tubers (modified stems), or new grapevines from cuttings, or new begonias from pieces of a leaf, or when buds from one plant are grafted into the stem of another. In fact, vegetative multiplication is very conspicuous in most plants, enabling them to spread with comparative rapidity, as the strawberry spreads by means of its runners, or the couch grass by its rootstocks (underground stems).

(2) **REPRODUCTION BY SPORES.** A spore, in general, is a single cell designed for reproduction and separated from the parent plant. There are two great classes of spores differing not in function, but in origin: (a) *Asexual spores* (Figs. 3-5) are usually formed by the division of the contents of a mother cell (sporangium), although

they are sometimes formed free by cell division at the tip of a special cell or filament. In many cases spores are provided with cilia and can swim freely in water; in others they are light and dry, and are carried by the wind. They are the most primitive spores, and are the only kind produced by many low plants; but they are retained even

zation, and the resulting sexual spore an oöspore or fertilized egg. It is evident, therefore, that in most plants there coexist three means of reproduction, namely, vegetative multiplication, asex-

ual spores, and sexual spores, which are used under varying conditions, and reinforce one another in the general work of producing new plants.

REPRODUCTION OF IDEAS. It is customary to divide the 'act of remembering' into three parts: retention, reproduction, and recognition. (See **MEMORY: RETENTION; RECOGNITION**.) The reproductive aspect of memory refers to (1) the excitation of a brain-tract that has received a functional modification by previous excitation,

and (2) the appearance of the corresponding mental processes. The word 'reproduction' is misleading. First, because it implies the 'reappearance' of mental experiences which have persisted and have maintained their identity during their absence from consciousness. An examination of the processes of retention does not warrant the implication. Secondly, reproduction is often posited where no explicit reference is made to a past event at all. Thirdly, a 'reproduced' image is usually schematic; i.e. it contains only the outlines or salient features of its counterpart. The sole definite meaning left for the term 'reproduction' is the unequivocal appearance of 'revived' sensations; i.e. of centrally aroused sensations which possess the function of referring directly to a definite period of past experience. Even when it is thus taken, the concept must not be confused with the old 'copy' theory, which made ideas weaker duplicates of sensations.

The conditions under which reproduction of ideas takes place are various. In the associational psychology, the single condition of reproduction was said to be association. Ideas were 'called forth' by the magic of association. If, however, we conceive association to mean certain conscious complexes themselves, and not their cause, we cannot say that it *conditions* reproduction. (See ASSOCIATION OF IDEAS.) Association and reproduction will have a *common* cause. The 'law' of association will be, i.e., a law of reproduction and will be stated in terms of cerebral connections. This general statement does not help us, however, to name the incentives to the reproduction of any particular set of processes. For this, we must take into account the functions of attention, feeling, will, and mental constitution (e.g. one is apt to 'reproduce' visual imagery if one's attention is directed to visual things, or if one is visually minded, or if one's mood fits in with some particular scene), and the special conditions which are enumerated under association—frequency, recency, vividness, etc.—i.e. the proximate conditions which determine the relative liability of reproduction of ideas.

Finally, a comparison of peripherally initiated sensations with the 'reproduced' sensations contained in imagery makes it possible to measure both the power of reproduction and the fidelity with which sensations, aroused without the co-operation of the sensory organs represent their 'originals.'

See authorities referred to under MEMORY; RETENTION; IMAGINATION; ASSOCIATION OF IDEAS, and for reproduction as an experimental method, see MEMORY.

REPRODUCTIVE SYSTEM, COMPARATIVE ANATOMY OF. The germ cells are not the only ones that are capable of increasing their numbers. This is a common property of all body-tissue cells, and by virtue of this fact the number of individuals may be increased by division of the body and subsequent regeneration (q.v.). In Infusoria no specialized reproductive organs are present. When the unicellular organism exceeds its size-limit, it divides into two parts or 'daughter cells.' (See REPRODUCTION; FISSION.) Reproduction of sponges is either asexual or sexual. Asexual reproduction, or budding, may

occur externally or internally. The sexual reproduction may be hermaphroditic or dioecious. Coelenterates are, for the most part, sexually separate, but some are hermaphrodites, as Ctenophora. There are no organs for the transmission of the sexual products to the exterior.

Sexual ducts occur for the first time in flat-worms. In some the entire ovary produces eggs, while in other forms a part of the ovarian cell only produces egg cells and the rest, the 'vitellaria,' is so modified that it produces only yolk. Both the female and the male glands communicate with the exterior by ducts leading to the copulatory apparatus. The sexes are almost always separate in echinoderms. In one group (Synapta) of the holothurians hermaphroditism is frequent. There are no copulatory organs nor accessory glands. The general organs of starfishes develop in five pairs of bundles. One pair lies in each arm and each pair opens dorsally to the exterior by a separate opening.

In the mollusks the generative apparatus is composed of germ glands, ducts, and copulatory organs. The sexes are separate throughout the whole phylum. Hermaphroditism is, however, wide-spread. In nearly all cases of hermaphroditism both kinds of sexual products are produced in the same gland. The gonads either have separate ducts or utilize the nephridia. The genital glands open either (1) into the pericardium, (2) into some part of the kidney or uterus, (3) into the cloaca, or (4) directly to the exterior. When there are separate ducts they may be very complicated in structure. The structure of the copulatory organ and the form of the ducts with their accessory glands and tubules vary much in detail in the different species. The sexes are distinct in many of the annelids, but Hirudinea, Oligochaeta, and some others are exceptions. The sexes of Polychaeta are separate with a very few exceptions. The ovaries or testes are segmentally repeated several or many times. The ripe eggs and sperm float in the coelomic cavity, to be picked up and discharged to the exterior by the nephridia, or by nephridia specially modified into genital ducts.

The sexes are separate in Crustacea except in a few cases. The male and female sexual glands are constructed on the same plan and have a similar position in the body. There is only one pair, and in certain species only one gland. The parts that make up the sexual apparatus are as follows: (1) The genital organ (ovaries and testes); (2) ducts (oviducts, vasa deferentia); (3) terminal parts (vulva, vagina, and receptaculum seminis in the female, and ductus ejaculatorius in the male); (4) outer copulatory organs. Except in Cladocera and some Copepoda the genital apertures are situated on the ventral side. In all hexapods they open at the end of the abdomen. In certain species there are glands whose secretion unites the sperm cells into capsules or spermatophores. A penis may also be present. The female apparatus may possess a receptacle for the penis and another for storing the sperm. The testis and ovaries consist of a varying number of long tubes which together enter the vas deferens or oviduct. The ovarian tubes are of two kinds, those with and those without nutritive cells. The nutritive cells may alternate with the egg cells or they may be collected in a bunch and furnish nutritive material to the egg cells by means of fine constricting strands. Coming to

the Chordata, we find that in *Balanoglossus* the sexes are separate, and the ovaries and testes are a row of saecular organs which open to the exterior by a series of pores, or, in the American species, by rupture. Tunicates are hermaphroditic.

In *Amphioxus* the sexes are separate. The sexual organs are horseshoe-shaped sacs which lie in 26 pairs and without ducts. The ova and spermatozoa burst the atrial cavity and reach the exterior by means of the atropore. The sexes of the lamprey are separate and the sexual organ is unpaired. The sexual products pass into the body cavity and thence to the exterior by two pores into the urinogenital sinus. There is a penis in the male.

In fishes, impregnation is internal in all the sharks except the Greenland shark. The claspers act as intromittent organs. With a few exceptions, such as the dogfish, there are two ovaries and the oviducts are separate from the ovaries. The oviducts, the Müllerian ducts, are united anteriorly and open into the body cavity. The eggs are extruded into the body cavity and then pass into the oviducts. There is a large shell gland in the oviduct. The majority of fishes lay eggs that are fertilized outside the body. Most sharks and a few teleosts are viviparous, the eggs being hatched in the oviduct or ovary. In two of the sharks the yolk-sac and the wall of the oviduct are united, suggesting the placenta of mammals. The ovaries of teleosts are continued backward into a duct. Posteriorly the two ducts fuse. The oviducts of the Dipnoi are somewhat coiled, like those found in Amphibia; each connects with the body cavity near the pericardium by means of a funnel-shaped aperture. Hermaphroditism is not uncommon throughout the Teleostei.

REPTILES AND BIRDS. The ovaries are broad in the turtles, and long and narrow in snakes and elongated lizards. The ovaries are usually asymmetrical. Only the left ovary is completely developed in birds. The oviducts open into the abdominal cavity by wide funnel-shaped apertures and in the walls of the ducts are glands for the formation of albumen and egg-shells. The ovaries, like the testes, increase in size during the breeding season. In birds the vas deferens, like the ovaries, opens into the cloaca by an independent aperture. In lizards it fuses with the ureter. There is a copulatory organ in reptiles; in birds it exists only in the ducks, geese, and Ratitæ.

The genital apparatus of mammals lies in the lumbar and pelvic regions. When the ova are mature they pass into the body cavity or are immediately caught up by the funnel-shaped opening of the oviducts. This portion is known as the Fallopian tubes. In the majority of mammals the oviducts fuse behind the Fallopian tubes to form the uterus. It is in the uterus that the ova attach themselves to the maternal tissue and develop. The fused region behind the uterus is known as the vagina. In monotremes the Müllerian duct remains distinct and there is a cloaca. In marsupials the Müllerian duct begins to fuse to form a vagina. In most other mammals an anterior fusion of the two parts of the uterus occurs. The degree of fusion varies in different species. In Primates the only evidence of the paired origin is seen in the Fallopian tubes. The testes of mammals develop in the same position as the ovaries, but they later pass out of the abdominal

cavity through an opening in the latter known as the inguinal canal, and descend into the scrotal sacs; but in many mammals the testes remain permanently in the abdomen.

External genital apparatus exists as follows: In elasmobranchs there are male 'claspers' which are inserted into the cloaca and oviduct of the female. In connection with them there is a gland which is histologically much like the uropygial glands of birds. In Amphibia the male of *Gymnophiona* alone possesses an eversible cloaca. In lizards and snakes there are two erectile penes outside the cloaca. Each is furrowed. Organs of similar nature, but much less developed, occur in the female. Chelonians and crocodiles have a copulatory organ united with the ventral wall of the cloaca. It is made up of two fibrous fused masses, and, as in the above copulatory organs, is regulated by well-developed muscles. There is a furrow on its surface. The female also has a median, less well developed organ of the same character. In most Ratitæ and some Carinatæ there is an eversible tube strengthened by two fibrous bodies. When at rest it is coiled up in the left side of the cloaca. The copulatory organ of monotremes lies between the urinogenital sinus and the cloaca, and is fused with the ventral wall of the latter. In all other mammals the organ arises on the ventral wall of the cloaca. In the female it is channeled. In the male the groove is closed to form a canal. Three bodies of erectile tissue are developed in connection with the penis of man. The greater part of one of these glands occurs at the apex of the penis and is known as the glans penis. The clitoris of the female is the homologue of the male penis.

Consult: Lang, *Text-Book of Comparative Anatomy* (London, 1891-96); Wiedersheim, adapted by W. N. Parker, *Comparative Anatomy of Vertebrates* (London, 2d ed., 1897).

REPTILE (Lat. *reptile*, neu. sg., sc. animal, animal, from *reptilis*, crawling, from *reperere*, to crawl; connected with *serpere*, Gk. *ἑρπειν*, *herpein*, Skt. *sarp*, to creep). A cold-blooded vertebrate animal of the class Reptilia, breathing by lungs and having a single median occipital condyle. In their larger, phylogenetic relationships, reptiles occupy a central position, but are closely in affinity with birds, so that the two classes were united by Huxley into a group, Sauropsida, in distinction from the Mammalia and from the Ichthyopsida, or amphibians and fishes. "On the one hand," Gadow asserts of the reptiles, "there is not the slightest doubt that they are evolved from some branch of the Stegacephali, whilst on the other hand the reptiles, probably through some branch of the Thoromorpha, have given rise to the mammals; some other reptilian branch, at present unknown, has blossomed out into the birds."

CLASSIFICATION. The history of the development of the ideas on the classification of reptiles is given under HERPETOLOGY (q.v.). The arrangement by Parker and Haswell is as follows:

Class REPTILIA:

Order I. Squamata.—This includes the Lacertilia (lizards), Ophidia (serpents), and Pythonomorpha (extinct snake-shaped forms, with paddle-like limbs and lizard-like skulls).

Order II. Rhynocephalia.—Lizard-like reptiles, often huge, scaly, with walking limbs; vertebræ amphicæalous; sacrum composed of two

vertebræ; teeth acrodont. This order has one living genus (*Sphenodon*).

Order III. *Chelonia*.—The turtles (q.v.).

Order IV. *Theromorpha*.—Sacrum composed of six vertebræ, limbs adapted for walking, four suborders: *Anomodontia*, *Placodontia*, *Pareiosauria*, *Theriodontia*—all extinct.

Order V. *Crocodylia*.—*Crocodyles* and alligators.

Order VI. *Sauropterygia*.—Extinct aquatic reptiles with a very small head, elongated neck, limbs usually flipper-like, and teeth in separate sockets.

Order VII. *Ichthyopterygia*.—Extinct aquatic reptiles with large head, no neck, long tail, flipper-like limbs, naked skin, and teeth lodged in a groove.

Order VIII. *Dinosauria*.—Extinct terrestrial reptiles, skin naked or armored, pelvis bird-like, teeth in sockets. See *DINOSAURIA*.

Order IX. *Pterosauria* (*pterodactyls*).—Extinct aerial reptiles, with long neck, sacrum composed of two or three vertebræ, skull bird-like, sternum present, fore limbs wing-like, and teeth in sockets.

An advance upon this, resulting from larger knowledge of fossil forms, has been educed by Boulanger and Gadow, so that the most complete classification now stands as follows:

Class REPTILIA:

Sub-Class I. *Proreptilia*.

Sub-Class II. *Prosauria*.—Orders: *Microsauri*, *Prosauri*.

Sub-Class III. *Theromorpha*.—Orders: *Pareiosauri*, *Theriodontia*, *Anomodontia*, *Placodontia*.

Sub-Class IV. *Chelonia*.—Orders: *Atheca*, *Thecophora*.

Sub-Class V. *Dinosauria*.—Orders: *Sauropoda*, *Theropoda*, *Orthopoda*, *Ceratopsia*.

Sub-Class VI. *Crocodylia*.—Orders: *Pseudosuchia*, *Parasuchia*, *Eusuchia*.

Sub-Class VII. *Plesiosauria*.—Orders: *Nothosauri*, *Plesiosauri*.

Sub-Class VIII. *Ichthyosauria*.

Sub-Class IX. *Pterosauria*.

Sub-Class X. *Pythonomorpha*.—Orders: *Dolichosauri*, *Mososauri*.

Sub-Class XI. *Sauria*.—Orders: *Lacertilia*, *Ophidia*.

The term sub-class is given to the larger subdivisions "to emphasize the fact," says Gadow, "that these reptilian groups are of undeniably greater morphological value than those which are generally called 'orders' in the Mammalia." This author tries to display their supposed evolutionary phylogenetic relations by the following scheme:

The earliest fossil reptiles are found in the Permian age. Reptiles attained their highest development in Jurassic and Cretaceous times, when

many were of gigantic proportions, and ruled the world. Since then the order has waned, only the recent and adaptive line of snakes seeming to flourish and promise continued prosperity at the present time.

CHARACTERISTICS. With the exception of modern chelonians and ancient dinosaurs, the reptiles in general are of an elongated form, the body being often nearly cylindrical and usually terminating in a very long tail. In a considerable number (as most serpents and some lizards) no traces of limbs are apparent; in some (as certain lizards) the limbs are rudimentary; while in the remainder the limbs are fully developed, although the feet rarely suffice to keep the belly from the ground. The feet are of the pentadactyl type, but not always five-toed.

The covering of the body presents several well-marked varieties. In a few of the lizards the skin is covered with regular scales, composed of a mixture of bony and horny matter, and lying over each other like those of fishes; in most lizards and in serpents scales and plates are developed on the surface of the corium or true skin, and covered over with epidermis, which is thrown off at intervals, the molt forming an accurate cast of the body of the animal; while in the crocodiles and tortoises the scales are converted into true bony plates, which in the former are imbedded in the tissue of the skin, and in the latter are united with the ribs, sternum, and other bones of the internal skeleton, to form the complete bony case into which the head and limbs of the animal can usually be retracted. See *SKELETON*, for structure of the scales.

The skeleton is completely ossified in all reptiles. The skull is small, loosely united, and articulates with the atlas, as in birds, by one condyle, which is formed mainly by the basioccipital. There is an auditory columellar apparatus within the fenestra ovalis, as in *Amphibia*. The mandibles consist of many pieces, and articulate with the cranium through quadrate bones—one of the principal characters separating this class from the mammals.

The mouth, except in the chelonians, is usually provided with conical teeth, adapted rather for seizing and holding prey than for dividing and masticating food. These teeth, like those of fishes, are successional; that is to say, new teeth are being constantly developed, while the older ones are regularly shed. (See *CROCODYLE*.) In some instances the teeth are attached solely to the jaws, while in others they are also attached to the pterygoid or palate bones. In chelonians the teeth are replaced by a horny beak, which, according to the habits of the animal, is adapted for bruising as well as cutting, and which in some species constitutes a somewhat formidable weapon.

The vertebræ, like those of other *Amniota*, are 'gastrocentrous,' that is, their centra "are formed by the pairs of intercentralia, while the basicentralia are reduced" or lost altogether; this characteristic separates reptiles wholly from amphibians. The total number is often great, especially in serpents and the tail of the lizards. The ribs form a true sternum, and the ilio-sacral connection is post-acetabular; the former of these characters separates reptiles from amphibians and the latter from mammals. Reptiles are mainly carnivorous, and swallow their prey whole. Hence the

jaws are adapted, by their mobility and subdivision into segments, to open very widely, and the œsophagus is capable of great dilatation. The tongue is commonly free, elongated, and bifid, except in the crocodiles, in which it is immovable, whence the popular idea that these animals do not possess this organ. The stomach is sometimes scarcely larger than the œsophagus and intestines (as in serpents), while in other cases it forms a sac of considerable size. In either case it is capable of great dilatation. A liver, pancreas, and spleen are always present, the two former pouring their secretions into the upper part of the intestine, which is short, wide, and not much twisted, and divided into two portions, corresponding to the small and large intestines of mammals, by a valve. It finally terminates in a wide cloaca, into which the ducts of the urinary and generative organs usually open. The kidneys differ from those of amphibians, and agree with those of birds, in having no nephrostomes, and in having each its one separate ureter. See ALIMENTARY SYSTEM, EVOLUTION OF.

Reptiles breathe air only by means of lungs, and never have gills even during embryonic life. The lungs are usually of large size; but as they are not subdivided, as in mammals and birds, into innumerable microscopic air-cells, the real aerating surface is comparatively small. In several groups they are merely capacious bags, whose vascular or aerating surface is but slightly increased by sacculi developed in their cells. In serpents one lung (usually the right one) is of extraordinary length, while the other remains altogether rudimentary. This inferiority of the respiratory apparatus of reptiles is further shown in the absence of those means for the continuous introduction and expulsion of air possessed by birds, and still more by mammals. See RESPIRATORY SYSTEM, COMPARATIVE ANATOMY OF.

This feeble respiratory system is correlated with the absence of any covering, such as hair or feathers, which might retain the bodily heat generated by the oxygenation of the blood, as is the case in the well-clothed birds and mammals; hence the blood remains at a temperature little above that of the air or water in which these animals live, and reptiles are placed with the similarly naked or scaly amphibians and fishes as 'poikilothermous' or 'cold-blooded.' (See ANIMAL HEAT.) The heart, unlike that of a bird or mammal, is divided into two atria, and an imperfectly divided ventricle; it has no conus, but semilunar valves exist at the base of the tripartite aortic trunk; the right and left aortic arch are complete and remain functional. The red corpuscles of the blood are nucleated, biconvex and oval—a point of distinction from mammals.

The brain and nervous system present no peculiarities calling for special remark; the presence of an intercranial hypoglossal nerve separates this class from the amphibia. The organs of the senses are well developed, but there are no lateral sense organs. No reptiles have external ears, but their hearing is good. See NERVOUS SYSTEM, EVOLUTION OF.

The sexes are always separate; and the male generative organs, which are far more highly developed than in amphibians, present peculiarities which, in association with the position of the anal aperture, have been adopted by zoölogists as a basis of classification of special taxonomic value

among the Ophidia. Fertilization is always internal, and most reptiles lay meroblastic eggs, from which the young hatch quickly under the influence of the warmth derived from the hot sand or decaying vegetation in which they are buried by the mother, or, in a very few cases, by her incubation. The eggs are comparatively few (except in the turtle tribe), and relatively large, containing a large quantity of food-yolk, so that the young are able to take care of themselves the moment they emerge; yet in most cases they receive some parental care. The integument of the eggs is parchment-like, containing little lime, and the color is always white. Certain reptiles, however, retain their ova in a sort of uterine cavity, formed by a dilatation of the oviduct near its termination in the cloaca, until the development of the embryo is so far advanced that the enveloping membrane bursts previously to the expulsion of the ovum, so that the young are actually born alive—a mode of generation to which the term 'ovoviviparous' is applied. An amnion and an allantois are formed in the process of development, allying reptiles with birds and mammals. See REPRODUCTIVE SYSTEM, COMPARATIVE ANATOMY OF.

In past times reptiles have dominated the earth, swarming in the seas, along the shores, on the land, and in the air. They reached huge size, and many were herbivorous, and preyed upon by others which, as they increased in size and power, must have been the principal active agency in the extermination of the fishes, amphibians and great cuttlefishes, which previous to the Mesozoic Age were the dominant animals of the earth. The alterations of physical conditions, which seem to have progressed steadily during the Mesozoic Age, toward dryness and coolness in the atmosphere, as well as toward elevation and drainage of the land, and the gradual increase of density (salinity) in the sea, were probably unfavorable to the reptilian forms of that time, both directly and indirectly, by being likewise unfavorable to the creatures upon which they fed. On the other hand, the growing clarification of the atmosphere consequent upon the draining and elevation of the land and the spread of terrestrial vegetation, which subtracted its excess of carbonic acid gas and contributed a larger amount of oxygen, stimulated the development of superior types which began in the Permian and slowly won their way in competition with the dinosaurian and other reptiles of their day until they finally overcame them in importance. That they were enabled to do so was due principally, no doubt, to their warmer covering (feathers and hair), enabling them to retain bodily heat, which gave them greater endurance of famine and climatic adversities, and promoted activity, which, in turn, reacted to stimulate and develop all the bodily parts and functions. At any rate the reptiles have steadily declined, many of their branches have become extinct, and others are approaching that end, while all have been driven by competition to the holes and corners of the world, to hiding in swamps, or amid loose rocks, or in hollow trees or among their leafy tops—places where their many enemies cannot easily get at them. Only the heavily armored turtles and crocodiles are able to survive freely in the water, land-tortoises existing only by being very small, well protected, and secretive; and lizards only by having diminished to small size and acquired

great agility. The only branch of the class that seems to be prosperous is that of the snakes, whose peculiar form, adaptive qualities, and excellent endowments for escape or defense enable them to fill a peculiar and little-contested place in the economy of the world.

Fossil Forms. The living reptiles are comparatively insignificant survivors of a mighty race, whose first appearance antedates the Permian period, since remains of two widely dissimilar groups occur in Permian rocks in Europe, North America, and South Africa. First becoming abundant in the Triassic, the rise of reptiles is coincident with the decadence of the Stegocephalia, the great armored amphibians. In the Jurassic the development of reptiles attained its highest level; they dominated land, sea, and air in forms as grotesque as the mythical griffon, dragon, and sea-serpent. It is noteworthy that the Mesozoic reptiles paralleled nearly all the adaptations which occurred ages later among the mammals. There were land reptiles of carnivorous habit, like the cats and wolves, heavy sluggish animals adapted to vegetable feeding, marine fish-like forms which strongly suggest the whales and porpoises, others which sat erect on the hind legs and tail, in some cases adapted to leaping like the kangaroo, and even 'dragons of the air' with bat-like wings. The supremacy of the reptiles extends into the Cretaceous with scarcely any diminution; in fact, it is here that several orders reach their culminating point; but toward the end of this period the dynasty of reptiles comes to an end, and at the dawn of the Eocene the mammals, which during the Mesozoic were extremely insignificant, become the reigning type.

Geographically, the reptilian fauna of the Mesozoic period was almost cosmopolitan, although the contemporary faunas of widely separated regions sometimes show considerable dissimilarity. This variation may be due to different climatic conditions, or to causes which prevent migration of animals. Regarding the general geological distribution of reptiles, it may be stated that the Karoo formations (chiefly Lower Triassic) of South Africa have yielded the anomodont land reptiles in remarkable numbers and diversity of form, while the Middle Trias and the Jurassic of Europe are especially rich in marine forms. Above the Triassic no land-reptiles are known for the Southern Hemisphere, the anomodonts having become extinct, but the northern continents, and especially North America, witnessed during the Jurassic and Cretaceous the development to gigantic size of ichthyosaurs, plesiosaurs, turtles, and especially dinosaurs. The pterodaelyls attain huge proportions in the American Cretaceous, and here for the first time appear the great sea-lizards or mosasaurs. It is certain that the true lizards, and probably snakes, existed in the Cretaceous, but as yet only a few doubtful remains have been discovered below the Eocene. None of the reptilian orders except those which exist at the present survived the Cretaceous, and the beginning of the Eocene witnessed a reptilian fauna essentially similar to that of to-day.

The origin of reptiles from stegocephalian Amphibia cannot be doubted; and as the earliest known reptile, palæohatteria, from the Lower Permian of Saxony, is already well differentiated from its stegocephalian contemporaries, it seems

probable that reptiles existed as early as the Upper Carboniferous. Some of the Microsauria, a sub-order of stegocephalians, are ranked by Gadow as reptiles. It is not improbable that the reptiles arose diphyletically, or in two parallel lines, from the Amphibia, and as far back as the Permian we find the widely divergent stems of the two great divisions of the order. Of late years the diphyletic character of the class has been noted by several writers, but it was not until 1902 that the two branches of reptilian descent were clearly differentiated by Osborn as sub-classes, under the names *Synapsida* and *Diapsida*. These names refer to the condition of the temporal region of the skull—whether primitively a single temporal arch, or separate upper and lower arches.

See special articles elsewhere in this work under the names of groups above mentioned, as DINOSAURIA, ICHTHYOSAURS, THEROMORPHIA, etc.

REPUBLIC. A form of political organization in which the principal agents of government are chosen by qualified electors, to whom they are, in theory at least, responsible. Such electors may comprise the whole adult population of the State, or all qualified male citizens, or a small group of persons exercising a constitutional or hereditary power of election. The earlier republics were of the latter sort, ranging from the free but limited democracy of Athens to the narrow oligarchies which divided the sovereignty of Italy during the Middle Ages. The democratic movement of the last century has, in the freer political communities of the Western world, largely substituted a popular for an oligarchical electorate, thus giving to the world republics of the type of France and the United States of America, and creating a new but inaccurate definition of republic as synonymous with popular government. See DEMOCRACY.

It is not to be denied that there may be a republic in reality which is not such in name, nor that a government which masquerades under republican forms may in fact be a thinly disguised monarchy or imperialism. In limiting the term republic to the form of government, we must be understood as speaking of the form through which government is actually administered. A monarchy in which the crown has become merely the symbol of social distinction and no longer represents political authority may fairly be described as a republic in all but name; while a military autocracy, like that of the Cæsars, though veiling its assumption of arbi-

trary power under republican forms, is none the less a monarchy. That the English government is approximating to the former condition, and that the military despotisms of Central America are perilously near the latter, cannot be denied, though it would be rash to say that in either case the conversion of the government from the one type to the other has yet become complete.

It is to the growing realization of this fact—that a republican form of government furnishes no guarantee against tyranny, and that monarchy is not inconsistent with a high degree of political freedom—even more than to the conservative reaction of half a century ago, that we must attribute the change in the character and aims of the liberal movement of the last century. The widespread republican sentiment which in 1848 threatened the thrones of Continental Europe has completely died out, and in its stead we find a growing sentiment for the liberalization of the monarchical institutions which survived that revolution. England has taken the place of the United States and Switzerland as the model of political reformers, and the aim is rather to transform existing institutions than to abolish them and substitute others of the republican type.

Attempts have been made, but without much success, to classify republics according to the extent to which popular power was diffused through the mass of the people. A more valid and useful distinction among governments of the republican type is found in the form in which the popular choice, whether wide or narrow, expresses itself, and this is determined not so much by political theory as by considerations of practical convenience. From this point of view republics fall into two classes, the pure and the representative. The former, illustrated in the local town government of New England, as well as in the Athenian democracy and the early Swiss republics, was strictly a government of the people by the people, all the citizens—a small and select class in Athens, the whole body of freemen in Appenzell and Schwiz—actually taking part in the administration of the State. This form of government is, from the nature of the case, limited to small and compact communities, with simple and common interests, and does not lend itself to the solution of vast and complex problems of government. It is obviously unsuited to the great modern State, with its large population, varied interests, and extensive dominion. For a republic of this type there is no alternative but the adoption of the representative form of government. This is the indispensable condition of the existence of republics of the modern type.

Most of the leading writers on governments have treated the republic as a recurring but merely temporary stage in the cycle of political growth and decay, which moves from the stability of orderly monarchy, through oligarchy, democracy, and anarchy, back to despotism. But the conditions of modern life and the problems of modern government are so different from those of old that the reflections and prognostications of Aristotle, Polybius, Machiavelli, and Hobbes may safely be disregarded by us. What is certain is that democratic government everywhere, but especially in its republican form, calls for character as well as a highly developed political instinct in the mass of the people constituting

the State; and when these conditions exist we may reasonably believe that, in a world which has come to cherish industrial rather than militant ideals, the popular republic may have a stability, a good order, and a capacity for progress which no other form of government has yet displayed. See CABINET; CONSTITUTION; CONSTITUTION OF THE UNITED STATES; DEMOCRACY; GOVERNMENT, and the authorities there referred to.

REPUBLICAN METHODIST CHURCH.

See METHODISM; O'KELLY, JAMES.

REPUBLICAN PARTY. In the history of American politics the term Republican has been applied to political organizations representing the most diverse principles. During the years 1791-92, under the leadership of Jefferson, the opponents of centralization in the National Government were molded into an effective political party, which assumed the official name Democratic-Republican, though its members generally called themselves Republicans. Later this organization became known as the Democratic Party (q.v.). During the years 1825-29 the followers of Clay and of Adams were known as National Republicans. (See WHIG PARTY.) In ordinary usage, however, the term Republican is applied to the powerful party which was organized in 1854-56 and elected Lincoln in 1860.

The present Republican Party took its rise from one overpowering impulse—opposition to the extension of slavery. Northern Whigs acceded with great repugnance to the new Fugitive Slave Law of 1850 (see COMPROMISE OF 1850), and its enforcement became daily more odious. When the Kansas-Nebraska Bill (q.v.) became a law the revolt was instantaneous. On the very morning after the passing of this bill, May 27, 1854, a gathering of some thirty Congressmen discussed the necessity of organizing a new party, and it was agreed that 'Republican' would be its appropriate name. Previously, on February 28, 1854, a mass meeting of Whigs, Democrats, and Free Soilers, in Ripon, Wis., had resolved that if the Kansas-Nebraska Bill should pass, they would "throw old party organizations to the winds, and organize a new party on the sole issue of the non-extension of slavery." Three weeks later local organization was effected, and the name 'Republican' was suggested as the one which the party should and probably would adopt. It was in Michigan, however, that the fusion of the opponents of the extension of slavery first completed a State organization, and formally adopted the name (July 6, 1854).

The new party was formed not so much by a coalition as by a fusion of diverse elements. There were: (a) a large proportion of the anti-slavery Whigs, like Seward, Greeley, and Lincoln; (b) the Free Soilers (see FREE SOIL PARTY), like Hale, Julian, and Sumner; (c) a great body of Know-Nothings, like Wilson, Banks, and Colfax; (d) some Abolitionists, who, though impatient with the Republicans' repeated assertion that they did not purpose to interfere with slavery where it actually existed, nevertheless found in the new party the best promise of effective opposition to slavery; and finally (e) anti-slavery Democrats, such as Hamlin, Cameron, and Bryant, who brought with them a strong popularizing influence. Later the war crisis led other Democrats into the Republican ranks, though in some in-

stances, as in the cases of Butler and Johnson, their allegiance was but temporary.

Before the new party had been in existence a year it had secured a popular majority for the opponents of slavery in 15 of the 31 States, and had elected 11 United States Senators and a plurality in the House of Representatives. The first Republican national convention met at Philadelphia, on June 17, 1856, and was attended by delegates from all the Northern States, from the Territories of Minnesota, Nebraska, and Kansas, from the District of Columbia, from Virginia, and from the border States of Delaware, Maryland, and Kentucky. The nomination for the Presidency was given to John C. Frémont, whose career as an explorer and pioneer made him a magnetic leader. The platform declared it to be "both the right and the duty of Congress to prohibit in the Territories those twin relics of barbarism, polygamy and slavery;" it demanded the immediate admission of Kansas as a free State, and denounced the Ostend Manifesto (q.v.), "with its highwayman's plea that might makes right." Whig influence was apparent in its strong declaration in favor of internal improvements at national expense, including the construction of a railway to the Pacific. Frémont obtained 114 electoral votes (Buchanan, the Democratic candidate, receiving 174), and polled a popular vote of 1,341,264, carrying all the free States except New York, Pennsylvania, Indiana, and Illinois. (See ELECTORAL VOTE and UNITED STATES HISTORY for further details as to Presidential elections.) A slight falling off in Republican strength in Congress reflected the waning of the first enthusiasm and the defection of some of the least disinterested members, but their places were soon more than filled by new adherents from the shattered American Party and from Whigs and Democrats, to whom the Dred Scott decision and the Leecompton Bill were intolerable. During Buchanan's administration the Republicans devoted their efforts to protesting against the extension of slavery, and to unsuccessful attempts to secure the passage of a Homestead Bill and the appropriation of public lands for educational purposes. In 1860 the Republican national convention was held in Chicago. The platform denounced Democratic threats of disunion; insisted that the rights of the States should be maintained inviolate, especially the right of each State to order and control its own domestic institutions according to its own judgment exclusively; declared that "the normal condition of all the territory of the United States is that of freedom, which Congress is bound to preserve and defend;" demanded the prompt admission of Kansas as a free State, and the passage of a Homestead Bill; favored a protective tariff, and river and harbor improvements; and advocated a Pacific railway, to be aided by national grants. In the balloting for candidates the more prominent leaders, Seward and Chase, were soon passed over as having made too many enemies or aroused too great apprehensions, and on the third ballot the nomination fell to Lincoln, largely from considerations of 'availability,' for as yet the full measure of his strength had by no means been revealed. Governor Hamlin, of Maine, a former Democrat, was given the second place on the ticket. Out of the 303 electoral votes Lincoln received 180, and his plurality was nearly 500,000; but his strength

was exclusively in the North, and his vote fell far short of a majority.

Republican rule began even before Lincoln's inauguration, for in the closing months of the 30th Congress the withdrawal of Southern members gave the Republicans a majority in both Houses, a fact promptly signaled by the admission of Kansas, and by the passage of a protective tariff act. The conduct of the war against the Confederate States was thrown into the hands of the loose-constructionist Republican Party; yet the opposition, especially in the later years of the conflict, was vigorous. The chief war measures were enacted by Republican votes, and favorite Republican policies were also brought to realization in the Homestead Bill of 1862, and the grants in aid of railways and of education. Really 'pivotal,' however, was the party's policy toward slavery. Here Lincoln himself took the lead. The preliminary Proclamation of Emancipation (q.v.), issued upon his own responsibility, served to "unite the South and divide the North." Formidable reaction followed, and in the autumn elections of 1862 the very existence of the Union was at stake. No one could doubt that the loss of Republican ascendancy would result in the ending of the war by some compromise which would involve the dissolution of the Union, yet the great States New York, Pennsylvania, Ohio, Indiana, and Illinois all showed Democratic majorities; but the New England States, Kansas and Minnesota, California and Oregon followed the President's leading, and the border States, too, came to the support of his policy. In the resulting Congress the Republicans found themselves in control by a majority of about twenty votes. Lincoln's policy had been vindicated: he had been clear-sighted enough to recognize that the moment had come to commit the party to an aggressive policy, and on a question of right and wrong he had been willing to trust the people. But nothing less than an amendment to the Constitution could be relied upon actually to abolish slavery forever. Such an amendment was proposed in December, 1863, but went over to the next session, and therefore became one of the vital issues of the campaign of 1864. Lincoln insisted that the advocacy of such an amendment should be made the 'keystone' of the platform. In sharp contrast with the resolutions of 1860, the Republican Convention now declared that slavery was the cause and the strength of the rebellion; that it was "hostile to the principle of republican government," and that "the national safety demanded its utter and complete extirpation from the soil of the Republic;" that the Constitution should be so amended as to "terminate and forever prohibit the existence of slavery within the limits or the jurisdiction of the United States;" and that no terms but unconditional surrender should be granted to the rebellious States. Lincoln was renominated by acclamation, and, as a mark of recognition of the patriotism of the loyal men of the border States, the nomination for the Vice-Presidency was given to Andrew Johnson, of Tennessee. Lincoln's vote in the electoral college exceeded that of his Democratic opponent, McClellan, ten to one, yet it is significant that his popular majority was less than 500,000. January 28, 1865, with the aid of eleven Democratic votes, the joint resolution (v. Amend. XIII. U. S. Const.) was passed by the House.

The end of the war found the Republican Party strong and united. But a severer test awaited it in the problem of reconstruction (q.v.), and but few weeks were needed to show how irreparable a loss the party had sustained in the death of Lincoln, and what a wretched blunder, from a purely Republican point of view, it had committed in making it possible for a strict-constructionist Democrat of Johnson's personality and antecedents to become President. During Johnson's administration the Republican majority in both Houses of Congress was overwhelming. Between the President and Congress there speedily arose over the policy to be pursued in reconstructing the South a controversy which culminated in the unsuccessful impeachment. The party in its platform of 1868 sanctioned the reconstruction policy of Congress, and insisted upon "equal suffrage to all loyal men in the South." General Grant received the unanimous nomination for the Presidency. His election was made a certainty by the fact that in the South negro suffrage was protected by Federal arms, while many of the whites were still disfranchised. Consequently only four of the Southern States, Delaware, Maryland, Kentucky, and Louisiana, chose Democratic electors. Republican majorities were maintained in both branches of Congress throughout Grant's first administration, although the opposition was gradually gaining strength. As a party measure the ratification of the Fourteenth and Fifteenth Amendments was exacted from Mississippi, Texas, and Virginia as a condition precedent to readmission, and the appointment of Federal supervisors of elections was authorized. Stimulated by protests against the manipulation of office for private or party purposes, the Republicans passed the first law for the reform of the civil service. The growing sentiment in favor of universal amnesty, universal enfranchisement, civil service reform, and the limiting of the power of the Federal Government over the local affairs of the States led to the breaking away of the Liberal Republicans (q.v.), who in 1872 made these the chief planks in their platform. Their avowed failure to come to any agreement as to the tariff, and their ill-advised nomination of Greeley, made the movement but a slight menace to the reelection of Grant, whom the Republicans had unanimously renominated upon a platform consisting chiefly of a glorification of the party's past achievements and strongly advocating a protective tariff. As a result of the *Crédit Mobilier* (q.v.) and other scandals the feeling became widespread that the Republican Party's long tenure of office had lowered the ethical tone of the party, and had given it into the hands of self-seeking and overbearing leaders. Moreover, the Republicans, as the party in power, were held responsible for the panic of 1873. Hence defection grew to such an extent that many of the Northern States were carried by the Democrats, who in 1875 secured a majority of 182 to 110 in the House. The Republican national convention in 1876 indorsed civil service reform, and commended the provision already made for the resumption of specie payments. The nomination for the Presidency was given to Governor Hayes of Ohio, and in the ensuing campaign many of the Liberal Republican bolters returned to their former allegiance. The result of the election was long in doubt, but by the Electoral Commission (q.v.) all the questions at issue were decided in

favor of Hayes, who was declared to have received 185 votes to 184 for Tilden, his Democratic opponent.

With the administration of Hayes there began a new period in the history of the Republican Party. The issues which had called it into existence had passed away, and the withdrawal by the President of the Federal troops from the South at the beginning of his administration may be said to have closed the strife between the two sections of the country. The old party leaders had left the field, for the most part, and their places had been taken by such men as Blaine, Garfield, Conkling, Sherman, Sehurz, Hoar, and Edmunds. The task which faced them was new, for economic problems upon which neither party had developed well-united views had become dominant; the currency, the tariff, and commercial relations were to be adjusted to the new and rapidly expanding industrial life of the people. In the first two years of Hayes's administration the Democrats were in control of the House, and in the last two years of both branches of Congress, while from the members of his own party the President received but half-hearted support, for it was by the aid of Republican votes that the Bland Silver-Purchase Bill was passed over his veto, and that the further retirement of United States notes was forbidden. The Republican convention of 1880 favored a protective tariff, Federal aid to popular education, "the protection of the honest voter at the South," and thorough civil service reform. Grant was for a time the leading candidate, but after a long contest the convention was 'stampeded' for Garfield, who was nominated on the thirty-sixth ballot. In order to conciliate the supporters of Grant, the second place on the ticket was given to Chester A. Arthur. During the administrations of Garfield and Arthur party lines were greatly blurred. The tariff act of 1883 and also the Pendleton Civil Service Bill received support from both sides of the chambers, yet they were in the main regarded as Republican measures. In 1884 the Republican platform was unusually pronounced in its advocacy of a protective tariff and urged international bi-metallism, the regulation of interstate commerce, and the restoration of the navy to its old-time strength and efficiency. The nomination of Blaine proved in many respects to be ill-advised. A large section of the party (see *MUGWUMPS*) refused to support him, and gave their votes mainly for Cleveland, who was elected, carrying not only the 'Solid South,' but also New York, Connecticut, New Jersey, and Indiana. During his administration Democrats were in the majority in the House. Substantial gains were made in the reform of the civil service and in the regulation of interstate commerce (Act of 1887), both of which the Republican platform had urged. A protectionist faction in the Democratic Party aided the Republicans in preventing a reduction of import duties. Cleveland's message of December, 1887, made the tariff the dominant issue of the campaign of the following year. The Republican platform declared the party to be "uncompromisingly in favor of the American system of protection;" asserted its opposition to combinations organized "to control arbitrarily the conditions of trade among citizens;" favored the "use of both silver and gold as money," and the building up of a strong navy. The nomination of Harrison,

of Indiana, and Morton, of New York, helped the party to regain those States and win the election. A scanty majority was secured in both branches of Congress. The "Omnibus Bill" for the admission of the Dakotas, Montana, and Washington brought the Republicans some votes, and Speaker Reed's rules put the House under the firm control of the majority, although they aroused not a little opposition. The protectionist McKinley Tariff Bill was passed, with the addition of a reciprocity clause. But in the Congressional elections of 1890 the Republicans were overwhelmingly defeated, and the Democrats carried the Presidential election of 1892 by a large electoral majority. The Republican platform had been very similar to that of 1888, and the nominations had aroused little enthusiasm; a rise in retail prices had followed the going into effect of the McKinley tariff, and had made it unpopular. During the first half of Cleveland's second administration the Republicans were in a decided minority in both Houses. But the reaction due to the disastrous panic of 1893 and dissatisfaction with the long-deferred and inconsistent Wilson-Gorman Tariff Bill presently reversed the situation in Congress, again bringing the Republicans into control. In the campaign of 1896 the currency issue was the all-important one. Twenty-two Republican State conventions pronounced against the free coinage of silver, and the platform of the national convention asserted the party's opposition to free coinage except by international agreement. Upon the adoption of this resolution, thirty-four free-silver delegates withdrew from the convention. The platform further "renewed and emphasized the party's allegiance to the policy of protection," and promised "to all of our products" "the most ample protection;" it favored a protectorate over Hawaii, and insisted that the United States "should actively use its influence and good offices to restore peace and give independence to Cuba." In this campaign the Republicans received aid from the 'Gold Democrats;' even the 'Solid South' was broken. McKinley received a majority over all other candidates of 286,257. The appeal which the Democrats had made to class animosity had reacted in favor of the Republicans, as the party of conservatism. In the following year the Republicans found themselves in control of both branches of Congress, though their majority in the Senate was but narrow. The Dingley Bill was promptly passed, restoring the strongly protective character to the tariff. The war with Spain, in 1898, forced to the front questions of policy which had been quite unforescen, and on which clean-cut party lines could not be drawn. The annexation of Hawaii had long been a favorite measure with some Republicans, and was effected by Republican votes. In 1899 the Republicans secured a strong majority in the Senate, and forthwith enacted a law making the gold dollar unequivocally the unit of value. Upon questions relating to the government of 'dependencies,' however, there was some crossing of party lines, a few leading Republicans with most of the Democrats taking the ground that the United States could not govern alien peoples without the consent of the governed. In the campaign of 1900 the great issue was that of 'imperialistic expansion.' The Republican platform renewed the pledge of independence to Cuba; and declared it to be "the high duty of the Gov-

ernment" "to put down armed insurrection and to confer the blessings of liberty and civilization upon all rescued peoples," promising them the largest measure of self-government consistent with their welfare and our duties. Again McKinley was the Republican nominee against Bryan, and he increased his vote over that of 1896. Outside of the Southern States the Democrats secured only 13 electoral votes, all from States dominated by the silver interest. In the first Congress of the new century the Republicans increased their strength in both Houses. The pledge of Cuban independence was redeemed, but within the party there arose serious differences as to the policy to be pursued toward the Philippines and also over reciprocity, which had been strongly indorsed in Republican platforms, but to which large financial interests, of great weight in Republican councils, stood inflexibly opposed.

The Republican Party began its career through a fusion of various party elements opposed to the extension of slavery. Its original task was accomplished with the close of the reconstruction period. New tasks have caused a differentiation in the party's personnel and in its centres of influence. In the industrial agitations of the closing years of the nineteenth century it found itself forced to stand upon the defensive as the party of conservatism. It has ever represented strong nationalizing forces at home, and a vigorous foreign policy, and its principles of broad interpretation of the Constitution have led it to enter with confidence upon the solution of problems imposed upon the United States by the expansion which followed the war with Spain.

REPUBLICAN RIVER. One of the head-streams of the Kansas River. It is formed by two forks in east central Colorado, and flows north-east into Nebraska, then east, and finally south-east into Kansas, where it joins the Smoky Hill River at Junction City to form the Kansas River (Map: Nebraska, F 3). It is about 500 miles long.

REPUDIATION (Lat. *repudiatio*, from *repudiare*, to repudiate, from *repudium*, repudiation, rejection of what one is ashamed of, from *re-*, back again, anew + *puere*, to be ashamed). The refusal of a State or government to pay its debt. It grows out of the practical bankruptcy of the State, though it often seeks justification

in the plea that the obligations previously admitted were illegal and therefore invalid. Debt-sealing by refunding operations frequently approaches repudiation in its practical effects, though it generally escapes the reproach of the name unless there are obligations or classes of obligations which are wholly ignored in the process. Among nations and States of weak public credit the practices mentioned are only too familiar, but the odium of the name attaches particularly to the history of the financing of the American commonwealths. In 1790 all existing State debts had been assumed by the general Government, partly on the ground of justice, because they had been contracted in the prosecution of the Revolutionary War, partly on that of expediency, as a means of strengthening the public credit. For a period of 40 years thereafter the State governments remained almost free from liabilities, notwithstanding the fact that the War of 1812 had called for extraordinary expenditures, and in 1830 the aggregate debt of all the States was only \$13,000,000. Then began an era of extravagant speculation and reckless enterprise. Population was increasing, and production was increasing even faster than population. The resources of the soil were more than equal to any demands that could be made upon them. But as yet no adequate means of communication between producer and consumer had been established, and a universal need was felt for such facilities of transportation as would insure quick delivery at moderate rates. To the sanguine colonist it seemed that the construction of railroads and canals was a work of public importance which would justify almost any financial assistance on the part of the State, and would return the investment a hundredfold.

States issued bonds in aid of the construction of railroads and canals, and in the South especially subscribed to bank stock, for the purchase of which they issued bonds. In other cases they simply indorsed the bonds of railroads and banks. Nor was it difficult for the States to secure loans. The United States national credit stood high abroad. Not only had the interest been promptly paid upon the national debt, but the United States offered the extraordinary spectacle of a nation which had actually paid the principal. European money-lenders, who had not yet learned to discriminate between national and State securities, felt confidence both in the honor and in the resources of the country. The bonds of the several States were therefore easily disposed of in foreign markets, until in 1842 their aggregate debt had swollen to the enormous total of \$213,000,000, an increase of more than 1500 per cent. since 1830. The panic of 1837 and the subsequent tightening of the money market precipitated the inevitable crash. First, Indiana found it impossible to meet the interest of her debts in 1840; Ohio was saved from following her example only by extraordinary efforts. Two years later the Bank of Pennsylvania failed, and every bank south of Philadelphia suspended payment. In the panic that ensued, Pennsylvania, Maryland, Mississippi, Michigan, Florida, Indiana, and Illinois found themselves in a condition approaching bankruptcy. But though all these States suspended payment of accruing interest, all of them, except Mississippi, Michigan, and Florida, finally

weathered the storm without resorting to the repudiation of any part of the capital debt.

It was in Mississippi that the word repudiation originated, in a message by Governor McNut of that State suggesting the plan of "repudiating the sale of certain of the State bonds on account of fraud and illegality." The bonds, to the amount of \$5,000,000, had been issued in 1838 as a subscription to stock of the Union Bank of Mississippi. As the bank succumbed early to reckless management and the security of the State became worthless, the State found itself saddled with a debt from whose expenditure it had had no benefit. It is not surprising that certain apparent irregularities in the issue of the bonds should be seized upon as a pretext for denying the debt, though the courts of the State later decided that these irregularities were not so material as to invalidate the bonds. The Legislature of Mississippi promptly branded this suggestion of repudiation as "a calumny upon the justice, honor, and dignity of the State." But though for the time being the bonds were thus saved from being formally repudiated, they fell into default. Successive Governors, indeed, urged their payment, but no provision was made for the purpose until 1852, when a proposition to levy a tax to pay the bonds and interest was submitted to the people and defeated at the polls by an overwhelming majority. Florida, which in the thirties had borrowed about \$3,900,000 for the support of banks, was caught in the bank failures and refused to pay her debts. In the meanwhile Michigan had repudiated a portion of its liabilities under the following circumstances: Certain bonds had been disposed of to the Morris Canal and Banking Company, to be paid for in installments. The Bank of Pennsylvania had become surety for the payment of these installments as they fell due. But canal company and bank both failed. It was ascertained that a large amount of the bonds, for which only partial payment had been made, had been transferred from the canal company to the bank, the latter having full knowledge, of course, of all the facts. It is true that the bonds had been hypothecated in foreign markets, and were now in the possession of innocent holders. Nevertheless, the State claimed that it was bound to repay only the money it had actually received, called for the surrender of the 'part paid' bonds, and issued new certificates for the amount it had actually received, with interest thereon.

The course pursued by Louisiana was equally open to criticism. The State had raised capital for internal improvements by loaning her credit to banks whose stock was secured by mortgages on real estate. During the era of prosperity these banks discounted a great deal of business paper which turned out to be bad when the day of trial came. In 1843 the Legislature enacted that all debts due to the bank should be payable in the depreciated State bonds issued by the banks, at their par value. In ante-bellum times, however, repudiation was in its infancy. After the war it sprang to great proportions, as the Southern States generally repudiated their debts. The burden of debts had greatly increased from 1860 to 1870, while the resources of the country had been wasted by the war. Practically no interest had been paid upon the debt contracted before the war. The so-called period of reconstruction was, moreover, riotous in its expendi-

ture of public moneys and brought about a large increase of the debt. With the revival of old conditions and the return to power of the classes which nominally ruled the States, the inability to pay resulting from the impoverished condition of the country was combined with a reluctance to pay debts which in their opinion had been forced upon the States by outsiders. In this category they placed the accrued interest upon antebellum debts as well as much of the debt which had its birth in the so-called reconstruction era. It is impossible to follow the history in all its details. With pretexts of fraud, jobbing, and corruption in the issue of bonds, or on the simple plea of poverty, one Southern State after another annulled its obligations outright or so scaled them in refunding operations as to destroy a large part of their face value. The aggregate debts of the States along the coast from Virginia to Louisiana, with Arkansas and Tennessee, are computed to have reached, each State taken at its highest point, \$236,000,000, while in 1880, after the policy of repudiation had been adopted, they amounted to \$108,000,000. The Southern States were joined by one Northern State, Minnesota, which in 1880, after 22 years of agitation, denunciation, and negotiation, finally agreed to compromise the payment of certain railroad bonds (guaranteed by her as far back as 1858) at 50 cents on the dollar, and accrued interest, the plea being that the railroads had failed to comply with the conditions of the issue. The inevitable result of repudiation has been that foreign capitalists have learned to discriminate between the values of different State securities; and while the bonds of the non-repudiating States, including those Southern States which have not followed the example of their neighbors, command a premium, the bonds of the various repudiating States fluctuate at from 10 to 50 per cent. of their face value.

Repudiation has not been confined to States. During the five years immediately following the panic of 1873, numerous cities, towns, and counties, even within those States whose corporate credit remained unimpaired, finding it impossible to meet their obligations, sought to evade them by repudiation. By appeal to the United States courts, however, their creditors could command an impartial judicial determination of the question. This is impossible in the case of States, as the 11th amendment of the Constitution, adopted in 1794, expressly provides that though individuals may be sued by States, States cannot be sued by individuals. Under this amendment, and the decisions which have grown out of it, no power can legally coerce a State to keep its pledges. There is therefore no power in the United States Government to prevent a recurrence of the humiliating spectacle of repudiation. The States only can provide remedies for it. The substantial increase of wealth in all sections of the country affords a guarantee for the future. Another and perhaps more efficient safeguard against its recurrence is to be found in the innumerable restrictions upon the debt-making power of the States which have found their way into recent State Constitutions.

Consult Scott, *The Repudiation of State Debts* (New York, 1893).

REQUESTS, COURT OF. An ancient English court having minor chancery jurisdiction, and

presided over by the Lord Privy Seal. It was inferior to the Court of Chancery. It was abolished by Stat. 16 and 17 Car. 1., c. 10. Certain inferior courts for the collection of small claims were formerly called courts of requests, or courts of conscience. They have all been abolished by statute, or have become obsolete. See **COURTS.**

REQUIEM, rē'kwī-ēm (Lat., rest). In the Roman Catholic Church, the mass for the dead; so called from the first word of the introit. Requiem masses were composed by many of the older masters, such as Palestrina, Vittoria, Anerio, Colonna. The most famous works of this kind in modern times are those of Mozart (1791); two of Cherubini, C minor (1793), D minor (1836); Berlioz (1837); Verdi (1873). One of the greatest choral works ever written bears also the title requiem, although it is written to German words selected from the Bible. This is the great *Ein deutsches Requiem* by Brahms, written on the death of his mother (1868).

REQUISITIONS (Lat. *requisitio*, from *requirere*, to search for, require, from *re-*, back again, anew + *querere*, to seek). Articles of daily consumption and use levied by an invading army from the inhabitants of occupied territory. They must be distinguished from *contributions*, with which the term is often confused, the latter being properly confined to money impositions above the ordinary revenue which legitimately belongs to the invader; and from *fincs*, which are payment exacted from a district by way of punishment for some offense committed against the enemy outside the regular military operations.

The adoption by civilized nations of modern rules of warfare prohibiting pillage does not guarantee security of property to an invaded district. The experiences of the past century have authorized three methods of obtaining support for an invading army from an occupied district. (1) It may purchase provisions and like articles required for consumption; (2) it may levy them at prices fixed by the commander; (3) it may force the inhabitants to furnish them without payment and on refusal send out detachments to collect them. Thus the produce of the farmer, the goods of the merchant, and the stock of the trader may be confiscated. By the Brussels Military Code (1874), Arts. 40, 42, rules are laid down governing the making of requisitions. It is customary for the modern army to have a vast commissary train, and requisitions are relied upon only to supplement this supply. The commander of the army may levy such articles as clothing and boots, to prepare which time is required, while corps commanders may requisition food and fodder for immediate use. The collections should be made through the local authorities, if these continue, by demand in writing, and receipt should be given as evidence of the compliance and as a voucher in case the Government should subsequently recoup the inhabitants. The discretion of the invader must be employed to apportion these demands to the resources of the district. *Contributions*, on the other hand, should be imposed only "on the order and responsibility of the general-in-chief, or of the supreme civil authority, established by the enemy in the occupied territory" (Brussels Code, S. 41). In levying contributions assessment should be made on the lines of civil taxation.

Fines may be levied by the invading commander to secure the safety of his communications and his troops. Consult: "Instructions for the Government of the Armies of the United States in the Field," *General Order No. 100, Adjutant General's Office* (War Department, Washington, 1863); also "Brussels Military Code," in *Proceedings of Brussels Conference* (Brussels, 1874); and "Hague Military Code," in *Proceedings of the Hague Conference* (The Hague, 1898).

REDOS (OF., behind the back). The wall at the back of an altar, seat, or large fireplace. In churches the redos is usually in the form of a screen detached from the choir. It is of two forms: a slight movable screen, and a permanent heavier structure. The custom did not become common until the position of the priest at the altar changed, toward the twelfth century, so that his back was turned to the congregation. Early ones were often merely hanging tapestries on rods; some were screens of gold and silver reliefs rising at the back of the altar, like the Pala d'Oro at San Marco, Venice, and that at San Jacopo, Pistoia, while others were of carved ivory, like one in the Cluny Museum (Paris). The architectural screens, with niches, statues, marble reliefs, and paintings, are especially fine in English and Spanish churches. The redos corresponds somewhat to the choir-screen previously used in the West and still used in the Greek and Russian churches between the altar and the congregation.

RESBY, rēz'bī, Sir JOHN (1634-89). An English historian, born in Thribergh, Yorkshire. He entered Trinity, Cambridge, but left almost immediately for Gray's Inn; traveled on the Continent for several years, and after the Restoration served as high sheriff of Yorkshire, then for several years in the House of Commons, and (1682 sqq.) as governor of York. He was an able politician and foresaw James's fall in time to save himself and make favor with William of Orange. His *Memoirs* (1734) and *Travels* printed with the *Memoirs* (1813, 1821, 1831) are very valuable documents for the history of the time.

RESACA DE LA PALMA, rá-sá'ká dá lá päl'má, BATTLE OF. A short but hotly contested engagement, fought on May 9, 1846, during the Mexican War, between about 5000 Mexicans under General Arista and about 2300 Americans under General Taylor, which ended in the defeat of the Mexicans. The ravine in which it occurred, covered by a thick growth of palm trees, is in Cameron County, Texas, 4 miles north of Brownsville, on the Point Isabel road. The Americans lost 39 killed and 83 wounded, the Mexicans about 160 killed, 228 wounded, and 100 missing, though by some writers the total number of killed, wounded, and missing has been given as 1000. Consult: Baneroft, *History of Mexico*, vol. v. (San Francisco, 1885); and Howard, *Life of General Taylor* (New York, 1892), in the "Great Commanders Series." See MEXICAN WAR.

RÉSAL, rá'zál', HENRY AMÉ (1828-96). A French mathematician and engineer, born in Plombières (Vosges), and educated at the Ecole Polytechnique and at the School of Mines. He served for fifteen years as departmental engineer of Doubs, gaining some repute there for his work on the mathematics of geology; became

professor of mechanics in the Polytechnique in 1870; was elected to the Academy of Sciences in 1873; and in 1888 was appointed inspector general of mines. Résal wrote many valuable memoirs on mechanics and physics. His published work includes: *Traité de cinématique pure* (1862); *Traité de mécanique céleste* (1865; 2d ed. 1884); *Traité de mécanique générale* (1873-89); *Traité des surfaces* (1891); and a French version of Salmon's *Analytical Geometry* (1870).

RESCISSION (Lat. *rescissio*, a cutting off, retrenchment, from *rescindere*, to cut off, from *re-*, back again, anew + *scindere*, to cut). In law, the rescinding or setting aside of a contract, either by mutual agreement of the parties to it, or by direction of a court of equity because of some legal defect in the contract. See CONTRACT.

In the case of rescission not depending on mutual agreement, the right to rescind may be based either upon fraud or mistake in the inception of the contract. The right of rescission on ground of fraud arises as soon as the party who is entitled to rescind has notice of the fraud. If, with full knowledge of the fraud, he continues to act under the contract or pursuant to its terms, he will be deemed to have approved the contract and to have waived his right of rescission. Upon rescission of the contract he is entitled to compel a restoration of property which he has given as performance of the contract on his part or to recover its money value in a quasi-contract action. He cannot, however, recover the property so given from third parties who are purchasers for value without notice. See FRAUD; EQUITY.

A court of equity, however, will disregard the parol-evidence rule as to written contracts (see EVIDENCE) if it finds that there was actually no agreement or meeting of the minds of the parties as to the term of the contract, and it will compel a surrender and cancellation of the written contract and a restoration of the parties to the contract to their original positions. This form of relief is technically known as rescission, although its real purpose is to render non-effective written evidence which has been improperly obtained or given. In case of all verbal contracts one entitled to rescind may do so without the aid of a legal proceeding by merely giving notice. This right, although equitable in character, is recognized and enforced at law. Upon giving such notice to the other party to the contract it is thereupon deemed to be at an end; and the party rescinding the contract is entitled to receive back the money or property which he has given under the contract, the title to the money or property being revested in him by operation of law as consequence of the rescission. He may not lawfully take the property forcibly, however (see REMEDY), but may at his election bring an action in quasi contract for the value of his performance under the contract, or trover for damages for refusal to return property, or replevin to recover the property itself. As a condition precedent to rescission he should also return any money or property which he has received under the contract.

In case of all contracts, whether written or verbal, if one entitled to rescind the contract on ground of fraud is sued upon the contract, he may set up the fraud as a defense. Fraud is strictly an equitable defense, but it has been

completely adopted by the law. It does not conflict with the parol-evidence rule, as the effect of proof of fraud is not to vary the terms of the contract, but to show that on equitable grounds the contract actually entered into should not be permitted to remain operative. If, however, one who has entered into a written contract wishes to be released from its obligations at any time on ground of mistake, or if he wishes to be released from the contract at any time before he is actually sued upon it on the ground that the contract was induced by fraud, his only relief is in equity, since the primary relief which he seeks is the cancellation and surrender of the contract. See CHANCERY; EQUITY. See also REFORMATION.

RESCRIPTS (Lat. *rescriptum*, answer, from *rescribere*, to write back, from *re-*, back again, anew + *scribere*, to write). Answers of the emperors and popes to questions in jurisprudence officially propounded to them. In the Roman Empire the *rescripta principis* were one of the authoritative sources of the civil law. After the third century they increased in number rapidly and superseded the responses of the jurists as one of the most important sources of Roman law, the privilege of giving responses no longer being conferred upon the jurists. The rescripts directed to corporate and municipal bodies were known as *pragmaticæ sanctiones*, a name which has found its way into the public law of Europe. See PRAGMATIC SANCTION.

RESCUE. In criminal law, procuring or aiding in the forcible deliverance of a prisoner from lawful imprisonment, by a third person. By the common law, a rescuer was held guilty of the same degree of crime as the prisoner, if he knew that the latter was lawfully detained when he rescued him. This knowledge was presumed if the culprit was in prison, or in the custody of an officer of the law, at the time. To-day, the offence is punishable in most jurisdictions, but not with the same severity as at common law.

In maritime law a rescue is the retaking of a captured prize from the enemy by prisoners of war. The latter do not acquire any rights in the recaptured property, but must return it to the lawful owners.

RESCUE GRASS, SCHRADER'S BROME GRASS (*Bromus unioloides*). A strong-growing South American grass introduced into many parts of the world; in the United States under the name of Australian oat. Its leaves are flat, linear, slightly roughened; its panicles spreading with numerous rather large flattened spikelets resembling the well-known 'chess' or 'cheat' to which it is closely related. It grows rapidly to a height of 1 to 3 feet, seeds freely, and dies after seeding. In the Southern States it is regarded as one of the best winter grasses, as it makes its principal growth during cool weather. It is usually cut several times during the season and if prevented from seeding continues for 2 or 3 years. If properly treated it is a valuable brome grass (q.v.), excelling rye or oats as a winter grass and in the large amount of nutritious hay it yields. It withstands drought well and will grow on almost any soil; its best growth, however, is on rich moist soil.

RESECTION (Lat. *resectio*, from *resicare*, to cut off, from *re-*, back again, anew + *secare*, to cut; connected with OHG. *sega*, Ger. *Säge*, AS.

sage, *sayu*, Eng. *saw*), or EXCISION OF JOINTS. An operation in which the diseased bone of a joint is cut out, in place of cutting off the entire limb. This operation is safer in properly selected cases than is amputation, since there is diminished shock from the absence of severance of large nerve trunks, arteries, and veins. Besides this advantage there is left to the patient a fairly useful limb, though there is, of course, more or less shortening and the motility of the joint is lost. The extent of the disease process present and the possibility of extension of the disease above the joint after operation, as occurs in malignant disease (see TUMOR), are the factors that determine the surgeon in a choice between resection and amputation. In young patients, where excision of a joint often includes the epiphyses of the growing bones and interferes materially with the future growth and development of the limb, the scope of the operation is much restricted. Owing to the development of more conservative measures in dealing with diseases of the joints, formal or complete excisions are not now practiced as much as they were by surgeons of a decade ago. For a description of the operation of excision as applied to the different bones and joints, consult Stimson, *Operative Surgery* (Philadelphia, 1893).

RESERVATION (ML. *reservatio*, from Lat. *reservare*, to keep back, from *re-*, back again, anew + *servare*, to keep). In English law a term applied to a clause in a deed, lease, or grant of land, which reserves out of the estate conveyed a right or interest in a portion of it. An estate in a 'stranger,' or person not a party to the conveyance, cannot be created by reservation, which can only operate in favor of the grantor himself. In the United States the word is frequently used as synonymous with exception. (See CONVEYANCE; DEED; MORTGAGE; LEASE.) The term is also employed to describe a method of obtaining the opinion of a full bench of a court or an appellate court upon a point of law as to which the trial judge is doubtful. This often saves the necessity of making a ruling compelling the parties to appeal afterwards. The jury is usually allowed to find the facts, and the verdict or judgment is not entered until the reserved point is decided. In many code States this is accomplished by taking a verdict subject to the opinion of the court.

RESERVATIONS, INDIAN. See INDIAN AFFAIRS; TREATIES, INDIAN.

RESERVE (OF. *reserve*, Fr. *réserve*, from OF. *reserver*, Fr. *réservé*, to reserve, from Lat. *reservare*, to keep back). A term common in military affairs both as regards the material and the personnel of an army. For *reserve* in European armies, see ARMIES; LANDWEHR; MILITIA; RELIEF; VOLUNTEERS.

RESERVE, NAVAL. See NAVAL RESERVE.

RESERVED CASES. A term applied in the Roman Catholic Church to sins of a heinous character, such as heresy, simony, and sacrilege, that for their adequate treatment require the attention of an ecclesiastic superior to the parish priest, either the Pope, the bishop, or the head of an Order. The object of transferring the right to absolve such sins to the higher ecclesiastic is partly to impress upon the offender the true turpitude of his offense. Consult Hausmann,

Geschichte der päpstlichen Reservatfälle (Regensburg, 1868).

RESERVOIR. See DAMS AND RESERVOIRS; WATER-WORKS.

RESHID PASHA, *re-shēd' pā-shā'*, **MUSTAPHA MEHEMET** (1802-58). A Turkish statesman, and long the chief of the Party of Progress in Turkey. He was born at Constantinople. In 1833 he negotiated the Treaty of Kutaia with Mehemet Ali (q.v.), the rebellious Viceroy of Egypt. He subsequently represented Turkey at the courts of Great Britain and France, but was recalled in 1837, and made Foreign Minister. In this office he aided the Sultan Mahmud II. in carrying out his plans for the reform of the administration; but the Old Turkish Party forced him out of his office before the close of 1838. After this he was sent as envoy to London, Berlin, and Paris. On the death of Mahmud II., in 1839, when the Ottoman throne was tottering under a fresh onslaught by Mehemet Ali, Reshid Pasha was again called to take charge of the Foreign Office by the mother of the young Sultan, Abd-ul Medjid. He succeeded, after a debate in council of three days' duration, in obtaining the *hatti sherif* (q.v.) of Gulhane (November 3, 1839), a constitutional charter which, however, soon became a dead letter. His foreign diplomacy checked Mehemet Ali in Syria through the intervention of the Quadruple Alliance (Great Britain, Austria, Prussia, and Russia), but a seraglio intrigue led to his dismissal. From 1841 to 1845 he was the Turkish representative at the French Court. In 1845 he was once more made Foreign Minister, and in 1846 he was appointed Grand Vizier. He was repeatedly deposed, and almost immediately recalled, according as the anti-reform party gained or lost the favor of the Sultan; but the complications with Russia which arose in 1853 threw the anti-reformers into discredit, and Reshid Pasha, more powerful than ever, was again recalled to the direction of foreign affairs. In 1855 he again retired from office, which he did not resume till after the Peace of Paris.

RESHT, *rēsh't*. The capital of the Province of Ghilan, Persia, situated near the southwest shore of the Caspian Sea, 150 miles northwest of Teheran (Map: Persia, C. 3). The houses are tiled and neatly built, and the streets are paved. Water is supplied by an aqueduct. There are a vast ruined palace, numerous caravansaries, large bazaars, and about 1200 shops and warehouses. Indian wares are imported from Balfrush in Mazanderan, and European manufactures from Russian Armenia. Resht is the chief entrepôt for the Persian silk trade. Extensive manufactures of shawls and carpets are carried on. Population, about 40,000. Enzeli, the port of Resht, on the Caspian Sea, about 18 miles distant, has 1500 inhabitants.

RESICZABÁNYA, *rē'shitzs-ō-bān'yō*. A mining town in the County of Krassó-Szörény, Hungary, about 50 miles southeast of Temesvár. There are extensive iron and coal mines and iron works in the vicinity. Population, in 1900, 11,770.

RESIDENCE (ML. *residentialia*, from Lat. *residere*, to reside, remain, from *re-*, back + *sedere*, to sit; connected with Gk. ἔρθαι, *hezesthai*, OChurch Slav. *sěsti*, Skt. *sad*, Goth. *sitan*, OHG. *sizzen*, Ger. *sitzen*, AS. *sittan*, Eng. *sit*). The

obligation to perform in person the duties of a benefice whose revenue was enjoyed. It was early a complaint that this obligation was violated. The Council of Sardica (347) in its twelfth canon enjoined upon bishops and in the sixteenth upon presbyters the duty of continuous service in their proper residence. The evil continued through the centuries. In Reformation times it was a reproach that non-resident holders of benefices were so common, owing to the custom of pluralities. The Council of Trent endeavored to remedy the evil by providing in its 23d and 24th sessions, that no prelate should absent himself from his diocese more than three months, except for urgent cause. In present practice in the Roman Catholic Church parish priests cannot be absent longer than one week from their cure, except with the permission of the bishop.

RESIDUAL ROCKS (from Lat. *residuum*, remainder, from *residere*, to reside, remain). Rocks which have been produced through the decomposition and disintegration of rocks belonging to any of the larger divisions; viz. sedimentary, igneous, and metamorphic rocks. The agents which bring about these changes are in part chemical and in part physical. The active agents of chemical change at the surface of the earth are oxygen, water, and carbonic acid, all of which exist in the atmosphere and in the waters which percolate within and near the earth's surface, and the changes which they bring about are chiefly oxidation, hydration, and carbonization. The new minerals which are developed by these processes may be said to be in general lighter in weight (more bulky) and more soluble than the minerals out of which they have been formed. They are also as a class softer, and possess for the most part a fibrous or sealy texture. Particularly due to the change in volume which this recrystallization involves, a physical force is brought into play which opens fractures in the rock and permits of its solution and disintegration. The more soluble constituents of the rock are taken in solution and removed, while the less soluble materials remain as a more or less incoherent mass constituting the residual rock type. The residue from rocks of igneous and generally granitic types has been given various names such as 'waste,' 'geest,' 'Gruss,' etc. In unglaciated regions residual rocks of this type occasionally possess their original textures, lacking only the compactness characteristic of those types. Where situated on steep slopes the upper portions of the deposit of waste will by the force of gravitation slide down toward the valley, a process which is described as 'creep.' In glaciated regions, on the contrary, the surface layers of waste have been carried away by the ice mantle and the hard underlying rock has usually also been planed down. The comparative recency of the glacial epochs in a geological sense thus furnishes a certain measure of the time necessary to decompose and disintegrate compact rock masses. The final product of decomposition and disintegration of granitic rocks is a fine clay or kaolin, and this has been the source of the great deposits of porcelain clay throughout the world. Before this final stage of the alteration has been reached the residual rock has usually the structural peculiarities of a coarser or finer sand, and thus we have the residual sand of granite, etc. Calc-

reous rocks, such as limestone or dolomite, furnish in the initial stages of their solution and disintegration a granular calcareous sand. Joints and other fissure planes in massive rocks greatly facilitate the processes of decomposition and disintegration. The solutions which are active in these processes find their way along the joint planes as trunk lines, and by their more ready access to the edges and corners of included blocks of rock soon produce a spheroidal and often concentric structure. Thus are brought about spheroidal blocks of the igneous rock type, the centres of which are usually little changed, but the peripheral zones of which represent altered phases of the rock, the outermost being the most nearly disintegrated. This process goes on quite rapidly, as is shown by the fact that monuments and fence posts of basic igneous rocks have within the course of a century so far disintegrated as to be almost useless for the purposes to which they were applied.

Plant life by sending its roots into the soil protects from disintegration the underlying rocks. In arid regions, however, where little if any plant life can exist, winds are effective in removing the superficial layers of waste and continually exposing the underlying rock. The material removed by the winds on being deposited produces æolian rocks. See ÆOLIAN ACCUMULATIONS.

RESIDUARY LEGACY. A legacy of all that remains of an estate after the debts and specific legacies have been paid. Where a testator desires to give the bulk of his estate to one person, as his wife, and at the same time to make other smaller bequests, it is customary to make the latter by means of express or specific legacies, naming the amount or specific property, and then to devise and bequeath all the 'rest, residue, and remainder' of his estate to the favored person by a residuary clause. It sometimes happens, however, after the debts and minor specific legacies are paid, that the estate is exhausted, and the one whom the testator most intended to favor gets nothing. The best method of guarding against this contingency is to put a condition in each of the specific legacies to the effect that it shall be null and void if the appraised value of the estate is not in excess of a certain sum, or to make an express or specific bequest to the person who is to take precedence over the others, then make the other minor bequests, and conclude by making the first person the residuary legatee of the rest of the estate. See LEGACY; WILL.

RESINA, rà-sē'nà. A town in the Province of Naples, Italy, situated on the Gulf of Naples, at the foot of Vesuvius, 5 miles by rail southeast of Naples (Map: Italy, E 10). It is built on the site of ancient Herculaneum. Exquisite fruits are grown, and the famous *Lacrimæ Christi* wine is made in the vicinity. There are manufactures of silk, glass, and leather. The town is surrounded by country houses, and is a place of recreation for the Neapolitans. The ascent of Mount Vesuvius is begun at Resina. Population (commune), in 1901, 19,766.

RESINS (OF. *resine*, Fr. *résine*, from Lat. *resina*, *resine*, from Gk. *ῥητινῆ*, *rhētīnē*, pine-resin). A class of solid or semi-solid organic substances mostly of vegetable origin. The class

includes many minerals which are assumed to be the product of extinct vegetation. The resins are allied to the volatile oils, in which they are found dissolved when directly obtained from plants. The various resins, all composed of carbon, hydrogen, and oxygen, differ widely in their chemical behavior.

The following are the general characters of this class of compounds: At ordinary temperatures they are solid, translucent, and for the most part colored, although some are colorless and transparent. Some are devoid of odor, while others give off an aromatic fragrance from the admixture of volatile oil. In their crude state they never crystallize, but are amorphous and brittle, breaking with a conchoidal fracture; when pure several of them may, however, be obtained in the crystalline form. They are readily melted by the action of heat, and are inflammable, burning with a white smoky flame. They are insoluble in water, but dissolve in alcohol, ether, and various oils. They are insulators or non-conductors of electricity, and become negatively electric by friction. Many of them possess acid properties, in which case their alcoholic solutions redden litmus. These resins combine with the alkalies, and form frothy soap-like solutions in alkaline lyes. The resinous soaps thus formed differ from ordinary soap in not being precipitated by chloride of sodium.

The resins are generally obtained by making incisions into the wood of trees which produce them; sometimes, however, they exude spontaneously, and in other cases require to be extracted from the wood with hot alcohol or other solvents. The crude resins are separated from the volatile oils, with which they form the so-called *oleo-resins*, by distillation; and from the gummy and mucilaginous matters with the aid of alcohol, which dissolves out the pure resins.

The resins are extensively used in making lacs and varnishes. Colophony, copalia, jalap, podophyllum, and the resin of scammony are used medicinally. Colophony, or rosin, is an antiseptic and forms an excellent application for wounds and ulcers. Copaiba acts as a stimulant and disinfectant, and is often prescribed in gonorrhœa. Podophyllum, jalap, and the resin of scammony are purgatives, the latter causing profuse watery evacuation of the bowels.

Various *fossil resins* are known, of which the most important is amber. Some chemists place asphalt among this class; and among the fossil resins described by mineralogists may be mentioned copalin, hartite, xyloretin, etc.

Resins also form important constituents of the substances known as *gum resins* (see GUMS) and are contained in the so-called *balsams*, a class of liquid or semi-solid products including benzoin, styrax, and the balsams of Peru and Tolu. Resins containing benzoic or cinnamic acid are sometimes spoken of as 'solid balsams.' The common resin or rosin of commerce exudes in a semi-fluid state from several species of pine, being derived chiefly from the *Pinus australis* and the *Pinus pinaster*. The crude turpentine (an oleo-resin) obtained from these trees is distilled, leaving behind the resin, a brittle solid somewhat heavier than water. The resin soap used in the manufacture of common qualities of soap is obtained by boiling rosin for some time with caustic soda and water. Other resins most commonly known and used include copal, dam-

mar, dragon's blood, frankincense, lac, mastic, and sandarac.

Consult: Wiesner, *Die technisch verwendeten Gummiarten, Harze und Balsame* (Erlangen 1869); Theniis, *Die Harze und ihre Producte* (Vienna 1879); Cameron, *Oils, Resins, and Varnishes* (London, 1886).

RESIN WEED. See COMPASS PLANT.

RESISTANCE, ELECTRICAL. That property of a conductor which determines the intensity of an electric current flowing through it for a given difference of potential at its terminals. The resistance of a conductor varies with its temperature, but is the same for all currents. The unit of resistance, the ohm (q.v.) is such a resistance as will cause a current of one ampere to flow over a conductor when there is difference of potential of one volt between its terminals. This relation

is given by Ohm's law that $C = \frac{E}{R}$, where C

stands for the current, E for the electromotive force, and R for the resistance. The resistance of a homogeneous conductor will vary directly as its length and inversely as the area of its cross-section, or in the case of a round wire inversely as the square of the diameter. Specific resistance is the resistance of a centimeter cube of a substance in microhms, while the relative conductivity of a conductor is its relative resistance to some standard substance, generally annealed copper. Resistance may be measured by means of the Wheatstone bridge (q.v) or by substituting known resistances for unknown, so as to produce an equivalent current, which is indicated by the deflection of the galvanometer (q.v.). Another method is to use the differential galvanometer and so arrange the known resistances that the same current flows through each set of coils, while there are also methods where use is made of the condenser and ballistic galvanometer. See ELECTRICITY; CONDUCTOR; OHM; ELECTRICAL UNITS.

RES JUDICATA (Lat., thing adjudged). In law, a matter of controversy which has been finally decided and determined on its merits by a court of competent jurisdiction. This implies that there has been no fraud or collusion by which the court has been misled. The importance of this doctrine lies in the fact that if a matter is once judicially determined it cannot again be litigated. To make the entire subject-matter of an action *res judicata* all the parties interested must be made parties thereto, either as plaintiffs or defendants. Only the points actually decided come within this rule. See JEOPARDY; JUDGMENT.

RESOLUTION. In law, an act or official expression of the will of a legislative body, corporation, or organized assembly. The term is sometimes used as being synonymous with *ordinance*, when applied to an act of a municipal council or a board of aldermen. However, resolutions are usually adopted to authorize ministerial acts, or to express the sentiment or regard of a body, whereas ordinances are passed to prescribe permanent rules of conduct or law. For example: If a common council desires to regulate the speed of vehicles, it would be done by an ordinance; whereas, if the freedom of the city were to be extended to a distinguished guest, it would be done by a resolution.

In the civil law the discharge of a valid contract by consent of the parties or by decree of a court is said to be a *resolution* of the contract. This is distinguished from a *recession*, which implies that the contract was void *ab initio*.

RESONANCE (OF. *resonnance*, Fr. *résonance*, from Lat. *resonantia*, echo, from *resonare*, to sound back, from *re-*, back again, anew + *sonare*, to sound, from *sonus*, sound; connected with Skt. *svan*, to sound). A general mechanical property which has many illustrations in nature. If a large bell is to be set in motion, it is only necessary to apply a series of impulses regularly timed at intervals to correspond with the natural period of the body. The column of air in a bottle or tube may be set in vibration by waves whose period is the same as that of the column of air. (This is illustrated by the strengthening of certain sounds heard when a bottle or a large seashell is put near the ear, for in any room there are present waves of all periods.) If a train of ether-waves passes through some material medium the minute portions of which have a frequency the same as that of the waves, it will set these portions of matter vibrating. The waves thus lose energy, which is gained by the matter. See RADIATION AND ABSORPTION.

RESONATOR. A device used in acoustics (q.v.) to reinforce or strengthen a given tone. Resonators, which are used largely in the analysis of sound, consist of hollow vessels usually bulb-shaped or cylindrical. The air of such a vessel has a natural period of vibration, and when the resonator is brought near a sounding body which is emitting waves of the same frequency the former will take up the vibration and will emit the sound. In analyzing sound which is made up of numerous harmonics or overtones the resonator will select a particular sound, which it will reinforce, and if a diaphragm is placed so that it will vibrate under the action of the air in the resonator, the motion can be communicated to a small gas flame, as in Koenig's manometric capsule. Resonators in the form of wooden boxes are frequently used to mount tuning forks on and are constructed of such dimensions that the contained air will vibrate in unison with the fork and so strengthen the sound.

RESORCIN, or RESORCINOL (from *res-in* + *orein*), $C_6H_4(OH)_2$. A diatomic phenol first obtained by Hlasiwetz and Barth in 1864, by fusing resins with potassium hydroxide. It has since been obtained by various other reactions. On an industrial scale it is made by fusing the sodium salt of meta-benzene-disulphonic acid with caustic soda, resorein being thus produced according to the following chemical equation:

The mixture is acidified with hydrochloric acid, and the resorein is separated by means of ether or some other liquid in which it is soluble. The crude resorein thus obtained is purified by distillation. It may be added that the meta-benzene-disulphonic acid used in making resorein is obtained by heating benzene with fuming sulphuric acid. Pure resorein is a colorless crystalline substance melting at 119° C. (246.2° F.) and boiling at 276.5° C. (529.7° F.). It has a faint odor and a sweetish taste, but leaves a dis-

agreeable pungent after-taste. It is freely soluble in water, alcohol, ether, benzene, amyl alcohol, glycerin, and other organic liquids. Resorcin is largely used in the arts for the preparation of phthalein dyes, such as fluorescein, eosin, etc.; it is also employed in the manufacture of azo-colors. It is often used in medicine. When applied externally it has the effect of removing scales in chronic skin diseases; it is an excellent remedy for dandruff, a mixture of resorcin and glycerin being best employed for this purpose. Administered internally, in dilute form, it is very valuable in fermentative dyspepsia.

RESPIRATION (Lat. *respiratio*, from *respirare*, to breathe), **ORGANS AND PROCESS OF**. The two great objects of respiration are: (1) To supply that amount of oxygen to the body which is essential to its economy, and (2) to remove the carbon dioxide which has been produced as a waste product. We may consider the anatomical details of the respiratory process in man and mammals under three different heads. First, there must be a special respiratory organ—the lungs—affording by its internal arrangement an immense extent of internal surface, covered by vascular network, through which the blood flows in innumerable minute streamlets, only separated by an extremely thin membrane from the atmospheric air that has been inhaled; secondly, there must be such an arrangement of the circulating system that fresh blood may be continually driven through the lungs, and then onward to the general system; and thirdly, there must be arrangements for the frequent and regular change of air contained in the lungs. The special organs of respiration consist of the larynx, the trachea, the bronchi, and the lungs. For a description of the first two, see LARYNX; TRACHEA.

The two *bronchi* resemble the trachea in structure except that the incomplete rings are distributed on all sides of the tubes. The bronchi on entering the lungs divide into smaller and smaller branches until finally each minute branch terminates in a *pulmonary lobule*. The smaller bronchi, as they are called, lose their cartilaginous rings and the circular or transverse muscular layer forms a distinct coat. The mucous membrane is very delicate and lined with ciliated epithelium. Within the lobules of the lung the smaller bronchi divide still further into more minute branches and their structure becomes more delicate, until at last they consist only of a thin membrane lined by a single layer of squamous epithelium. At this point they widen out into small funnel-like air spaces (*intercellular passages*), the walls of which bulge irregularly in different places into small sac-like dilatations which are the *air cells* of the lungs. These air cells are from $\frac{1}{300}$ th to $\frac{1}{3000}$ th of an inch in diameter. Their walls are very thin and are lined by a single layer of flattened cells continuous with those of the intercellular passage. The air vesicles of one lobule do not communicate with those of another, nor even with those of adjacent intercellular passages as a rule. Therefore any obstruction of a bronchus cuts off the supply of air to the lobule beyond. Elastic tissue fills in the space between the air cells and within this elastic tissue ramifies a dense network of capillary blood vessels which lies close against the air cells and which is separated from their contents by only

an extremely delicate membrane. It is here that the interchange of gaseous elements between the atmosphere and the blood takes place.

The pulmonary lobules are bound together by connective and elastic tissue to form very much larger structures called lobes. Of these lobes the right lung presents three and the left two. Each lung is enveloped by a serous covering—the *pleura*—which is reflected from the lung at the point where the bronchus and great blood vessels enter and passing outward line the cavity of the chest. (See PLEURA.) In health there is no space between the layer of the pleura which covers the lung and that which lines the chest wall, but in disease or injury serum, blood, pus, or air may collect therein. These conditions are termed respectively *pleurisy with effusion*, *hæmato-thorax*, *pyo-thorax* or *empyema*, and *pneumo-thorax*.

In consequence of the great number of air cells which constitute their substance (over 600,000,000, it has been calculated), the lungs (except in the fetal state, when no air enters them) are the lightest organs, in relation to their size, in the body. Although their bulk is so great that, with the heart, they occupy almost the whole of the cavity of the chest, they only weigh about three pounds and a half in men, and two pounds and three-quarters in women. Their color varies at different ages. At birth they are of a pinkish white tint; in adult life they are of a slate color, and present a mottled appearance; and in old age they become of a still darker tint. The polygonal markings which are seen on the surface correspond to the outer surface of the lobules already noticed. Their shape is adapted to that of the cavity in which they are lodged, each lung being conical in form, with its apex rising into the neck, while its base, which is broad and concave, rests upon the convex surface of the diaphragm; and between the two lungs lie the heart and the great vessels that proceed from it. During life—except in certain diseases, as, for instance, pericarditis (q.v.)—the inner margins of the lungs nearly overlap the heart, leaving only a roundish space of that organ, less than two inches in diameter, uncovered, while their lower borders extend to the cartilages of the ribs, and fit into the angle formed between those cartilages and the diaphragm.

For the method by which the blood is perpetually changed in the lungs, see CIRCULATION.

For a description of the shape and framework of the chest, see CHEST. The chest (or thorax, as it is termed by anatomists) is so constructed as to be capable of enlargement in height (vertically), in depth (or from the front backward), and in width (or from side to side). Its height is increased mainly by the descent of the diaphragm, and to a certain extent by the elevation of the ribs and the widening of the intercostal spaces; while its depth and width are increased by the elevation of the ribs, which carry forward and elevate the breast-bone (or sternum), especially at its lowest end, and are slightly rotated on an imaginary axis, joining their extremities, by which their central portion is raised, and slightly removed from the mesial plane of the chest. It is only in forced or deep inspiration that all these means of enlarging the chest are called into play. An ordinary inspiration is attended in men with very slight elevation of the ribs (about one-twentieth of an inch), while in women the elevation is much greater, especially in the upper ribs, the

cause of this difference in the sexes probably lying in the narrower waist of the female requiring a compensation in the upper part of the chest. There are three varieties of ordinary respiration—viz.: (1) Abdominal, or that chiefly effected by the diaphragm, and seen in the motion of the walls of the belly; (2) costo-inferior, or that in which the seven lower ribs are observed to act; and (3) costo-superior, or that effected in a considerable degree by the upper ribs. The first variety occurs in infants up to the end of the third year; the second in boys after the age of three, and in men; and the third in adult females.

The following points in connection with the respiratory movements require notice. Every complete act of respiration is divisible into four parts—viz.: (1) Inspiration; (2) a short pause, not always observed; (3) expiration; and (4) a considerable pause, occupying, according to Vierordt, about one-fifth of the whole time required for one complete respiratory act. The act of expiration is always more prolonged than that of inspiration, the former being to the latter in the ratio of 12:10 in adult males, and as 14:10 in children, women, and aged persons. The number of respiratory acts performed in a minute varies at different ages. According to Quetelet, at birth there are 44 respirations in one minute; at 5 years of age, 26; from 15 to 20, 20; from 20 to 25, 18.7; from 25 to 30, 16; from 30 to 50, 18.1; so that from 16 to 20 may be taken as the ordinary range for healthy adults, although Hutchinson gives the wide range of from 16 to 40. The average ratio which the number of respirations bear to the number of pulsations in a given time is about 1:4½, and if there is any great deviation from this ratio, there is probably some obstruction to the aëration of the blood, or some disorder of the nervous system. Thus, in pneumonia (or inflammation of the lungs), in which a greater or less amount of pulmonary tissue is unfitted for its office, the number of the respirations increases in a more rapid proportion than the number of pulsations, so that the ratio becomes as 1:3, or even as 1:2. In hysteria a similar or even greater deviation from the normal ratio may occur; and Elliotson records a case in which the respiratory movements were 98, or even 106, while the pulse was 104. On the other hand, in certain typhoid conditions, and in narcotic poisoning, the respiratory acts are diminished in number, the ratio of respiration to pulsations being as 1:6, or even 1:8.

When the lungs have been emptied as much as possible of air by the most powerful expiratory effort, they still contain a quantity over which we have no control, and which may be estimated at about 100 cubic inches. To this portion of the contents of the lungs the term *residual air* is applied. In addition to this residual air, physiologists distinguish, in connection with the respiratory process, *reserve air*, which is that portion which remains in the chest after an ordinary gentle expiration, but which may be displaced at will; *breathing* or *tidal air*, which is the volume that is displaced by the constant gentle inspiration and expiration; and *complemental air*, or the quantity which can be inhaled by the deepest possible inspiration, over and above that which is introduced in ordinary breathing. The greatest volume of air that can be expelled by the most powerful expiration, which is obviously the sum of the reserve, breathing, and complemental air,

is designated as the *vital capacity*—a term originally introduced by Dr. Hutchinson, the inventor of the spirometer, who found, from nearly 5000 observations, that of all the elements or factors which might be supposed to influence it, *height* alone stood in a definite and constant relation to it, this relation being expressed by the rule that "for every inch of stature from 5 to 6 feet, 8 additional cubic inches of air (at 60° F.) are given out by a forced expiration after a full inspiration." Hutchinson found that 225 cubic inches is the average capacity of a healthy adult 5 feet and 7 inches tall. With regard to bodily weight as a factor, Hutchinson found that "when the man exceeds the average weight (at each height) by 7 per cent., the vital capacity decreases 1 cubic inch per pound for the next 35 pounds above his weight." Age and muscular development do not influence the result so much as might have been expected. It has been not unfrequently observed that the vital capacity is small in athletic men, and that it has been in excess in persons by no means remarkable for physical power. The *maximum* vital capacity met with by Hutchinson was 464 cubic inches; this was in a man 7 feet high, whose weight was 308 pounds; the *minimum* was 46 cubic inches, and occurred in the case of a dwarf whose height was only 29 inches and who weighed 40 pounds. The average inspiration in a healthy man at rest is about 30 cubic inches, and this increases with exercise of any kind. When we consider that the amount of air taken in at each respiration is only about one-seventh the capacity of the lungs, we see how slowly the air is renewed; but the law of the *diffusion of gases* (q.v.) here comes in play, for the air in the air cells and finer tubes being charged by the respiratory process with a great excess of carbonic acid, as compared with the inspired air contained in the larger tubes, a diffusion of the carbonic acid necessarily takes place in the outward direction, while the oxygen from the air, or the air itself, similarly diffuses itself in an opposite direction, toward and into the air cells themselves. The *total amount* of air which passes through the lungs in 24 hours must obviously vary with the extent and frequency of the respiratory movements. The total daily amount for a person at rest is 686,000 cubic inches. This quantity is largely increased by exertion.

The *alterations* in the inspired air effected by respiration consist essentially in the removal of a portion of the oxygen, and its replacement by a nearly corresponding bulk of carbonic acid. The amount of carbonic acid in the expired air varies inversely with the number of respirations: it reaches 5.5 per cent. (or more) when the respirations are only 6 in the minute, while it falls as low as about 2.6 per cent. when the respirations are 96 in the minute. About 4.35 per cent. of carbonic acid is, on an average, added to the air in ordinary respiration, while about 4.782 per cent. of oxygen is removed, the actual diminution of bulk of the expired air (after the removal of the moisture obtained from the lungs) being about one forty-fifth of its volume. Hence, unless where there is free ventilation, the air in an apartment containing men or animals must soon become vitiated by containing a great excess of carbonic acid (for ordinary atmospheric air only contains about one part of carbonic acid in 2500 parts),

and a deficiency of oxygen. The absolute quantity of carbonic acid (and consequently of carbon) exhaled in 24 hours is liable to great variations, caused by the temperature and moisture of the air, age, sex, muscular development, the nature and quantity of the food, muscular exercise, sleep, state of health, etc. Smith calculated that an adult man in a state of rest exhales in 24 hours an amount of carbonic acid equivalent to 7.144 ounces of carbon, and he estimated that it should be increased to 8.68 and 11.7 ounces for non-laboring and laboring persons respectively at their ordinary rate of exertion; that the total amount of carbonic acid is greatly increased by external cold, and diminished by heat; that it is increased by a moist, and diminished by a dry atmosphere; that it increases in both sexes to about the thirtieth year, when it remains stationary for fifteen years, after which it diminishes; that at all ages beyond eight years it is greater in males than in females, and that it increases during pregnancy; that it is greater in robust than in slender men, the quantity of carbon expired per diem to each one pound of bodily weight being (according to Smith) 17.07, 17.51, and 17.99 grains at forty-eight, thirty-nine, and thirty-three years of age respectively; that it is greatly increased by eating, and is diminished by fasting; that it is increased by muscular exertion (Smith found that when walking three miles an hour he excreted 2.6 more carbonic acid than when at rest, while tread-wheel labor occasioned about double the excretion that was caused by walking); that it was diminished by sleep; and that it is increased in the exanthematous fevers (measles, smallpox, scarlatina, etc.) and in chlorosis, while it is diminished in typhus and in chronic diseases of the respiratory organs. See MUSCULAR FORCE.

There has been much discussion with regard to the extent to which the nitrogen of the air is affected by respiration. Usually a small amount of this gas is given off, but the quantities absorbed and exhaled so nearly balance each other that its special action on the organism must be very trifling, further than as being a diluter of the oxygen, which would be too stimulating if breathed in a pure state. The amount of the watery vapor with which the exhaled air is saturated may range from about 6 to 27 ounces in 24 hours, its usual range being between 7 and 11 ounces. It is not pure water, but holds in solution a considerable amount of carbonic acid and an albuminous substance in a state of decomposition, which, on exposing the fluid to an elevated temperature, occasions a very evident putrid odor. See BRONCHITIS; PNEUMONIA; TUBERCULOSIS.

The well-known anatomical divisions of the lungs, known as lobes, are composed histologically of an enormous number of little lobes or lobules. Each lobule is separated from surrounding lobules by connective tissue, and the lobules which come to the surface of the lung are often distinguishable as little polygonal areas. Each pulmonary lobule consists of a single terminal bronchus and the group of air cells and spaces connected with that bronchus. The terminal bronchus on entering a lobule divides into several branches known as alveolar ducts. These open into considerably larger cavities called infundibula, from the sides of which the air sacs or

air cells open out like alcoves. The terminal bronchus is lined by a single layer of ciliated columnar epithelium. Outside of this are some elastic fibres and thin irregular bundles of smooth muscle cells. As the alveolar ducts are approached the ciliated epithelium is replaced by lower epithelium of the non-ciliated variety. In the alveolar ducts the epithelium is cuboidal, and the elastic tissue and smooth muscle are greatly reduced in amount. In the infundibulum

1. Trachea and bronchi. 2. Small bronchus showing air cell and lobule. 3. Ultimate bronchus of dog.

the epithelium consists mainly of large flat non-nucleated cells known as respiratory epithelium. Among these are scattered smaller polyhedral cells which are remains of fetal life and are called embryonal cells. Elastic tissue forms the supporting framework of the air sacs and forms a distinct ring around the mouth of each sac. In addition to the elastic tissue there is usually a small amount of fibrous connective tissue and some connective tissue cells surrounding the air sacs. Besides the parts just described, which may be considered as the parenchyma of the lung, there are seen in all sections of lung tissue bronchi of various sizes. The smaller bronchi are lined with a single layer of columnar ciliated epithelium lying upon a basement membrane. Beneath the latter is the stroma of the mucous membrane, outside of which is a circular layer of smooth muscle, the whole being surrounded by a connective tissue or fibrous coat. In the medium size and larger bronchi a distinct sub-mucous coat is present in which are imbedded the acini of mucous glands, while in the fibrous coat are situated various sized plates of hyalin cartilage. In the largest of the bronchi the epithelium, instead of consisting of a single layer, is made up of several layers, and there is an increase in the thickness of the muscularis mucosæ and of the fibrous coat.

The blood vessels of the lung belong to two distinct systems: one, the bronchial system, is for the nourishment of the lung proper; the other, the pulmonary system, is for the purpose of exposing the blood to the air in the lungs. Both systems of vessels enter the lung at the hilus accompanying the large divisions of the bronchus. Within the lung the pulmonary system of vessels give off branches which correspond to the divisions of the bronchi, and on reaching the septa between the infundibula, break up into an extremely rich network of capillaries which surround the air sacs. At the margins of the air sacs the blood from the capillary network enters the radicles of the pulmonary veins, which

accompany the arteries to the surface of the lung. The bronchial system of vessels accompany the bronchial tubes and supply capillary networks to them and to the other structures of the lung. The lymphatics of the lung, like the blood vessels, consist of two sets. One of these originates in the lymph spaces of the interlobular connective tissue and in the subpleural lymph spaces, communicating by means of the latter with the surface of the pleura. The second set of lymphatics, the bronchial lymphatics, originates in the subepithelial lymph spaces of the bronchi, which communicate with the mucous surfaces of the bronchi and air sacs. From these spaces definite lymphatic channels are formed which follow the blood vessels to the surface of the lung and pass thence by means of a few large trunks to the bronchial lymph glands. The nerves of the lung come from both cerebro-spinal and sympathetic systems. The main nerve trunks enter the lung at the hilus and follow the branchings of the blood vessels and the bronchi. On arriving at the smaller bronchi the nerves break up into fine non-medullated fibrils which pass to the muscular tissue and to the mucous membrane.

RESPIRATION (in plants). A series of processes by which plants release the necessary energy for growth, movement, and similar work. Although the true nature of respiration was stated by Ingenhousz before the beginning of the nineteenth century and its relation to growth and the evolution of heat was clearly set forth by DeSaussure in 1824, confusion between photosynthesis and respiration has persisted to the present day.

The method of obtaining energy in the presence of free oxygen by oxidizing and decomposing materials within the body is known as normal respiration. The process of self-decomposition in the absence of free oxygen is known (inaptly) as intramolecular respiration; while the process of securing energy by the decomposition of the surrounding medium is designated as fermentation. Under ordinary conditions, almost all plants are able to absorb free oxygen from the atmosphere at all times. But if the absorption of free oxygen is impossible, the protoplasm may set up such changes in its own substance or in media adjacent to it as to secure the necessary energy by their decomposition. Some of the very simplest plants (anaerobic bacteria) have adapted themselves to this mode of life and flourish only in the absence of free oxygen. Others (bacteria, yeasts, molds, etc.) may live and grow in the presence of free oxygen, but when deprived of this actively decompose the substances with which they are in contact, which are then said to ferment or putrefy.

Normal respiration consists essentially of four independent processes: first, the absorption of oxygen; second, the union of oxygen with the substances to be oxidized; third, the decomposition of these substances, with the formation of various end products, differing according to circumstances; fourth, the elimination of these products. Its activity varies much with different plants and different parts of the same plant, and is influenced strikingly by external conditions. Considering only respiration occurring under favorable conditions, that of organs rich in protoplasm is more active than that of watery organs. Thus

growing points (buds), flowers, seeds, and so on respire more actively than fleshy leaves and tubers. The respiration of water and marsh plants is in general less active than that of land plants. The rate of respiration in active plant organs is several times greater per unit of weight than human respiration. The most active respiration recorded is that of young wheat leaves, which consume in 24 hours one gram of oxygen for each 0.1 gram of their weight. In human respiration one gram of oxygen is consumed per 100 grams of weight. Active aerobic bacteria may consume 200 times as much oxygen as that used by man per unit of weight. When the oxygen pressure is reduced to one-third its normal, respiration is retarded. Under increased pressure the results differ according to the duration of exposure. For a short time plants may respire normally at two to six atmospheres of pure oxygen. Under a longer exposure to such pressures respiration is likely to be retarded. Variations in temperature, which are frequent in nature, exert a double effect; as the temperature rises more oxygen is absorbed and more CO₂ is eliminated. With rising temperature respiration does not, as most functions do, attain a maximum and then diminish with further increase of temperature, but it is accelerated until death ensues. Yet the respiratory rate does not increase in direct proportion to the increase of temperature. Light appears to have little or no effect upon respiration.

INTRAMOLECULAR RESPIRATION. The exclusion of oxygen from plants which normally use it produces a profound disturbance of the usual metabolism, as shown by the fact that the end products of respiration, instead of being chiefly carbon dioxide and water, are alcohol, hydrogen, organic acids, etc. For most plants, a period of intramolecular respiration seems to be a time to be tidied over, growth ceases, and most other functions are suspended. After the decomposition of the protoplasm has gone to a certain extent, death ensues. Therefore, at high temperatures, which accelerate the process, intramolecular respiration suffices to maintain life for a shorter time than at low temperatures. See FERMENTATION.

RESPIRATION, ARTIFICIAL. The exchange of air as in natural breathing (see RESPIRATION, ORGANS AND PROCESS OF), produced by mechanical means. Respiration is suspended when for any reason the muscles concerned in breathing are deprived of their wonted nervous stimulation, by poisoning of the nerve centres which govern them. This may take place in asphyxiation by poisonous gases, in drowning, poisoning, or by prematurely cutting off the placental circulation during parturition; and it is in these circumstances that artificial respiration finds its greatest usefulness. (See ASPHYXIA.) The object in resuscitation (q.v.) is to imitate as closely as possible the natural respiratory movements. These should be rhythmical and at the rate of twelve or fourteen to the minute. Several methods of carrying on artificial respiration have been devised. Of these the most generally useful is that of Sylvester. In this method the body of the person to be revived is placed upon the back, the shoulders being slightly elevated, and high enough to keep the chin from falling forward on the chest. The arms are then grasped

just above the elbows, and raised gently and steadily upward and forward to their full extent, and at the same time rotated slightly outward. This position is maintained for two or three seconds and secures *inspiration*. The arms are now lowered and pressed firmly against the sides of the chest for two or three seconds, thus bringing about *expiration*. These movements are repeated in alternation with regularity and precision, at the rate above mentioned. Sylvester's method is the one generally employed to resuscitate the drowned. Before proceeding with artificial respiration in these cases certain preparations have to be made. To drain off water from the stomach and chest, the patient is stripped to the waist and placed face downward with the pit of the stomach raised above the level of the mouth by a roll of clothing or other material placed transversely beneath the trunk. Pressure is then made upon the patient's back. The tongue must be held out, the larynx kept open, and the mouth and throat cleared of mucus. In cases of drowning efforts to resuscitate should be continued for at least an hour, apparently inanimate individuals having been brought to life at the end of that time, after having been immersed half an hour or longer. Attempts to restore respiration should be supplemented by friction, the administration of stimulants, and the application of heat to the abdomen and lower extremities.

Schultz's method, applicable especially to the resuscitation of newly born infants, is as follows: The operator stands behind the patient. The shoulders are grasped, with an index finger in each armpit, the thumbs over the shoulders, and the rest of the fingers resting obliquely over the back. The whole weight of the child's body is now allowed to hang from the shoulders. This lifts the ribs, expands the chest, and produces mechanical inspiration. Expiration is produced by swinging the child forward at arms' length to a point where the lower limbs and pelvis topple over toward the operator, thus bringing about extreme flexion of the trunk, and forcing the abdominal viscera against the diaphragm. This motion is then reversed, and the process repeated at the rate of eight or nine times a minute.

In the method of Byrd-Dew the neck is supported by one hand, the thighs upon the other, the child lying upon its back. The head is allowed to fall backward so that the glottis may remain freely open. The body is then alternately extended and flexed, which movements determine respectively inspiration and expiration.

Fell's method of artificial respiration consists in pushing a tube into the larynx and trachea, and forcing warmed air into the lungs by means of a bellows. Expiration is secured by pressure on the sides of the chest.

Gibbons's method, which is applied by its author to cases of apparent death from electricity, consists of inserting one end of a tube into a nostril of the inanimate person and then, after closing the other nostril, working two bellows alternately so as to exhaust the air in the lungs and then supply fresh air under pressure.

Laborde's method depends on rhythmical traction of the tongue. This organ is seized, as far back as possible, between the thumb and index finger wrapped in linen, and alternately pulled forcibly forward and relaxed. This method is supposed to excite breathing by reflex action.

A practicable and very useful method especial-

ly for young children is mouth-to-mouth insufflation. A piece of gauze is laid over the mouth of the child and air breathed directly into its lungs from those of the operator.

RESPIRATORY SOUNDS. Sounds produced during inspiration and expiration as perceived by auscultation, either by placing the ear upon the chest or through the medium of the stethoscope (q.v.). When the ear is placed upon the chest of a healthy adult, a soft, rustling sound is heard, comparable to the sighing of a gentle breeze among the leaves. This sound is louder and more marked during the inspiratory act, which is in health longer than expiration in the ratio of 6:5. To this sound the name *vesicular murmur* has been given. Certain areas of the chest, where the large bronchi are nearer the surface, viz. over the sternum, the junction of the first costal cartilage with the sternum, and a diamond-shaped space at the back in the middle line, the sound becomes tubular, and higher pitched, and expiration and inspiration are of equal length. This is called bronchial breathing and is significant of disease when it occurs elsewhere than over the areas above indicated. Where these two sounds shade into each other, *broncho-vesicular* breathing is heard.

In pathological conditions of the lungs, the vesicular murmur undergoes many important modifications. It is, for example, diminished or completely obliterated in pleurisy (q.v.) with effusion and in pneumothorax; it becomes louder and higher in pitch over consolidated lung tissue such as occurs in pneumonia and pulmonary tuberculosis (q.v.). One of the earliest physical signs of phthisis is a prolonged respiratory murmur, and this alteration of the normal rhythm is also characteristic of asthma and emphysema (q.v.). Interrupted breathing, sometimes called *cog-wheel respiration*, is heard in healthy but nervous individuals, but in disease it is caused by the breaking of the column of air passing through the bronchials by tenacious mucus, or by the expansion of different lobes at different times.

Certain adventitious sounds to which the generic name *râles* is applied are heard in disease, and are produced either in the bronchial tubes or air vesicles. Dry râles are whistling, squeaking sounds, caused by the passage of air through bronchial tubes narrowed in places by swelling of the lining mucous membrane, as in bronchitis, or by spasm, as in asthma; or by tough, adherent mucus. Moist râles are produced by the expansion of previously closed air cells, or by the passage of air through fluid in the bronchial tubes or in a cavity. These are heard in tuberculosis, the resolving stage of lobar pneumonia, pulmonary œdema, etc. *Metallic tinkling* is a sharp, quick sound resembling that produced by striking a glass vessel with a pin. Its presence gives evidence of the presence in the lung of a cavity of considerable size containing air, and surrounded by firm walls. A *friction sound* is produced by the rubbing together of the visceral and parietal layers of the pleura when rough from inflammation, and is indicative of pleurisy. Consult Loomis's *Physical Diagnosis* (New York, 1902). See AUSCULTATION.

RESPIRATORY SYSTEM, COMPARATIVE ANATOMY OF THE. The system of organs that have the function, in the animal body, of taking in oxygen from the surrounding mediums (water

and air) and of getting rid of carbon dioxide gas and certain other excrementitious products. In Vertebrata these organs are either gills or lungs. In invertebrates the skin always functions, more or less, as a respiratory organ, and in addition various other organs subserve this function also. Whatever form or position the respiratory organ may assume, it must be richly supplied with blood vessels so that the blood containing carbon dioxide may come in close relation with the surrounding medium. No organ may be spoken of as a respiratory organ which has not this vascular apparatus. Specialized respiratory organs do not appear in the animal kingdom until the segmented worms are reached, and even in many of the segmented worms no specific respiratory apparatus is developed. The integument of lower forms and sometimes the wall of the intestine, when this organ is present, perform the respiratory function; the integument is better able to do so, since it is the part that comes most intimately in contact with the surrounding media.

In echinoderms there are no respiratory organs that are homologous throughout the phylum. In holothurians this function is performed by the 'respiratory tree,' a mass of delicate branched tubules which open into the eloaca; by the oral tentacles; and by the entire body-wall. In the other forms various other organs perform this function.

Mollusks, as a rule, have one (in a few cases more than one) pair of breathing organs, the gills, which are covered and protected by the mantle. In some forms this gill is wanting and in others it is functionally replaced by other and phylogenetically newer organs. Blood flows into these gills and after taking in oxygen from the water it flows back again, first to the heart and then to all parts of the body. The lamelli-branch gills appear double on account of the strong development of the two rows of branchial leaflets, and in some mollusks increased surface is obtained by a folding of the leaflets. Scaphopoda and many Gastropoda do not possess true gills. In certain cases they are replaced by adaptive gills. The latter may be delicate leaflets forming a rosette around the anus; or folds to the right and left in the mantle cavity; or cerata. The dorsal finger-like processes of Nudibranchiata. Some Pulmonata have become adapted for aerial breathing. In this case the mantle cavity is richly supplied with blood vessels in its dorsal wall and gains a respiratory aperture, the so-called 'lung.'

Respiration in all Crustacea takes place in the outer integument. In small Crustacea there are no specially developed respiratory organs, and respiration is performed by the entire body surface. In the large Crustacea certain parts of the body are adapted to perform this function more actively than others. To fit such parts of the body for a respiratory function folds of the integument arise and the soft skin of the folds is functional in respiration. When this fold is transformed into a hard shield, it serves to protect the delicate breathing organs. The function of respiration is performed in most Crustacea by the thoracic limbs. Some of the crabs live more or less on land and are adapted to retain water in the branchial cavity and to breathe air directly. In the latter case the part of the branchial cavity that functions as a lung has its

integument modified into branched tufts which project into the air cavity and are well provided with vascular organs.

The respiratory organs of insects are segmentally arranged air-conducting tubules, the trachea, which connect with the exterior by means of segmental openings, the stigmata. These openings are often guarded by bristles or tufts to keep out foreign particles. Internally the tracheal tubes branch and subdivide again and again and penetrate all through the tissues of the body. The trachea are lined by chitinous spirals to keep the tubes open. This chitin is continuous with the chitin of the exoskeleton and is shed with the latter.

In Amphioxus more than the first half of the length of the alimentary tract is devoted to the purposes of respiration, since its walls are provided with gill-slits. This may be called the respiratory part of the alimentary tract (prosenteron) in contradistinction to the remainder, hinder portion, the digestive part. Gill-slits to the number of 100, more or less, are borne by it. The variability in number is due to the fact that gills continue to increase in number as the animal grows older, new ones being formed posteriorly. In Ammocoetes, of the Cyclostomi, there is a muscular fold at the posterior end of the branchial part of the œsophagus. In Petromyzon that part of the œsophagus which contains the gills is entirely cut off from the alimentary tract and the cut-off end of the latter grows forward above the gill-portion to join the mouth cavity. Thus two canals pass backward from the mouth. From Elasmobranchii onward the gills are in close relation with the skeletal parts of the visceral arches. As a rule teleosts possess four gill-arches, but certain rudimentary gills on the mandibular and hyoid arches indicate that fishes formerly possessed more gill-arches than at present. Fishes take in water through the mouth, and by a constriction of the latter force it out through the gill-slits. During the process of breathing the gill-arches rise and fall. The Dipnoi, as the name indicates, breathe both by gills and by lungs. The lung-sac of the Dipnoi is an unpaired bilobed sac.

LUNGS. The air-bladder and lungs have a similar development and the latter has developed from the former. Both are outgrowths of the alimentary tract; the air-bladder is usually formed on the dorsal, and the lung on the ventral side, however. The point at which the air-bladder arises from the œsophagus is not a fixed one, and the duct which connects the bladder with the œsophagus may remain open, may be reduced to a solid strand, or may eventually disappear altogether. In the last case the air-bladder probably gets its contained gas from its own wall. The air-bladder always lies above the alimentary tract. In a few cases it is paired. It may be transversely constricted to form several divisions, or caecal processes may be present. The internal surface of the air-bladder of fishes may be spongy, a condition similar to that of the lungs of Dipnoi and Amphibia. The lungs of some of the Dipnoi show posteriorly a paired condition, although anteriorly there is only one part. The lungs of certain Amphibia (*Menobranchus* and *Proteus*) are lower in development than those of the Dipnoi in so far as their internal surface is smooth. In reptiles and in the other vertebrates the form of the lung is determined by that of the body.

The lungs show a branched system of bronchi. In this respect the lungs of crocodiles and some other forms show a decided advance over those of Amphibia. The lungs of birds (q.v.) are in connection with large sacs, the 'air-sacs.' These air-sacs fill the interstices in the body cavity, pass between the muscles, under the skin, and even into the hollow bones.

In man the lungs of the two sides are not symmetrical; the right lung has three lobes, the left two. They are connected with the exterior by the air passages composed of the bronchial tubes, trachea, larynx, and windpipe. This system of organs arises on the ventral side of the œsophagus as a duct, and constricts off to form a distinct tube. The separation begins anteriorly. The lungs arise as lateral buds at the posterior end of the furrow. Cartilaginous supports first arise in Urodeles. Definite tracheæ appear in Sirenia, Amphiuma, and Gymnophiona. The cartilaginous bands take on the form of half rings first in the Gymnophiona. A differentiated larynx appears in the Anura, is regulated by muscles, and has vocal cords. The larynx of reptiles makes no advance over that of Anura, but in crocodiles and turtles the larynx is imbedded in a depression of the hyoid. The thyroid cartilage of mammals is supposed to have been derived from a part of the hyoid. In birds two larynges are present, the lower of which, the syrinx, is the functional voice organ and is restricted to birds alone.

Consult: Lang, *Text-Book of Comparative Anatomy* (London, 1891-96); Weidersheim, adapted by W. N. Parker, *Comparative Anatomy of Vertebrates* (London, 1897).

RESPONDENT (from Lat. *respondere*, to answer, from *re-*, back again, anew + *spondere*, to promise). A party who is called upon to answer in proceedings against him in certain courts. A person who is sued in an admiralty court, or in a court of chancery or equity, is known as the respondent. In this sense the term corresponds to the word defendant. The term is also applied to one who opposes an appeal, and in that sense it is the opposite of appellant (q.v.). In the English divorce courts the defendant is known as the respondent. See **APPEAL**.

RESPONDENTIA (Neo-Lat., from Lat. *respondere*, to answer). A term employed in maritime law to denote a loan of money on the whole or a part of the cargo of a ship, and conditioned to be paid with 'maritime interest' when the cargo is safely delivered at the port to which it is consigned. A respondentia bond is commonly given as evidence of the contract. The lender of the money assumes the risk that the goods may be lost at sea, and if such casualty occurs he loses the amount he has advanced. If there is a partial loss the lender is entitled to have the goods which are saved sold for his benefit. The loan is practically only on the personal security of the borrower, as the goods may be sold by the latter free from any lien at any time during the voyage or upon their arrival. The advantage which accrues to the lender in consideration of the unusual risk he assumes is that he may contract for practically any rate of interest which the borrower is willing to pay. See **BOTTOMRY**; **USTRY**. Consult the authorities referred to under **ADMIRALTY LAW**.

RESSEL, rês'sel, JOSEPH (1793-1857). An Austrian inventor, born at Chrudim, Bohemia, and educated at Vienna and at Mariabrunn. In the latter place he studied forestry, and from 1817 until his death he held various posts in the Austrian Department of Forestry, being stationed for some time at Triest. Ressel was an able mechanic and invented several machines. His claims to the discovery of the screw propeller, which he did not patent, owing to an unfortunate accident at the trial trip of the screw steamboat, rival those of Sauvage, Ericsson, Smith, and Wilson. Consult Reitlinger, *Joseph Ressel* (Vienna, 1863).

REST (AS. *rest*, *ræst*, Goth., OHG. *rasa*, Ger. *Rast*, rest; ultimately connected with Skt. *ram*, to rest, to rejoice). In music, an interval of silence occurring in the course of a movement between one sound and another. With the use of mensurable music (q.v.), rests began to be represented by regular fixed signs, and finally the following values were one after another decided on:

1	2	3	4	5	6	7	8	9
Pausa maxima.	Pausa longa perfecta.	Pausa longa imperfecta.	Pausa.	Semipausa.	Suspitium.	Semispitium.	Pausa. Fassa.	Pausa. Semifassa.

Ultimately the tails of the shorter notes were reversed and thus our present rest characters came into use. The following are the principal rest characters:

					Thirty-second.
Whole.	Half.	Quarter.	Elighth.	Sixteenth.	second.

For rests of a number of bars, it is now usual to draw one or two oblique lines across the staff, and write on them in figures the number of measures during which the voice or instrument is to be silent; thus 5 in common time, denotes a rest of 5 whole notes. A rest, like a note, may be prolonged by one or more dots.

REST-CURE. A system of treatment inaugurated about 1870, after the recognition of the success of Prof. Samuel Jackson, by Dr. S. Weir Mitchell (q.v.) of Philadelphia. It is calculated "to renew the vitality of feeble people by a combination of entire rest and excessive feeding made possible by passive exercise obtained through the steady use of massage and electricity." The cases most benefited by such treatment are those of women who are 'nervous,' thin, and anæmic, partial or entire invalids. Seclusion from relatives and friends; absolute rest in bed for six weeks or more; neither reading, writing, nor sewing, and often not raising the hand or turning over in bed without aid; massage of the entire body except the face every day for six weeks; the use of the induction current with slow interruptions over the whole of the body but the face and neck during forty to sixty minutes each day; together with large quantities of milk, cocoa, and malt extract combine to make up the treatment. While rest-cure is especially suitable to the thin, it also benefits cases of 'fat anæmia' and the large majority of neurasthenics. It has also been of great value in indigestion and

alcoholism, and some early cases of tuberculosis. Rest-cure is employed in modified form by many physicians. Consult Mitchell, *Fat and Blood* (Philadelphia, 1877).

REST-HARROW. A popular name for several species of European herbs and sub-shrubs of the natural order Leguminosæ. Common rest-harrow (*Ononis arvensis*) is sometimes abundant in neglected pastures, but is easily controlled by cultivation. Yellow rest-harrow, or goat's rue (*Ononis Natrix*), is sometimes grown for ornament.

RESTIGOUCHE, rēs'té-gōosh'. A river in the northwestern part of New Brunswick, Canada, forming for about 50 miles the boundary between that province and the Province of Quebec (Map: New Brunswick, B 2). It is 200 miles in length, and falls into Chaleurs Bay in the Gulf of Saint Lawrence. For the last 18 miles it is navigable for the largest ships.

RESTITUTION (Lat. *restitutio*, from *restituere*, to restore, from *re-*, back again, anew + *statuere*, to place, from *stare*, to stand). In law, return to the rightful owner of property which has been unlawfully detained. The term is applied alike to cases where the property has merely been converted to the use of some one under a claim of title, and where it has been stolen. In the United States, where there is doubt as to the identity of the property, the issue should be decided by a replevin action. (See REPLEVIN; EXECUTION.) The term is also applied to the restoration of a part of a cargo which has been lost by jettison. See MARITIME LAW.

RESTORATION (Lat. *restauratio*, from *restaurare*, to restore, from *re-*, back again, anew + **staurus*, Gk. *σταυρός*, firmly fixed, stake; connected with *stare*, to stand, Skt. *sthāvara*, fixed, *sthā*, to stand). A term employed in the history of England and France in connection with the reestablishment of monarchical government. In England it is applied to the accession of Charles II. In France the term is applied to the accession of Louis XVIII. in 1814, after the abdication of Napoleon (First Restoration), and after the 'Hundred Days' in 1815 (Second Restoration).

RESTORATIONISTS. A sect which, under a new name, has revived a very ancient doctrine, which has found advocates at all times since the days of Origen (q.v.). One of the most remarkable doctrines of that Father was his belief of a general *apokatastasis*, or 'restoration' of all things, in which, after a purgation proportioned to the various moral conditions of their souls at the time of death, all men, however wicked, and all the evil angels, even Lucifer himself, would be restored to the favor of God, and reunited to Him in heaven. This doctrine was condemned at the time, and has since been repeatedly rejected by the churches of the East as well as of the West. The doctrine has been renewed in more than one form since the Reformation by various classes, who have taken the name of Universalists (q.v.). The particular title of Restorationists was given in the United States to the followers of the Rev. Hosea Ballou (q.v.), who, in addition to the tenet above explained, held that all retribution is confined to this life, and taught that at the resurrection all men will be admitted to everlasting happiness.

RESTORATION OF PAINTINGS. To restore a painting to its original condition is a delicate operation, requiring great knowledge and skill. By the operation of ignorant restorers of the past many of the most important paintings have been destroyed; indeed, it is a question whether restorers have not inflicted more damage than time itself. In former times the process was chiefly one of repainting and it was then that the chief damage was done, even though the artist himself was often a man of ability. One of the most difficult tasks of the modern restorer is to remove these outer coatings of paint.

The first step in the process of restoration is to clean the picture—i.e. to remove the coating of dust with which it has become encrusted, or the varnish originally applied, which in the course of time becomes dust color or opaque. The usual process is to dissolve the varnish by means of brandy, weak alcohol, or some similar substance applied with the sponge, oil also being frequently applied to prevent deleterious action upon the colors. In Germany the process invented by the celebrated Bavarian chemist Max von Pettenkofer (q.v.) is often applied, which consists in subjecting the painting to cold fumes of alcohol. Unvarnished paintings are in like manner carefully washed with brandy, vinegar, or some similar substance.

The transferring of a painting from a damaged canvas, panel, or wall is effected by gluing it to a paper plaque fastened on gauze. The canvas or wood is then carefully removed by means of instruments and chemicals, and the painting is glued to a new canvas, after which the paper is removed from the surface of the painting. In case of a fresco the paper is rolled upon a cylinder while the plaster is being removed with a chisel. The retouching of the parts of the painting damaged during the restoration with dry color is an important process, which should be intrusted to most skillful hands. The glass plates now used instead of varnish in most modern galleries, though superior as a protection to the painting, have the disadvantage of preventing the study of the ensemble of the picture by their reflective powers.

RESTRAINT OF TRADE, CONTRACTS IN.

It has always been regarded as contrary to the policy of the common law that one should deprive himself of the right to engage in business or trade, and all contracts entered into for that purpose have with certain limitations been regarded as illegal and consequently null and void. Thus a contract that one would never engage in his business or trade within ten miles of London was deemed valid and enforceable, but a contract not to engage in any particular trade or business in England for five years was considered illegal as against public policy. The later tendency of the English courts is to test the validity of the contract by its reasonableness in view of all the circumstances of the case irrespective of any arbitrary rule as to time and space. The early decisions of the United States followed the early rule of the English courts. Later decisions recognize that the United States constitute practically one country for purposes of trade, and consequently do not hold contracts in restraint of trade invalid when the restraint extends over an entire State, or indeed over nearly all of the United States. The Sherman Act of 1887, which

is applicable, however, only to persons and corporations engaged in interstate commerce, forbids pools or combinations for the division of traffic. The modern tendency in the United States is, as in England, to make the test of reasonableness of the restraint depend on the character of the business and the special circumstances of the case. Contracts for the purpose of creating so-called corners in the market of any commodity of general or necessary use have always been held void as unlawfully restraining trade, and contracts unreasonably in restraint of commerce are deemed void on the same principle. See *TRUSTS*.

Congress, acting under the constitutional power to regulate commerce, has passed an act known as the Sherman Act (26 U. S. Statutes at Large, 209) declaring that all contracts and combinations in restraint of interstate or international commerce are illegal and void. In construing these statutes the United States Supreme Court has held that all contracts directly restraining commerce, interstate or international, whether such restraint be reasonable or unreasonable, are illegal, thus changing the common-law rule, that the restraint must be unreasonable in order to invalidate the contract. See *CONSPIRACY; COMBINATION; COMMERCE; MONOPOLY; STRIKE; TRUSTS*.

Consult the authorities referred to under *CONTRACT*; and Jolly, *Contracts in Restraint of Trade* (2d ed., London, 1900); Matthews, *Covenants in Restraint of Trade* (London, 1893); Shelling, *Trusts and Monopolies* (Boston, 1893); Stickney, *State Control of Trade and Commerce* (1897).

RESTREPO, rã-strã'pó, JOSÉ MANUEL (c.1775-c.1860). A South American historian and politician, born in New Granada (Colombia). He wrote *Historia de la revolución de la república de Colombia* (1827), which includes an appendix containing several original documents. As he took a personal part in the events described, the work has an especial value, and it is written in a judicious and impartial style. Restrepo was Secretary of State under Bolívar.

RESTRICTIVE COVENANTS. Covenants in conveyances which bind the purchaser to use the land conveyed thereby in some particular way, or which prohibit him from making use of it for certain designated purposes. Common examples of such covenants are: the restrictive clauses in deeds prohibiting purchasers from building beyond an imaginary 'house line' on the land, that is, within a certain distance from the street; or prescribing the character of the buildings which they shall be permitted to erect thereon. Restrictive covenants create equitable easements in favor of the owner of the land for the benefit of which they are made; and "run with the land," that is, continue to operate in favor of all subsequent owners of that land. It is by restrictive covenants that the character of the improvements on real estate in suburban towns and additions is fixed. The class of people, the character and minimum cost price of buildings, and the purposes for which they may be used, may thus be regulated. Consult Washburn *On Real Property*, and *On Easements*; Jones *on Easements*.

RESURRECTION (Lat. *resurrectio*, from *resurgere*, to rise again, from *re-*, back again, anew + *surgere*, *surrigere*, *subrigere*, to rise, from *sub*, under + *regere*, to direct, rule). The

restoration of man after death to the full possession of his powers and faculties. In one form or another, this conception is found among Mazdayasnians, Jews, Christians, and Mohammedans. As to the time, manner, and subjects of the future change there has been much difference of opinion. While the prevailing view has generally been that the dead will rise simultaneously on the last day, there are great religious teachers who have regarded the resurrection as taking place in the case of each person immediately upon death. The resurrection has been conceived of as an awakening from the sleep of death; a reanimation of the body; a restoration of the body by the coming together of the particles that constituted it at the moment of death; a creation of a new body in harmony with the perfected spiritual character; a clothing of the departed spirit with a spiritual body descending from heaven; or a development of the germ of a spiritual organism already existing within the physical body before death. Some have maintained that all men, regardless of nationality, religious belief, or character, will be raised from the dead, while others have held that only members of a particular nation, the adherents of a certain form of religion, or the possessors of a good character will be deemed worthy to share in the resurrection.

Whether the idea of a resurrection originated with Zarathushtra, already existed before his time in Iran, or was developed by his disciples cannot be determined with certainty. In its most concrete form it is met in the later parts of the Avesta (q.v.) and in the Bundahish. Here all men are to be raised on the last day by the Saoshyant (q.v.), or Saviour, and those who are living at that time are to be endowed with immortality, the bodies of the dead being brought together from the different elements in the course of fifty-seven years. It is on the whole most probable that there existed a popular belief in a future resurrection already before the time of Zarathushtra. The custom of leaving the dead in the field to be consumed by wild beasts, without building for them a house, goes back to extreme antiquity. While such a practice might seem to preclude ancestral cult and the hope for immortality, the unimpeded return of the body to the different elements of nature apparently made the worship of ancestral spirits less a matter of ceremony, and in connection with the idea of a coming destruction and renovation of the world, led the Iranian mind to expect a reconstruction of each human being from its constituent parts scattered among the elements. That this occurred at a very early period is rendered probable by the emphasis put upon the future life by such Iranian peoples as the Scythians and the Thracians, who must have left the common home at a remote epoch. We have positive evidence that this doctrine was taught in the Achaemenian period in a work of Theopompus, the historian of Philip of Macedon, used and quoted by Diogenes Laertius, Æneas of Gaza, and probably Plutarch. Herodotus and Xenophon probably also heard of it, though they emphasized only the belief in immortality on the part of the Persians.

In early Hebrew thought there is no trace of this conception. It is unknown alike to prophets, legislators, and poets. The third chapter of Genesis no doubt reflects the attitude of large

circles in Israel; if man had been allowed to remain in the Garden of Eden he might have continued his existence indefinitely by the magic virtue of the life-giving fruit; but as he was driven out of the garden, he returns to dust and is no more. Nevertheless, the survival of ancestral worship and necromancy shows that to many minds there were exceptional personalities rising above the average lot of the shades in Sheol (q.v.), still possessing high rank, power over the living, and supernatural insight. The valley of bones in Ezekiel xxxvii. does not suggest, but rather precludes, familiarity with the doctrine of a resurrection. In Job xix. 25-27 the text has evidently suffered much in transmission, but the whole trend of the thought clearly shows that there can be no reference to either a life beyond or a resurrection. The possibility of such a return to life is emphatically denied in chapter xiv. The first reference in Hebrew literature to the resurrection is found in the Book of Daniel, written in B.C. 165. According to Daniel xii. 2, some of those that sleep in the dust are to be raised. Evidently the Maccabean martyrs and the apostates are intended. An apocalypse written c. 110 B.C. and preserved in Isaiah xxvi. declares that Yahweh's dead shall live and his dead bodies shall arise, for his dew is a dew of healing and the earth shall cast forth the dead. Whether all Israelites are meant is uncertain. Within the canonical Old Testament these are the only passages that show an acquaintance with the doctrine. How long before the year B.C. 165 it became known in Israel we have no means of determining. In the earliest part of the Book of Enoch, written c. 108 B.C., there is an allusion to some who are neither slain on the judgment day nor raised from the place of torture (xxii. 13). The resurrection is apparently limited to righteous Israelites. This is clearly the conception in Enoch xci. 10; xcii. 3-5, written c. 88 B.C.; in the Psalter of Solomon iii. 12, xiii. 11, xiv. 9, xv. 13, written c. 60 B.C.; in II. Maccabees vii. 9, 14, 23, 29, 36, xii. 43, 44, written c. 20 A.D.; and in the Testaments of the Twelve Patriarchs, Jude xxv., and probably originally in Benjamin x. A number of apocalyptic works written apparently in the reign of Domitian seem to contemplate a universal resurrection. This is most clearly the case with IV. Ezra vii. 32; probably also with Baruch xlii. 7, l. 2, li. 1 (though in xxx. the resurrection is limited to the just), and with Enoch li. In the Apocalypse of Moses, which in reality is a life of Adam and Eve, the resurrection of the whole human race is clearly taught (x., xiii., xxviii., xli., xliii.), the addition "all that are a holy people" in xliii. being probably an interpolation; also in Sibylline Oracles ii. 214-237, written c. 200 A.D. The prevailing view, however, in the Talmudic and Midrashic period was that the heathen would not rise from the dead, but that the resurrection would be only for the righteous. Whether this would include all Israelites was a mooted question, the opinion being frequently expressed that some classes would be excluded. Thus the Mishna tract *Sanhedrin* xi. 1 excludes from the world to come those who deny the resurrection of the dead and the divine origin of the law as well as the Epicureans, while it records the opinions of Rabbi Akibah, who excluded also those reading non-canonical books, and of Abba Shaul, who added any person pronouncing properly the name of Yahweh (see JEROVAH), and *Kethub-*

hoth 111 b distinctly states that "the people of the land [i.e. the unlearned] shall not be raised to life." Before the third century A.D. the resurrection is always a work of God Himself. But Rabbi Samuel taught in the name of Rabbi Jonathan that the righteous would raise the dead (*Pesachim*, 68). Later it was held by many teachers that the Messiah would raise the dead. The general opinion was that resurrection would occur in Palestine. Even the Jews who had died outside of the holy land were supposed to be led through subterranean passages to Palestine, where they were to be raised (*Pesikta rabbath i.*). Many supposed that of the human body one bone would never molder into dust, and that from this 'almond of the spine,' or *os sacrum*, the resurrection body would be formed (*Bereshith rabba* xxviii.).

There probably never was a time when the belief in a resurrection was universally held in Israel. While it was championed in one form or another by the Pharisaic party, it was strongly opposed in many circles. It is not known or accepted by the authors of Ecclesiasticus, Judith, Tobit, and I. Maccabees, and it is of course emphatically denied by Ecclesiastes. The Sadducees adhered to the old idea of Sheol and rejected the doctrine of a resurrection. The Samaritans seem to have maintained the same attitude in earlier times, though they subsequently accepted the doctrine. (See SAMARITANS.) The Essenes cherished a view concerning the nature of the soul and the future life closely resembling that of the Pythagoreans, ultimately due to Indian or Persian influences, according to which the soul has existed before birth and will exist eternally after its bondage to the body is ended. A similar view was held by Jewish Gnostics. Where Greek thought prevailed the idea of immortality (q.v.) was accepted rather than that of a resurrection. This may be seen not only in the Wisdom of Solomon iii. 1-9, iv. 7, v. 16, vi. 20; IV. Maccabees xvii. 5, 18, xviii. 3; and Philo, *De vita Mosis* ii. 633, *De Abr.* 385; *De Somn.* 586; *De migratione* 407, but also in Palestinian works like Jubilees xxiii., xxv., and Slavonic Enoch lxx. 8, 9, 10, lxxvi. 7. Even where the term was kept, the idea of a resuscitation of the physical body was abandoned, as by Josephus (cf. especially *Bel. Jud.* iii. 8, 5) for the thought of an endowment with a spiritual organism. As a result of contact with Arabic learning, there was an unmistakable tendency to substitute the doctrine of a natural immortality of the soul for that of a resurrection of Israel only. It was not wrongly that Maimonides was accused of having set aside completely the doctrine of a resurrection in his *Mora Nebuchin* or "Guide of the Erring." Modern Judaism has been largely determined in this as in other respects by Moses Mendelssohn, whose work, *Phädon oder über die Unsterblichkeit der Seele* (1767), made a profound impression on his age.

The attitude of Jesus on this question cannot be determined with certainty. Aside from Luke xiv. 14, which, if genuine, shows that Jesus looked forward to a recompense at the resurrection of the just, there is but one saying of His recorded in the Synoptic Gospels that has any direct relation to the subject. This is found variously reported in Matthew xxii. 23-32, Mark xii. 18-27, and Luke xx. 27-38. Jesus evidently rejects the view of the Sadducees on the ground

that they do not understand the Scriptures and fail to appreciate the power of God. On the other hand, He clearly does not accept the current Pharisaic doctrine of a resurrection on the last day, since He based His argument for the fact that the dead are raised on the words of Yahweh to Moses in which He speaks of Himself as the God of Abraham, Isaac, and Jacob. The point of the argument is that, according to the Scriptures, these patriarchs were addressed as living several centuries after their death, and therefore must have been raised from the dead; and the natural inference is that Jesus believed in a spiritual resurrection by which those to whom God stands in relation as their God are immediately after death raised into life to be in His presence forever. Concerning those who shall be accounted worthy to share in the resurrection, He further stated His conviction that they would neither marry nor be given in marriage, but be like the angels. His warning, "Fear ye him who is able after he has killed to slay both body and soul in Gehenna," also seems to indicate that He limited the resurrection to those who should be accounted worthy. See GEHENNA; HELL.

A new assurance of a resurrection to a blessed life beyond was given to those who became convinced that Jesus had been raised from the dead. Unless it can be proved that certain of the older Epistles ascribed to Paul are not genuine, there is positive evidence that not much more than twenty years after the death of Jesus a glorious figure appeared in a vision to Paul and was identified by him as the crucified Nazarene and that Paul had heard of similar visions seen by Peter, James, and others (I. Cor. xv. 4-8). This conviction revolutionized Paul's life and caused him to see in the resurrection of Jesus the guarantee of an eternal life and the sole reason for righteous conduct in this life. While the important passage in I. Corinthians xv. contains no intimation of an empty tomb, and cannot be pressed as proving a physical resurrection or an appearance to women, the earliest Gospels, Matthew and Mark, written in the main before the end of the first century, suggest that Jesus first appeared to His disciples in Galilee, and that some women had found the tomb empty, but said nothing about this because of fear. The later Gospels, Luke and John, make Jerusalem the place of the first appearance of Jesus to His disciples and strongly emphasize the physical character of the resurrection body while ascribing to it functions impossible to a physical body.

In the conflict with Gnosticism, which denied the resurrection, the Church found it necessary to give added emphasis to the resurrection of the flesh. Hence the earlier creeds, which simply affirmed a belief in a resurrection or an eternal life, were gradually changed into the formula 'the resurrection of the flesh' found in the Apostles' Creed. Since the thought of a resurrection of the wicked as well as the good sporadically occurs in the New Testament (as in John v. 28, Acts xxiv. 15, Heb. vi. 2, Rev. xx. 13), the idea of an interval between a first resurrection of believers and a second resurrection of the rest of mankind developed, and was especially cherished by those who looked forward to a thousand-year period of Messianic rule. See MILLENNIUM.

Through the influence of Greek philosophy the doctrine of the natural immortality of the human soul (see IMMORTALITY) became so important a

part of Christian thought that the resurrection naturally lost its vital significance, and it has practically held no place in the great systems of philosophy elaborated by Christian thinkers in modern times.

The doctrine of the resurrection was adopted by Mohammed from Jewish or Christian sources and adhered to both by Sunnites and Shiites. It was subjected to grave doubts by Moslem thinkers in the times of the Bagdad caliphate, but is to-day generally accepted.

RESURRECTION. A sombre and powerful novel by Tolstoy (1899), treating of the problems of Russian life of to-day, and arraiging especially the Russian judicial prison system. The theme is the repentance of a nobleman who as a jurymen is called on to try a girl whom he had previously ruined. Impressed with the injustice of their relative conditions, he gives up his life to atonement with the result that both he and his victim are regenerated.

RESURRECTION PLANT. See ROSE OF JERICHO.

RESUSCITATION (Lat. *resuscitatio*, from *resuscitare*, to raise again, revive, from *re-*, back again, anew + *suscitare*, to raise, from *sus-*, up, under + *citare*, to call, rouse). The revival of the apparently dead. The apparently dead to whom efforts to restore are of use are those asphyxiated by drowning, by breathing illuminating gas, or by suffocation, and those suffering from syncope or the effects of electricity. In syncope, or fainting, the head and heart should be placed on a low level, while the lower extremities are elevated. If this manipulation is not rapidly successful, respiration may be excited by sprinkling the face suddenly with water and applying to the nostrils some pungent volatile substance such as spirits of camphor or weak ammonia. Victims of electric shock may sometimes be resuscitated by the use of artificial respiration by means of Gibbons's instrument. This consists of two bellows so arranged that one pumps air into the lungs through a nostril while the other exhausts the lungs of respired air. In the case of asphyxiation from inhaling either illuminating gas or carbonic dioxide, artificial respiration should be employed together with administration of oxygen through the nostril. Apparently drowned persons may often be resuscitated by syphoning the water out of the stomach and then using artificial respiration and keeping the body warm by means of artificial heat. See HALL, MARSHALL; RESPIRATION, ARTIFICIAL.

RESZKE, řěsh'ke, EDOUARD DE (1856—). A Polish opera singer, brother of Jean de Reszke, born at Warsaw. After studying with his brother, he received instruction from Ciaffei, Steller, Coletti, and Sbriglia. Originally he had studied scientific farming in Silesia, and had devoted himself to the care of the family estates. It was at the suggestion of Jean, then in the first flush of his success, that he took up the study of music. He made his first public appearance in 1876 at the Italiens in Paris, as the King in Verdi's *Aida*, which was so successful that Massenet intrusted to him the creation of *Le roi de Lahore* at La Scala in Milan. From 1880 to 1884 he sang with the Royal Italian Opera Company in London, where he became famous as one of the greatest dramatic basses of his time.

RESZKE, JEAN DE (1853—). A Polish dramatic tenor, born at Warsaw. Through the influence of his father, a prominent State official, and his mother, who was possessed of remarkable musical talent, he saw much of the world's great artists, the family salon possessing an attraction for the most celebrated musicians of the day. When but twelve years of age, De Reszke was singing in the Cathedral, where the quality of his voice aroused the interest of the city. Afterwards he took up the profession of law, and obtained his degree and license. But the attraction of music proved too strong, and he began to study for the stage under Ciaffei and Cotogni. In 1874 he made his debut at Venice, as Alfonso in *La Favorita*, under the name of De Reschi. Soon afterwards he appeared in London in the same rôle, where the critics complained that his voice lacked the deep quality and resonance of a barytone. He attained considerable celebrity, however, but his physical strength began to suffer from the wear and tear

of singing parts too low for him, and acting upon the advice of Sbriglia, he retired from the stage, and prepared himself in a tenor repertoire. On the completion of two years of study he made his second debut before the public, in 1879, this time in the tenor rôle of *Robert le Diable*, at Madrid. His success was instantaneous, and his career a continuous artistic triumph. His repertoire includes *Faust*, *Lohengrin*, *L'Africaine*, *Aida*, *Le Cid* (written for him by Massenet), *Les Huguenots*, *Elaine*, *Romeo and Juliet*, and *Tristan*. He is conceded to be one of the most artistic singers and actors known to the operatic stage. Since 1891 both De Reszkes have, with short interruptions, been favorite members of the Metropolitan Opera House Company in New York.

RETAINER (from Lat. *retinere*, to retain, hold back, from *re-*, back again, anew + *tenere*, to hold). The employment of an attorney, counselor, or other legal practitioner, to prosecute or defend an action, or represent a person, in his professional capacity. It is not necessary that a retainer be in writing; a mere verbal request is sufficient. Upon being retained an attorney has full powers incidental to professional representation. The term is also applied to a fee paid to a legal practitioner for his services, usually in advance, and constituting only a part of his whole fee. See ATTORNEY; COUNSELOR.

The act of an executor, to whom the estate is in debt, in retaining in his hands a sufficient amount to satisfy his claim, is also technically known as retainer.

RETAINER. See LIVERY.

RETAINING WALLS. Walls built to retain earth or other incoherent substances in positions and forms which, without such artificial aid, they could not maintain. Most earths, if left to themselves, will not stand with vertical sides, but will fall or slide down until they assume a certain slope. The angle which this slope makes with the horizontal is called the 'angle of repose,' and it varies according to the nature of

DIAGRAM OF RETAINING WALL.

the material, the amount of water it contains, etc. The same earth will have different angles of repose under different conditions. In the accompanying figure, E represents a section of a mass of earth which it is desired to retain by the wall ABDC. If the line BG represent the angle of repose, then it is evident that the duty of the retaining wall is to keep in position the wedge-shaped mass of earth ABG. This mass tends to destroy the retaining wall, (1) by overturning it by rotation along the front edge D; (2) by the crushing of the stone along the front edge; and (3) by sliding the wall forward on its base, DB, or along some horizontal plane above the base. In designing a retaining wall the engineer seeks to fix its dimensions so that it is safe against destruction by any or all of these

destructive tendencies. The difficulty of doing this arises from the fact that the pressures exerted by the wedge-shaped mass of earth vary so greatly with the character and physical condition of the material that they can only be roughly approximated. Engineers have worked out numerous formulas for calculating the dimensions of retaining walls, which are designed to meet the varying conditions of the load, but these formulas have to be based on so many hypotheses that their practical value, except for general indications, is quite limited. The greatest difficulty arises from the action of water, which accumulates behind the wall and may transform the earth to a semi-fluid state, thus enormously increasing its pressure, and one of the chief desiderata in retaining-wall construction is that this water shall be kept drained away. This is usually accomplished by having drainage holes, commonly called 'weep holes,' through the wall at intervals, by means of which the water runs off as fast as it accumulates.

Retaining walls are generally made trapezoidal in section, as shown by the diagram, but they are also built with rectangular sections and with concave faces. Danger from crushing seldom exists except in very high walls, and danger from shifting can be easily avoided by laying the masonry with its courses dipping slightly from the front toward the rear. Careful workmanship and perfect drainage are the essentials of good retaining-wall construction.

BIBLIOGRAPHY. For a discussion of the theory of retaining-wall construction for various forms of walls and various conditions of loading, consult: Howe, *Retaining Walls for Earth* (New York, 1896); Merriman, *Retaining Walls and Masonry Dams* (New York, 1892); Cain, *Practical Designing of Retaining Walls* (New York, 1888); and Baker, *Treatise on Masonry Construction* (New York, 1900). See MASONRY.

RETALIATION (from Lat. *retaliare*, to retaliate, from *re-*, back again, anew + *talis*, such). Properly, the return of like for like; usually, the infliction upon a wrong-doer of an evil similar to that which he has wrought. In early law, when wrongs are redressed by the act of the injured party or kinship group, such redress often takes the form of retaliation. The retaliatory idea sometimes assumes peculiar forms; as when the man whose father has been slain seeks to slay in return not the offender himself, but the offender's father. The clearest expression of the *lex talionis*, or law of retaliation, is found in the Jewish rules, "An eye for an eye and a tooth for a tooth," and "Whoso sheddeth man's blood, by man's hand shall his blood be shed." In the Roman XII. Tables *talis* is authorized as a penalty for mayhem (*membrum ruptum*) if the injured party refuses to accept pecuniary compensation. Retaliation is sanctioned in the Visigothic laws, but this (according to Brunner, who asserts that there is practically no retaliatory element in old German law) was due to the influence of the Old Testament. A modern parallel was afforded in colonial Connecticut, where the penalty of castration was imposed in at least one instance on the authority of the Mosaic rule.

When public punishment begins to take the place of private vengeance, penalty may be, and often is, measured according to the degree of

wrath which the offense commonly arouses, but purely retaliatory penalties tend to disappear. To punish a perjurer by hewing off the hand which he has raised in swearing, or a slanderer by cutting out the tongue, is not properly retaliation. Such penalties may originate in a sort of personification of the offending member, or they may be based, as Brunner suggests, on the desire to make the relation of crime and punishment obvious: "the penalty itself is to declare why it is imposed." Retaliation may be based, in part, on this idea, but such symbolic penalties are not in themselves retaliatory. More closely akin to retaliation is the infliction upon a false accuser of the penalty which would have been inflicted on the accused if the charge had been sustained.

The term retaliation is sometimes loosely employed to describe the return of evil for evil even when there is no similarity between the offense and the punishment. In this broad sense, retaliation includes all extra-legal vengeance and all legal punishment. It is in this sense that we speak of 'the retaliatory theory' of punishment, meaning the theory which bases the right of the community to punish criminals on the fact that they have injured the community by their crimes.

RETBERG, rət'bĕrk, RALF VON (1812-85). A German writer on art, born at Lisbon, where his father was then stationed as a captain in the German-English Legion. From 1829 to 1845 Retberg served as an officer in the Hanover Army, and then settled in Munich. His works are of especial value for the knowledge of art and culture at Nuremberg, and include: *Nürnbergers Briefe zur Geschichte der Kunst* (1846); *Nürnbergers Kunstleben in seinen Denkmälern* (1854); *Kulturgeschichtliche Briefe* (1865); *Albrecht Dürers Kupferstiche und Holzschnitte, kritisches Verzeichnis* (1871). Posthumously, *Die Geschichte der deutschen Wappenbilder* (Vienna, 1888) was published from his manuscripts.

RETENTION (Lat. *retentio*, from *retinere*, to retain, hold back), or CONSERVATION. In psychology, the effect which is left upon the organism by psychophysical processes. One is said to retain one's experiences and to 'live them over' again and again. Retention is, therefore, the presupposition of memory. In Hertzian psychology (see HERBERT) ideas are supposed to maintain their existence even after they have left consciousness. But most recent writers on psychology regard retention as a physical function. It is, they assert, the brain that 'retains.' This view is based partially on the observation of pathological cases, which reveals the fact that both general and specific disturbances of memory are connected with definite changes either in the cortex as a whole or in some limited area of it. (See APHASIA.) These pathological facts have told us something of the 'seat' of retention. Lesions in one region of the cortex affect retention of visual sensations and ideas; lesions in another region, that of auditory sensations and ideas. There is, however, still much doubt as to the extent of the differentiation of cerebral functions. Concerning the actual physiological changes which are left over from excitation there is also some difference of opinion. Most psychologists agree, however, that the activity which a stimulus produces ceases with the passing of the stimulation, but that some kind of modification remains.

Wundt maintains that the exercise of nervous elements leaves a tendency toward repetition of the same function whenever the same elements are reëxcited.

The conditions under which retention takes place are both general and special. The general conditions are health, plasticity of the nervous system (retention is much easier in childhood and youth than in old age), mental disposition, attention, and the formation of associations. Among special conditions influencing retention stand emotion and mood; vividness, intensity, and duration of the impression; repetition and the concreteness or abstractness of the material composing the experience.

See MEMORY; MENTAL CONSTITUTION; REPRODUCTION OF IDEAS.

RETENTION OF URINE. A lack of power to evacuate the bladder. This may be either complete or partial. It should be carefully distinguished from *suppression*, in which there is a failure on the part of the kidneys to secrete urine, and consequently the bladder is empty. The causes of retention may be *organic* or *functional*. Among the chief organic causes are: (1) Urethral stricture, (2) injuries resulting in contraction or rupture of the urethra, (3) tumors within the urethra or pressing upon it from without, (4) foreign bodies in the urinary canal, such as small calculi, clotted blood, pieces of bougies, catheters, etc., (5) enlargement of the prostate gland, acute or chronic, especially in aged men, abscesses in the perinaeum, the pressure of a loaded rectum, the head of the child during labor, or pelvic tumors of any kind. The functional causes of retention are spasm of the urethra or the neck of the bladder, partial or complete paralysis of the bladder, and hysteria.

The symptoms of retention consist of an urgent desire to pass water, with partial or entire inability to accomplish the desire; restlessness, discomfort, and even violent pain accompany the straining efforts to evacuate the bladder. On percussion above the brim of the pelvis, the bladder is found to be distended in proportion to the amount of accumulated urine. If relief is not speedily afforded the bladder may give way and discharge its contents into the peritoneal cavity, in which case death soon follows; or the urethra behind the stricture may give way, and the urine be extravasated into the surrounding tissues, provoking severe inflammation and gangrene.

Treatment will depend in its details upon the cause operative in each case. Only general principles can be given here. Spasmodic retention can nearly always be relieved by warm baths, heat to the perinaeum, purgation, sedatives, or in extreme cases by a few whiffs of chloroform. Attempts should be made to draw off the urine through a small catheter. If this measure fails, recourse must be had in a few hours to aspiration of the bladder, through a hollow needle thrust into it through the abdominal wall above the pubes. This measure, however, is rarely

necessary. Paralysis of the bladder may arise from the general weakness of old age, from a depressed state of the nervous system in fevers of the typhoid type, in spinal disease, apoplexy, etc. Retention from paralysis is often accompanied by a dribbling away of the urine, so that it may at first be mistaken for incontinence. In chronic prostatic cases the urine has to be regularly drawn off with the catheter.

RETHEL, rä'tel, ALFRED (1816-59). A German historical painter. He was born near Aix-la-Chapelle, May 15, 1816. His artistic training began at the age of thirteen under Schadow in the Düsseldorf Academy; but, dissatisfied, he repaired in 1836 to Frankfort to work under Philip Veit and Schwind. At Düsseldorf he had earned reputation with episodes from the life of Saint Boniface, one of which (1832) is in the National Gallery in Berlin, and in Frankfort he painted a "Nemesis" (1837); a "Daniel in the Lions' Den" (1838, Städels-Institut); "Guardian Angel of Emperor Maximilian" (fresco, ib.); "Resurrection" (Church of Saint Nicholas); the portraits of Emperors Maximilian I. and II., Charles V., and Philip of Suabia, for the Römer (1838); "Saints Peter and John Healing the Lame" (1840-41, Leipzig Museum); and "Finding of the Body of Gustavus Adolphus" (Stuttgart Museum). In the competition for a cycle of eight frescoes from the life of Charlemagne to adorn the city hall at Aix-la-Chapelle he carried off the first prize, and after a visit to Italy (1844-45), executed (1847-52) four of the subjects, to wit: "Otho III. in the Tomb of Charlemagne"; "Destruction of the Irminsul;" "Defeat of the Saracens at Cordova;" and "Conquest of Pavia in 774." The cartoons for these are in the National Gallery, Berlin, and the cycle was afterwards completed from Rethel's designs by Josef Kehren. This monumental work, imbued with the spirit of grandeur and simplicity, was the greatest achievement of historical painting in Germany during the first half of the nineteenth century. Attacked by a nervous disease, Rethel in vain sought relief in a second visit to Italy in 1852-53, and died insane at Düsseldorf, December 1, 1859. A series of six water colors depicting the "Expedition of Hannibal Crossing the Alps" (1844-45), and his illustrations to the "Danée of Death" (1848, with poetical text by Reinick, 13th ed. 1902), deserve special mention. His brother and pupil, ORTO (1822-92), who also studied under Karl Sohn and Schadow at the Düsseldorf Academy, painted at first Scriptural subjects, such as "Boaz Meeting Ruth" (1855, Leipzig Museum), and afterwards chiefly portraits and genre scenes. For Alfred Rethel's biography, consult: Müller von Königswinter (Leipzig, 1861); Valentin, in *Aesthetische Schriften*, i. (Berlin, 1892); *Art Journal* (London, 1865); and Peeht, *Deutsche Künstler*, ii. (Nördlingen, 1879).

RÉTIF DE LA BRETONNE, rä'téf' de la bre-tôn', NICOLAS EDMÉ (1731-1806). A French novelist, nicknamed by Grimm the "Gutter-Rousseau," born in Sacy. The discovery of his love-letters to another woman than his wife in 1765 led to the first recognition of his literary talent. From the first his fiction was the work of observation and largely of personal experience. Its success was gradual, but steady. *Le pied de Fanchette* (1769) made him known, *Le paysan*

perverti (1775) made him famous and sought by distinguished men. Of his other writings the *Monsieur Nicolas* and the 42 volumes of *Les contemporains* (1780-85) are most noteworthy. The novels are declamatory and rhetorical, but they offer the first serious treatment of the petty bourgeois in fiction. A fair idea of his manner and merits may be obtained from Assezat's selection (3 vols., Paris, 1875).

RETIMO, rā'tē-mō. A seaport town of the island of Crete, on the north coast, 38 miles west of Candia (Map: Greece, F 6). Population, in 1900, 9311.

RETINA. See EYE.

RETINITIS (Neo-Lat., from *retina*, so called because like fine network, from Lat. *rete*, net). Inflammations of the retina are primary or secondary to inflammation of other parts of the eye. Both eyes are usually affected. Sight is impaired, the size or form of objects seems altered, the field of vision is contracted; there is a feeling of discomfort in the eyes and at times dread of light. The ophthalmoscope shows a fundus hazy from swelling, tortuous, and dilated veins, a disk with indistinct margins, sometimes hemorrhages. Recovery may be complete or partial. Atrophy of the retina and the optic disk may result in loss of sight partially or completely. Treatment includes absolute rest of the eyes with protection from light, use of atropine locally, and constitutional treatment of the cause of the retinitis. This depends upon the variety. *Simple retinitis* may result from overuse of the eyes in any way or may be the beginning of other forms. *Albuminuric retinitis*, which occurs during nephritis, is characterized by the presence in the retina, in addition to hemorrhages, of white spots. At the macula lutea these are often arranged in a star-like form. Treatment is that of the kidney disease. *Diabetic retinitis* presents a picture similar to the preceding form, but with the white spots arranged irregularly around the macula, and the treatment is directed to the cause. *Syphilitic retinitis* occurs in the hereditary form and in the secondary stage of acquired syphilis. The fundus is hazy, the disk red and hazy; there are scattered grayish and white spots, often with pigmented borders, especially near the macula, and white marks along the vessels. The course is slow, relapses frequent, and though early and thorough treatment of the constitutional disease gives good results, there is likely to be some permanent diminution of vision. *Hemorrhagic retinitis*, as its name indicates, is characterized by the occurrence of numerous hemorrhages. It occurs in persons with diseases of the arteries and heart, and frequently precedes cerebral hemorrhage. Treatment of the arterial disease is very important. *Leukæmic retinitis* causes pallor of the disk with white and yellow spots, sometimes with a pink border, and hemorrhage areas.

RETINOSPORA. A tree. See CYPRESS.

RETIREMENT (from *retire*, from OF., Fr. *retirer*, to draw back, from *re-*, back + *tirer*, to draw, from ML. *tirare*, to draw). A statutory provision or age limit by which officers in the military or naval services cease from active duties, and are placed on the retired list. In the United States Army the compulsory age

limit is sixty-four, but the President may retire an officer at sixty-two. In the United States Navy the retiring age is sixty-two years. Army regulations provides that when an officer becomes disabled or unfitted for the performance of duty by reason of wounds, sickness, or improper habits, a retiring board will convene and action be taken according to the verdict. Officers on the retired list are permitted to wear the uniform of their actual or highest brevet rank when retired, except that the number or insignia of the regiment, corps, or department will not be worn. Retired officers receive 75 per cent. of pay (salary and increase) of their rank. A limited number may be assigned at their request to duty with full pay to militia or schools as instructors, or in time of war to other duty. In the British Army officers are permitted to retire voluntarily with gratuities or pensions, and are also obliged to retire according to age limit (which varies according to rank held), or after a period of non-employment, on half pay. Regulations similar in effect obtain in all countries.

RETORSION (ML. *retorsio*, *retortio*, a bending or twisting back, from Lat. *retorquere*, to bend or twist back, from *re-*, back again, anew + *torquere*, to twist). A term of international law signifying an act of retaliation by one nation against another. Unlike reprisal (q.v.), it is not a sufficient justification for war, but is rather a political measure intended to compel one nation to accord equality of treatment to the subjects of the other residing within its jurisdiction. Thus, where one nation imposes restrictions upon aliens residing within its territory, as by unequal taxes, or by differential import duties, or fails to observe the rules of international comity, as by refusing to grant the accustomed privileges to ambassadors and other diplomatic agents, the aggrieved nation is justified in applying the same kind of treatment to the offending nation or its subjects. The increasing commercial relations of modern States have greatly extended the field in which the principle of retorsion may be applied, and it is now most frequently resorted to by those nations which depend largely upon tariffs or import duties for their revenue.

RETREAT (OF. *retréte*, *retraicte*, Fr. *retraite*, from ML. *retracta*, retreat, from Lat. *retrahere*, to draw back, from *re-*, back again, anew + *trahere*, to draw). In military tactics and strategy, a retirement before, or in the face of, an enemy. It is one of the most difficult as well as important manoeuvres of modern warfare. The most important feature of the retreat, and the one on which rests its ultimate success, is the rear guard (q.v.). In barrack, army post, or camp life and routine in the United States Army, the bugle call 'retreat' signifies sunset, and is played by the field music (See BUGLE AND TRUMPET CALLS.) There is usually a parade or roll-call at that hour known as the evening parade, at which time extra duty details, guards or pickets, are paraded and go on duty. The ceremony of the retreat is observed throughout the armies of the world and is usually accompanied by gun fire and the lowering of the national color, which is hoisted again at reveille (q.v.).

RETREAT. A term used in the Roman Catholic and Anglican churches to designate a time of temporary retirement from active life

for the sake of prayer, meditation, and spiritual exercises. The practice is very ancient in the Church, as a following of the practice of Christ himself. The stricter retreats, especially those which the clergy of most Roman Catholic dioceses make every year, involve the giving up of the whole time to spiritual exercises, and usually silence is observed during them; but in the case of those who cannot leave their employment, services in the early morning and evening are provided; in their case the order of observances does not materially differ from that of a mission (q.v.).

RETRENCHMENT (from *retrench*, from OF. *retrencher*, *retrancher*, Fr. *retrancher*, to cut off, from *re-*, back + *trancher*, to cut, from Lat. *truncare*, to lop, from *truncus*, maimed). A defensive work in military fortification. It closely resembles the redoubt (q.v.) in construction and is usually built across the gorge of a redan or bastion, or from shoulder to shoulder, when it is apprehended that the salient angle may fall into the hands of the enemy. See FORTIFICATION; REDAN; REDOUBT.

RETRIEVER. See FIELD DOG; and Plate of DOGS.

RETROACTIVE (from Lat. *retroactus*, p.p. of *retroagere*, to turn back, from *retro-*, back + *agere*, to do, act, drive) or **RETROSPECTIVE LAWS.** These terms are used interchangeably to denote statutes which apply to a state of facts which existed before their enactment. Retroactive laws that are of a criminal or penal nature are specifically known as *ex-post-facto* laws, and are expressly forbidden by the United States Constitution. The Constitution also prohibited laws impairing the obligations of contracts. With these exceptions Congress, or the legislatures of the various States, are free to enact retrospective statutes whenever they may deem it advisable to do so. Although retroactive laws are in disfavor where they have the above effect, there are many which are necessary to remedy defects in the law theretofore existing. For example, statutes making valid deeds of married women executed within a certain time prior to their passage, or conveyances which did not bear a certain stamp required by law at the time of their execution, may have a most salutary effect. See EX-POST-FACTO LAWS; LAW; STATUTE; INTERPRETATION.

RETROGRADE (OF. *retrograde*, Fr. *rétrograde*, from Lat. *retrogradi*, to go backward, from *retro-*, back + *gradi*, to walk). A term applied to the motion of the planets among the fixed stars when they appear to move in the reverse order of the signs of the zodiac (q.v.). All the planets move in the same direction round the sun, and therefore apparent retrograde motions must be due to their motion relative to the earth. In the case of comets, however, we have instances of motion about the sun in the opposite direction to that of the planets, and in such orbits the motion (referred now to the sun, not to the earth) is said to be retrograde. In the case of the planets, let S be the sun, and let the two circles represent the orbits of two planets. First, let the planets be, at P and Q, toward the same side of the sun. The planet nearer the sun has of course the greater velocity, and therefore, if *p* and *q* repre-

sent their positions after the lapse of a given time, Pp is greater than Qq, and therefore the direction of the line pq (in which one is seen from the other) has rotated in the *opposito*

direction to that in which either planet revolves about the sun. Hence, when a superior planet is in opposition (i.e. if Q be Jupiter, and P the earth), it appears to move backward among the stars. When an inferior planet is between the earth and sun (i.e. if Q be the earth, and P Venus), it appears to move backward also. If the planets be on opposite sides of the sun, as at P and R in the figure, let *p* and *r* be their positions after a given time; then *pr* has turned from the direction PR in the direction in which the planets revolve about the sun. Hence any planet, superior or inferior, appears to move directly when the sun is between it and the earth. Between these two opposite cases, there must, of course, be points at which the apparent motion is neither retrograde nor direct—then the planet is said to be *stationary*. This case occurs whenever, for an instant, the lines PQ and pq are parallel; that is, when the two planets are moving with equal velocities transverse to the line joining them, these velocities being parallel, and toward the same side of the joining line.

RETURNING BOARDS. In the United States, official bodies designated by law for canvassing the results of popular elections. The general rule is that a returning board in canvassing the returns sent to it acts in a ministerial capacity and must leave the correction of error or fraud to the courts unless the return be void on its face, in which case, of course, the returning board must reject it. The board for canvassing the returns of State elections usually consists of certain designated State officers including the Secretary of State and the Attorney-General. In some States the returns are canvassed by the presiding officers of the Legislature in the presence of the two Houses. In the case of members of the Legislature the returns are usually sent to the Secretary of State, though sometimes to a returning board, but all contests are decided by the Houses themselves in pursuance of a constitutional privilege everywhere allowed. In the case of local officers contested returns are settled by the courts acting as a canvassing authority, or in a *quo warranto* proceeding. In the case of Presidential electors Congress provided by the Act of 1887 that disputed returns in any State might be settled by such organs and according to such procedure as State law might provide. If this be not done within six days of the meeting of the electors, the two Houses of Congress have the final determination of the election.

RETZ, rĕts, GILLES DE LAVAL, Seigneur de. See BLUEHEARD.

RETZ, rĕs. JEAN FRANÇOIS PAUL DE GONDÏ, Cardinal de (1614-79). A French politician and author, born at Montmirail. His early education was intrusted to Saint Vincent de Paul, and he

later attended the Jesuit College at Clermont. It is said that he was compelled by his family to enter the Church in the expectation that he would become Archbishop of Paris, a position which had been held by two members of his house. He was brilliant in his studies, but dissolute in private life. He engaged in political intrigues with the Count of Poissons, but after the death of that nobleman resumed his theological studies and was made coadjutor of the Archbishop of Paris in 1643 by Louis XIII. He devoted himself to his duties with zeal and won popularity by his profuse distribution of alms. At the time of the Fronde (q.v.) he was at first of great assistance to the royal cause, but soon aroused the distrust of the Court, and became the leader of the popular party, displaying consummate talents for intrigue. In 1651 he became reconciled with the Queen mother, Anne of Austria, and with her aid he succeeded in obtaining a cardinal's hat. After the return of the Court to Paris, in 1652, a mission to Rome was offered to Gondi which he seemed disinclined to accept. Mazarin was determined that his rival should be silenced, however, and managed to have Cardinal de Retz arrested and imprisoned at Vincennes. The Cardinal thereupon resigned the Archbishopric of Paris, which had come to him by the death of his uncle, and was allowed to retire to Nantes, whence he made his escape to Spain (1654) and repaired to Rome. There, in spite of his previous renunciation, he again claimed the Archbishopric of Paris, and in 1662 he succeeded in bartering the Archbishopric for profitable benefices. At the same time he became reconciled to Louis XIV. and returned to France, but abstained from further political intrigue. He sold his estates, paid his heavy debts, and devoted his life to charity and religion. His *Œuvres*, which cover the years 1643-55, are described by Voltaire as displaying the grandeur, impetuosity, and inequality of genius. They are not, however, trustworthy, on account of political bias. The best edition of his works is that by Feillet in the *Collection des grands écrivains de la France* (Paris, 1870-96. Consult: Chantelauze, *Le cardinal de Retz, étude historique* (Paris, 1878); id., *Le cardinal de Retz et ses missions diplomatiques à Rome* (ib., 1879).

RET'ZIUS, MAGNUS GUSTAV (1842—). A Swedish histologist, born in Stockholm. He was for some time professor of histology and anatomy in the Caroline Institute. His printed works on anthropology include: *Finska Kranier* ("Finnish Skulls," 1872); *Biologische Untersuchungen* (1880-81); and *Gehörorgane der Wirbelthiere* (1881-84). With Prof. Axel Key he published *Studien in der Anatomie des Nervensystems und des Bindegewebes* (1875). In 1890 he became editor of the *Biologische Untersuchungen*.

RETZSCH, rēch, MORITZ (1779-1857). A German painter and engraver. He was born in Dresden, December 9, 1779, and studied at the academy of his native city, where he became a professor in 1824, and died July 11, 1857. Although treating romantic subjects, he belongs to the followers of Mengs. His chief celebrity rests upon his illustrations in outline of the great German poets, Schiller, Goethe, etc., whom he interpreted with great vigor and sympathy. His etchings of Goethe's *Faust* (26 plates, 1884)

are particularly well known, not only in his own country, but also in France and England. Among other important works are the outline illustrations of Schiller's *Lied von der Glocke* (43 plates, 1884); his *Shakespeare Gallery* (80 plates, 1860); and his outline drawings of Bürger's *Ballads* (15 plates, 1872). His oil paintings, treating classical subjects, are of little interest, but he succeeded better with portraits.

REUHLIN, roik'lén, JOHANN, known also by the Greek form of his name, CAPNIO (1455-1522). The first humanist of Germany and one of the earliest promoters of Hebrew studies in that country. He was born at Pforzheim, in Baden, February 22, 1455. He began his studies at his native place, continued them at Freiburg, and in 1473 accompanied Prince Frederick of Baden to Paris, where he made the acquaintance of Johann Wessel (q.v.) and began to study Greek. The next year he went to Basel, where he took his bachelor's degree in 1475 and his master's in 1477. He then revisited France, studied law at Orleans and Poitiers, and gave lectures in Greek and Latin. In 1481 he established himself at Tübingen as teacher of jurisprudence and literature. He entered the service of Eberhard, first Duke of Württemberg, accompanied him to Italy in 1482, and was employed in a number of public services. He visited Italy again in 1490. In 1492 the Emperor made him a count of the German Empire, and about the same time he began the study of Hebrew under a learned Jew who was Imperial physician. In 1496, after Eberhard's death, he went to Heidelberg, and made a third visit to Italy in the service of the Elector Palatine in 1498. At Rome he applied himself with renewed vigor to the study of Hebrew and Greek. He returned to Württemberg in 1499, and in 1502 was made a member of the Swabian confederate tribunal, retaining the office till 1513. In consequence of a quarrel between Ulrich, Duke of Württemberg, and the Swabian League, he went to Ingolstadt in 1519 and taught Greek and Hebrew at the university. When the plague broke out at Ingolstadt two years later he returned to Tübingen, intending to devote himself exclusively to study, but soon fell sick, and died at Liebenzell, June 30, 1522. Reuchlin is justly regarded as the father of Greek and Hebrew studies in Germany. He had great ability as a teacher, and, although for most of his life he held no professorial chair and was not always free to lecture openly, nevertheless he directed and encouraged the study of both languages in his generation. His devotion to Hebrew was the cause of the most interesting and important incident of his life. In 1510 one Johann Pfefferkorn, a baptized Jew, called upon princes and subjects to prosecute the religion of his fathers, and especially urged the Emperor to burn or confiscate all Jewish books except the Bible. Reuchlin remonstrated, maintaining that only books directly written against Christianity should be destroyed. This attitude drew upon him the enmity of the Dominicans, and particularly of the Inquisitor Jakob van Hoogstraten (q.v.). Reuchlin's opponents controlled the universities of Paris, Louvain, Erfurt, and Mainz; but many of the distinguished and independent thinkers of Germany were on the side of the scholar. Ulrich von Hutten and Franz von Sickingen in particular gave him support and pro-

tection, the latter threatening Hoogstraten and the monks with terrible vengeance if they did not cease to persecute "his teacher, Doctor Reuchlin, that wise, experienced, pious, and ingenious man." The *Epistolæ Obscurorum Virorum* (q.v.) was an outcome of the contest. While there was much in Reuchlin's character and experience to draw him toward the Reformation, he never openly joined the movement, and late in life declared against Luther. Melancthon was his great-nephew. Reuchlin's works include editions and Latin translations of Greek texts: a *Vocabularius Latinus Breviloquus* (1475); a manuscript Greek grammar (not published); the *Rudimenta Linguae Hebraicæ* (1506), which, with pardonable pride, he declares to be "the first attempt to execute a grammar of the Hebrew tongue," and made "without any foreign help;" *De Accentibus et Orthographi Hebræorum Libri III.* (1518); an edition of the seven Penitential Psalms (1512), the first Hebrew book printed in Germany; *De Verbo Mirifico* (1494); and *De Arte Cabbalistica* (1517), works on the Cabbala; *Scenica Progymnasmata* (1497), and *Sergius* (1507), Latin satirical comedies, not without humor and literary merit; the *Augenspiegel* (1511; ed. by Mayerhoff, Berlin, 1836), a reply to a book by Pfefferkorn (the *Handspiegel*). Two of Reuchlin's Greek treatises, the *De Quatuor Idiomatibus* and *Colloquia graeca*, have been published by Horawitz under the title *Griechische Studien* (Berlin, 1884). The best biography of Reuchlin is Geiger, *Johann Reuchlin; sein Leben und seine Werke* (Leipzig, 1871); consult also: id., *Johann Reuchlins Briefwechsel* (Tübingen, 1875); Horawitz, *Zur Biographie und Korrespondenz J. Reuchlins* (Vienna, 1877); Holstein, *J. Reuchlins Komödien* (Halle, 1888); Strauss, *Ulrich von Hutten* (6th ed., Leipzig, 1895), for the controversy about the Jewish books.

REULEAUX, rē'lō', FRANZ (1829—). A German mechanical engineer, born at Eschweiler, near Aix-la-Chapelle, where his father had machine shops. After finishing his apprenticeship in Koblenz, he worked in his father's shops, studied at Karlsruhe, and for a year was head of a factory in Cologne. Then he taught in Zurich (1856-64) and in Berlin (1864-96), where from 1868 until retirement he was director of the Industrial School. Reuleaux was intimately connected with German machinery exhibits at Philadelphia in 1876 and at Sydney and Melbourne (1879-81). His *Briefe aus Philadelphia* (1877) voice a sharp criticism on German methods of construction and especially on the lack of artistic design. To remedy this fault Reuleaux gathered a great collection of kinematic models in Berlin. His works are: *Konstruktionslehre* (with Moll, 1854-62); *Der Konstrukteur* (1860-62, and often); *Kurzgefasste Geschichte der Dampfmaschine* (1891); and *Thomassche Rechenmaschine* (2d ed. 1892).

REUMONT, rē'mōn', ALFRED VON (1808-87). A German historian. He was born at Aix-la-Chapelle, studied at Bonn and Heidelberg, and in 1832 traveled through Greece and the Ionian Islands. In 1835 he entered the diplomatic service, and subsequently was Minister Resident in Italy, principally at the Papal Court. His historical works include: *Ganganelli, seine Briefe und seine Zeit* (1847); *Beiträge zur italienischen*

Geschichte (1853-57); *Die Jugend Katharinas de' Medici* (1854); *Die Grafen von Albany* (1860); *Zeitgenossen* (1862); *Geschichte der Stadt Rom* (1867-70); *Lorenzo de' Medici il Magnifico* (1874); *Geschichte Toscanas* (1876-77); *Vittoria Colonna* (1881); and *Charakterbilder aus der neueren Geschichte Italiens* (1886). Upon art he wrote biographies of Michelangelo (1834), Andrea del Sarto (1835), and Benvenuto Cellini (1847), and other works.

REUNION, CHAMBERS OF. See LOUIS XIV.

RÉUNION, rā'ūnyōn', ILE DE LA. formerly called ILE DE BOURBON. An island in the Indian Ocean belonging to France, and situated 400 miles east of Madagascar and 100 miles southwest of Mauritius, in latitude 21° S., longitude 55° 36' E. (Map: World, M 26). It is of nearly regular oval shape, 34 miles long by 22 miles broad, and has an area of 775 square miles. It is entirely of volcanic origin, and very mountainous, with numerous extinct craters, the highest peak being the Piton des Neiges, with an altitude of 10,069 feet. In the region known as the Pays Brûlé rises the only active volcano, the Piton de la Fournaise, 8713 feet above the sea. The plateau composing the island is fissured on all sides by deep cañons through which numerous mountain torrents run to the sea. The climate is generally pleasant and healthful, but the island is occasionally visited by devastating hurricanes. The flora and fauna resemble those of Madagascar. There are luxuriant tropical forests.

Over one-third of the total area is under cultivation. The principal products are sugar, vanilla, coffee, cacao, and spices. The imports and exports in 1900 amounted to \$4,250,825 and \$3,367,850 respectively. About 60 per cent. of the exports consists of sugar, and about 90 per cent. of the total commerce is with France and the French colonies.

The administration of the colony is in the hands of a Governor, who is assisted by a privy council and an elective council-general. The island is represented by one Senator and two Deputies in the French Parliament, and its towns are administered under the municipal code of France. The local budget for 1901 balanced at about \$900,000, and the subvention from France amounted to over one-half of the revenue. The population in 1897 was 173,192, including over 15,200 Indian coolies, 4500 natives of Madagascar, about 9000 Africans, and nearly 1000 Chinese. The white population is far from pure. The capital is Saint-Denis.

The discovery of the island at the beginning of the sixteenth century is usually assigned to the Portuguese navigator Mascarenhas, after whom it was named originally. It was acquired by France in 1649. From 1810 to 1815 the island was held by Great Britain. Consult: *Annuaire de l'île de la Réunion* (Saint Denis, annually); Oliver, *Crags and Craters: Rambles in the Island of Réunion* (London, 1896); Garsault, *Notice sur la Réunion* (Paris, 1900); Hermann, *Colonisation de l'île Bourbon et fondation du quartier Saint-Pierre* (ib., 1901).

RÉUS, rā'ūs. A town of Catalonia, Spain, in the Province of Tarragona, five miles northwest of the town of Tarragona (Map: Spain, F 2). The principal buildings are the Gothic Church of San Pedro, rebuilt in 1512-69,

with a high octagonal tower, and the handsome modern Fortuny Theatre. There are also a large hospital, several colleges, and an academy of fine arts. Cotton-spinning, which was introduced by English manufacturers in the latter part of the eighteenth century, and silk-spinning are the principal industries. The exports are wines, fruit, grain, and confectionery. Population, in 1887, 28,780; in 1900, 26,220.

REUSCH, roish, FRIEDRICH (1843—). A German sculptor, born at Siegen. He studied in Berlin at the Academy and under Albert Wolff, whom he assisted on the equestrian monument to Frederick William III. After his return to Berlin from a visit to Italy in 1874, he fashioned the marble group of "Market-Traffic" (1879) for the Belle-Alliance Bridge, and the "Genius of Steam" for the Technical Academy at Charlottenburg. In Königsberg, where he was appointed professor at the academy in 1881, he executed the large group of "Strength, Justice, and Moderation" for the Government building, the statues of "Albert, First Duke of Prussia" (1891), and of Emperor William I. (1894), both outside the royal palace, besides several other memorials, many busts and decorative figures for public buildings. At Siegen are a "Soldiers' Monument" (1877), the equestrian statue of "William I." (1892), and a bronze statue of "Bismarck" (1900), and there are also several charming mythological genre groups to his credit.

REUSS, rois. Two sovereign principalities of Germany, situated between the Prussian Province of Saxony, the Kingdom of Saxony, Bavaria, and some of the Saxon duchies, and separated from each other by the outlying district of Neustadt of the Grand Duchy of Saxe-Weimar (Map: Germany, D 3). They are: Reuss Elder Line, or Reuss-Greiz, and Reuss Younger Line, or Reuss-Schleiz. Reuss-Greiz covers an area of 122 square miles and is largely mountainous. Its principal products are woolens and knit goods. The Constitution of 1867 provides for a legislative assembly of 12 members, of whom three are nominated by the Prince, two by the nobility, three elected by the towns, and four by the rural districts. The capital is Greiz. The principality is represented by one member in the Bundesrat and sends one deputy to the Reichstag. Population, in 1900, 68,287, almost entirely Protestants.

Reuss-Schleiz consists of a number of detached parcels of territory with a total area of 319 square miles. It is a mountainous country with deposits of marble and salt. The chief manufactures are woolen and cotton goods, machinery, musical instruments, and leather. The legislative body consists of 16 members, of whom three are elected by those paying the highest taxes, and 12 by the rest of the qualified voters, the head of the House of Reuss-Köstritz being an hereditary member. The executive and in part the legislative powers are vested in the Prince, who is assisted by a cabinet of three members. The principality sends one member to the Bundesrat and one deputy to the Reichstag. The population in 1900 was 138,993, almost entirely Protestant. The capital is Gera. Consult: Mauke, *Heimatkunde des Fürstentums Reuss* (Halle, 1877); Gaul, *Beiträge zur Landeskunde des Fürstentums Reuss* (Greiz, 1900).

REUSS, EDUARD WILHELM EUGEN (1804-91). An Alsatian Protestant theologian. He was born at Strassburg, July 18, 1804, was educated at the seminary of his native town, studied theology and Oriental philology at Göttingen, Halle, and Paris, and took orders in the French Protestant Church. He returned to Strassburg as privat-docent, was made professor extraordinary at the university in 1834, and held different positions there till 1888. He died April 15, 1891. His principal works are: *Die Geschichte der heiligen Schriften des Neuen Testaments* (1842; 6th ed. 1887; Eng. trans. 1884); *Histoire de la théologie chrétienne au siècle apostolique* (1852; 3d ed. 1864; Eng. trans. 1872-74); *Histoire du canon des Saintes Ecritures* (1862; Eng. trans. 1884); *Die Geschichte der heiligen Schriften des Alten Testaments* (1881; 2d ed. 1890). He was one of the editors of the great edition of Calvin's works (59 vols., 1869-1900), and published a complete French translation of the Bible with commentaries (19 vols., 1875-81). Consult the memorial address by Lobstein (Strassburg, 1891).

REUSS, RODOLPHE (1841—). An Alsatian historian, born in Strassburg and educated there, at Jena, at Berlin, and at Göttingen. He became professor at the gymnasium of Strassburg in 1865, and after the Franco-Prussian War resumed this position, retiring from the Protestant seminary. From 1872 to 1896 Reuss was librarian of the Strassburg library. In 1896 he was appointed professor at the Ecole des Hautes Etudes in Paris. His historical writings in both French and German deal with Alsace; among them are: *Beiträge zur Geschichte des dreissigjährigen Krieges im Elsass* (1868); *Vieux noms et rues nouvelles de Strasbourg* (1883); and the important *Alsace au XVIIIème siècle* (1897 et seq.).

REUTER, roi'ter, CHRISTIAN (1665-1712). A German author, born at Kütten, near Halle. He was a witty and gifted writer, and was especially effective in character delineation. In his *L'honnête femme; oder die ehrliche Frau zu Pflissine* (1695) he skillfully uses Molière's fable in *Les précieuses ridicules*. His chief work is the novel *Schelmuffsky Reisebeschreibung* (1696), which was reedited by Schullerus in 1885, and his other writings include *Der ehrlichen Frau Schlampampe Krankheit und Tod* (1696) and *Letztes Denk- und Ehrenmahl der Frau Schlampampe* (1697), which were republished in 1890.

REUTER, FRITZ (1810-74). A German humorist, who wrote in Low German (Plattdeutsch). He was born at Stavenhagen, in Mecklenburg-Schwerin, and was educated there and at Rostock and Jena, where he was arrested for political agitation (1833), and condemned to death, a sentence commuted to thirty years' imprisonment. He was confined in various fortresses till 1840, when he resumed legal studies at Heidelberg, afterwards managing his father's estate till 1850, when he became a private tutor at Treptow in Pomerania. Here he first began to write Low German sketches in prose and verse, the first volumes of which, *Läuschen un Rimels* (1853), showed such charming blending of humor and pathos in anecdotes and genre pictures as to achieve an immediate success, which was confirmed by the reception of *Polterabendgedichte* (1855) and *De Reiss' nah Belligen* (1855). In 1856 Reuter moved to Neubrandenburg and gave

himself wholly to writing. The best of his many volumes are *Schurr-Murr* (1861) and *Olle Kamellen* (1860-66). This latter contains the partly autobiographical *Ut mine Festungstid* and *Ut mine Stromtid*. (his greatest work); and the vigorous picture of Germany in 1813, *Ut de Franzosentid*, with other work of less value. In 1863 Reuter moved to Eisenach, where he died, July 12, 1874. Reuter is one of the most realistic of the greater German writers. It is the realism of the Dutch genre painters, minute, good-humored, bourgeois, as artistic in pathetic as in comic scenes. Reuter's works are in 13 volumes (Weimar, 1863-68), with two volumes of *Remains* and *Biography* (ib., 1875), and a comedy, *Die Drei Langhänse* (1878). Consult: Glagau, *Fritz Reuter und seine Dichtungen* (2d ed., Berlin, 1875); Ebert, *Fritz Reuter, sein Leben und seine Werke* (Güstrow, 1874); Romer, *Fritz Reuter in seinem Leben und Schaffen* (Berlin, 1895).

REUTER, HERMANN FERDINAND (1817-89). A German theologian, born at Hildesheim. He studied in Berlin and Göttingen; in 1843 became lecturer in the University of Berlin; from 1853 to 1876 was successively professor at Breslau, Griefswald, and again at Breslau; and in 1876 was called to Göttingen. His writings in Church history show thorough and scholarly research, and his criticisms are well grounded and clearly expressed. His publications include *Geschichte Alexanders III.* and *der Kirche seiner Zeit* (1845-64) and *Geschichte der religiösen Aufklärung im Mittelalter* (1875-77). He founded the *Zeitschrift für Kirchengeschichte*, in which he published his *Augustinische Studien* (1876).

REUTER, PAUL JULIUS, BARON (1821-99). A pioneer in the business of news-gathering, born at Cassel, Germany. He was connected with the electric telegraph system from its earliest establishment in Europe, and was the first to organize a central bureau for the systematic collection and dissemination of telegraphic news. This office was opened at Aix-la-Chapelle in 1849. In 1851 he transferred his office to London. Reuter established agencies in all parts of the world to supply him with news; and, by using all available means of communication, and serving all papers impartially, he built up a noteworthy news service. In 1865 he transferred his business to a limited liability company, of which he was manager until 1878. In the same year he obtained from the Hanoverian Government a concession for the construction of a cable line between England and Germany. The title of baron was conferred upon him by the Duke of Saxe-Coburg-Gotha in 1872.

REUTLINGEN, roit'ling-en. A town in the Kingdom of Württemberg, Germany, on the Echatz, at the foot of the Swabian Alps, 20 miles south of Stuttgart (Map: Germany, C 4). The thirteenth-century Gothic church, partly rebuilt in 1844, is now undergoing a thorough restoration. There are a gymnasium, a weaving school, a school of women's work, and a pomological institute. The town is an important centre of the yarn, woolen, cotton, and cloth industry. In 1240 Reutlingen became a free Imperial city. Subsequently it was a member of the Swabian League, and was annexed to Württemberg in 1803. Population, in 1890, 18,542; in 1900, 21,481.

RÉVAI, rá'voi, NICHOLAS (1750-1807). An Hungarian poet and philologist, born at Szent Miklós (Toronto). He entered the Piarist Order when he was seventeen, taught drawing, philosophy, poetics, and rhetoric in the schools of the Order, and in 1802, after several years devoted entirely to literature, was appointed professor of Hungarian philology in the University of Pesth. He had begun to write poetry even before joining the Piarists, and in 1778 and 1787 published volumes of elegies, and versions from the Latin elegiasts, the Alexandrine poets, the Anacreontics, and a part of the *Iliad*. But his chief title to remembrance lies in his work in the realm of comparative grammar, his discovery that Lapp, Finnish, Estonian, and Ostiak are nearly akin to Hungarian, and his researches in Magyar etymology, as contained in *Antiquitates Literaturæ Hungariæ* (1803) and *Grammatica Hungarica* (1803-06).

REVAL, rév'al (Russ. *Revel*). An important Baltic seaport of Russia, and capital of the Government of Esthonia, situated on the Bay of Reval, an inlet of the Gulf of Finland, about 230 miles west-southwest of Saint Petersburg (Map: Russia, B 3). The town consists of two parts, the upper town or Domberg (Cathedral Hill), with the old castle, the administration buildings, and the residences of the aristocracy, and the lower town, mediæval in appearance and containing the old town hall, the House of the Schwarzhäupter (an association of merchants), dating from the time when the town was a member of the Hansa, and a guild house with a museum of Baltic antiquities. The educational institutions include three gymnasias, a Realschule, and a technical railway school.

The manufactures are machinery and beer. The harbor of Reval is one of the most spacious in Russia and freezes but seldom. The annual value of the commerce is over \$30,000,000, giving Reval the third rank among the Baltic ports of Russia. The principal exports are spirits, grain, flax, and animals; the chief imports, cotton, coal, and petroleum. Reval is the seat of an admiralty and of the administration of the Baltic light-houses. The sea baths in the vicinity are well patronized. Population, in 1897, 64,600, about one-half Esthonian, and over one-fourth German. The foundation of Reval is ascribed to the Danish King Waldemar II., who built there a castle in 1219. The town joined the Hanseatic League in 1285 and soon attained considerable commercial importance. In 1346 it passed from the overlordship of the Danes to that of the Teutonic Knights. Sweden acquired it in 1561, and Peter the Great annexed it to Russia in 1710. Consult: Amelung, *Revaler Altertümer* (Reval, 1884); Rottbeck and Neumann, *Geschichte und Kunstdenkmäler der Stadt Reval* (Reval, 1896).

RÊVE, râv, LE (Fr., The Dream). One of the Rougon-Macquart series of novels by Emile Zola (1888). The story is in strong contrast with others of the series, the life of cathedral establishments forming the background of an idyllic tale of mysticism and human love.

REVEILLE, re-väl'yá, or (more usually in United States military service) rév'á-lé' (OF. *reveil*, Fr. *rêveil*, awakening, from OF. *reveiller*, to awake again, from *re*, again + *veiller*, to awake, from Lat. *ex*, out + *vigilare*, to awake, from *vigil*, wakeful, from *vigere*, to be lively;

ultimately connected with Eng. *wake*). A military trumpet, bugle, or drum call sounded at break of day, or such time afterwards as may be ordered, to rouse the men from sleep. Officially, it is the commencement of the day's routine. The military day is from reveille to retreat (q.v.); and the night from retreat to reveille. See BUGLE AND TRUMPET CALLS.

REVELATION (Lat. *revelatio*, from *revelare*, to reveal, unveil, from *re*, back again, anew + *velare*, to veil, from *velum*, veil, cloth, sail, from *vehere*, to carry along). In theology, a term used in both a general and a specific sense. In its broadest signification it expresses the unveiling or manifestation of the Divine to the human. In the narrower sense it is applied to one form of this manifestation, viz. the written word of God.

Using the term in the first or general sense, God manifests Himself in nature, in history, in the moral government of the world, in reason, and in the old ethnic religions and certain of the pagan philosophers. It seems impossible to believe in man and in a personal God without believing in a Revelation. The aspirations of the soul demand it. Man himself, as reflecting the Divine image, warrants it. Nature is the speaking and acting of God. It is Divine language in cipher. The universe is a manifestation of God's glory, a disclosure of His power. Specific revelation does not contradict these indications of Divine truth in nature. It gives them articulate expression. *History* and revelation are inseparable. The march of events and the development of ideas are but parts of a moving panorama of Divine creation and guidance. History is a chapter in the book of man's evolution. Behind the veil of external contingency there are the moral order of the life of nations, the rise and fall of dynasties, the progressive history of the human race, the development of man's religious consciousness in thought and in civilization. *Reason* and revelation are not antagonistic. Reason grasps and discerns and even defines the supersensuous. It is part of the Divine image in man, and so is naturally predisposed to the reception of the revealed. Many truths sometimes held not to be discoverable by reason are perfectly agreeable to it when discovered. The *ethnic religions* were clearly media of Divine revelation. They were partial disclosures of God to man—a feature in His gradual unveiling of Himself. They were preparatory to Christianity. *Pagan philosophy*, in the persons of some of its brightest lights, was a forerunner of the written word. Men like Socrates, Plato, and Aristotle among the Greeks, and Cicero, Epictetus, and Marcus Aurelius among the Romans, had wonderful glimpses of truth, and formulated admirable moral codes. They have been described as Christians without knowledge of the Christ. In fact, natural and revealed religion are now widely viewed as parts of a great whole, and not as distinct and separate manifestations of the Divine. Much of the teaching of revelation, technically so called, consists in the unveiling to us of nature and of life. Revelation does not merely superadd to the achievements of human knowledge. It penetrates to the moral and spiritual meaning of the world in which we live.

The advocates of a special revelation maintain that, despite all this, the fact remains that

the disclosure of the Divine in revelation generally was but partial, and therefore preparatory to a specific revelation. Man in his intellectuality was painfully sensible of the soul-sickness of the world, but he had no cure. To break the power of sin and quicken the higher and spiritual life he needed a revelation of fatherly love. The deepest discoveries and loftiest achievements of the human intellect needed to be supplemented by a special revelation. "The world by wisdom knew not God." The specific revelation was given in the written word. It may be divided into three epochs, the primitive revelation or protevangelium, the covenant revelation to Israel, and the revelation in the appearance of Jesus Christ. The Incarnation (q.v.) is held to be the culmination of every Divine manifestation, the central point of all history, sacred and profane (Heb. i. 1 and 2). The Old Testament represented a gradual process of education, as evinced, for instance, in the voice in the garden, the theophanies, the burning bush, and dreams and visions. God gave to men as they were able to receive. But the message became more and more explicit as the history of the ancient people was developed, until it culminated in Jesus Christ, in whom men saw "God manifest in the flesh" (John i. 18). The Old Testament is meaningless without the New. The Bible message is incomplete without the story of the Christ.

In discussing the specific revelation of the Scriptures it should be borne in mind that revelation and inspiration are not synonymous terms. Scientific theology distinguishes between them as to both authorship and function. The author of revelation, in the Old Testament and the New, is held to be the Divine Word, the *Logos* (John i. 1 et seq.). The author of inspiration is the Holy Spirit (II. Peter i. 21). *Revelation* has been limited to the direct communication from God to man of (1) such knowledge as man could not attain to in and of himself, and (2) information which, though attainable in the ordinary way, was not, in point of fact, known to the person who received the revelation. *Inspiration* is explained as the actuating energy of the Divine Spirit, under whose guidance the human agents chosen by God have officially proclaimed His will either by (1) word of mouth, or (2) the committal to writing of the several parts of the Bible.

REVELATION OF SAINT JOHN, THE. The name given in the English Bible to the last book in the New Testament. In early lists and manuscripts it is called the Apocalypse of John, the current English title, Revelation, being from the Latin equivalent of the Greek word *Apokalypsis*, the first word of the book.

I. THE NATURE OF APOCALYPTICAL LITERATURE. The Book of Revelation belongs to a distinct class of literature, which has been called,

after the title of this book, apocalyptic. (See APOCALYPTIC LITERATURE.) Only in the light of this classification can the book be understood. The purpose of an apocalypse is usually to explain the present dominion of evil in the world, and to encourage faith by foretelling the approaching end of evil and the fulfillment of the prophetic hopes. The explanation of evil is usually found in the angel-world, and the consummation hoped for is a new world-age, which will come by a miraculous deed of God. Man can do nothing but wait for it with patient faith, and the seer's art consists chiefly in discovering the time and manner of its coming. This he does by such a fitting together of ancient prophecies and apocalyptic images with the events of his own time as shall give assurance that the longed for end is at hand.

Turning to the Book of Revelation, there can be no doubt that it is an apocalypse in the sense just defined, and the presumption that it is to be interpreted as such is strong. Like Daniel, it was written in a time of religious persecution at the hands of the ruling kingdom of the world, and its aim was to encourage the faithful to resist the allurements and endure the violence of the world power in view of the speedy coming of judgment and deliverance. Like Daniel, it has the course and end of world-history in view, and not principally the destiny of the individual soul. Other apocalyptic features of the Book of Revelation are its constant use of the vision form with angelic interpreters; its abundance of highly wrought and fantastic imagery, derived in large part from the Old Testament and from apocalyptic traditions, though freely combined and applied to new conditions; its explanation of the present dominance of evil as due to angel powers, whose malign rule is embodied in the Roman Empire; and its general scheme of the future, which with slight exceptions runs parallel to that of Jewish apocalypses. The mark that distinguishes the book as Christian is the identification of the Messiah with Jesus. We do not find, however, that this involves differences great enough to justify us in separating the book from the class and applying to it different methods of interpretation. It is, then, to be assumed that the predictions of the book concern the immediate and not the distant future, as indeed the writer explicitly affirms (i. 1, 3, xxii. 10-12). There is every probability that the earthly representative and agent of the power of evil is the Roman Empire. We shall expect to find visions or fragments from earlier writings or traditions, and to be able to distinguish between their earlier setting and application and the meaning our author gives them. Furthermore, we shall expect to find the value of the book to lie not in disclosures of the course of Church history down to the present, nor in predictions of still future events, but, historically, in its fitness to meet a great crisis in the life of the early Church, and permanently in its underlying faith in God and the certain victory of His cause.

II. CONTENTS AND PLAN. After the opening admonitions, in the form of letters, to resistance and endurance, the book sets forth the approaching judgments which will lead up to the destruction of Rome and of the satanic beings that inspire and sustain it, and to the final blessedness of the faithful. The progress of the successive visions is not, however, simply chronological, for

we seem to have reached the final judgment and consummation already in chs. vi.-vii. The movement is rather toward greater concreteness and detail, and the writer is interested in accumulating a variety of figurative and prophetic materials for the expression in stirring and impressive ways of his one message that the day of God's coming to bring evil to an end and good to its rights, and its glory, is close at hand. The first suggestion of a plan is found in the successive sevens, the seals, the trumpets, and the vials, but these do not include various important sections of the book. The contents of the seventh seal seems to be set forth in the new series of seven angels with trumpets (viii. 1-5), and the seventh trumpet (xi. 15-19) is followed, but not at once, by the seven vials of God's wrath (xv.-xvi.). But chs. vii., x.-xi. 14, xii.-xiv., xvii.-xxii. have no proper place in this scheme, and justice is not done to the new beginning in ch. x. It is therefore better to divide the book somewhat as follows: Introduction (i. 1-8) I. The Seven Letters (i. 9-iii. 22). II. Preliminary Judgments (iv.-ix.). (1) The actors: God (iv.); Christ (v.); Destructive Powers (vi.); (2) Promises (vii.); (3) Judgments (viii.-ix.). III. Final Judgments (x.-xx.). The Prophet's new commission (x.); Promises (xi. 1-14); Summary or Prelude (xi. 15-19); the Actors: Satan (xii.) and the Roman Empire and emperor-worship (xiii.); Summary promises and warnings (xiv.); Judgments culminating against Rome and its Satanic upholders (xv.-xx.). IV. The Consummation (xxi.-xxii. 5). Conclusion (xxii. 6-21). There are departures from any strict order, which are probably due in part to the use of unrelated sources, and in part to the author's practical aim, which leads him by anticipation to introduce encouraging voices and visions here and there before the end.

III. THE INTERPRETATION. The curious history of the interpretation of this book cannot here be reviewed. It has been supposed to have been written against Mohammed and the Turks; against the Pope and the Roman Catholic Church; against Luther and the Reformation; against Napoleon, etc. Many still hold that the book predicts the whole course of Church history past and to come. The form in which this so-called *Church historical* or *continuously historical* interpretation has still some advocates among scholars (Auberlen, W. Milligan, Benson) is that according to which the book contains in its symbols, not the definite events, but the conflicting powers or principles, good and evil, of Christian history. Almost all scholars, however, seek for the meaning of the book in the conditions of the writer's own time.

The Roman Empire is recognized as the persecuting and godless power, the agent of Satan, whom the book assails and whose fall it announces. Isolated scholars of far older times knew this, but it was especially the work of Lileke, Bleek, and Ewald that established it. With this is commonly connected the view that Nero was the wounded head (xiii. 3), the name signified by 666 (xiii. 18), and the one whose return from Hades and attack upon Rome in alliance with the Parthians is predicted in chapter xvii. The number 666 may, however, stand, as Clemen has recently argued, for ἡ ἑξάρτη βασιλεία, the Latin Kingdom.

In different parts of the book different periods

and different types of religious and Christian thought appear to be indicated. These facts, together with the breaks in the plan of the book already referred to and the composite character of some Jewish apocalypses, have led to the effort to solve the remaining obscurities by literary analysis, and the theory of various dates and authors. Weizsäcker suggested in 1882 that the writer incorporated some older oracles, Jewish or Christian, such as vii. 1-8, vii. 9-17, xi. 1-13, xii., xiii., xvii. Vischer, on the other hand, proposed the view that the book is a Jewish apocalypse (iv. 1-xxii. 5, omitting obvious Christian amendments), set in a framework (i.-iii., xxii. 6-21) and slightly revised by a Christian hand. This theory came out in 1886 with Harnack's indorsement and was accepted by several German critics. More elaborate analyses followed. Two Jewish apocalypses were found in the book by Weyland, and Spitta (1889) made the original book a Christian apocalypse by John Mark (A.D. 60), to which a later Christian added two Jewish apocalypses of the times of Caligula and Pompey. Against this method there has been a reaction in favor of the simpler view of Weizsäcker. The unity of the book is maintained, but the writer is believed to have made use of materials already shaped by earlier hands, and in part Jewish in origin. The Jewish character of vii. 1-8 and of xi. 1-13, with its date before A.D. 70—Jewish oracles applied in a figurative sense to Christians as the true Israel—and some of the peculiarities of xii., xiii., xvii., and other passages, may thus be explained in a way consistent with the ascription of the book to a Christian writer of Domitian's reign.

The next problem naturally is concerned with the first meaning of these incorporated materials. The most important study in this direction is that of Gunkel in reference to chapter xii. (1895). His theory is that the dragon who seeks to kill the child and persecutes the mother is ultimately derived from a Babylonian account of the birth of Marduk, the sun-god, destined to destroy the chaos-dragon and to create the world. Many who have not accepted Gunkel's reconstruction of an otherwise unknown part of the Babylonian myth have approved in general his emphasis on tradition as a great factor in the production of an apocalypse, and many have assented in particular to his theory that a sun-myth underlies chapter xii., whether Babylonian or Greek (Dieterich) or Egyptian (Bousset) in origin. Wellhausen has objected to the method and declared that the writer's own meaning is all we need to inquire after, and that he has shaped his figures to represent current events to a much greater degree than Gunkel allows. Bousset, one of the most important recent writers on the subject, adheres in general to Weizsäcker's idea of the composition of the book and to Gunkel's view of the significance of tradition. He put forth the hypothesis that an apocalypse of Antichrist, of Jewish origin, was current in New Testament times and on into the Middle Ages, that it was not dependent on Revelation, but that several of the fragmentary (Jewish) traditions which Revelation incorporates were derived from it (vii. 1-8, xi. 1-13, xiii., 11-17, xiv. 14-20).

Over against the fixity of apocalyptic tradition, rightly emphasized by Gunkel and Bousset, it is necessary to recognize the fact that the writer of Revelation used Old Testament ma-

terial with much freedom, and in the spirit of a poet, rather than in that of a hide-bound scribe. This is illustrated by such passages as i. 12-20, iv., xviii., xxi.-xxii. 5. The author writes as one whose mind is filled with Old Testament prophetic language; one who is almost limited to it for the expression of his thoughts, yet uses it freely and puts into it the emotions of his own soul. That his emotions were intense is a fact that must be seriously reckoned with in studying his book, whatever one may think about the question of actual ecstasy.

IV. HISTORICAL OCCASION, PURPOSE, AND DATE. The Seven Letters (chapters i.-iii.) are the most original part of the book and contain the most specific references to concrete conditions. Though addressed to actual churches whose conditions the writer knows, they are evidently meant, taken together, to give the message of the spirit of Christ to all His churches. The seven cities are named in geographical order, moving from Ephesus north, east, and south. The worship of the Emperor had been enforced in this region for a long time. Pergamum had a temple to Augustus in B.C. 29 and remained the centre of the cult in Asia (cf. Rev. ii. 13). The Book of Revelation was written chiefly to encourage Christians to resist this worship at whatever cost and to warn those who were falling away under its pressure and the enticements of the heathen thought and life that went with it. This cult is the second beast of chapter xiii., and all who take part in it are threatened with the impending fate of Rome itself, while those who resist it even to death will receive a glorious reward. Some persecutions of Christians had already been endured (ii. 3, 13, iii. 8), but far more severe trials were at hand (ii. 10, iii. 10) for which the book would prepare the way. The glory and reward of martyrdom are its theme. An official persecution of Christianity such as is here contemplated points to a time not earlier than Domitian. The relaxation of earlier zeal, the loss of love, the adoption of heathen ways of living, which the letters condemn, indicate the same period, as does the fact that Paul's position as founder of the church at Ephesus appears to be wholly a thing of the past. It is true that xi. 1-13 dates from before A.D. 70, but it is no less certain that it was originally a Jewish oracle. Its application in a figurative sense to the safety of the true worshippers of God, that is Christians, in the approaching crisis shows that the literal siege and fall of Jerusalem had long ago proved the oracle to be in its literal sense—which was indeed contrary to the word of Jesus—untrue. In xvii: 10, Vespasian seems indicated, but verse 11 is probably meant to carry us over into Domitian's reign. If the Nero myth is referred to in chapter xvii., this also, in this form, belongs to the close of the century. We may therefore conclude that the book was written, as Irenæus says, "near the end of the reign of Domitian," that is about A.D. 93-96.

V. THE CHRISTIANITY OF THE BOOK. The relation of the book to Paulinism is an unsolved problem. The stress it lays upon the transcendence of God, and upon the kingly and judicial functions of Christ, its view of salvation as a reward for overcoming the world and keeping the commands of God, are Judaistic aspects of the religion of the book. Its attitude toward Rome, also, is not that of Christ (Mark xii. 17) and

of Paul (Rom. xiii. 1-7, cf. 1 Pet. ii. 13-17). Yet an anti-Pauline tendency need not be inferred. Circumstances had changed, and Rome had become the power of lawlessness, instead of the one who restrained that power (11 Thess. ii. 7), so that Antichrist would inevitably take on a Roman in place of a Jewish form. Furthermore, over against the Jewish-Christian traits of the book we find a Christology not unrelated to Paul's (cf. i. 5, iii. 14, with Col. i. 18, and Rev. v. 9 sqq. with Phil. ii. 5 sqq.), an eschatology at many points in striking agreement with his, and a universality which at least is totally different from the exclusiveness of Paul's Judaistic opponents (vii. 9 sqq.). We cannot therefore with Baur regard Revelation as a simple product of the Jewish Christianity which opposed Paul. It is probably best to say that the book represents a late development of primitive Christianity, not much influenced either way by Paul.

VI. CANONICITY AND AUTHORSHIP. The place of Revelation in the canon has been much disputed. It was accepted in the Western Church after Hippolytus wrote in its defense against Caius, a Presbyter of Rome (c.215). For a long time the Eastern Church refused to recognize the book as canonical. Eusebius records and sympathizes with the objections of its critics. It was not in the original Syriac New Testament. The pressure of the Western Church finally secured its place in the canon. In the West only Jerome shows some sympathy with Eastern doubts. Its place in the canon was again somewhat insecure at the beginning of the Reformation—Luther in the first edition of his New Testament expressed a strong aversion to it, because of its obscurity, and especially because he did not find in it the Pauline gospel. Later he expressed a more favorable judgment. Zwingli did not accept it as canonical. Calvin at least did not comment upon it.

The writer calls himself John (i. 1, 4, 9; xxii. 8), and says that he saw his visions on the island of Patmos (q.v.), where he was, it would seem, in banishment. Justin Martyr is the first to identify this John with the Apostle, and from Irenæus and Tertullian onward this view was almost unquestioned. Yet Dionysius of Alexandria (c. 255) argued on the basis of a comparison with the fourth Gospel that the author of Revelation was another John; and Eusebius suggested the Presbyter John, of whom Papias speaks. The earliest opponents of the canonicity of the book, the Alogi, ascribed it to the Gnostic Cerinthus, an idea adopted by Caius. The author himself does not say that he is an Apostle (see on the contrary, xxi. 14; xviii. 20), and nowhere reveals any personal knowledge of the earthly life of Jesus. It cannot quite be said that he assumes a position of personal or official authority over the seven churches. He is their brother and fellow in trial (i. 9), but the authority that speaks through him is Christ. He claims only to be a true prophet, truly to convey the message of Christ. For his book he makes great claims, but not for himself. Of the three possibilities: that it is by the Apostle; that it is a pseudonymous writing, in the Apostle's name; and that it is by another John—the second can with some confidence be rejected. For though pseudonymity characterizes all Jewish apoca-

lypses, we find here none of the familiar signs of it, no references to known events in the life of John such as we should expect. If the Apostle were the recognized head of the churches of Asia, centring in Ephesus, during the last quarter of the first century, the expression "John to the seven churches" (i. 4) would suggest him. If that place was occupied by John the Presbyter, he would be the one indicated. The most serious difficulty in the way of accepting the Apostle's authorship is the radical difference in style and in conception that separates the Apocalyptic from the Gospel. Though minor points of likeness exist, the difference is so great that it seems almost impossible to ascribe them to one mind. The difficulty is greater now that it is no longer probable that they can be separated widely in date by putting Revelation before A.D. 70. The question of authorship must therefore remain open, but this question does not affect our view of the value of the book and the way in which it is to be understood.

BIBLIOGRAPHY. The Church-historical view can be read best in Milligan, *Commentary on the Apocalypse*, Baird Lectures (London, 1886); id., *Discussions on the Apocalypse* (ib., 1893); id., *The Book of Revelation*, Expositor's Bible (New York, 1899); and in Benson, *The Apocalypse* (London, 1900); the older critical view (contemporary-historical), in the commentaries of Lücke (2d ed., Bonn, 1848-52); Bleek (Berlin, 1862); and Ewald (Göttingen, 1862). Consult also the commentary of Alford (London, 1867). The best recent commentaries are those of Bousset (Göttingen, 1896) and Holtzmann (Freiburg, 2d ed., 1893), and in English, Simeox, Cambridge Bible (Cambridge, 1898), and Scott, Century Bible (Edinburgh, 1902). REVENUE, PUBLIC. See FINANCE; TAXATION.

REVENUE CUTTER SERVICE, UNITED STATES. A military service, organized by act of Congress in 1790, for the enforcement of navigation and customs laws. It was the first armed maritime force of the Government, having been constituted about eight years before the United States Navy. There being no naval establishment at that time, the service, as a matter of convenience, was attached to the Treasury Department, then presided over by Alexander Hamilton, where it has since remained. Its first fleet consisted of 10 small, single-masted, light-draught sail-

ing vessels, manned with 10 masters, 30 mates, 40 mariners, and 20 boys. By degrees, and as occasion arose, the service was augmented in strength and armament, and on July 1, 1799, Congress authorized the President to "cause the revenue cutters to be employed to defend the sea-coast and to repel hostility to vessels and commerce within their jurisdiction." The rapid growth of foreign trade, and a shipping interest that was constantly developing at home, created the necessity for more efficient means of protection, and swifter cruisers, better armed, manned and equipped, were gradually added to the force. The duties of these vessels were extended to the suppression of piracy that had become common on account of the many adventurers attracted to American waters. A distinctive revenue ensign and pennant were provided by law. (See Colored Plate in article FLAG.) Beginning in 1843, steamers were introduced, and they have entirely superseded the old type of sailing cutters.

Revenue cutters have participated in all the wars of the United States except the Algerine war, and have been prompt to respond to any emergency. In 1797, when France assumed a belligerent attitude, and during the troublous times that followed, the cutters aided in maintaining the dignity and position of the Government. Seven of them were employed in the waters of the West Indies. The Embargo Act of 1807, intended to countervail Napoleon's decrees, put the service into special requisition in guarding the seaboard and preventing the departure of unauthorized merchant ships. In the War of 1812 its force was actively engaged in patrolling the coast and repelling foreign invasion. During the nullification troubles of 1832-33 several revenue vessels were stationed off Charleston ready to enforce the execution of the tariff laws. At the time of the Seminole War, in 1836, they transported troops and munitions, and afforded protection to settlers along the coast. In the war with Mexico eight vessels shared in the naval attacks on Alvarado and Tabasco and cooperated with the naval squadron. In 1858 the steam cutter *Harriet Lane* took part in the naval expedition to Paraguay, and was considered one of the most efficient ships of the fleet. During the Civil War the cutters were busily engaged conveying dispatches, pursuing blockade-runners, doing guard and reconnaissance duty, and joining in attacks on the enemy's forts and batteries. Throughout the war with Spain 20 vessels of the service, carrying 71 guns, 131 officers, and 725 men, were employed with the army and navy, while 3, just constructed, with 25 officers and 210 men, were under orders to go to the front when the war closed. Eight cutters were in the North Atlantic squadron on the Cuban blockade, 4 cooperated with the navy on the Pacific coast, while one was in the Battle of Manila Bay.

In 1903 there were in the service 44 vessels, 17 of them harbor and anchorage boats, steam launches, etc., 1 a practice bark, and the remaining 26 steamers ranging from 152 to 869 tons burden. Those built of steel in recent years are admirable models of marine design and architecture and are among the fastest of their class afloat. Nearly all have been constructed under the immediate supervision of officers of the corps and devised with special reference to the general needs of the service. They are usually armed

with from 2 to 9 improved rapid-fire guns, and are provided with necessary small arms for the use of the crews. In time of war their equipment may be readily augmented. The vessels are kept prepared, as far as possible, for prolonged voyages and the performance of any duty that may be legally assigned them. In this connection it may be stated that about all the early authentic information concerning the natural features of Alaska, its climate, the characteristics of the natives, and the resources of that country, were obtained by explorations made by officers of the revenue cutter service. Several vessels make cruises each year into the Bering Sea and Arctic Ocean for the protection of the fisheries and Government interests.

The active list of the service comprised, in 1903, 37 captains, 37 first lieutenants, 37 second lieutenants, 37 third lieutenants and cadets, 1 captain of engineers, 35 chief engineers, 17 first assistant engineers, 18 second assistant engineers, and 1 constructor, and in addition about 1000 petty officers and seamen. The officers of the engineer corps rank with line officers of corresponding grades, and the constructor has the rank of first lieutenant. All are commissioned by the President, by and with the advice and consent of the Senate, and, under the law, rank is held as follows: Captains with majors in the army and lieutenant-commanders in the navy; first lieutenants with captains in the army and lieutenants in the navy; second lieutenants with first lieutenants in the army and lieutenants (junior grade) in the navy; third lieutenants with second lieutenants in the army and ensigns in the navy. When revenue cutters serve in cooperation with the navy, pursuant to law, their officers hold rank with and next after naval officers of the grades named. The commissioned officers of the service receive the same pay and allowances as officers of corresponding rank in the army, and are retired for physical disability or on reaching the age of 64 years. Promotions are made, in the order of seniority, to fill vacancies which may occur in the various grades, after the candidates have qualified by a professional examination.

In 1876 Congress enacted a measure permitting the Secretary of the Treasury to appoint cadets to fill vacancies occurring in the grade of third lieutenant. The object was to provide means for educating young men for deck officers. Under the operation of this system nearly two-thirds of the active list of the line in 1903 were composed of cadet graduates. Some 10 additional appointments have been made from graduates of the Naval Academy. Before the cadet system was organized candidates from the merchant marine and volunteer navy were admitted directly to the grade of third lieutenant. An applicant for a cadetship must be not less than 18 nor more than 25 years of age, of vigorous constitution, physically sound and well formed, not less than 5 feet 3 inches in height, of good moral character, and unmarried. He is required to pass a satisfactory entrance examination in spelling, geography, general history and Constitution of the United States, grammar, composition and rhetoric, arithmetic, algebra, geometry, trigonometry, physics, English literature, one modern language (either French, German, or Spanish), and general information. The examination, which is open to all qualified

persons, is held annually under the direction of the Civil Service Commission. From those passing highest, provided they reach the required standard, a class is formed which is ordered to report for instruction on the practice ship *Chase*. The term on the practice ship covers a period of three years and comprehends a strict course of discipline and instruction in all matters pertaining to the professional requirements of an officer. A cadet receives \$500 per annum and one ration per day, and must provide himself with the prescribed uniforms. At the expiration of his probationary term of three years, if his deportment and progress have been satisfactory, he is rewarded with a commission as third lieutenant. Original appointments in the engineer corps are made from civil life upon thorough examinations.

The work of the Revenue Cutter Service, as defined by law, consists in the enforcement of about every statute bearing upon the maritime interests of the nation. Its duties embrace the protection of the customs revenue; the enforcement of the laws against smuggling, those pertaining to national quarantine, the neutrality laws, the navigation laws, including vessels' documents, and all requirements in regard to the rules for preventing collisions, officers' papers, steamboat inspection, and passenger service; the laws in suppression of piracy, robbery, and mutiny on the high seas; those for the protection of the seal fisheries and sea-otter hunting grounds in Alaska, and for the prevention of illegal traffic in firearms, ammunition, etc., in that territory; the laws for the protection of wrecked property and the timber reserves of the United States; the laws for the suppression of the slave trade; those that require necessary life-saving appliances to be kept on board merchant vessels; the laws in regard to the anchorage of vessels in the ports of New York and Chicago, in the Saint Marys River, Michigan, etc., and the regulations to insure the safety of observers of and participants in regattas on navigable waters. During the dangerous and inclement season, from December 1 to April 1 of each year, revenue cutters are, by direction of the President, required to cruise actively along the coast to afford aid to vessels in distress. Those detailed for such duty are provided with special supplies, including extra provisions for the shipwrecked, and are instructed to extend to all requiring relief such assistance as may be adapted to their condition and necessities. The cutters on the Great Lakes are, during the period of open navigation, charged with similar important work. An important function of revenue cutter officers is their connection with the Life-Saving Service (q.v.). They are detailed to do the inspection work of the latter and to drill the surfmen in the use of life-saving apparatus, and to see that the equipments of the stations are kept in efficient condition. Several officers are also assigned to superintend repairs and the construction of new stations. Besides the fixed duties of the service there are numerous others which it is called upon to perform from time to time, such as aiding the Public Health and Marine Hospital Service, the Lighthouse Establishment, the Coast Survey, the Fish Commissioner, the ocean telegraph lines, etc. Each vessel has assigned to her a certain district, within which she carries out her specified duties. The districts on the Atlantic and Pacific seaboard and the Great

Lakes are contiguous and therefore cover the entire coast of the United States.

REVERBERATORY FURNACE. See IRON AND STEEL; LEAD.

REVERE, rē-vēr'. A town, including three villages, in Suffolk County, Mass., five miles north by east of Boston; on the Boston and Maine and the Boston, Revere Beach and Lynn railroads (Map: Massachusetts, E 3). It is finely situated on the Atlantic coast, and is an attractive residential place and a summer resort. Revere Beach has a bath-house built and maintained by the State, and is one of the most popular bathing resorts on the Massachusetts coast. It has also a splendid boulevard. There are a handsome town hall and a public library with 7000 volumes. Revere was settled in 1626 and, under the name of Rumney Marsh, formed a part of Boston until 1738. Incorporated as Chelsea in 1739, it was set off and reincorporated as North Chelsea in 1846, and received its present name in 1871. Population, in 1890, 5668; in 1900, 10,395.

REVERE, rā'vā-rā, GIUSEPPE (1812-89). An Italian poet, born at Triest. He wrote for *La Concordia*, a liberal journal of Turin; took part in the events of 1848; and afterwards lived in Turin, Genoa, and Rome. He began his career as a dramatist with a series of historical plays, in the form made popular by Niccolini. He also wrote the historical works, *La cacciata degli Spagnuoli da Siena* (1847); the poetical works, *Sdegno e affetto* (1845), *Nuovi sonetti* (1846), *Persone ed ombre* (1862), *Ossiride* (1879); and two volumes of sketches, *Bozzetti alpini* (1857) and *Marine e paesi* (1858).

REVERE', PAUL (1735-1818). An American patriot, born in Boston, Mass. He learned from his father the trade of a goldsmith and soon became skillful as an engraver on silverware. In 1756 he served as a lieutenant in the Crown Point expedition, and, returning to Boston, established himself as a goldsmith and a copper-plate engraver. He was a member of the grand jury which in 1774 refused to serve on account of the act of Parliament making judges independent of the legislature as regards salary. He engraved the plates and printed the paper money ordered in 1775 by the Provincial Congress, and in the same year established a powder mill in Boston. He early took an active interest in the disputes with the English Ministry, participating in the "Tea Party" (1773) and carrying the news of it to New York and Philadelphia, and in 1774 became a member of a society organized to watch the British in Boston. On April 18-19, 1775, at the request of Joseph Warren, he made his memorable midnight ride to Lexington to warn Hancock and Samuel Adams of the approach of English troops, arousing the people on the way. Then, passing on toward Concord with William Dawes and Dr. Samuel Prescott to warn the people there, he was captured by a party of British soldiers and was brought back to Lexington, where he was released on the next day. This ride has been made the theme of a celebrated poem, *The Midnight Ride of Paul Revere*, by Longfellow. Subsequently becoming lieutenant-colonel of State artillery, Revere accompanied the unsuccessful Penobscot expedition in 1779.

REVERIE, or **REVERY** (Fr. *rêverie*, OF. *resverie*, from *resver*, *rêver*, *rever*, to rave, from

Lat. *rabies*, rage, from *rabere*, to rage). A word borrowed from the French, and somewhat loosely used to signify a state of mind obtaining during waking life and characterized by neglect of present surroundings, meditateness or abstraction. True reverie, like the dream of sleep, is marked by a condition of discursive, passive attention. There is, to be sure, abstraction, forgetfulness of one's environment, but the trend of consciousness is not toward any definite goal. Like the dream, too, the reverie is apt to be fleeting and easily forgotten. Its fancifulness and fleetingness is but another evidence of the lack of control by active attention. Consult: Titchener, *Outline of Psychology* (New York, 1899); James, *Text-Book of Psychology* (New York, 1892); Carpenter, *Mental Physiology* (London, 1888). See ASSOCIATION OF IDEAS; ATTENTION; DREAMING; HYPNOTISM.

REVERSION (Lat. *reversio*, from *revertere*, to turn back, from *re*, back again, anew + *vertere*, to turn; connected with Skt. *varṭ*, Ochurch Slav. *vrātĭti*, *vratiti*, to turn, Goth. *vaírþan*, AS. *veorþan*, OHG. *werdan*, Ger. *werden*, to become). A form of heredity (q.v.). Cases occur where an individual inherits not its parents' physical or mental characteristics, but those of its grandparents, or more remote ancestors. This happens in cultivated plants and domestic animals artificially bred from wild forms. If such forms are neglected or return to free nature, i.e. run wild, they tend to 'revert,' 'throw back,' i.e. to transmit the characteristics of the original wild species or variety. Darwin remarks that reversion may be divided into two classes: (1) Those occurring in a variety or race which has not been crossed, but has lost by variation some character that it formerly possessed, and which afterwards reappears; (2) all cases in which an individual with some distinguishable character, a race, or species, has at some former time been crossed, and a character derived from this cross, after having disappeared during one or several generations, suddenly reappears. He gives extensive examples in illustration, and concludes that a tendency to atavism is "an integral part of the general law of inheritance." In breeding zebra-hybrids by crossing mares of various sizes with a male zebra, the hybrids, says Ewart, showed a curious blending of characters, derived apparently partly from their actual and partly from their remote ancestors. As the result of Ewart's experiments some of the hybrids in make and disposition strongly suggest their zebra sire, others their respective dams, but even the most zebra-like in form are utterly unlike their sire in their markings, probably taking after an ancestor thousands of generations removed. Consult: Darwin, *Variation of Animals and Plants Under Domestication* (London, 1888); Ewart, *The Penycuik Experiments* (London, 1899). Compare ATAVISM.

REVERSION. The residue of an estate or interest remaining in a grantor of real property who has conveyed away one or more estates in it, amounting to less than a fee simple in quality and duration. A reversion is said to arise by operation of law, that is, without special act of the parties to a conveyance, and in this respect it differs from a remainder, which must be created by express words in a conveyance. See REMAIN-

DER. Consult the authorities referred to under REAL PROPERTY.

REVETMENT (Fr. *revêtement*, from *revêtir*, OF. *revestir*, to line, from *re*, again + Fr. *vêtir*, OF. *vestir*, to clothe, from Lat. *vestire*, to clothe, from *vestis*, garment). An important device in both permanent and field military fortifications. In the former, it is usually a retaining wall of masonry, built for the purpose of holding back or strengthening the earth of which the works are composed. Revetments are ordinarily used for the escarp (q.v.) and counterescarp (q.v.) of the ditch (q.v.), the more important being the escarp, which has to hold back the great mass of earth represented by the rampart, parapet (q.v.), and banquette. It is usually of solid brickwork or stone, about 5 feet thick at the top, and sloping outward as it descends (on the ditch side only) about 1 in 6. Additional strength is obtained by reinforcing the revetment wall by massive buttresses at intervals of 15 feet, called *counterforts*, and these again are sometimes connected and strengthened by masonry arches outside the revetment. In field works the amount of resistance offered by a redoubt or similar fortification to the artillery fire of an enemy will greatly depend on the character of the revetments, which may be of sods, timber, hurdles, or gabions (q.v.). See FORTIFICATIONS; REDOUBT; and SIEGE AND SIEGE WORKS.

REVIEW (OF., Fr. *revue*, from *revoir*, to review, from Lat. *revidere*, to see again, from *re*, back again, anew + *videre*, to see). A military parade, followed by inspection and review, the latter usually consisting of a salute tendered to the reviewing officer as the troops 'march past.' This ceremony to-day is merely an exhibition of number, equipment, bearing, discipline, physique, and general condition, and consequently is treated almost exclusively as a compliment to a distinguished visitor, or as the finale to a field day. In the United States Army, reviews may be held by a battalion, regiment, brigade, division, or corps; but only on such occasions and for such purposes as are authorized by army regulations.

REVIEW. See PERIODICAL.

RÉVILLE, rā'vêl', ALBERT (1826—). A French Protestant clergyman and author, born at Dieppe (Seine-Inférieure). He studied at Dieppe, Geneva, and Strassburg; was for a time vicar at Nîmes, later pastor at Luneray, near Dieppe, and in 1851 became pastor of the Walloon Church at Rotterdam. In 1873 he returned to Dieppe, where he pursued philosophical studies until his appointment as professor of the history of religions in the Collège de France. He also became president of the section of religious sciences in the Ecole Pratique des Hautes Etudes. He ranked as one of the most advanced representatives of the French liberal Protestantism of his time. His publications include a translation (1849) of Whately's *Introductory Lessons on the History of Religious Worship* (London, 1849), *Essais de critique religieuse* (1860; 2d ed. 1869), *Théodore Parker, sa vie et ses œuvres* (1865), *Douze sermons* (1874), *Protégomènes de l'histoire des religions* (1881), and the *Histoire des religions* (1883-89), his most extensive and important work.

REVILLOUT, rā'vê'voo', EUGÈNE (1843—). A French Egyptologist, born at Besançon. He

was educated for the Church, but preferred Oriental studies, entered the department of Egyptian antiquities at the Louvre as an assistant in 1869, aided in founding the Ecole du Louvre in 1880, and in 1881 became professor and curator of the Egyptian collection of that museum. Revillout's great work was the publication of the *Chrestomathie démotique* (1878-80), supplementing Brugsch's discoveries in the demotic language. Besides, he specialized on Egyptian law, founded, with Brugsch and Chabas, the *Revue Egyptologique* in 1880, and published: *Papyrus coptes* (1876), *Le roman de Setna* (1880), *Corpus Papyrorum Ægypti* (1885-92), *Cours de droit égyptien* (1885), *Cours de langue démotique* (1885), *Lettres sur les monnaies égyptiennes* (1895), *Mélanges sur la métrologie, l'économie politique et l'histoire de l'ancienne Égypte* (1897), and *Précis du droit égyptien* (1899-1903).

REVISED STATUTES. The acts of the legislatures of the various States and of Congress are usually printed and bound into volumes after each session of those bodies. This is done by an authorized printer under the supervision of a State official, usually the Secretary of State, who compares the acts as thus printed with the original copies thereof, and certifies as to their accuracy. Such publications are known as the *statutes at large*, and include all acts whether general or local in character. After a large number of these volumes have been issued, covering a considerable number of sessions, it naturally follows that many of the acts found in the earlier volumes are repealed or amended by acts reported in the later ones; and that some statutes have become practically obsolete by reason of changed conditions. Where this state of facts exists, it is necessary to examine all the 'year books,' as such volumes are usually called, in order to determine the statute law on any given subject. In order to render the statute law more accessible, settle positively any questions as to the intention of the legislature in passing acts repealing former ones, and to cure any defects in form or substance which have become apparent in existing statutes, most of the States have at some time authorized thorough revisions of their statute law. The work is usually done by a committee of the State legislature, who arrange the existing statutes under proper general heads, and draft such amendments and alterations as they may deem advisable. Strictly local or special statutes, not of general interest, are sometimes omitted in the revision. The general laws as thus collected, arranged and amended, are reenacted by the legislature and then constitute the official revised statutes of the State, superseding all original acts on the same subject. There have been several revisions of the statutes of the United States. For acts supplementary to or amendatory of the revised statutes, the Statutes at Large, published after each session, should be consulted.

REVIVALS (from *revive*, from Lat. *revivere*, to live again, from *re*, back again, anew + *vivere*, to live), RELIGIOUS. A term widely used among Protestants since early in the eighteenth century, to denote periods of marked religious interest, when church-members are quickened to a new sense of responsibility and privilege, and others are for the first time brought openly to

confess their faith. By an extension of its meaning, the term is sometimes applied to various important religious movements of the past, like that of the Day of Pentecost (Acts ii.), of the Wiclifites in England, the Hussites in Bohemia, and the Reformers of the sixteenth century. In a similar way it might be used of the religious zeal which led to the First Crusade, the work of the great monastic Orders in some periods of their history, the Oxford Movement, and so on. But it is more accurate and better to limit the application of the term 'revival' to the history of modern Protestantism, especially in Great Britain and America, where such movements have flourished with especial vigor. Yet in so doing, one should not forget that there were similar revivals of religion in Scotland as early as the end of the sixteenth century (under Wishart, Cooper, and Welsh), and again, both there and in the north of Ireland, about a generation later, when Bruce and Livingstone were prominent as leaders (the Stewarton Movement).

Seasons of religious quickening occurred in the colony of Massachusetts Bay between 1704 and 1718, but in importance and influence they were far overshadowed by the work of Jonathan Edwards (q.v.) at Northampton in 1734. His preaching so deeply affected his hearers that about three hundred persons were converted. The movement spread through a large part of New England in the next two years, and formed a suitable introduction to 'The Great Awakening,' a revival which extended through almost all the colonies and influenced either directly or indirectly almost all the churches. This movement began about the same time as that of John Wesley in England. Its most active agent was George Whitefield (q.v.), a preacher of singular power and inexhaustible energy, who came from England to America in 1739, and traveled through the country, preaching in the open air to audiences of thousands, and winning a large number of converts. The Great Awakening proper occupied the years 1740-42. Several evangelists were enlisted in its service, notably the zealous but censorious Gilbert Tennent (q.v.), a Presbyterian, who had begun revivalist work in New Jersey before Whitefield's arrival. Among the most obvious results of the Awakening were the addition, between 1740 and 1760, of 150 churches to the number already established in New England and the doubling of the number of Presbyterian ministers in the middle colonies. Princeton College grew out of the movement, and the plan for a school for the education of the Indians was conceived about the same time, from which later came Dartmouth College (q.v.). The Wesleyan movement did for England what the Great Awakening did for America, but with a new and permanent ecclesiastical organization as its product.

Toward the end of the eighteenth century a fresh series of revivals began, lasting intermittently from 1797 to 1859. The beginning of this long period was called, in New England, the 'evangelical re-awakening.' The work was carried on at first by parish ministers, not by traveling evangelists, and the churches soon came to depend upon revivals for their growth and even for their life. As time went on, the work was taken up by itinerant preachers also. Among the prominent leaders were Nathan Strong, Edward Dorr Griffin, Jeremiah Hallock, Timothy

M. Cooley, and Charles G. Finney. The early years of the nineteenth century were marked by great missionary zeal, reaching out beyond the boundaries of New England, and even to foreign lands. See MISSIONS, CHRISTIAN.

Toward the southwest, in Tennessee and Kentucky, we meet for the first time with 'camp-meetings,' great open-air assemblies, which since 1800 have played an important part in the evangelistic work of the Methodist Church. (See CAMP-MEETING.) Ministers of other denominations at first participated in this movement, special sympathy being manifested by the Presbyterians, but the extreme excitement soon alienated them from it. A considerable number of Presbyterians, however, who continued to believe in the revival theory as there illustrated, withdrew from communion with the main body, and formed the nucleus of what has since become the Cumberland Presbyterian Church. (See PRESBYTERIANISM.) One of the most valuable products of the camp-meeting idea is the Chautauqua Assembly, a highly successful educational enterprise, which is still closely connected with religious work. (See CHAUTAUQUA.) One of the most noteworthy revivals of the whole series was that of 1858-59, which, like the Great Awakening, affected nearly all branches of Protestantism, and was nowhere more successful than in New York City. No account of modern revivals would be complete without prominently mentioning the work of Dwight L. Moody, who for many years exerted a large influence in Great Britain and America, reaching all classes of society.

What is commonly called the revival period of American religious history may be said to have closed soon after the middle of the nineteenth century. Horace Bushnell's work on *Christian Nurture*, published in its completed form in 1861, was undoubtedly a sign of the changing religious temper. Men's minds were turning to other ways of extending the Church's influence as being at once more normal and more promising. The establishment of several theological schools, like Andover, Bangor, Hamilton, Newton, and others, due largely to the interest evoked by the revivals early in the century, tended to promote this very change.

Although revivals mark a temporary departure from the historic method of propagating Christianity, which is by religious training accompanying the sacrament of baptism, yet they are a natural incident in the development of Protestantism. Most of the Protestant churches require some evidence of regeneration before admitting members into their fellowship, and this evidence is most naturally sought in religious experience, especially in the process of conversion. This is commonly understood to mean such a change of heart and disposition, often sudden, as can be wrought only by the operation of Divine grace. This idea laid firm hold upon many American churches, so that conversion came to be regarded as the normal mode of entrance upon the religious life. Baptism continued to be administered, but the significance of infant baptism was largely lost sight of, and the historic system of catechetical instruction generally disappeared. No student of the subject can doubt that large numbers of the conversions were genuine, or that the system of evangelizing, in the hands of earnest and sincere men, has been productive of great

benefit to humanity; but, on the other hand, it is impossible to doubt that grave abuses have appeared in connection with it. Such purely physical phenomena as swoons, outcries, and convulsions were confounded with spiritual experiences. These are now known to belong to the domain of pathology, and to indicate a psychophysical condition, often met with elsewhere in the history of religion and of civilization.

REVOCATION (Lat. *revocatio*, from *revocare*, to revoke, recall, from *re-*, back again, anew + *vocare*, to call). In law, the annulling, vacating, or cancellation of a legal instrument with intent to make it null and void in effect, or the withdrawal of an authority previously conferred. Where an instrument is made in good faith, and without wrongfully affecting the rights of third parties, it is generally held to be irrevocable, if it conveys property or rights to some one who pays for the same or accepts them as a gift. Powers not coupled with an interest in the donee are revocable.

REVOLT OF ISLAM, THE. A poem by Shelley (1818). The original title was *Laon and Cythna*, the names of the chief characters of the story, telling of a nation roused to freedom by a young poet. His triumph is brief, for the hero, Laon, is condemned to be burnt, and his martyrdom is shared by Cythna. The regeneration of society, an echo of the French Revolution, is the leading idea.

REVOLUTION (Lat. *revolutio*, from *revolvere*, to turn over, from *re-*, back again, anew + *volvere*, to turn; connected with Goth. *walwjan*, AS. *walcean*, Eng. *wallow*). In politics, a radical change in the fundamental constitution of a State, as opposed to reform, which implies a gradual transformation carried out in accordance with established principles and through legal forms. Usually, though not of necessity, it connotes a popular upheaval in which the will of the masses replaces for the time all laws and authority. The history of every nation presents instances where the organic growth of years and centuries has within a brief space of time been altered or destroyed by a people that has lost faith in the efficacy of orderly evolution. The English Revolution of the seventeenth century once for all established the rights of the nation as against its ruler. The American Revolution, so called, freed the united English colonies on the Atlantic seaboard of North America from the sovereignty of the English Crown and made them free and independent States. The French Revolution of 1789 overthrew the Bourbon monarchy and after three generations of sequential struggles brought in the sovereignty of the French people. It produced a profound effect on the constitution of society and the relation of peoples and sovereigns throughout Europe. On the technical aspect of revolutions in the science of politics, consult: Locke,

Essay on Government; Burgess, *Political Science and Comparative Constitutional Law* (2 vols., Boston, 1896). On its historical aspects, see the history of different nations. See also Lilly, *A Century of Revolution* (London, 1890).

REVOLUTIONARY TRIBUNAL. The name given to the court for the trial of political offenses instituted by the French Convention on the night of March 10, 1793. The name was proposed by Cambacérès. Danton and his associates considered that such a court had become necessary, inasmuch as the disasters which had befallen the national armies on the frontiers had led to dangerous conspiracies against the revolutionary Government. Its members were chosen from the various departments, and their appointment was ratified by the Convention. Their function was to sit in judgment on all persons accused of crimes against the State, and from their sentence, delivered with appalling promptitude, there was no appeal. During the Reign of Terror, when Fouquier-Tinville (q.v.) was the public prosecutor, this tribunal acquired a fearful notoriety by doing away with almost all forms of justice, and making itself the willing instrument of the Committee of Public Safety. After several changes in organization, the Revolutionary Tribunal was finally abolished, May 31, 1795. See FRENCH REVOLUTION.

REVOLUTIONARY WAR. See UNITED STATES.

REVOLVER, MILITARY. The military revolver is a weapon of much disputed value, as is shown by its varying relative importance in the armies of the world. It has, perhaps, found a greater sphere of usefulness in the United States cavalry than with any other troops in the world. The ordinary range of usefulness of the service revolver—if judged by the sighting of those now in general use—is practically limited to 50 yards, the weapon itself being required to be strong enough to stop a man, and if possible a horse. The responsible authorities of the great military powers remain officially faithful to revolvers of over .40 calibre, and bullets of from 180 to 313 grains; although their officers are often supplied, or supply themselves, with lighter and less bulky weapons of reduced calibre. This is especially true of British officers. The United States Colt, calibre .38, fires a bullet lighter by nearly 30 grains than that of any other power, with the exception of those used by the Swiss dismounted officers, French officers, and the revolvers of the new Russian model. Its cylinder contains six chambers, and in order to facilitate the loading of cartridges and the simultaneous ejection of the emptied shells the cylinder is mounted upon a crane pivoted in the frame below the cylinder, so that on drawing the cylinder latch to the rear the cylinder swings to the left and downward out of its seat in the frame. Thus, all the chambers are exposed for loading, while the pressure against the end of the ejector rod under the barrel forces out the shells. This done, the cylinder is returned to its position in the frame and is automatically secured by the cylinder latch. One of the most important American revolvers is the *Smith and Wesson*. Formerly, Smith and Wesson revolvers were constructed in calibres from .22 to .45, but about the year 1890 the .22 calibre was discon-

tinued. These revolvers are equipped with an automatic shell ejector, so that when the revolver is opened by its clasp the barrel and cylinders tip downward, an action which simultaneously ejects the empty shells. This mechanism is one of the most important inventions ever made in connection with revolvers, and has been adopted by practically all the revolver manufacturers throughout the world, since the patents covering the invention expired. The Army Model Number 3, made by Smith and Wesson, weighs 2½ pounds, is central fire, with a calibre of .44. It takes six cartridges and has a length of barrel of 6½ inches.

All American pistols and revolvers use metallic cartridges. Although it is conceded that if loaded a certain way the breech-loading revolver has no advantage over the muzzle-loader, and even though it is admitted that the muzzle-loading pistol charged as are dueling pistols gives better results than a breech-loading pistol of the same weight, length of barrel, and bore, loaded with a factory metallic cartridge, yet, owing to the great amount of labor necessary to load them, they are, as a rule, unpopular with pistol-shots, and naturally are out of the question for military purposes. The mark IV, .445 service model revolver of the Webley and Scott Revolver Company was adopted in 1893 by a joint War Office and Admiralty committee for the exclusive use of the British Army and Navy, as well as the Indian and Colonial forces. It weighs 2 pounds 3 ounces, and has a 4-inch barrel. The cylinder may be locked or free as desired, a good feature of the weapon being its combination of the trigger action with the cocking action. As already stated, the British officer selects and purchases his own weapon, and since the advent of the automatic pistol a general need was felt for a revolver which should be capable of approaching the rapidity of fire of the automatic pistol. Since 1901 the Webley-Fosbery revolver has made its appearance, and has the great advantage of taking the regular service ammunition. See PISTOL; and Plate of PISTOLS AND REVOLVERS.

REVUE DES DEUX MONDES, *revu' dâ dē mônd* (Fr., Review of the two Worlds). The most important French magazine, founded in 1831 by F. Buloz, and now conducted by Brunetière. It is a bi-monthly and numbers among its contributors the leading French writers in literature, art, politics, and history.

REWA KANTHA, *rā'wâ kân'thâ*. A collection of 61 native States, constituting a British political agency, in the Gujarat division of Bombay, India. The combined area is 4980 square miles, and the population in 1901 was 478,889 having fallen off from 733,506 in 1891.

REWARD (OF, *rewarder, reswarder, regard-er, regarder, to regard, from re-, back + warder, garder, to watch, mark, heed, guard, from OHG. warden, Ger. warten, AS. wærdian, Eng. ward; connected ultimately with Gk. ὥρα, horan, to see*). A compensation or premium offered by a government or a private individual to the public in general for the performance of a particular act specified therein. In England, statutes forbid the offering or receiving of a reward for the return of stolen property under conditions protecting or sheltering the thief. In the United States compounding a felony is a crime, but the English

statute prohibiting the receiving back of property believed to have been stolen, without investigation, is not generally followed. The offer of a reward may be made verbally, by writing, or in the newspapers, and when made to the public indefinitely, may be accepted by any one who may see the offer. The various States differ as to whether one performing the service without having seen the offer is entitled to the reward. Where the offer of a reward is made in the newspapers, it may be withdrawn or revoked in the same way, and one who saw the offer, but did not see the revocation and performed the service called for, is not entitled to recover. The general principles of contracts govern, and the performance of the service requested completes a unilateral contract, on which an action can be maintained. One who goes to great trouble and expense to get the desired information, but does not succeed in doing so until after the offer is revoked, is without remedy. A police officer cannot recover a reward offered for the detection of a criminal, if his efforts were in the line of his duties; but if his services were not in any sense official, and were performed in his leisure time, he may claim such a reward just as any other individual could do. Consult the authorities referred to under CONTRACT.

REWARI, or **RIWARI**, rē'wā-rē'. The chief commercial town of the District of Gurgaon, Punjab, British India, 48 miles southwest of Delhi, at the junction of two railways (Map: India, C 3). It has a fine town hall, handsome Jain temples, and the interesting ruins of the fort of Gokulgarh. It is an important grain-distributing centre; sugar and salt are also exported, and great quantities of iron are imported for manufacturing purposes. Rewari dates from about n.c. 1000, when it was built near the site of an older town, ruins of which exist on the east. Population, in 1891, 27,900; in 1901, 27,300.

REWBELL, rē'bēl'. **JEAN FRANÇOIS** (1747-1807). A French politician, born at Colmar, Alsace. He practiced law, became president of the corporation of advocates, was elected as a Deputy of the Third Estate to the States-General for the District of Colmar, and in the National Assembly became known for his knowledge of jurisprudence, his bold Republicanism, and his denunciations of Royalist conspiracies. In 1791 he became president of the Assembly, afterwards was general secretary to the directory of Haut-Rhin, and in 1792 was elected to the Convention. He was an opponent of the Jacobin Club, to whose suppression in November, 1794, he greatly contributed; was a member of the Committee of Public Safety and was elected to the Council of Five Hundred. In November of 1795 he became a member of the Directory, in which he exercised great influence on matters of finance and justice. He was elected president of the Directory in 1796, and was chosen by lot to retire in May, 1799. He sat in the Council of Ancients, but after the coup d'état of the Eighteenth Brumaire (November 9, 1799) withdrew from public life. Consult the standard works on the French Revolution, and Sciout, *Le Directoire* (4 vols., Paris, 1895-97).

REYBAUD, rā'bō'. **LOUIS** (1799-1879). A French author and politician, born at Marseilles. He entered journalistic work, and settled in Paris

in 1829. Besides editing a *Histoire scientifique et militaire de l'expédition française en Egypte* (10 vols., 1830-36), he published *Etudes sur les réformateurs ou socialistes modernes* (1840), which won the Montyon prize; a satirical romance, entitled *Jérôme Paturot à la recherche d'une position sociale* (1843); and a satire on Revolutionary ideas, *Jérôme Paturot à la recherche de la meilleure des républiques* (1848).

REYER, rā'yār', **LOUIS ETIENNE-ERNEST** (1823—). A composer of the modern French school. His real name was Rey. He was educated in the municipal schools. In 1850 he produced *Le Sélam*, a symphonic ode with chorus, set to a poem by Théophile Gautier. Several operas followed, one of the most conspicuously successful being *La Statue* (1861). He was elected to the Académie in 1876, and about the same time succeeded Berlioz as librarian at the Paris Opéra. Meanwhile he gained considerable reputation as a feuilletoniste on the *Journal des Débats*, and through his essays published in 1875 under the collective title of *Notes de musique*. In 1862 he was made a chevalier of the Legion of Honor, and he became an officer of that order in 1886. His compositions include: operas, *Maître Wolfgram* (1854), *Sacountal* (1858), *Erostrate* (1862), *Sigurd* (1884), *Salammô* (1890); cantatas, *Victoire* (1859), *L'Union des arts* (1862), *L'Hymne dur Rhin*; and male choruses.

REYKJAVIK, rik'yá-vék'. The capital of Iceland, situated on the southwest coast of the island at the head of the Faxa Fjörður (Map: Denmark, F 1). It consists chiefly of wooden houses, and has a small cathedral, a classical college, a theological seminary, and a medical school. In the house of the Althing are a library and a collection of Icelandic antiquities. During the summer there is steam communication with Copenhagen. Population, in 1901, 6682.

REYNARD (rā'nērd) **THE FOX**. The greatest mediæval beast epic, in which animals become the mouth-pieces of human society. Versions of this epic are found in the chief languages of Western Europe. The narrative is made up of stories derived from European folk-lore and of more or less literary survivals of the Æsopic fable. Though the first extant signs of the epic date back to 940 (*Ecbasis Captivi*), the various elements of the tale did not group themselves into a whole until the twelfth century. In the Latin *Isegrimus*, which is, however, mainly of literary origin, the animals already have specific names. The principal character is Reynard (from the Germanic Raginohard, meaning 'the wily, the crafty one')—the fox, whose deadly enemy is Isegrim (probably German *eisen* and *grimm*, signifying 'strength,' 'endurance')—the wolf. About these two and their bitter feud are found grouped: Noble the lion, Bruin the bear, Tibert the cat, Baldwin the ass, Chanticleer the cock, Kyward the hare, etc. The fact that *Isegrim* was used in 1112 as the epithet of a man (one of the conspirators against Gaudry, Bishop of Laon) shows that the tale was popularly current at an early date. The French *Roman de Renard*, a lost version of which was probably the source of most of the other European versions, is a cycle of episodes in octosyllabic verse, compiled by various authors at various epochs. The narrative is there divided into 'branches,' thirty in number;

which together constitute over 30,000 verses. The oldest manuscript of this compilation is of the end of the thirteenth century, but we have a German poem of the twelfth century, modeled on an earlier version of the same French work. Various 'Trouveres' attempted to give shape to this material, though the romance never attained genuine unity. The names of three alone of these compilers have been handed down: Pierre de Saint Cloud, Richard de Lison, and a clerk who called himself *Prestre de la Croix en Brie*. These names indicate that the Ile de France, Champagne, Normandy, and Flanders are the localities where the various parts of the poem took shape. The gist of the tale, in this completed form, is that the Fox has given offense to the Wolf and to several other animals, for which reason he is called before the court of justice held by the Lion. At first he refuses to come and through trickery rids himself of those sent after him. Finally, when forced to appear, he pretends repentance and is pardoned by the Lion. The offense, however, is repeated in a different form and again the Fox goes free. At last the Wolf in despair challenges him to single combat. Here again the craft of the Fox gains a complete victory, which ends in his being recognized as the real master of beasts.

In the fourteenth century the story was again taken up and given a number of remodelings on French soil; chief among these are *Renart le Nouvel*, by Jacquemard Gelée, and the famous *Renart le Contrefaite*, by an unknown clerk of Troyes. Here the romance has become a veritable compendium of moral, historical, and political ideas expounded by Reynard in conversation.

The romance was very popular in foreign lands. It was translated into Middle High German in 1180 by the minnesinger Heinrich der Glicheære; it was imitated in Catalonia by Raymond Lulle and given an English form (published by Caxton) and a Flemish form. Goethe modernized the German version in his *Reinecke Fuchs* (translated by T. J. Arnold). Mediæval art delighted in depicting scenes from the *Renard*.

For a detailed bibliography, consult: Ernest Martin, *Le roman de Renart* (Strassburg-Paris, 1882-87), and Potvin, *Le roman du Renard* (Paris, 1891). The best edition of the French version is that of Martin, *op. cit.*; the German *Reinhart Fuchs* is edited by Reissinger (Halle, 1886), the Flemish verse version *Reinaert de Vos*, by Van Helten (Groningen, 1887), and Caxton's English version is edited by Thoms, Percy Society (London, 1844). For questions of sources, etc., consult: Sudre, *Les sources du roman de Renart* (Paris, 1893); id., in *Petit de Julleville, Histoire de la langue et de la littérature française*, vol. ii. (Paris, 1896); G. Paris, *Le roman de Renard* (ib., 1895); F. S. Ellis, *History of Reynard the Fox* (London, 1894); and T. Jacobs, *Reynard the Fox* (ib., 1895).

REYNAUD, řá'no', JEAN ERNEST (1806-63). A French philosopher and author, born at Lyons. He was at first a mining engineer, but came into public notice as an opponent of Saint-Simonism, his previous creed, in a series of articles in the *Revue encyclopédique*. His chief works, *Terre et ciel* (1854), is a résumé of the ideas he had already set forth in the *Encyclopédie nouvelle*, which he and M. Pierre Leroux had founded in 1835, and he published also *Minéralogie des gens du monde*

(1834); *Considérations sur l'esprit de la Gaule* (1847); *Vie et correspondance de Merlin de Thionville* (1860); and *Etudes encyclopédiques* (1866).

REYNOLDS, řen'oldz, GEORGE WILLIAM MAC-ARTHUR (1814-79). An English politician and author. He was educated at the Royal Military College at Sandhurst (1828-30). Disliking the prospect of a military career, he left before completing his studies and traveled on the Continent, acquiring a wide knowledge of the most modern French literature. *The Youthful Impostor* (1835), his first novel, was followed by a volume of translations from Hugo (1836), and by two volumes of essays entitled *Modern Literature of France* (1839). In 1846 he became editor of the *London Journal*, for which he wrote *The Mysteries of London* in imitation of Eugène Sue's *Mysteries of Paris*. In the same year he started *Reynolds's Miscellany*, to which he contributed during the twenty-three years of its life many sensational tales. He took a leading part in the Chartist movement and was one of the last to abandon its cause. In 1850 he started the still existing *Reynolds's Weekly Newspaper*, an organ of the laboring classes.

REYNOLDS, HENRY ROBERT (1825-96). An English Congregational minister, born at Romsey, Hampshire. He studied at Coward College and at the London University (1841), and five years afterwards was ordained to the charge of a church at Halstead, Essex, but continued his studies, and graduated in 1848. His second pastorate was in Leeds (1849), with intervals of Continental travel until he became president of Cheshunt College (1860-94). He was associate editor of the *British Quarterly Review* in 1866-74, edited the *Evangelical Magazine* in 1877-82, and published: *The Philosophy of Prayer* (1881); *Buddhism* (1886); and *Athanasius* (1889).

REYNOLDS, JAMES EMERSON (1844-). An Irish chemist, born in Booterstown, County Dublin, and educated at Dublin University. He was chosen professor of chemistry to the Royal Dublin Society in 1870, to the Royal Irish College of Surgeons in 1873, and in Dublin University in 1875. Reynolds discovered thiocarbamide and many other compounds of the same class, and published *Lectures on Experimental Chemistry* (1874) and *General Experimental Chemistry* (1880).

REYNOLDS, JOHN. See RAINOLDS, JOHN.

REYNOLDS, JOHN FULTON (1820-63). An American soldier, born at Lancaster, Pa. He graduated at West Point in 1841, was assigned as brevet lieutenant to the artillery, and during the Mexican War participated in the defense of Fort Brown and the battles of Monterey and Buena Vista. At the outbreak of the Civil War he was commandant at West Point. He was commissioned brigadier-general of volunteers in August, 1861, and was given a brigade of the Pennsylvania Reserve Corps before Washington. The next year he took part in both the Peninsula and Northern Virginia campaigns, and during the succeeding Maryland campaign commanded the Pennsylvania Volunteer Militia for the defense of his native State. In November he was given the command of the First Corps of the Army of the Potomac and was promoted to be major-general of volunteers. He took part in Meade's at-

tack on the Confederate left at Fredericksburg, and at Gettysburg arrived on the field about two hours after the fighting had begun on the first day of the battle and was in chief command on the field until late in the morning (July 1st), when he was shot and instantly killed by a Confederate sharp-shooter.

REYNOLDS, JOHN HAMILTON (1796-1852). An English poet, born at Shrewsbury, Shropshire. After a secondary education, he entered in a minor capacity an insurance office, and in 1814 published two books of verse, *Sadie, an Eastern Tale*, inscribed to and qualifiedly praised by Byron, of whose manner it was a frank imitation; and *The Eden of Imagination*, in the style of Wordsworth and Hunt. In 1818 he obtained a post in a solicitor's office, and in the year following published a moderately skillful parody of Wordsworth's style a poem called *Peter Bell* (thus antedating the actual publication of Wordsworth's poem of the name). He was at one time a proprietor of the *Athenaeum*, and about 1638 removed to the Isle of Wight, where he was clerk of the county court. His best work is to be found in *The Garden of Florence, and Other Poems* (1821).

REYNOLDS, JOSEPH JONES (1822-99). An American soldier, born at Flemingsburg, Ky. He graduated at West Point in 1843, was brevetted second lieutenant of artillery, and from 1846 to 1855 was a member of the faculty at the Military Academy. In 1857 he resigned and became professor of mechanics and engineering at Washington University, Saint Louis, but three years later gave up this position to become a merchant at Lafayette, Ind. At the outbreak of the Civil War he entered the Federal service as colonel of the Tenth Indiana Volunteers and a month later was commissioned brigadier-general of United States Volunteers. In January, 1862, he again resigned, in August was again commissioned colonel, and in September was again promoted to brigadier-general. In November he was advanced to be major-general, and in 1863 participated in the battles of Chickamauga and Chattanooga. From January 6 to June 16, 1864, he commanded the defenses of New Orleans. He was mustered out of the volunteer service in 1866, and was reappointed colonel of the Twenty-sixth Regular Infantry. A year later he was brevetted major-general and in 1877 retired from active service.

REYNOLDS, SIR JOSHUA (1723-92). The most celebrated English portrait painter. He was born at Plympton, Devonshire, July 16, 1723. His father was the Rev. Samuel Reynolds, rector of Plympton, Saint Mary, and master of the grammar school. He intended his son for the medical profession, but Joshua, having manifested from an early age an ardent desire to be a painter, was, in 1741, placed under Hudson, the principal portrait painter of the day. After being in the studio of this artist two years he commenced on his own account as a portrait painter at Plymouth Dock, now Devonport, and met with great encouragement. In 1745 he went to London and established himself in Saint Martin's Lane; but on the death of his father in 1746 he returned to Plymouth Dock. Upon the invitation of Commodore Keppel, who was in command of the Mediterranean squadron, he sailed for Italy from Plymouth in 1749, and on his arrival in Leghorn,

proceeded to Rome. He stayed about three years in Italy, most diligently employing his time in visiting the various cities where the chief art collections are to be found. Upon his return to London in 1752 his works attracted great attention, eclipsing everything that had been done there since Van Dyck's time. When the Royal Academy was instituted in 1768 he was elected president; he was knighted by George III., and on Ramsay's death in 1784 succeeded him as painter to the King. He founded the Literary Club (1764) for Dr. Johnson's benefit. To him Goldsmith dedicated his *Deserted Village*. He died in his palatial house in Leicester Square on February 23, 1792, and after lying in state at the Royal Academy, was interred in the crypt of Saint Paul's.

Sir Joshua was very prominent in the social world and lived in friendly intercourse with Johnson, Burke, Goldsmith, Gibbon, Garrick, and other leading men of his period. His principal literary works consist of fifteen *Discourses Before the Royal Academy* (1778), treatises on the history of art of a high critical and artistic value. They are written in a precise, good style, and inculcate those maxims of art commonly known as academic.

The formative influence in Reynolds's art was the great Italian masters, especially the Venetians, Correggio, the Bolognese Eclectics, and Michelangelo. He was much of an eclectic himself, and there was little that was strikingly original about his work. His composition and brush work were learned, but his drawing, especially of the limbs, was often faulty. The strong point of his paintings was their color, showing the influence of Titian; but Sir Joshua's technical experiments had a disastrous result upon their preservation. His portraits are admirable realistic representations; the men are strong in action and character, the women gentle and pure, the children innocent and natural. They form an epitome of London society of his day.

He is estimated to have painted from two to three thousand portraits, most of which are in English private collections. The National Gallery, however, possesses a number of his best works, including those of Admiral Keppel, Lord Heathfield, the Hero of Gibraltar, Goldsmith, Dr. Johnson, Garrick, the members of the Dilettante Society, and three portraits of himself. The National Portrait Gallery (London) and the Royal Academy are rich in his works, as are also the London private galleries and the University of Oxford. Especially worthy of mention are the portraits of Lady Cockburn and her children, the Duchess of Devonshire (Devonshire House), Nelly O'Brien (Hertford House), and "Mrs. Siddons as the Tragic Muse" (Dulwich Gallery).

Although Sir Joshua preferred historical painting, his works of this character are less important. There are good examples in the Hermitage Collection, Saint Petersburg, including the "Continence of Scipio;" the best, perhaps, is "Ugolino and His Sons in the Tower." Among his few genre pictures are the "Girl with the Mouse-trap" (Holland House), and the "Strawberry Girl." His beautiful and well-known "Angels' Heads" (National Gallery) are in reality portrait studies. There are also good examples of Reynolds's work in the principal American collections.

BIBLIOGRAPHY. The older biographies of Rey-

nolds, those of Malone (1798), Northcote (1813), Farrington (1819), Beeche (1835), and Cotton (1856), have been superseded by the comprehensive *Life* by Tom Taylor (London, 1865), which also includes the researches of Leslie. Other good biographies are those of Chesnan (Paris, 1887), Phillips (London, 1893), and Gower (ib., 1902).

REZONVILLE, re-zôn'vel'. A village of German Lorraine, 10 miles west-southwest of Metz and 2 miles southwest of Gravelotte. The battle of Gravelotte (q.v.) is sometimes called the battle of Rezonville.

RHACHITIS, rá-kí'tis. See RICKETS.

RHAD'AMAN'THUS (Lat., from Gk. ῥαδάμανθος). In Greek legend, a son of Zeus and Europa, and brother of Minos (q.v.). In Homer and the older epic, Rhadamanthus is a hero, who by special favor of the gods has been translated, with others, to Elysium or the Islands of the Blest. In later story these islands become the kingdom of Cronos and the released Titans, and Rhadamanthus, married to Alcmene, mother of Hercules, holds high rank and sits as judge. Another conception of the other world prevailed later, in which Rhadamanthus, with Minos, Æacus, and Triptolemus, because of their justice in this life, sit in judgment on the souls of the dead, and assign them their due meed of bliss or punishment.

RHADAMES, rád'a-méz. An oasis and town in North Africa. See GADAMES.

RHÆTIA, rē'shí-à, or better, **RÆTIA**. A Roman province lying in the Alps, north of Italy and east of Helvetia, and bounded north by Germany and east by Noricum, thus embracing the Grisons and part of Tyrol. It was watered by the Rhine, Athesis (Ádige), and Ænus (Inn). The natives were chiefly engaged in herding sheep and cattle. They were a hardy and warlike race, but were conquered about B.C. 15 by the Romans under Tiberius and Drusus. Later Vindelicia, to the north, was united with Rætia. The chief town of Rætia proper was Tridentum (Trent); and of Vindelicia, Augusta Vindelicorum (Augsburg).

RHÆTIC BEDS. A series of strata forming the uppermost portion of the Triassic system, which is extensively developed in the Rætian Alps.

RHAMNACEÆ (Neo-Lat. nom. pl., from Lat. *rhamnos*, from Gk. ῥάμνος, buckthorn, Christ's-thorn), **BUCKTHORN FAMILY**. A natural order of about 40 genera and 500 species of dicotyledonous, often spiny trees or shrubs, natives of and widely distributed in temperate and tropical countries. They have simple leaves; small, generally green flowers; and either fleshy fruit, not opening when ripe, or dry and separating into three parts. Some species have been used in dyeing (buckthorn), some in medicine (red root), and the fruit of some for food. (See **JUJUBE**.) The sweet red pulp of the thickened flower stalks of *Hovenia dulcis*, a native of China and Japan, is edible. In flavor they resemble the pear. The chief genera are *Rhamnus*, *Ceanothus*, *Zizyphus*, *Hovenia*, *Phytica*, and *Gouania*.

RHAMNUS. A genus of shrubs and trees. See **BUCKTHORN**.

RHAMPHORHYNCHUS, rám'fó-rín'kūs (Neo-Lat., from Gk. ῥάμφος, *rhamphos*, curved

beak + ῥύγχος, *rhyngchos*, snout). A fossil flying reptile of Upper Jurassic age. See **PTERODACTYL**.

RHAMPHOSUCHUS, rám'fó-sū'kūs (Neo-Lat., from Gk. ῥάμφος, *rhamphos*, curved beak + σείχος, *souchos*, crocodile). One of the largest fossil crocodiles, known by fragmentary bones found in the Pliocene deposits of the Siwalik hills of India. The animal must have attained a length over all of about 50 feet.

RHAMPSINITUS (Lat., from Gk. Ῥαμψινίτης). A King of Egypt, the subject of a remarkable tale related by Herodotus. According to the Greek historian, Rhampsinitus possessed enormous wealth, and wishing to store it securely, caused a treasure house of stone to be built. The architect who constructed the building left a secret entrance concealed by a movable stone, and on his death bed informed his two sons of the fact. The sons repeatedly entered the treasury, and each time carried away as much of the treasure as they were able. Finally, the elder brother falls into a trap set by the King, and the younger brother, at his request, cuts off and carries away his head that he may not be recognized. The headless body is exposed, guarded by soldiers, but the younger brother, by a clever stratagem, makes them drunk and obtains possession of it. The King then attempts to capture the thief by the aid of his daughter, who is ordered to receive all who desire to visit her, promising her love to him who can relate the most remarkable adventure experienced by himself. The thief visits the princess and tells her the story of the theft, but when she attempts to seize him he slips into her hands his dead brother's arm, which he has brought under his cloak, and makes his escape. Thereupon the King, admiring his cleverness, grants him immunity for his theft, and gives him his daughter in marriage. Rhampsinitus is to be identified with Rameses III., whose treasury at Medinet Habu is the building referred to in the story of the thief. The accounts of Herodotus are derived from the popular tales and legends which, in his time, were current in Egypt.

Consult: Herodotus, ii., 121-124; Wilkinson, *Manners and Customs of the Ancient Egyptians* (London, 1878); Clouston, *Popular Tales and Fictions* (Edinburgh, 1887); Budge, *A History of Egypt* (New York, 1902).

RHAPSODISTS (from Gk. ῥαψῳδός, *rhapsōdos*, bard, from ῥάπτειν, *rhaptein*, to stitch together + ᾠδή, *ōdē*, song, from ἄδειν, *adēin*, to sing). A name applied in ancient Greece to professional reciters of poetry, and especially to a class of wandering minstrels who recited the Homeric poems. So long as the Homeric lays were handed down by oral transmission, the rhapsodists were a highly respected class, and there can be little doubt that they often exercised a considerable influence upon the text of the poems. But with the commission of the poems to writing and the circulation of manuscript copies, the character of the rhapsodists gradually changed, so that in the fourth century they are represented as stupid persons, with nothing to commend them but a retentive memory. Their recitations, however, continued to be popular until a comparatively late period. The rhapsodist carried a staff, and when reciting wore a crown as a mark of his office. He did not confine himself to mere recitation, but commented upon the poet's meaning and discussed questions of interpretation.

Each recitation was known as a 'rhapsody,' and hence this term is often applied to the separate books of the *Iliad* and the *Odyssey*. The most important source of information concerning the rhapsodists is Plato's *Ion*.

RHAPSODY (Lat. *rhapsodia*, from Gk. *ῥαψωδία*, recital of poetry, portion of an epic recited at one time, from *ῥαψωδός*, *rhapsódos*, bard). A term in modern music, applied to an instrumental composition written in the form of a fantasia usually upon folk-songs or national melodies. The rhapsodies of Raff and Lalo, and especially the Hungarian rhapsodies of Liszt, have become famous.

RHATANY (Brazilian, Port. *ratanhia*, from Quichua *ratana*, the native name), or **RATANY**, *Krameria triandra* and *Krameria Ixina*. Half-shrubby plants of the natural order Polygalaceae, natives of the cold sterile tablelands of the Andes in Peru and Bolivia. Their roots have been used medicinally as an astringent and tonic. When powdered and mixed with orris root or charcoal the roots are used as a tooth-powder. Rhatany root is exported chiefly from Lima, Peru. It is extensively employed in Portugal to color wines, the coloring matter in the roots being known as rhatanic acid.

RHAZES. The Latin name of **ABU BEKR MOHAMMED IBN ZAKARIYA AL-RAZI**. The most important of the mediæval Mohammedan physicians. He was born about the middle of the ninth century in the Persian city of Rai. Up to his thirtieth year he devoted himself to music, and then took up the study of medicine at Bagdad. He became the head of a hospital at his native place and later at Bagdad. After his reputation was made he traveled, visiting different courts. He died either in 923 or 932. Much of Rhazes's knowledge was drawn from Greek sources, but he was more than a mere borrower and is famed as the first to describe smallpox and measles (in his book *Al-jardari ical-hasba*, several times translated into Latin, and into English by Greenhill, London, 1848). He is said to have written more than two hundred works; the most famous was the *Kitâb al-tibb al-Manşûri*, a general treatise on medicine in 10 books. The *Kitâb al-hâwi (liber continentis)*, a cyclopædia of medicine, was edited from his papers after his death. Both these works were translated into Latin in the fifteenth century. Consult: Wüstenfeld, *Geschichte der arabischen Aerzte und Naturforscher* (Göttingen, 1840); Leclerc, *Histoire de la médecine arabe* (Paris, 1876).

RHEA (Lat., from Gk. 'Ρέα). A Greek goddess representing the productiveness of nature and anciently identified with Cybele. She was the daughter of Uranus and Gæa, wife of her brother Cronus, and mother of Zeus, Hades, Poseidon, Hera, Hestia, and Demeter. She had an ancient place of worship in Crete, where she gave birth to Zeus on Mount Ida.

RHEA, or **REA SILVIA**. In Roman tradition, a Vestal virgin, the daughter of the Alban Numitor, and mother of Romulus and Remus, by Mars. When Amulius usurped the throne, the infants were exposed and Rhea Silvia was condemned to be buried alive for breaking the vow of chastity required of the Vestals. She was also called Ilia.

RHEA (Lat., from Gk. 'Ρέα, daughter of Uranus and Gæa). The generic and English name of a family of South American ratite birds allied to the ostrich, from which they differ in having the feet three-toed, and each toe armed with a claw; also in being more completely feathered on the head and neck; in having no tail; and in having the wings better developed and plumed, and terminated by a hooked spur. The wings are, indeed, more efficient than in any other of the Ratitæ, although unfit for flight.

Rheas are known to Brazilians as 'ema' and to Argentines as 'nandu,' 'avestruz,' or 'chueke.' There are two species, of which the best known (*Rhea Americana*) is considerably smaller than the ostrich, standing about three feet high. It is uniform gray, except on the back, which has a brown tint. The male is larger and darker

NANDU (*Rhea Americana*).

colored than the female. The back and rump are furnished with long feathers, much inferior to those of the ostrich in beauty as plumes, but marketable as material for dust-brooms and the like. The skins are made up into rugs, of which large numbers are fabricated in the neighborhood of Mendoza, Argentina. The rhea inhabits the great grassy plains of South America, southward of the equator, and abounds on the banks of the La Plata and its more southern tributaries. It is generally seen in small troupes, usually associated with guanacos, and eating grass, seeds, berries (especially of *Empetrum*), worms, snails, and almost anything else it can swallow. It runs with great celerity, using its wings in aid. It is polygamous, one male securing possession of two or more females, which lay their eggs together in a mere hollow, where, when 20 or 30 are gathered, they are incubated by the cock.

A smaller and more recently discovered species (*Rhea Darwini*) has light brown plumage, each feather tipped with white. It inhabits Patagonia, and extends northward along the base of the Andes to the edge of Peru, and differs from the other in many particulars. A third species has been catalogued, but it is now considered a dark, local race (variety *Macrorhyncha*) in Northeastern Brazil of the ordinary nandu.

Excellent portraits and descriptions of the three forms may be found in the *Transactions* of the Zoölogical Society of London, vol. iv. (1862). Consult also: Darwin, *A Naturalist's Voyage* (London, 1860); Selater and Hudson, *Argentine Ornithology* (ib., 1889).

RHEA FIBRE. See RAMIE.

RHEGIUM, rē'ji-üm. The ancient name of a city of Magna Græcia, Italy, now known as Reggio di Calabria (q.v.).

RHEGIUS, rē'ji-üs (Latinized form of his family name, *Rieger*; the form *Regius*, as if from *König*, king, is incorrect), URBANUS (1489-1541). A Protestant Reformer. He was born at Lange-nargen, on Lake Constance, studied at Freiburg, and at first was professor of rhetoric and poetry at Ingolstadt; later he turned to theology, entered the priesthood of the Catholic Church, and became a doctor of theology at Basel. In 1520 his views underwent a change and while cathedral preacher at Augsburg he wrote satirical pieces against the Church and openly preached Lutheran views. In 1521 he was removed, but in 1524 was again preacher in Augsburg, and so remained till the diet held there in 1530. When the Emperor had silenced the evangelical preachers of the city, he entered the service of Ernest, Duke of Brunswick-Lüneburg, and removed to Celle, where he died. In the Eucharistic controversy he wavered, but finally decided for Lutheran views. His Latin works appeared at Nuremberg in 1561, three parts; his German in four parts, in 1562; again at Frankfort, 1577. Of these works the best known are: *Formulæ Caute Loquendi* (1535; in German, 1536; last ed. by Steinmetz, Cella, 1880); *Dialogue von der trostreichen Predigt* (1537), a devotional work much read even in the seventeenth century; *De Restitutione Regni Israelitici* (1536; Ger. trans.). Consult his *Life* by Uhlhorn (Elberfeld, 1861); and Steitz, *Die Theologie des Urbanus Regius, speziell sein Verhältnis zu Luther und zu Zwingli, 1521-23* (Gotha, 1898).

RHEIDT, rīt. A town of Prussia. See RHEYDT.

RHEIMS, or **REIMS**, rēmz, Fr. pron. rāns. The capital of an arrondissement in the Department of Marne, France, situated on the Vesle, 107 miles by rail east-northeast of Paris (Map: France, L 2). The vine-clad Montagne de Rheims and adjacent hills rise on the south and west, and detached forts at various points surround the city. The mediæval ramparts have been replaced by tree-lined boulevards, but some of the ancient gateways have been preserved, of which the most noteworthy is the Porte de Paris. The town is well built, the material used being limestone, of the district, which, with the prevalence of the older style of domestic architecture, gives the place a picturesque appearance. There are many quaint old houses. The most striking public building is the thirteenth-century cathedral, which, although it still lacks the towers of the original design, is one of the finest extant specimens of Gothic architecture. It is 453 feet long. The elaborate west façade has 500 statues and a splendid rose window, and is flanked by two towers. Scarcely less beautiful is the north portal, with its sculptures. The cathedral is famous as the church in which the French kings were crowned. The eleventh-century Romanesque Abbey Church of Saint Remy is of nearly equal

size. Other interesting buildings are the hospital occupying the ancient Abbey of Saint Remy, the fifteenth-century archiepiscopal palace with a museum of sculpture, and a handsome hôtel-de-ville, begun in 1627, containing the public museum and library of over 80,000 volumes. The Porta Martis, a Roman relic, is a fine triple triumphal arch of the fourth century in a fair state of preservation. The chief modern educational institution are the lyceum and a preparatory school of medicine and pharmacy. Rheims is one of the principal entrepôts for the wines of Champagne. It is a great centre of woolen manufactures.

Rheims is built on the site of *Durocortorum*, or *Civitas Remorum*, the capital of the Remi. On the Montagne de Rheims, south of the city, are a number of Gallo-Roman remains. Under the Frank rule Rheims was a place of much importance, and it acquired a religious interest from its having been the scene of the baptism of Clovis and his chief officers by the Bishop, Saint Remy, in 496. In the eighth century it became the seat of an archbishopric, and from 1179, in which year Philip Augustus was solemnly crowned there, it was the place for the coronation of the kings of France down to the time of Charles X. The town suffered severely during the campaign of 1814, and on September 4, 1870, was occupied by the Germans. Population, in 1901, 108,385. Consult: Marlot, *Histoire de Reims* (Rheims, 1843-45); Justinus, *Reims, la ville des sacres* (Paris, 1860); Gosset, *Cathédrale de Reims* (ib., 1894).

RHEINBABEN, GEORG, Baron von (1855—). A Prussian statesman, born at Frankfort-on-the-Oder. He studied law and political science at Heidelberg and Berlin, became referendary at the district court at Erfurt, in 1877, government assessor in Schleswig, in 1882, was appointed to an assistant position in the ministry of finance in 1885, and promoted rapidly to higher offices until, in 1896, he became president of the government-board at Düsseldorf. Made Prussian minister of state and secretary of the interior in 1899, he succeeded Miguel as minister of finance in 1901.

RHEINBERGER, rīn'bērk-ēr. JOSEPH (1839-1901). A German organist and composer, born in Vaduz, Liechtenstein. He received the greater part of his musical education at the Royal School of Music, Munich, where he subsequently taught the organ, counterpoint, and composition. He was organist of Saint Michael, conductor of the Oratorio Society, repititor at the Court Opera, and Court kapellmeister, and he was regarded as one of the greatest theory and organ teachers of his time. His music is essentially German in character, but somewhat too heavy to be popular. His organ sonatas and other compositions for that instrument are especial favorites in America. His compositions include: *Christophorus*, oratorio; *Toggenburg* and *Waldmorgen*, cantatas; *König Erich*, ballad for chorus with pianoforte; *Wittekind*, and *Das Thal des Espingo*, chorus; the *Wallenstein* and *Florentine* symphonies; overtures, pianoforte, chamber, organ, and orchestral music; and the operas *Die sieben Raben* (1896) and *Türners Tochterlein*.

RHEINE, rī'ne. A town in the Province of Westphalia, Prussia, on the Ems, at the head

of navigation, 24 miles by rail north-northwest of Münster (Map: Germany, B 2). It is known principally for its manufactures of cotton, jute, linen, tobacco, and machinery. Population, in 1900, 10,371.

RHEINFELS, rīn'fēls. The largest and one of the most beautiful of the ruined castles on the Rhine. It was built in 1245 by the Count of Katzenbogen, one of the petty barons of the Rhine. In modern times it was a strong Hessian fortress. In 1794 the French gained possession of it and blew it up in 1797. It is now the property of the Emperor of Germany.

RHEINGOLD, rīn'gōlt, DAS. The first division of Richard Wagner's music drama *Der Ring des Nibelungen*. It was first given in Munich, September 22, 1869. See RING OF THE NIBELUNGEN.

RHEINHOLD, rīn'hōlt, HUGO (1853—). A German sculptor, born at Oberlahnstein, Hesse-Nassau. For several years he pursued a mercantile career in San Francisco and in Hamburg, before devoting himself to art in Berlin, under Max Kruse, and at the Academy under Herter, with signal success, as proved by his marble group, "By the Wayside," in the National Gallery, Berlin, and the large group in bronze, "Dynamite in the Service of Civilization," at the Nobellhof, Hamburg.

RHENANUS, rā-nā'nūs, BEATUS (1485-1547). A German classical scholar, whose real name was Bild von Rheinau. He was born at Schlettstadt, Alsace, and after studying at the University of Paris, spent most of his life in his native city. He was an intimate friend of Erasmus. His works, which show great critical acumen, include editions of *Plini Epistolæ* (1514); *Tacitus* (1519); *Tertullian* (1521); and *Livius* (with Gelenius, 1535), the *editio princeps* of *Villojus Paterculius* (1522); and an historical work, *Rerum Germanicarum Libri Tres* (1531), which was considered the finest piece of historical research of his day. He was the first to question the authenticity of the *Dialogus* of *Tacitus*. Consult: Horowitz, *Beatus Rhenanus* (Vienna, 1872); *Des Beatus Rhenanus litterarische Thätigkeit* (ib., 1872); *Die Bibliothek und Korrespondenz des Beatus Rhenanus* (ib., 1874); and Knod, *Aus der Bibliothek des Beatus Rhenanus* (Leipzig, 1889).

RHENISH ARCHITECTURE. See ROMANESQUE ARCHITECTURE.

RHENISH CONFEDERATION. See CONFEDERATION OF THE RHINE.

RHENISH PRUSSIA. A province of Prussia. See RHINE PROVINCE.

RHENSE. A village of Prussia in the circle of Coblenz, on the Rhine, noted historically as the meeting-place of a diet, which, in July, 1338, during the struggle between the Emperors and the Papacy, took a firm stand for the former by declaring that whoever had received a majority of electoral votes was *ipso facto* German King and Holy Roman Emperor without further Papal confirmation.

RHEOTROPISM (from Gk. 'ρείν, *rhein*, to flow + τροπή, *tropē*, turn). The imperfectly understood sensitiveness which enables plant organs, especially roots, to bend their tips either toward or away from the source of a

current of water in which they are placed. Negative rheotropic curvatures are often merely gross mechanical effects of the force of the stream. But positive curvatures (i.e. toward the source) are undoubtedly due to a specific reaction on the part of the organ. Positive rheotropism of roots, is exhibited well by seedlings of the radish, maize, and *Vicia sativa*. To demonstrate this phenomenon seedlings with roots about 2 centimeters long need only to be affixed to the sides of an inclined wooden trough in which a current of water is flowing. In spite of the tendency of gravity and the force of the moving water to cause roots so immersed to grow downward, they will, after a few hours, bend up stream.

RHESUS (Lat., from Gk. 'Ρῆσος). (1) A Bithynian river god, son of Oceanus and Tethys. (2) A Thracian ally of the Trojans, of whom the oracle declared that if his white horses should drink the waters of the Xanthus or feed on the grass of the plain of Troy, the city would not be taken. As soon as Rhesus in his journey reached the Trojan territory, he was surprised and slain in his camp by Odysseus and Diomedes, and his horses were carried off.

RHESUS (from Lat. *Rhesus*, Gk. 'Ρῆσος, name of a river in the Troad, another in Bithynia, a King of Thrace, etc.). A small brown monkey (*Macacus rhesus*), common all over India. It is known as the Bengal monkey, or 'bandar' of the Hindus. It moves about in large bands, ascending to the height of 8500 feet in the Himalayas, and is often protected and fed in the neighborhood of temples, by the Hindu priests, although not universally regarded as sacred. This monkey is one of those most familiar in menageries, where it may be recognized by the straightness of its moderately long hair, by the tapering tail, about one-half the length of the head and body, and by the nakedness of the buttocks, for some distance around the callosities. This is the monkey commonly carried about by Hindu jugglers, who teach it amusing tricks; and many stories are told of its superior intelligence. Compare MACAQUE.

RHETORIC (Lat. *rhetorica*, from Gk. ῥητορικῆ, *rhētorikē*, rhetorical art, fem. sg. of ῥητορικός, *rhētorikos*, relating to an orator, from ῥήτωρ, *rhētōr*, orator; connected with εἶπειν, *erein*, to say, and ultimately with Eng. *word*). Taken broadly and philosophically, the science and art of communication in language, including all the processes and technical means by which, through language, the members of a community react one upon another. The general tendency of modern textbooks has been to broaden the scope of rhetoric to include everything pertaining to the art of composition, and even to annex adjoining territories, such as poetics, and stylistic and literary criticism. But although rhetoricians are still far from agreement, the goal of recent thought is fairly well expressed in the definition here given.

Regarded from the scientific point of view, rhetoric properly belongs to that branch of knowledge which is concerned with the relations of men in society. The place and rationale of the science may be indicated as follows. In every community a great variety of activities go on simultaneously. One important group of

these activities consists of all the processes by which, through a variety of media, men express themselves and convey their thoughts and feelings to their fellows. This group may be called the expressive-communicative group of activities. It includes not only the more primitive modes of thought-conveyance, such as gesture, grimace, picture writing, the histrionic dance, and the like, but also the most highly elaborated modes, such as the arts of architecture, sculpture, music, painting, and oral and written speech. This large class may be subdivided in two ways: (1) according to the medium employed in the process of thought-conveyance, and (2) accordingly as the emphasis is thrown upon the individual or the social phase of the process. The first method of classification leads to the differentiation of the several arts; the second to the distinction of processes mainly self-expressive from processes mainly communicative. The subject matter of rhetoric is thus seen to be distinguished from that of allied sciences by the fact (1) that its medium is language, and (2) that the emphasis is thrown upon the phase of communication; that is, upon prose. The proper subject matter of the science may therefore be summed up in the phrase 'Expression in language for communication's sake,' just as the proper subject matter of poetics may be summed up in the phrase 'Communication in language for expression's sake.' But it should not be forgotten that although rhetoric is the science of communication, it is still concerned to a large extent with questions of expression.

If we regard rhetoric as it has been outlined above, its underlying problem is seen to concern the reciprocal speech relations of the individual and the community. Of this problem there are three principal phases, as follows:

I. *Psychological problems* relating (1) to the nature of the writing or speaking man, (2) to the mental activities involved in the process of composing. Here arise questions regarding (a) the nature and genesis of expression, (b) the characteristics of genius, (c) the acquirement and cultivation of the speech habit, and (d) the factors operating in the experience of the individual to turn his self-expression into the communicative channel. The first of these questions has been treated at some length by Darwin in his *Expression of the Emotions*, and by those who have sought to controvert him; the second, by Lombroso and others; and the third, by many recent psychologists. The fourth is as yet practically unexplored. It is obvious, however, to touch upon it briefly, that every successful writer or speaker is on one side receptive, on the other productive. As receptive he is a product of heredity and of the social environment. Through imitation of his fellows, this native impulse results in the acquirement of the resources of language, and the individual thus develops a writing or speaking personality. On the other hand, as productive, the writer exhibits the faculties of invention and social imagination. He creates by combining old ideas in new ways that suit better the needs of his contemporaries. He has a sympathetic imagination, which enables him to penetrate into the minds of his hearers, to read their desires, and to conceive how his words will act upon them. His expression is thus, in a sense, drawn from him, and shaped, by his keen realization of

the needs of his hearers. He produces in order to satisfy these needs.

II. *Social problems*, relating to the dynamic effect of speech upon the community of hearers or readers. The assumption which underlies discussion of the subject from this point of view is that language is preëminently the social bond—the connective tissue by which society is held together in organized forms. The main questions relate (1) to the typical modes of response on the part of individuals and groups of individuals in the community, (2) to the formation of social or public opinion. Dially, *Psychology of the Aggregate Mind of an Audience*, has endeavored to show that the minds of an assemblage listening to a powerful speaker undergo a curious process called 'fusion,' by which the members of the audience, losing their individual traits, are reduced, as it were, to a single individual, whose characteristics are those of an impulsive youth of twenty, imbued in general with high ideals, but lacking in reasoning power and will. But it is important here to distinguish, as Tarde has done (*L'Opinion et la foule*), between a 'crowd' and a 'public,' the associative principle of the former being physical, of the latter psychological. The rise of printing, which enables communication of the same matter simultaneously to persons widely separated in space, tends to the formation of a true public, which is not 'fused,' but can freely exercise both reason and volition.

III. *Formal problems*, relating to the medium of communication, namely, language, or, more precisely, discourse, that is, language in organized form. The main problems concern: (1) the nature and origin of discourse; (2) the peculiar function of discourse as (a) on one side, the expression of the individual, and (b) on the other side, the means of social interchange; (3) the structure or morphology of discourse in (a) its minuter forms (words, phrases, sentences, paragraphs, figures, rhythms), (b) its larger forms (whole compositions), (c) its typical modes (description, narrative, exposition, argument, persuasion); and (4) the typical methods of distribution (books, newspapers, conversation, etc.). The formal aspect of rhetoric has been developed in considerable detail in ancient and modern treatises, but has not been consistently unified or properly connected with the other two phases. It has been the practice of rhetoricians to make certain postulates of a formal character, such as the principle of unity in variety, of symmetry, or of purity, and upon these, by a process of deductive reasoning, to build a structure of theory. Of all the principles that have been advanced to explain the structural side of rhetoric, that of organic unity is perhaps most fundamental, and from it may be derived all of the usual rhetorical qualities. But the truth is that all such principles are derivative, not primary. A truly scientific exposition would demonstrate that the peculiar forms and qualities of any piece of discourse are the natural outcome of the interaction of the individual and society in the process of communication. An oration, for example, is the product of two forces, (1) the impulse of the individual to a certain kind of self-expression, and (2) the demand of the social mind for a certain kind of communication. The oration is the meeting point of these two forces. It is the path of least resistance traced by the language of the orator in adapt-

ing his utterance to the hearers' needs and desires.

RHETORIC, FIGURES OF. A term popularly applied to a large and heterogeneous class of language-forms, all characterized by the fact that they are deviations from what is plain, literal, and straightforward. From ancient times figures have been regarded by rhetoricians as 'embellishments' of speech; that is, as conscious devices and ornaments. Figures are commonly said to give life, strength, and beauty to style, but it would perhaps be truer to say that they have the power of arousing in the reader or hearer the same emotional and imaginative processes which gave birth to them in the mind of the writer.

Since the conceivable modes of departure from literal statement are almost infinite in number, it is obvious that an exhaustive enumeration of figures is difficult, and a classification of them well nigh impossible. The ancients, for whom the subject had a peculiar fascination, enumerated as many as 250 distinct species, and although modern writers, generally speaking, have been less prodigal in their invention, the *Arto of Poesie*, attributed to Puttenham (1589), names and defines 107. In recent text-books the tendency is to limit the number to 10 or 12. The important figures are as follows:

I. FIGURES OF IMAGERY. These are figures which arouse concrete images in the mind of the hearer. (a) *Metaphor* is a form of expression in which one object is made to appear under the image of another which it resembles in some particular. Thus in the sentence, "The ice makes daggers at the sharpen'd eaves," icicles are presented to us under the image of daggers, which resemble them in shape and color. Sometimes a metaphor contains two images which fail to blend, as in "With swift rapier-thrusts of irony, the prosecuting attorney applied the thumbscrews to the unwilling witness." Such figurative jumbles are called mixed metaphors. Akin to the metaphor, though distinct as being a legitimate development of semasiology (q.v.), is catachresis, in which a word is extended in meaning beyond its strict sense, as 'a silver drinking-horn.' (b) An extended metaphor in narrative form is called *allegory*. Bunyan's *Pilgrim's Progress* is a famous example. A short, pointed allegory in which animals are represented as speaking and acting is called a fable. The brief allegories of the Bible are known as parables. (c) *Simile* differs from metaphor in that the resemblance between object and image which is assumed in metaphor is in the simile expressly stated by means of the word *like* or *as*. Thus "His face was a withered moon" is metaphor, but "All his face was white And colorless, and like the wither'd moon, Smote by the fresh beam of the springing east," is simile. (d) *Synecdoche* is a kind of metaphor in which the image is related to the object as a part to the whole, as the whole to a part, as genus to species, etc. Thus in "All hands on deck," *hands* is used for *men*. (e) In *metonymy* the image is an accompaniment of the object; that is, what contains it, stands for it, as, "The poorest man may in his cottage bid defiance to all the force of the Crown," the *Crown* standing for *the King*. Metonymy and synecdoche are, however, so nearly alike that the distinction is hardly worth preserving.

II. FIGURES OF ARRANGEMENT. In these figures, words, phrases, clauses, or sentences are disposed in some peculiar and striking way to correspond to peculiar sequences of thought. (a) *Climax* consists in the arrangement of words, clauses, or sentences in the order of their importance, the least forcible coming first and the others rising in importance until the last; as in this example: "It is an outrage to bind a Roman citizen; it is a crime to scourge him; it is almost parricide to kill him; but to crucify him—what shall I say of this?" (b) *Antithesis* occurs when corresponding parts of a sentence are so juxtaposed as to give force to contrasting ideas; as, "To err is human, to forgive divine." Both climax and antithesis may appear also in the arrangement of the larger units of composition, as paragraphs and complete essays, as well as in the smaller units of words, clauses, and sentences.

III. FIGURES OF CONTRADICTION. In these figures there is an apparent contradiction between the form of expression and the idea to be expressed. (a) In *irony* the speaker's words seem to convey one meaning, but in reality convey just the contrary, the real meaning being suggested by the tone of the voice or the implication of the words. (b) *Epigram* is a brief, pointed sentence. Talleyrand's saying, "Language was given to man to conceal his thoughts," is a good example of epigram. (c) In *hyperbole* an object is greatly exaggerated in size or importance, for impression on humorous effect; as, "Swifter than the winds and the wings of the lightning." Hyperbole may also be looked upon as a kind of metaphor. Of the figures defined above, four—metaphor, metonymy, synecdoche, and irony—are often called 'tropes,' because in them a word is turned from its ordinary meaning or application. But the word is also applied to a figure of any kind expressed in a single word.

Among the figures which are less easy to classify may be mentioned the following: *Apophysis*, *paraleipsis*, or *omission* is the pretended omission or passing over of what one is really mentioning. *Apostrophe* is a turning aside to address an inanimate object, or a person not present. *Asyndeton* consists in the omission of connectives, as "I came, I saw, I conquered." *Epanorthosis* is an effective correction of something which has just been said, as "His fault—perhaps I should rather say his crime." *Epi-plexis* is a figure in which a person seeks to move or persuade by means of gentle upbraiding. *Epitlocce* is a climax consisting of several clauses so framed that the last part of one clause is repeated as the beginning of the next, as "He not only spared his enemies, but continued them in employment; not only continued them, but even advanced them." *Epistrophe* is a figure by which successive clauses or sentences end with the same emphatic word or phrase, as "Are they Hebrews? So am I. Are they Israelites? So am I. Are they the seed of Abraham? So am I." *Euphemism* is the use of mild, softened language on unpleasant subjects, for the purpose of avoiding the directness of plain speech. *Interrogation* is the asking of questions, not to gain information, but to assert more emphatically the opposite of what is asked. *Litotes* is a figure in which the author denies one thing instead of directly affirming the opposite. *Onomatopœia* is the use of a word, phrase, or clause to imitate

the sound of the thing signified as 'rat-tat-tat,' 'bow-wow.' *Personification* or *prosopopœia* is the representation of inanimate objects as living beings, as "Necessity is the mother of invention."

RHETT, rêt, ROBERT BARNWELL (1800-76). An American politician, born at Beaufort, S. C. His name was originally Smith, but after entering public life he changed it for that of a prominent colonial ancestor. He received a liberal education, studied law, and in 1826 became a member of the State Legislature. In 1832 he was elected Attorney-General of the State, and during the Nullification agitation attracted wide attention by his radical advocacy of the theory of State's rights, in which he outstripped Calhoun himself. In the fall of 1836 he was elected as a Democrat to Congress, sitting by reelection until 1849, and taking a leading part in the acrimonious slavery debates. In 1850 he was elected United States Senator to fill the vacancy caused by the death of John C. Calhoun and took his seat January 6, 1851. He at once took the most extreme position in regard to slavery, and stoutly opposed all compromises as only temporary expedients to put off for a short time the inevitable secession. In the heated campaign of the year 1852 he advocated the immediate withdrawal of South Carolina from the Union without consultation with other Southern States. The Union candidates were generally successful at the ensuing election. Rhett took the defeat as a personal rebuke, resigned his seat in the Senate, and retired to his plantation. In the Charleston *Mercury*, in which he purchased a controlling interest, he continued to advocate his extreme views, and in 1860 again came into prominence as one of the most radical members of the South Carolina convention which adopted the ordinance of secession, and was the author of its address to the people. In the Montgomery convention which met to organize a provisional government for the seceding States he was one of the most active delegates, and was chairman of the committee which reported the Confederate Constitution. Subsequently he was elected a member of the Lower House of the Confederate Congress. After the war he settled in Louisiana.

RHEUMATISM (Lat. *rheumatismus*, from Gk. *ῥευματισμός*, liability to rheum, a flux, from *ῥεματίζεσθαι*, *rheumatizesthai*, to have a flux, from *ῥεῦμα*, *rheuma*, flux, flow, from *ρεῖν*, *rheîn*, Skt. *sru*, to flow). An acute or chronic disease characterized by painful local inflammations. It may be divided for convenience of description into the articular (that involving the joints) and the muscular varieties. Either form may be acute or chronic. Acute articular rheumatism is a constitutional disease, not contagious, and characterized by fever, pain, and inflammation in and around the joints and a tendency to involvement of the pericardium and endocardium. The joints are apt to be attacked in succession. Rheumatism is a disease of moist and temperate climates, and the acute articular form usually occurs in young adults, although children are not by any means exempt.

The close analogy that exists between acute rheumatism and certain of the infectious diseases has led many investigators to believe that it is due to a specific germ, in spite of the fact that no microorganism has as yet been found constantly associated with the disease. A more generally

accepted theory is that it is due to some morbid material produced in the system as a result of defective metabolism. It has been suggested that this material is lactic acid. Others believe that the disease is due essentially to some nervous disturbance. The immediate exciting causes are exposure to wet and cold, or a chilling of the body such as occurs from sitting in a draught. The symptoms often begin quite suddenly, at night, with pain and stiffness in the joints, with nausea and vomiting, followed by all the manifestations of a high fever. The latter may reach as high as 108° F. in severe cases. The pulse is comparatively slow, there is great thirst, profuse acid sweats, and the urine becomes high-colored, scanty, and abnormally acid. The affected joints are painful and tender, hot, red, and swollen. Swelling is apt to be most apparent in joints scantily covered with muscle, viz. the knee, wrist, elbow, ankle, and the joints of the hands and feet. One or more joints may be affected, and the disease travels from joint to joint. Acute rheumatism is distinguished by the number and severity of its complications. These affect principally the serous membranes of the body. Pericarditis (q.v.) is a common complication. Endocarditis (q.v.), which often results in chronic cardiac trouble, is also of frequent occurrence. Pleurisy (q.v.) with effusion is often seen in association with pericarditis. Less often, bronchitis, pneumonia, and inflammation of the cerebral arteries occur. In itself, acute articular rheumatism is not a fatal disease, and the majority of cases recover within a week or ten days. Relapses, however, often occur, and weeks or months may elapse before entire cure is attained.

Chronic articular rheumatism may result from an acute attack, but most frequently it arises independently in persons of advanced middle age. The causative elements are similar to those of the acute form, but the onset is insidious. It is most apt to attack those whose occupation exposes them to cold and damp. The joints gradually become painful and stiff, and the condition varies from time to time. It is worse in the morning and is aggravated by damp weather. Late in the disease the joints become greatly distorted and ankylosis may supervene.

Muscular rheumatism is an affection of the voluntary muscles and of the fasciæ and periosteum to which they are attached. It is inflammatory in character and may be acute or chronic. In contrast to the articular variety, muscular rheumatism is never complicated by cardiac disease. It is a malady of adult life; is almost always due to cold and damp; and one attack predisposes to another. The first attack is generally acute. The onset is sudden with pain in the affected muscles, with slight tenderness, and considerable stiffness and difficulty of movement, by which the pain is increased. Fever is absent or slight. The acute attack lasts about a week. When the disease reaches the chronic stage the attacks return frequently and finally become constant and aggravated when the weather is damp. This form of rheumatism is prone to involve particular groups of muscles, and different names have been applied to it according to its location. When situated in the occipito-frontal muscles it is called *cephalalgia* and may be mistaken for neuralgia of the trifacial or occipital nerves. The eye or jaw muscles may be affected, giving rise to pain when these parts are used. *Torticollis* (wry-

neck) is an affection of the muscles of the side of the neck usually rheumatic. It is generally limited to one side, toward which the head is twisted. *Cervicodynia*, involving the muscles of the back of the neck, is comparatively rare. *Pleurodynia* is applied to a rheumatic affection of the thoracic muscles. Pain is excited by forced breathing, coughing, or sneezing. It is often mistaken for pleurisy or intercostal neuralgia, which it closely simulates. A very common form of muscular rheumatism is *lumbago* (q.v.).

For the efficient treatment of even mild cases of acute rheumatism rest in bed is imperative; indeed, in severe cases the patient cannot do otherwise than lie still. Local measures to relieve pain consist in wrapping the affected joints in cotton wool, upon which some anodyne liniment, such as belladonna or opium, or oil of wintergreen, may be sprinkled freely. The drugs now used internally consist of salicylic acid and its derivatives, with acetanilid, antipyrin, or morphine to relieve severe pain. It is agreed, however, among the best authorities that no medicine has much control over the course or duration of the disease. The diet should consist of milk chiefly, either alone or diluted with barley water, lime water, or vichy. Lemonade is beneficial as a drink. In acute muscular rheumatism hot poultices applied to the parts affected will afford great relief. The treatment of *lumbago*, wry-neck, *pleurodynia*, etc., is dealt with fully under those titles. Chronic rheumatism is best treated locally by friction with stimulating liniments. Much relief is obtained both from pain and loss of function by exposure of the joints to superheated air in a specially devised apparatus. Electricity and hydrotherapy (q.v.) are useful in improving the circulation and nutrition of the joints. Internally the most constantly employed drug is potassium iodide. The alkaline waters may be taken habitually. The greatest attention must be paid to the general health, and good food, warm clothing, and tonics, particularly cod-liver oil, iron, arsenic, and strychnine, are necessary to prevent relapses and recruit the strength.

RHEYDT, rit, or **RHEIDT**. A town in the Rhine Province, Prussia, on the Niers, 28 miles northwest of Cologne (Map: Prussia, B 3). It has a handsome new town hall, statues of William I. and of Bismarck, and a fine Hohenzollern fountain in the market-place. It manufactures silks, woollens, velvets, machinery, cigars, paper, etc., and has dye-works. Rheydt received municipal privileges in 1856. Population (commune), in 1890, 26,830; in 1900, 34,034.

RHIN, rān, BAS- (Fr., Lower Rhine). A former frontier department of France, corresponding nearly to the present German administrative district of Lower Alsace in the Imperial territory of Alsace-Lorraine (q.v.). It was ceded to Germany in 1871 by the Treaty of Frankfurt.

RHIN, HAUT- (Fr., Upper Rhine). A former frontier department in the east of France, with the exception of the Territory of Belfort (q.v.), since 1871 comprehended within the German District of Upper Alsace. The Territory of Belfort is often called Haut-Rhine. See ALSACE-LORRAINE.

RHIND PAPYRUS. A mathematical manuscript written by an Egyptian scribe, Ahmes, who lived before B.C. 1700. It is now deposited in

the British Museum. See AHMES; ALGEBRA; EISENLOHR.

RHINE. The principal river of Western Europe. It rises in Southern Switzerland, and flows in a general northwest direction through Western Germany and Holland, emptying into the North Sea after a course of 760 miles (Map: Germany, B 3). The Rhine proper is formed in the Canton of Grisons, Eastern Switzerland, by two main headstreams, the Vorderrhein and the Hinterrhein. The former is the larger of the two. It rises on the north slope of the Saint Gotthard group within two miles of the source of the Rhone, at an altitude of 7690 feet, and passes northeast along the base of the Glarner Alps till it meets the Hinterrhein coming from the south from the glaciers of the Rheinwaldhorn. The combined stream, swelled by numerous mountain torrents to a width of 45 yards, flows northward, separating Switzerland from Liechtenstein and Austria, and enters the Lake of Constance. It leaves the main body of the lake at the town of Constance, and passes into the Unter See (Lower Lake) a short distance farther on. The Rhine now flows westward, becomes narrow and very rapid, finally (below Schaffhausen) plunging over a rocky precipice 70 feet high. Another and smaller fall is encountered at Zurzach, below which the Rhine receives its first great tributary, the Aar, which brings to it the waters of Northwestern Switzerland. The river bed continues for some distance to be narrow and rocky with several rapids. It continues its westward course to Basel, where it makes a sharp turn to the north and enters wholly into German territory, having formed the boundary between Germany and Switzerland from the Falls of Schaffhausen to this point. At Basel the river is 190 yards wide and is henceforth navigable without obstructions. It now flows on the boundary between Baden and Alsace through a wide and level flood-plain bordered by the Vosges Mountains on the west and the precipitous and romantic Black Forest on the east. In this valley it passes Strassburg, just below which city it receives the Ill, which drains Upper Alsace. After forming for about 50 miles the boundary between Baden and the Palatinate it is joined at Mannheim by the Neckar from the east. It continues its course northward through Hesse, passing the town of Worms, and at Mainz receives the Main, its principal affluent from the right. At Mainz the river makes a short turn to the west, and then at Bingen an abrupt turn to the northwest. It now enters upon the most romantic and celebrated part of its course, reaching from Bingen to Bonn, a distance of about 80 miles, all through Prussian territory. Here the river is much narrowed and winds between steep mountains rising often from the water's edge. The heights are crowned by the famous ruined castles and the slopes are covered with vineyards, this stretch being well known for the Rhenish wines. The chief town on the Rhine in this part of the course is Coblenz, at the confluence of the Moselle, the largest tributary from the left. After passing the Siebengebirge at Bonn the river and its valley again widen out, and from Cologne to its mouth the Rhine flows through a low, level country, turning gradually westward as it enters Holland. The largest city on its banks below Cologne is Düsseldorf. A short distance below

Düsseldorf the Rhine is joined by the Ruhr from the right, and a little farther down it receives the Lippe, also from the right. Shortly after passing the Dutch boundary it divides into two arms, the southern and larger of which, known as the Waal, flows into the great delta of Southern Holland, where it merges with the Meuse and the Scheldt. The northern arm divides again at Arnhem, the Yssel coursing north into the Zuzyder Zee, and the other arm flowing westward, parallel with the Waal. This latter arm, called Lek (Leek) below Wijk, pours its waters into the North Sea through the Nieuwe (New) Maas. At Wijk a narrow arm, which at first bears the name of the Crooked Rhine, branches out northward and flows past Utrecht, below which it is known as the Old Rhine. At Utrecht the Vecht branches out from this arm and flows into the Zuzyder Zee. The Old Rhine, which has barely the dimensions of a river, flows past Leyden, and discharges into the North Sea, a few miles north of Scheveningen.

Commercially the Rhine is probably the most important river of Europe, its valley being densely populated, with numerous important industrial cities, especially along its middle course. Canals connect the Rhine with the Meuse, the Seine, the Saône, the Danube, and the Ems. The Rhine-Rhone Canal follows the course of the river from Strassburg almost to Basel, and is generally used instead of the river, whose current here is very swift. The shipping at the principal ports on the Rhine amounts to nearly 8,000,000 tons annually, and the river is visited every year by more than 1,000,000 tourists. The legends of the Rhine figure prominently in German folk literature.

RHINE, CONFEDERATION OF THE. See CONFEDERATION OF THE RHINE.

RHINE-HESS. A province of the Grand Duchy of Hesse (q.v.), Germany.

RHINE/LANDER. A city and the county-seat of Oneida County, Wis., 103 miles northwest of Green Bay, on the Wisconsin River, at the Pelican Rapids, which afford large water power, and on the Chicago and Northwestern and the Minneapolis, Saint Paul and Sault Ste. Marie railroads (Map: Wisconsin, D 3). It is the centre of a region noted for its extensive lumber output, and has several saw and planing mills, a refrigerator factory, a veneer factory, boiler and iron works, etc. Population, in 1890, 2658; in 1900, 4998.

RHINE PROVINCE (Ger. *Rheinprovinz*, or *Rheinland*), or RHEINISH PRUSSIA. The most densely populated province of Prussia, bounded by the Netherlands on the north, Westphalia and Hesse-Nassau on the east, Lorraine on the south, and Luxemburg, Belgium, and the Netherlands on the west (Map: Prussia, B 3). It covers an area of 10,423 square miles. About 43 per cent. of the total area is under tillage. The chief agricultural products are rye, wheat, barley, oats, and potatoes. There are extensive vineyards

along the Rhine and Moselle, and wine is exported on a large scale. The large coal fields to which the province mainly owes its industrial development are situated chiefly along the Ruhr and the Saar. The province produces annually upward of 25,000,000 tons. Iron, zinc, lead, copper, quicksilver, and manganese are mined. Salt, sulphur, and several kinds of stone and useful earth are also produced in considerable quantities. The production of different metal articles from locomotives and guns to needles and small tools ranks first among the manufacturing industries of the province. The textile branches have also attained a high state of development. Some of the textiles, such as the woolen fabrics of Aix-la-Chapelle or the silks of Krefeld, are foremost in the world. The Rhine Province has also extensive glass works, paper mills, chemical works, and tanneries, besides a number of sugar refineries, distilleries, and breweries.

The extensive trade of the province is greatly promoted by the excellent transportation facilities, especially the railways. There are about 2400 miles of railways. The chief commercial centres of the province are Cologne, Düsseldorf, Aix-la-Chapelle, Coblenz, and Duisburg. It is divided into the five districts of Coblenz, Düsseldorf, Cologne, Treves, and Aix-la-Chapelle. The capital is Coblenz. The province is represented in the Prussian Landtag by 28 members in the upper and 62 delegates in the lower chamber. It returns 35 members to the German Reichstag. The population of the Rhine Province more than trebled during the nineteenth century. In 1819 it was only about 1,871,000; in 1900 it was 5,759,000, showing an increase of 12.8 per cent. since 1895. Over 70 per cent. is Roman Catholic.

RHINITIS (Neo-Lat., from Gk. *ῥίς*, *rhis*, nose). Inflammatory disease of the mucous membrane of the nose; nasal catarrh. Low temperature, air in motion and moisture, or mechanical irritants, together with certain bacilli combine to cause a hyperæmic swelling with first a dryness, then an increased production of mucus and a transudation of serum into the blood vessels. Emigration of leucocytes may follow (see INFLAMMATION) and desquamation of epithelium from the mucous membrane may occur. The disease is commonly known as 'cold in the head.' The mucous membrane may remain thickened permanently or may become atrophic, so that an ordinary attack of rhinitis may terminate in three or four days, or may pass into a chronic condition, continuing for months. Some cases are caused by reflex irritation, the primary seat of trouble being in over-stimulated sexual organs. In the treatment of acute rhinitis preparations of ammonium, belladonna, potassium citrate, ipecacuanha, camphor, carbolic acid, and saline cathartics are used, as well as alkaline or astringent topical applications. Similar treatment is used in cases of chronic rhinitis, besides surgical

interference in the way of removal of hypertrophic tissue, both mucous membrane and bone, as well as the correction of intra-nasal deformities. Hay fever (q.v.) is sometimes termed 'pruriginous rhinitis.' *Rhinitis ulcerosa* is considered under OZÆNA. For a study of the bacteriology of nasal inflammation, see Howard, in *American Journal of the Medical Sciences*.

RHINOCEROS (Lat. *rhinoceros*, from Gk. ῥινόκερος, *rhinokērōs*, rhinoceros, nose-horned, from ῥίς, *rhīs*, nose + κέρας, *kerōs*, horn). An animal of a family of perissodactyl ungulates (q.v.), the Rhinocerotidae, closely allied to the tapirs, and containing the largest and most powerful of terrestrial mammals, except the elephants. There are five existing species, all natives of the warm parts of Asia, the Indian Archipelago, and Africa. The form of the rhinoceros is massive and uncouth. The limbs are thick and strong; each foot is terminated by three nearly equal toes, covered with broad, hoof-like nails, with a fourth non-functional toe on the front feet. The tail is small and terminated by a small tuft. The head is large, the muzzle prolonged, ears moderately large, eyes small, and nasal bones combined into an arch for the support of a horn or horns. The upper lip in most species is prolonged, pointed, and prehensile. The incisors are defective in the Asiatic species, and, as well as the canines, wanting altogether in the African species; the molars and premolars are alike and highly effective as grinders. The skin is extremely thick and smooth, but soft and sensitive, although in the Asiatic species it has the appearance of a rigid armor, studded with tubercles and jointed in folds or wrinkles where necessary to permit movement of the head and limbs. The hide is used for making whips, harness, ropes, and so on, and when dried and hardened forms a material for shields capable of resisting spear thrusts and old-fashioned bullets. When properly dried and prepared it has the translucency and mottled appearance of tortoise-shell, and from it are made various ornamental objects by East Indian artificers. The nasal horn or horns are formed of a solid mass of agglutinated bristles which spring from the skin of the nose, but are rooted upon a bony plate surmounting the skeleton of the nose. This horn is not only a powerful weapon, but with it the animal can root up and overturn bushes and small trees whose leaves and roots it seeks to eat.

The Indian rhinoceros (*Rhinoceros Indicus*) formerly ranged over most of the peninsula, but is now restricted almost entirely to the Assam plain, and lives chiefly in grassy jungles. It is the largest known species and sometimes exceeds five feet in height and ten feet in length. The single horn is sometimes two feet long and eighteen inches in circumference at the base. The Javanese or Sondaic rhinoceros (*Rhinoceros Sondaicus*) is a much smaller species, also one-horned, found from Bengal to Java. Its armor has a tessellated appearance, and the female is hornless. The Sumatran or hairy rhinoceros (*Rhinoceros Sumatrensis*) is so distinct that some naturalists have placed it in a separate genus (*Cetorhinus*). It ranges from Northeastern India to Borneo, has a more hairy coat than the others, and two short blunt horns, one behind the other. A hairy-eared race (var. *lasiotis*) inhabits Assam.

The two species of African rhinoceros differ from the Asiatic ones mainly in the absence of incisor teeth and in the smoother, unfolded skin; and they have been put into a separate genus (*Atelodus*) by some naturalists. Possibly a third species exists, of which nothing very definite is known. The more familiar and widespread of the African rhinoceroses is the 'common' or 'black' one (*Rhinoceros bicornis*) formerly abundant all over the eastern and south-central parts of the continent, but now become rare and restricted. It is not black, but bluish lead-color, if anything rather lighter than the other species usually called 'white.' This rhinoceros stands 5½ feet at the withers in the case of large males or 'bulls,' and has two horns. The front one, usually much the longer in South African examples, sometimes attains a length of 40 inches, but is always less in northern specimens. The rear horn varies from a mere knob to a length almost equal to its fellow, and is usually straighter and much compressed. The upper lip is pointed, extensible, and prehensile, and this species feeds almost wholly on leaves, twigs, and roots. It frequents bushy and rocky districts rather than open plains. It spends the day in an accustomed lair well hidden from observation, and starts at sunset for a drinking-place along a well-trodden path. Having drunk it will wander about feeding during the night, will drink again at daybreak, and then return to its resting-place. Some hunters regard this rhinoceros as naturally ferocious and vindictive, while others consider it stupid and timid, but subject to sudden panics, in which it is as likely to rush headlong toward the hunter as away from him. At best, however, it is dangerous, and its speed and agility are extraordinary. The other African species, the white, Burchell's or square-mouthed rhinoceros (*Rhinoceros simus*), is larger than the 'bicornis,' the biggest, indeed, of the entire tribe, and differs from the other prominently in having a blunt, squarish muzzle, the upper lip not being at all prehensile. In conformity with this it is a grazing, not a browsing animal.

Fossil RHINOCEROSSES. The existing species are the lone remnants of a once numerous group that abounded in North America from Eocene to late Miocene time, and in Europe from Eocene to Pliocene time. The fossil and living species may be grouped under three families. The Hyracodontidae, represented by the genera Hyrachyus and Hyracodon of Eocene and Oligocene time, comprised hornless, lightly built animals adapted for running on the uplands. They show a tendency to reduce the number of functional digits of the feet from five to three and thus to parallel the evolution seen in the horse's hoof. The Amynodontidae, comprising the American genera Amynodon, Metamyndon, and the European Cadurocotherium, were heavily built, short-bodied animals adapted to more or less aquatic habits of life. The skull was hornless and the eyes were situated high on the head. The upper incisors are reduced and the canine teeth are enlarged to form tusks for use in uprooting water plants. The true rhinoceroses (*Rhinocerotidae*) began as light-limbed runners without horns, that lived at the same time as the members of the two preceding families. After the hyracodonts and amynodonts had become extinct the rhinoceroses began to adapt themselves to

the habits of life of their predecessors and evolved along six different lines of descent. A gigantic animal, *Elasmotherium*, found in the Pleistocene deposits of Northern Asia, thought to have descended from *Aceratherium*, attained a length of 15 feet, and had two large horns in tandem and prismatic teeth. The woolly rhinoceros (*Atelodus antiquitatis*) is found fossil in the Pleistocene deposits of England and in the cave deposits of Europe, and its complete carcasses have been obtained from the frozen mud banks of the tundras of Northern Siberia. It was a large two-horned species, with a heavy fur of coarse woolly hair.

BIBLIOGRAPHY. The best general account of the tribe is by Lydekker in *Royal Natural History*, vol. ii. (London, 1896). Consult, also: Blandford, *Fauna of British India: Mammals* (ib., 1888-91); Baker, *Wild Beasts and Their Ways* (ib., 1890); Hornaday, *Two Years in the Jungle* (New York, 1885); Drummond, *Large Game . . . of Southeast Africa* (Edinburgh, 1875); and similar books of naturalists and sportsmen relating to Southern Asia and Africa; Osborn, "Phylogeny of the Rhinoceroses of Europe," *Bulletin of American Museum of Natural History*, vol. xiii. (New York, 1900); id., "The Extinct Rhinoceroses," *Memoirs of the American Museum of Natural History*, vol. i., part iii. (ib., 1898). See Colored Plate of **PACHYDERMS**.

RHINOCEROS BEETLE. A name in the South for a large scarabæid beetle (*Dynastes tityus*). It is most abundant in the southern Atlantic States, but extends west to New Mexico and north to Cape May and southern Pennsylvania. It is a large beetle, nearly 2½ inches in length, and is stout. The male has two long

A MALE RHINOCEROS BEETLE.

horns, one extending forward from the head and the other from the thorax, from which fact it derives its popular name. The female resembles the male, but lacks the horns. It is pale bluish gray in color and the wing-veins are marked with darker irregular spots. The egg is an eighth of an inch in length and is laid in rich earth or decaying trunks of old trees of several varieties. The insect in all stages has a very strong and disagreeable odor.

RHINOCEROS-BIRD. (1) An oxpecker or buffalo-bird (qq.v.) which settles upon the backs of rhinoceroses. (2) A hornbill.

RHINOCEROS HORNBILL. See **HORNBILL**.

RHINODERMA (Neo-Lat., from Gk. *ῥίς*, *rhis*, nose + *δέρμα*, *derma*, skin). A small frog (*Rhinoderma Darwini*) of Chile, remarkable for

its bell-like voice, and for the fact that the internal vocal sacs in the throat of the male are converted into nests for the eggs, which hatch there, whereupon the sacs become nurseries for the 5-15 tadpoles until they reach maturity. The process is not wholly known, but has been studied by Espada, an outline of whose investigations is given in English by Gadow, *Amphibia and Reptiles* (London, 1901).

RHINOPLASTIC OPERATION (from Gk. *ῥίς*, *rhis*, nose + *πλασσειν*, *plassein*, to mold). When a portion or the whole of the nose has been destroyed by accident or disease the deficiency may be restored by a transplantation of skin from an adjoining healthy part. After paring away any remains of the old nose, a flap of skin of the required shape is carefully dissected from the forehead until it hangs by a narrow strip or pedicle between the eyebrows. Then after all bleeding is stopped the flap is twisted on itself so that its skin surface remains out, while its base is brought down in position to correspond to the original base of the nose. The edges of the flap are then sutured accurately to the denuded edges of the former membrane, spaces being left on either side of the lower end of the flap for the nostrils. As practiced at the present time the operation has received two important modifications: The first consists in the use of a permanent frame of gold or aluminum or platinum, which is fastened into the bony framework surrounding the nasal aperture and which gives shape and profile to the nose; the second consists in the employment of skin-grafts to cover the unsightly area in the forehead and prevent the deforming cicatrix that would otherwise result. See **AUTOPLASTY**; **SKIN-GRAFTING**.

RHINS, rān, JULES LÉON DUTREUIL DE (1846-94). A French geographer and explorer, born at Saint Etienne. He took part as a midshipman of naval volunteers in the expedition to Mexico and was an ensign during the Franco-Prussian War. From 1871 to 1876 he was captain of a foreign-going ship, in 1876-77 commanded the *Scorpion* of the King of Annam's navy, and in 1882 was Egyptian correspondent of the *Temps*. From 1891 to 1894 he explored Chinese Turkestan (Eastern Turkestan), and the most inaccessible and least-known regions of Northern and Western Tibet. He was murdered by natives at a small town of Eastern Tibet. His publications include *Le royaume d'Annam* (1879), *Carte de l'Indo-China orientale* (1881), *Levé du cours de l'Ogooné* (1884), and *L'Asie centrale* (1889). The results of his last journey were edited by his assistant, Grenard, *Mission scientifique dans la Haute-Asie* (3 vols., 1897-98).

RHINTHON, rīn'thōn (Lat., from Gk. *Ῥίνθων*). A Greek comic poet of Tarentum who lived about n.c. 300. He was the first to develop in a written form and to introduce into Greek literature the so-called Hilarotragedia (*Ἱλαροτραγῳδία*), a species of burlesque tragedy in which the tragic myths were treated in the spirit and style of comedy. He is frequently quoted by Cicero and Varro, and by Athenæus, Hesychius, and other Greek writers, but of his 38 dramas only insignificant fragments are extant. Consult *Völker, Rhinthonis Fragmenta* (Halle, 1887).

RHIZOCARPEÆ. See **PALEOBOTANY**.

RHIZOCEPH'ALA (Neo-Lat. nom. pl., Gk. *ῥιζοκέφαλος*, *rhizokephalos*, having the flower growing immediately from the root, from *ῥίζα*, *rhiza*, root + *κεφαλή*, *kephalē*, head). An order of most degraded cirripeds, the root-barnacles, especially of the genera *Sacculina* and *Peltogaster*. The few forms known are parasitic on the abdomens of various crabs.

RHIZ'ODON'TIDÆ (Neo-Lat. nom. pl., from Gk. *ῥίζα*, *rhiza*, root + *ὄδους*, *odous*, tooth). A family of carnivorous Paleozoic fishes of the crossopterygian suborder Rhipidistia, in which the median fins are always more or less subdivided by a process of concentration analogous to that prevalent among dipnoans. The notochord was persistent, and the jaws bore many peculiar teeth. These teeth were highly complicated in

EUSTHENOPTERON FOORDI.

the Holopterychida, less so in the Rhizodontida, with a larger central cavity. A well-known example, found in an unusually good state of preservation, is *Eusthenopteron Foordi*, herewith figured, which abounds in the Devonian rocks of Quebec, and whose pectoral fin has only one stout basal cartilage—an 'archipterygium.' All were small fishes. Consult Woodward, *Vertebrate Paleontology* (Cambridge, 1898).

RHIZOIDS (from Gk. *ῥιζώδης*, *rhizōdēs*, root-like). Colorless, hair-like structures developed by liverworts, certain algae, mosses, and fungi (toadstools and molds). Their function is to anchor the plant in favorable situations and in some cases perhaps to absorb water. The ferns have rhizoids only in connection with the very small prostrate sexual plant (gametophyte, q.v.).

RHIZOP'ODA (Neo-Lat. nom. pl., from Gk. *ῥίζα*, *rhiza*, root + *πούς*, *pous*, foot). The first and lowest class of Protozoa (q.v.); a large assemblage of varying forms agreeing in the possession of projections of the body-protoplasm called 'pseudopodia.' These pseudopodia are used as organs of locomotion and also for ob-

dosarc,' which is granular and more opaque. Most of the numerous species are spherical with radiating pseudopodia, but the lowest forms have no constant shape. Most rhizopods are provided with some sort of shell, but the lowest forms have no such covering. The simplest shells are those made up of particles of dirt or foreign material of some sort, united together by some secretion of the ectosarc; in other cases the shell is formed of a horny material called 'acanthin' or of carbonate of lime or silica, often in a very remarkable and elaborate pattern. Generally rhizopods are freely moving animals, but some are attached in adult life by stalks. The individuals are usually distinct, but colonial rhizopods are known, and such colonies are sometimes half an inch across.

The only internal organs of the Rhizopoda are the 'vacuoles,' those which contain more or less digested food and those which contain the waste matter or excreta of the body. The latter are the larger and more conspicuous, and, owing to the sudden collapse when the excreta are thrown out of the body, are known as 'contractile' vacuoles. Reproduction takes place by simple budding or fission, the two processes differing only in the relative size of the resulting individuals. The formation of spores, however, occurs in many cases, especially after a resting period. Such resting periods occur during unfavorable conditions such as prolonged cold or drought, or when an unusual amount of food has been taken. In most cases during such a resting period the rhizopod surrounds itself with a firm, impervious coat, called a 'cyst.' When the unfavorable conditions cease the sarcode divides up into several minute spores, each of which on the dissolution of the cyst becomes a new individual. The growth of these individuals is rapid when food is abundant. For further information, see Bütschli's *Protozoa in Bronn's Klassen und Ordnungen des Thierreichs* (Leipzig, 1887); concerning fresh-water forms, see Leidy *Fresh Water Rhizopods of North America* (Washington, 1879).

RHODE ISLAND. A North Atlantic State of the United States, belonging to the New England group, and situated between latitudes 41° 18' and 42° 3' N. and between longitudes 71° 8' and 71° 53' W. It is bounded on the north and east by Massachusetts, on the south by the Atlantic Ocean, and on the west by Connecticut. Rhode Island is the smallest in area of the United States. It has an extreme length from north to south of 48 miles, and an extreme width from east to west of 36 miles. Its area is 1250 square miles, of which 1053 square miles, or 673,920 acres, are land surface.

TOPOGRAPHY. The greater part of the State belongs to the eastern Appalachian belt known in the Southern States as the Piedmont Plain. It is rough and hilly, though the general elevation is not great, being less than 600 feet throughout the State, with the exception of a few monadnocks. The highest point is Durfee Hill, near Gloucester, in the northwestern part; its altitude is 805 feet. The western part of the coast-line is bordered by lagoons and marshes, while the eastern part of the State is separated from the main portion by Narragansett Bay, a large, irregular, and branching inlet extending 28 miles inland, with a breadth of from 12 to 3 miles. It incloses a number of islands, the

1. A radiolarian, showing the interior; 2, cross-section of the same through the processes.

taining food. They may be of very irregular and constantly changing shape or comparatively rigid, independent of each other, or forming a very complex network. The protoplasm or 'sarcodē' of a rhizopod consists of an outer layer called 'ectosarc,' which is thin, transparent, and homogeneous, and an inner portion called 'en-

71 30'

71 15'

AREA AND POPULATION OF RHODE ISLAND BY COUNTIES.

County.	Map Index.	County Seat.	Area in square miles.	Population.	
				1890.	1900.
Bristol	C 3	Bristol.....	25	11,428	13,144
Kent.....	B 3	East Greenwich.....	169	26,751	29,976
Newport.....	C 3	Newport.....	117	28,552	32,599
Providence.....	B 2	Providence.....	411	255,123	328,683
Washington.....	B 4	Kingston.....	331	23,649	24,154

largest of which are Aquidneck or Rhode Island, Conanicut, and Prudence Island. Aquidneck, containing the town of Newport, is a beautiful island, 15 miles long and 3 miles wide. It is lined with bold cliffs and fine beaches, and is known as the 'Eden of America.' Nine miles off the coast lies Block Island, a sandy reef inclosing a salt lagoon. The rivers of the State are small. The three largest are the Blackstone and the Pawtuxet in the north, flowing into the upper part of Narragansett Bay, and the Pawcatuck in the south, flowing into the Atlantic Ocean on the Connecticut boundary. All of these are rapid streams, with a number of falls supplying considerable water-power. Like all glaciated areas, the State is studded with numerous small lakes.

CLIMATE AND SOIL. The climate is mild and equable compared with that of the rest of New England. It is influenced chiefly by winds coming from the Gulf Stream. The cold winds striking the eastern coast of New England are almost unfelt here. The mean temperature for January is 36° and for July 76°. The average relative humidity ranges between 80 and 95 per cent. throughout the year. The average rainfall is about 45 inches, ranging in localities from 40 inches in the north to nearly 50 on the coast. The soils are in general coarse, stony, and not well adapted for agriculture, and there is very little alluvial land.

GEOLOGY AND MINERAL RESOURCES. Archæan rocks, chiefly the Montalban gneisses, form the surface of the western half of the State to within three miles of Narragansett Bay. The Narragansett Basin, including the bottom of the bay, its islands and both shores, together with a region running northeast into Massachusetts, forms an interesting patch of Carboniferous deposits. It seems to have been a shallow trough undergoing a continual subsidence as the coal beds and intervening strata were laid down, until the whole deposit attained a thickness of several thousand feet. The basin has since been subjected to folding movements, in which process the strata were crushed and faulted, and the coal converted into graphitic anthracite, and locally almost or wholly into pure graphite. These anthracite beds form the principal mineral deposits of the State, but access to large portions of them is difficult, owing to the proximity of the bay. Along a part of the western edge of the Carboniferous area runs a dike of magnetite iron ore containing considerable deposits, while limestone and granite are the most important of the other mineral resources.

FISHERIES. The fisheries employed in 1898 about 1700 persons. The value of the product for that year was \$955,058, to which the oyster catch contributed more than \$500,000. Next to oysters the most important fish are scups and squeteagues.

AGRICULTURE. In Rhode Island the number of acres included in farms decreased 17.8 per cent. between 1850 and 1900, the acreage in the latter year being 455,602, or 67.6 per cent. of the total land surface. The number of farms meanwhile remained almost the same, so that the average size decreased from 103 acres in 1850 to 83 in 1900. The improved land in 1900 (41.1 per cent. of the farm acreage) was only a little over one-half as great as the improved area in 1850. In the census year 1900 the most important cereal, corn, represented only 8149 acres, and the next

in rank, oats, only 1530 acres. Hay and forage form by far the most important crop, amounting in 1899 to 69,776 acres; but this was a decrease from 94,111 in 1889. Potatoes are relatively important, representing, in 1899, 5817 acres. Sweet corn and other vegetables are grown for the local markets. Much attention is given to the growing of apples, peaches, and pears. The number of peach trees increased over four-fold between 1890 and 1900. Considerably over half the fruit trees are in Providence County. Cranberries, strawberries, and other small fruits are grown.

STOCK-RAISING. Significant increases were made in the number of dairy cows and horses in the last half of the nineteenth century, but there was a very great decrease in the number of other cattle, sheep, and swine. The following table shows the number of domestic animals on farms:

	1900	1890
Dairy cows.....	23,660	23,943
Other cattle.....	12,374	10,834
Horses.....	11,390	9,864
Mules and asses.....	43	51
Sheep.....	6,629	11,400
Swine.....	11,508	12,055

In 1899 the value of dairy products was \$1,923,707. Of this amount 89.2 per cent. was realized from sales, mainly of milk. In the decade of 1890-1900 there was a decrease of 49.4 per cent. in the quantity of butter produced on farms, and an increase of 21.8 per cent. in the quantity of milk.

MANUFACTURES. Since 1870 over 22 per cent. of the total population have been engaged as wage-earners in this line of industry. The number in 1900 was 96,528, of whom 26,984 were women, and 5036 children under sixteen years of age. The total value of products increased 29.2 per cent. from 1890 to 1900, being in the latter year \$184,074,378. The shallow depth of the water at the port of Providence has prevented the development of ocean traffic and thus has withheld from the State a great advantage. The raw materials of manufacture are transported long distances, and the centralization of the railroads has in a measure deprived the State of the advantages of competitive rates. Rhode Island has become well known for the superiority of certain of its products. The State has ranked second in cotton manufacture from the beginning of the industry, as estimated by the number of spindles employed. The spinning of cotton by the factory system began in 1790 at Pawtucket, and it was here that cotton was first spun by water power in the United States. As early as 1815 there were 140,000 spindles within a radius of 30 miles of Providence. Since 1890 a very slight decrease has taken place in the number of spindles, the number in 1900 being 1,920,522.

The manufacture of wool in the State by the factory process began in 1804; here the first power loom used in the manufacture of woolens in the United States was installed in 1814. Between 1890 and 1900 the production of worsted goods increased enormously, and the State ranks second in this branch of the woolen industry. But the value of other kinds of woolen goods has greatly decreased. The dyeing and finishing of textiles are industries which have increased enormously

since 1890, as has also been the case with the silk and silk goods industry. Next in importance to the textiles are jewelry and silverware. The State ranks first in each of these and second in the reducing and refining of gold and silver not from the ore. These industries are almost wholly concentrated in Providence. They began here prior to the Revolution, but the prominence of the city in this respect dates from about 1894, when improved machinery was applied. All three of these industries made large gains in the decade 1890-1900. The foundry and machine-shop industry mainly turns out engines and boilers, for which the State has an established reputation. The manufacture of rubber boots and shoes (not included in the appended table) amounted in 1900 to \$8,034,417 in value, and the manufacture of electrical apparatus reached \$5,113,292 in the same year.

The following table shows the relative importance of most of the leading industries:

INDUSTRIES	Year	Number of establishments	Average number wage-earners	Value of products, including custom work and repairing
Total for selected industries for State..	1900	614	66,381	\$116,440,265
	1890	514	60,084	90,433,113
Increase, 1890 to 1900.....		100	6,297	26,007,152
Per cent. of increase.....		19.5	10.5	28.8
Per cent. of total of all industries in State..	1900	14.7	68.8	63.3
	1890	15.2	74.1	63.5
Foundry and machine shop products.....	1900	149	8,799	\$13,269,086
	1890	101	6,876	10,170,286

TRANSPORTATION AND COMMERCE. The railroad mileage increased from 108 in 1860 to 217 miles in 1890 and decreased to 209 in 1900. All the important lines are under the control of the New York, New Haven and Hartford Railroad. The value of foreign imports at the port of Providence for the year ending June 30, 1901, was \$1,146,511. The exports are altogether insignificant. Of greater importance is the coastwise traffic, there being a considerable trade with the important North Atlantic ports. Newport and Bristol and Warren are also customs districts, but the trade of both is small.

BANKS. The first bank of Rhode Island was

the Providence Bank, founded in 1791. The early banking history of the State, however, centres around the Providence Institution for Savings, which dates from 1819. It has been the tendency during the past few years for the national banks and savings institutions either to liquidate or become trust companies. The report of the Comptroller of the Currency for the year ending June 30, 1902, gives the following statistics:

	National Banks	State	Savings
Number.....	36	3	24
Capital.....	\$12,305,000	\$395,000
Surplus.....	3,788,000	\$3,338,000
Cash, etc.....	1,523,000	92,000	2,343,000*
Loans.....	27,472,000	1,003,000	31,789,000
Deposits.....	19,154,000	735,000	71,900,000

* Including amount due from banks and bankers.

GOVERNMENT. The State Constitution was adopted in 1842, replacing the original charter granted by King Charles II. An amendment proposed in the General Assembly must receive the votes of a majority of all the members elected to each House at two consecutively elected Assemblies, and then be approved by three-fifths of the electors present and voting in the town and ward meetings.

Since 1888 a residence and home in the State for two years and in the town or city for six months preceding an election have been required for voting, with a small additional property qualification for those voting for the city council of any city or upon any proposition to impose a tax or for the expenditure of money in any town or city. The capital of Rhode Island is Providence.

LEGISLATIVE. According to the amendment of 1900, the General Assembly meets on the first Tuesday of January in each year at Providence. Each town or city has one representative in the Senate, and one or more in the House of Representatives, but no town or city can have more than one-sixth of the 72 members to which the House is limited, and no town or city can be divided for purposes of representation. Senators and Representatives are paid according to time of actual attendance, with a maximum limit of 60 days, plus mileage. The House impeaches and the Senate tries all cases of impeachment.

EXECUTIVE. The Governor, Lieutenant-Governor, Secretary, Attorney-General, and Treasurer are annually elected at the same time and place as are Senators and Representatives, namely, at the town, ward, and district meetings, on the Tuesday next after the first Monday in November. They hold office one year. The Lieutenant-Governor succeeds to the Governorship in case of a vacancy, and in case of further vacancy the position is filled by appointment by the General Assembly acting in grand committee. The pardoning power is exercised by the Governor with the advice and consent of the Senate.

JUDICIAL. The judicial power is vested in one Supreme Court and such inferior courts as the General Assembly may establish, the powers of the several courts being prescribed by law. Judges of the Supreme Court are elected by the General Assembly in grand committee, and their term of office continues until their positions are declared vacant by a resolution of the General Assembly.

FINANCES. The paper money system, which was prevalent throughout all the colonies, kept Rhode Island's finances in a continual state of disorder. The Revolution left the State with a large debt and heavy taxes, and this condition of affairs was not remedied until Rhode Island joined the Union. In 1789 the Revolutionary debt was repudiated by the passage of the compulsory tender act compelling creditors to accept paper money at an arbitrary rate. On January 1, 1902, the balance on hand in the treasury amounted to \$158,272.71. The total receipts during the year were \$1,490,621.96 and the expenditures \$1,537,502.41. There was a balance on hand of \$111,392.26 on January 1, 1903. The total debt was \$2,998,000. From this sum, however, there should be deducted a sinking fund of \$444,451.56.

MILITIA. In 1900 there were 95,737 men of militia age. The militia in 1901 numbered 1413.

POPULATION. The population increased from 68,825 in 1790 to 147,545 in 1850, 345,506 in 1890, and 428,556 in 1900. As to population, the State stood 34th in rank in 1900. There were in that year 407 inhabitants to the square mile, which figure exceeded that for any other State. There was a foreign-born population (1900) of 134,519, Ireland, Canada, and England being chiefly represented. The percentage of city population is very large. In 1900 Providence had a population of 175,597; Pawtucket, 39,231; Woonsocket, 28,204; Newport, 22,034; and Central Falls, 18,167.

The State sends two members to the National House of Representatives.

RELIGION. The principal Protestant denominations are the Baptist, with one-third of the total Protestant church membership, and the Protestant Episcopalians, with about one-fifth. The Roman Catholics have about one-fourth of the population.

EDUCATION. The public school system was established in 1828 and was greatly improved under the administration of Henry Barnard (q.v.). The proportion of illiteracy, due in large part to the numbers of foreigners, is greater than in any other of the North Atlantic States—8.4 per cent. in 1900. In 1900-01 the school population (5-15 inclusive) of the State was 85,084, of whom 69,067 were enrolled in schools. Of the 1960 teachers employed in the public schools in 1900-01 the male teachers constituted only 9.1 per cent. The average monthly salaries of male and female teachers in the same year were \$115.32 and \$51.14 respectively. The school fund is insignificant. The State has only one normal school. It is situated at Providence. The State maintains a college of agriculture and mechanic arts. For Brown University, see article.

CHARITABLE AND PENAL INSTITUTIONS. There are a State hospital at Providence and a soldiers' home at Bristol. There are two insane hospitals, one at Providence and the other at the State farm, Cranston. Other State institutions located at the State farm are the almshouse, workhouse, reformatory, and penitentiary. In 1901 the State appropriated \$259,000 for the maintenance of the State institutions and \$136,891 for construction.

HISTORY. The stories of Norse exploration within the present limits of the State rest upon slight foundation. True history begins when Roger Williams (q.v.) was banished from Massachusetts Bay, and settled with a few com-

panions, at 'Providence Plantations,' on land purchased from the Narragansett Indians, probably in June, 1636. Already, however, William Blackstone, who had fled from the tyranny of the 'lords brethren' in Massachusetts, as he had left England to escape the 'lords bishops,' had settled near Pawtucket River. In March, 1638, a band of Antinomians banished from Massachusetts Bay, under the leadership of William Coddington and John Clark, made a settlement at Poanasset (Portsmouth), on Aquidneck Island (Rhode Island). The next year a secession from this settlement founded Newport, but in 1640 these two towns were united under William Coddington as Governor. In 1643 Samuel Gorton (q.v.) founded Warwick upon the mainland. At Providence the government was at first a pure democracy, "ignoring any power in the body politic to interfere with those matters which alone concern man and his maker." Each of these settlements was at first independent. In 1642 it was determined to seek a patent from England, and the next year Roger Williams went to England for this purpose. Through the influence of the Earl of Warwick, Parliament granted (1644) a charter uniting the settlements as the "Incorporation of Providence Plantations in the Narragansett Bay in New England."

The towns, at first, from jealousy and exaggerated ideas of individual importance, refused to enter into the confederation, but finally through fear of revolutions within, and of Massachusetts without, the union was formed in 1647. This jealousy lasted well into the nineteenth century and explains much of the peculiar conduct of the colony and of the State. Complete religious toleration was granted together with the largest measure of political freedom. William Coddington sought to bring the Island into relations with the United Colonies of New England, while President. In 1650 he went to England, and in 1651 secured a grant of the islands within the colony. Williams was able to have this grant vacated in 1652, but not until 1654 were the settlements again united. In 1663 the charter of Rhode Island and Providence Plantations was secured, and this served as a constitution until 1843. During the war waged on charters by James II., the charter of Rhode Island was abrogated by Sir Edmund Andros (q.v.), 1686-89, but on his deposition the old government was quietly renewed under it, though a property qualification for suffrage was added in 1724.

Relations with the other New England colonies were unpleasant. The colony suffered severely in King Philip's War (q.v.), though opposed to the policy which caused it. Connecticut and Massachusetts claimed practically all of the territory included in the charter limits. The Connecticut boundary, after much wrangling, was finally settled in 1727, and the Massachusetts boundary was confirmed in 1746-47, but was not finally settled until 1862. Both of these colonies looked on Rhode Island as a nest of heretics and a refuge for the disaffected. The colony was shut out from the United Colonies of New England, and in every way made to feel her slight influence. Nevertheless the growth of the colony in population and wealth was steady, and many of the inhabitants turned to the sea for a livelihood. In the colonial wars Rhode Island privateers inflicted much damage, and some of her

citizens were accused of piracy. In 1775 an army of observation was organized for the defense of the colony, and two of the thirteen ships ordered by Congress were built here. Rhode Island renounced allegiance to Great Britain on May 4, 1776, and united with the other colonies for defense. During the Revolution Newport was held (1776-79) by British troops, and in 1780 the French fleet was stationed there. The famous soldier of Rhode Island was General Nathanael Greene (q.v.). After the Revolution the State blocked every attempt to give increased power to Congress. This was partly due to the prevalent exaggerated individualism and partly to the desire to retain the right to levy import duties and to force her paper money into circulation. Much paper money had been issued early in the century and in 1786 another era of inflation began. The paper issued on land mortgages depreciated, but many attempts were made to make it a legal tender. A debtor might deposit with a judge of the court the sum owed and upon notice to the creditor the debt was legally satisfied. The notices began, "Know Ye," and hence the epithet applied in derision to residents of the State. The country or paper money party was in complete control, and a test act requiring all to regard the paper as equal to specie was passed.

The State refused to send delegates to the convention which drew up the Federal Constitution, and when that instrument was submitted for approval it was overwhelmingly rejected by the town meetings. Many attempts to call a convention to consider the Constitution failed, and it was not until threats of coercion had been made that the instrument was ratified, May 29, 1790. Though the commercial and manufacturing interests of the State grew rapidly, the power still lay in the country districts, as the basis of representation had not been changed since the granting of the charter, except to admit new towns. Dissatisfaction finally culminated in Dorr's Rebellion in 1841. (See DORR, THOMAS WILSON.) A new State constitution was adopted as a result in 1842, which has been frequently amended since. The property qualification for suffrage was not abolished until 1888, and election by a plurality has been allowed since 1893. Previously the election of Governor and State officers was often thrown into the Legislature. Until 1900 the Legislature met in Newport in April to canvass the vote and adjourned to Providence in January to transact business. Now all sessions are held in Providence. A prohibitory amendment to the Constitution was adopted in 1886, but was repealed in 1889. During the Civil War the State furnished more than her quota of troops. In national politics the State has been erratic. From 1792 to 1800 she gave her vote to the Federalist electors, but in 1804 was Democratic. In 1808 and 1812 the Federalists again secured control, but in 1816 and 1820 the State was once more Democratic. Rhode Island supported the tariff wing of the Democracy in 1824, but in 1828 was National Republican (the name originally borne by the Whig Party) and in 1832 Whig, only to be Democratic again in 1836. From 1840 to 1848 the Whig candidates received her votes, and in 1852 the State went back to Democracy. Since 1856, however, the State has been Republican in national elections:

RHODES (Lat. *Rhodus*, from Gk. Ῥόδος). An island now belonging to Asiatic Turkey and long an important, wealthy, and independent State of ancient Greece. It lies off the southwest coast of Asia Minor, from the nearest point of which it is distant about 12 miles. It is 49 miles long and 21 miles in greatest breadth, and is traversed in the direction of its length—from northeast to southwest—by a chain of mountains, which reach in Mount Atayros (the ancient Atabyrion) a height of 4070 feet. The present population is about 30,000, of whom two-thirds are Greeks. The island is governed by a Turkish pasha, but is in general neglected, and shows few traces of its ancient prosperity. Its climate is temperate and its valleys are fertile, producing oil, oranges, citrons, etc.

Rhodes rose into importance at a very early period. It is certain that Ialysus was a place of trade during the second millennium B.C., for Mycenaean vases have been found in its necropolis. When the island first appears in history it is peopled by Dorians who dwell in three cities, Lindus, near the centre of the east coast, with a good harbor, and still a town; Camirus, on the west coast; and Ialysus, also on the west coast, near the northern end of the island. These cities, with Calymna, Cos, and Halicarnassus, formed the Doric Hexapolis which later, by the expulsion or withdrawal of Halicarnassus, became a Pentapolis. During the seventh and sixth centuries B.C. the island shared in the commercial prosperity of the Greek States of Asia Minor. A colony was planted at Phaselis, on the east coast of Lycia, and, alone of the Asiatic Greeks, the Rhodians took part in the first colonizing of Sicily, where they settled Gela, according to the tradition, about B.C. 690. A hundred years later,

after an unsuccessful attempt at Lilybæum, another band settled the Lipari Islands. Secure from attack by land, and on friendly terms with the unaggressive naval powers of Phœnicia and Egypt, the island maintained its independence till the Persian conquest, and did not finally yield till after the Ionian revolt, at the beginning of the fifth century B.C. The Rhodians were among the Greeks who served with Xerxes, though their contingent was small. After the Greek victories, they joined the Delian League, thus passing ultimately into the Athenian empire. They revolted in B.C. 411, and in 408 the three cities combined to found a new capital of the island. This city, Rhodes (q.v.), henceforth represents the island. Excavations were begun on the Acropolis of Lindus in 1902 by Danish scholars, and in the first season the Propylæa and ancient Temple of Athena were discovered.

RHODES. The capital of the island of the same name, situated at its northern extremity, with harbors on the east side, and the Acropolis on a hill which rises abruptly from the west coast. The modern city, called Kastro, has a picturesque appearance from the sea as it rises gradually from the two harbors, now choked with sand. In ancient times the main harbor was fortified and could be closed. The present fortifications only include about one-fourth of the ancient city, and date largely from the fifteenth century. The place has preserved its mediæval aspect, and there are many traces on the stone houses of its occupation by the Knights of Saint John, besides the great castle, the hospital, and especially the straight and picturesque Knights' Road, lined with ancient buildings bearing coats of arms. The earthquakes of 1851, 1856, and 1863 wrought great destruction in the town. By the powder explosion of 1856 the Church of Saint John, built in 1500, and the Grand Master's palace, were badly damaged, and the two edifices were destroyed by the earthquake of 1863.

Rhodes was founded in B.C. 408, and was girt by strong walls, surmounted by towers, and provided with two excellent harbors. It soon attained wealth and a very important commercial position. The early years of the fourth century were marked by struggles between democracy and aristocracy, leading to interventions by Sparta and Athens. Rhodes joined the second Athenian League, but in B.C. 356, with Byzantium, Chios, and Cos, withdrew, thus bringing about the Social War, which ended in Athens conceding the independence of the allies. Rhodes, however, soon fell under the control of Mausolus of Caria, but again became free, though in B.C. 332 it voluntarily acknowledged Alexander. This King greatly favored the city, whose trade rapidly increased, though it was occupied by a Macedonian garrison. On the death of Alexander, B.C. 323, the Rhodians rose and expelled the intruders. The third and second centuries B.C. were the acme of Rhodian prosperity. Wealth had not corrupted the dignity and morality of the people. Art flourished, filling the city with statues and planting at the mouth of the harbor the famous Colossus (q.v.). A later school of art, probably in the first century B.C., produced the Laocoön. In the wars of the period the Rhodians seem to have sought to hold aloof unless their trading interests were threatened. Like the kings of Pergamum, they appealed to Rome as a better ally than their

powerful neighbors, and joined in the war against Philip V. of Macedon. Later, during the war with Perscus, they endeavored to check the Roman advance, and the Roman Senate punished this presumption by making Delos a free port, with damaging effect on the Rhodian trade. After the death of Caesar, whose side the Rhodians had taken against Pompeius in the civil war, they were defeated in a naval engagement by Cassius, who in B.C. 42 entered the city by force, massacred the hostile leaders, seized the public property, and rifled the temples. This visitation broke the power of Rhodes, but it long continued to maintain its prestige as a seat of learning. Even under the Roman Empire, Rhodes continued to maintain a nominal independence and was not attached to any province, except for brief periods, when in disgrace with the reigning Emperor. In the reorganization of the Empire by Diocletian this position was abolished, and Rhodes became the centre of the Province of the Islands. It was afterwards attached to the Byzantine Empire and shared its fortunes till in 1309 it was occupied by the Knights of Saint John of Jerusalem, who for over 200 years maintained themselves against the Turks, and even gained some foothold on the mainland. They withstood several sieges, notably one in 1480, but were attacked again in 1522 by Sultan Solymán the Magnificent, and after the most heroic resistance finally found their position untenable, and were forced to abandon the island. RHODES, COLOSSUS OF. See COLOSSUS.

RHODES, CECIL JOHN (1853-1902). A South African statesman and financier, born at the vicarage of Bishops Stortford, Hertfordshire, England, July 5, 1853. In 1870 his name was entered at Oriel College, Oxford, but an affection of the lungs compelled him in the same year to sail for Natal, whence, in 1871, he made his way to the diamond fields at Kimberley. He speedily acquired a large fortune, and, with his health well restored, returned to matriculate at Oxford in 1873. From 1876 to 1881 he spent one half of the year at Oxford and at the end of that time took his B.A. and M.A. Early in life Rhodes gave evidence of the blending in him of the materialist and the dreamer. Shrewd in the advancement of his own interests, and not entirely unaffected by the loose ethics of the mining camp, he was possessed at the same time of a profound conviction of the virtues of the British imperial system, and he made it his life plan to extend the sway of the British Empire over South Africa. In 1880 he entered the Cape Parliament; there he directed his efforts toward the establishment of cordial relations between the English and the Dutch in the Colony, and was instrumental in bringing about the annexation of Bechuanaland in 1884. This was a forward step in the extension of British supremacy in South

Africa, and brought the young statesman into conflict with the Boer Republic of the Transvaal, whose policy was guided by the ambitious and astute 'Oom Paul' Kruger, Rhodes's one formidable rival to the end. In 1888 Rhodes obtained from Lobengula, King of the Matabele, the cession of the immense region north of the Limpopo, which speedily came to be known as Rhodesia (q.v.); and in October, 1899, the British South Africa Company was incorporated, with almost full rights of sovereignty over that territory. Rhodes was in fact the sole manager of the company's affairs, and he devoted to the development of the country the resources of the De Beers Consolidated Mines, a corporation controlling the entire diamond industry at Kimberley, organized by Rhodes in 1888.

In 1890 Rhodes became Premier of Cape Colony, retaining at the same time his post as managing director of Rhodesia. He effected much salutary legislation within the Colony, first definitely entered upon the scheme of a British Cape-to-Cairo railway; found time to crush a formidable insurrection of the Matabeles in 1893; yet found time, too, to play an unscrupulous game of politics in the Transvaal, where the discontent prevailing among the foreign inhabitants of Johannesburg afforded him the opportunity for plotting the overthrow of the South African Republic. The Jameson raid in December, 1895, coming before his schemes were fully matured, was a crushing blow for Rhodes, who now appeared before the world as the instigator of a piratical attempt on the government of a friendly nation. (See SOUTH AFRICA; JAMESON, LEANDER STARR.) He was forced to resign the Premiership of Cape Colony, and for a time his political influence was gone. For the next three years he devoted himself to the affairs of the Chartered Company, suppressed a second insurrection of the Matabeles in 1896-97, and hastened the northward advance of his transcontinental railway and telegraph lines. In 1898 he reëntered the Cape Parliament, and had made some progress toward regaining his predominant position in South African affairs, when the Boer war broke out. During the early part of the war he was besieged at Kimberley, where he was attacked by his old illness. He went to Egypt in the early part of 1901, but failing to find health there, returned in February, 1902, to Cape Colony, and died at Cape Town, March 26, 1902. He was buried on his estate in the Matoppo Hills, near Buluwayo, in Matabeleland.

Rhodes's character was the subject of much diverse criticism. By some he was regarded as preëminently a man of money, actuated entirely by selfish motives, and one who for the attainment of his ends did not scruple to plunge South Africa into war. To those of British inclinations he appeared rather as one of the great builders of empire, a descendant of Clive and Warren Hastings. This lineage, in great measure, cannot be denied Rhodes, though there may have been in him also a touch of Sir John Hawkins and Sir Francis Drake. Rhodes's will, by which he left almost his entire fortune for the purpose of educating the Anglo-Saxon youth to the idea of empire, radically modified previously formed estimates upon his character. (See RHODES SCHOLARSHIPS.) The various biographies of Rhodes naturally are prejudiced to a greater or lesser extent. "Vindex," *Political Life and*

Speeches of Cecil Rhodes (London, 1900), is eulogistic, but contains much original material; "Imperialist," *Cecil Rhodes, a Biography and Appreciation* (ib., 1897), is favorable and well written. The best life on the whole is that by Hensman, *Cecil Rhodes* (ib., 1902), favorable, but not altogether apologetic. Stead, in the *Review of Reviews* (1902), gives a remarkable study of the psychology of Rhodes.

RHODES, JAMES FORD (1848—). An American historian, born in Cleveland, Ohio, May 1, 1848. He was educated in the public schools and at the universities of New York and Chicago, but he did not graduate, though the degree of LL.D. was afterwards conferred upon him. He was Paris correspondent of the *Chicago Times* (1867-68) and made journeys of industrial investigation in Germany and England, which he continued afterwards in the Southern United States. Then he engaged in business in Cleveland, Ohio, until 1885, when he retired and devoted himself to a *History of the United States from the Compromise of 1850*, a political narrative and analysis of the events growing out of slavery, the Civil War, and the reconstruction era, giving special prominence to Congressional and other political debates and to characterizations of public men, and emphasizing the influence of public opinion. The first two volumes (1892) carry the narrative to 1860; the third (1895) to 1862; the fourth (1901) to the close of the war. He became president of the American Historical Association in 1899 and was awarded an important German prize for his researches. His narrative, although based mainly on Northern sources, is impartial and sober, and is generally considered to be the best work covering the period treated.

RHODES, LAW OF. A code apparently drawn up by the Rhodians at the time of their great naval power in the third century B.C., though it is only known from the references in Roman law. The code was declared binding by Antoninus Pius, in so far as it did not conflict with Roman law, but its provisions are not known, except that "if cargo is thrown overboard to lighten a ship, all must contribute to make good the loss incurred for the benefit of all," a doctrine still accepted in maritime law. The treatise, *Ius Navale Rhodiorum*, is nothing but a group of mediæval forgeries. See CONSOLATO DEL MARE; OLERON, LAWS OF.

RHODESIA, rōd'zi-ā or rō-dē'shī-ā, NORTH-ERN. A division of British Central Africa, under the administration of the British South Africa Company. It comprises the territory bounded by the Congo Free State and German East Africa on the north, the British Central Africa Protectorate and Portuguese East Africa on the east, the Zambezi River on the south, and Portuguese West Africa on the west (Map: Congo, E 6). It is divided into Northeastern and Northwestern Rhodesia, the latter being also known as Barotseland. Unlike Southern Rhodesia, Northern Rhodesia has been only slightly explored and is still practically held by the natives. Barotseland or Northwestern Rhodesia is under the rule of King Lewanika, who, however, is advised by a resident of the British South Africa Company. His chief kraal is on the eastern bank of the Zambezi, at Lialui. Gold and coal have been found. Barotesland is well watered and fer-

tile, but its climate is unhealthy. Northeastern Rhodesia is divided into nine districts, with Fort Jameson as the seat of administration. The population of Northern Rhodesia is estimated at about 400,000. The Europeans in Northeastern Rhodesia numbered 165 in 1901.

RHODESIA, SOUTHERN. A British South African protectorate under the administration of the British South Africa Company. It occupies the territory between the Zambezi on the north, the Limpopo on the south, Portuguese East Africa on the east, and the British Bechuanaland Protectorate on the west, comprising the countries of Matabeleland and Mashonaland and the districts of Banyai, Manica, and Makalaka (Map: Cape Colony, H 1). Its area is estimated at 175,000 square miles. The larger part of the country is an elevated veld, well wooded and studded with granite kopjes which attain a considerable height in Mashonaland. The country is well watered by the tributaries of the Zambezi and the Limpopo and is covered with a luxuriant vegetation. The climate is healthful in the elevated districts, which occupy the larger part of the country, but is malarial and oppressive in the valleys of the Zambezi and the Limpopo.

The mineral deposits of Southern Rhodesia include gold, coal, copper, silver, antimony, arsenic, and lead. Gold is found principally in the central part of Mashonaland in the valleys of the Umtali and the Imbesi rivers. The gold deposits of Southern Rhodesia show traces of ancient workings. Their exploitation has been hindered by the lack of transportation facilities and of labor. The total output from 1890 to 1902 amounted to 194,170 ounces. Extensive coal deposits were discovered in 1900 in the Wankies district, in the western part of Mashonaland, and a company has been formed for its exploitation.

Apart from its rich mineral resources, Southern Rhodesia possesses a fertile soil and is well adapted for grazing. From 1890 to 1901 there were surveyed over 18,000,000 acres of land. Good crops of European cereals are raised. But the development of agriculture as well as that of the mineral industries is crippled by the scarcity of labor. Salisbury, the capital, is connected by rail with Cape Colony as well as with Beira, on the coast of Portuguese East Africa. From Bulawayo the line is being extended through the Wankies coal fields to Victoria Falls on the Zambezi and from there it is proposed to continue the road through Northern Rhodesia to Lake Tanganyika. A light railway line has also been completed from Salisbury to the Ayrshire mine in the Lomagundi district. The roads are over 3000 miles long. Salisbury and Bulawayo have been organized into municipalities and are provided with all the institutions of modern cities.

The administration of Southern Rhodesia is vested in the British South Africa Company, but there is also a resident commissioner appointed by the Secretary of State for the Colonies. The executive council is composed of the resident commissioner, the administrators of the company, and not less than four members appointed by the company with the approval of the Secretary of State. The legislative council is made up of the administrator of the company, the resident commissioner, five members appointed by the company, and four members elected by the registered voters, two for each of the provinces of Mashona-

land and Matabeleland. The judges of the High Court are appointed by the Secretary of State from a list submitted by the company. The native affairs are under the control of a secretary who is assisted by native commissioners. The military police of the territory is under the control of the High Commissioner for South Africa. According to an informal census taken in 1901 Mashonaland contained 4021 Europeans, 328,729 natives, and 187 Asiatics; and Matabeleland 7011 Europeans, 162,211 natives, and 906 Asiatics.

In the first half of the nineteenth century the territory now known as Southern Rhodesia was held by the Matabeles, who were forced by the Boers to retreat north of the Limpopo. With the discovery of gold in that part of the continent Cecil Rhodes succeeded in concluding a treaty with Lobengula, under which the chief of the Matabeles bound himself not to enter into any agreement with any power without the approval of Great Britain. In 1880 the mining rights over the territory were also secured by Cecil Rhodes (q.v.) for a consideration of a monthly salary of £100 to Lobengula, 1000 rilles, and a large quantity of ammunition. A royal charter was obtained for the British South Africa Company in 1889, and a considerable military force was sent to explore the interior of the country. An uprising of the Matabeles in 1893 ended in the overthrow of Lobengula and the formal annexation of Matabeleland. A more serious uprising occurred after the withdrawal of the white police to Bechuanaland, in 1896. The rebellion soon spread to Mashonaland, and it was only with the assistance of troops dispatched from Natal and Mafeking that peace was restored in 1897.

Greswell, *Geography of Africa South of the Zambezi* (London, 1893); Keane, *South Africa* (ib., 1895); Keltie, *Partition of Africa*, contains bibliography (ib., 1895); Thomson, *Rhodesia and Its Government* (ib., 1898); Dawkins, *Précis of Information Concerning Southern Rhodesia*, with bibliography (n.p. 1899); Hall and Neal, *The Ancient Ruins of Rhodesia* (New York, 1902).

RHODES SCHOLARSHIPS, THE. A number of stipends established under the will of Cecil John Rhodes (q.v.), who died in 1902, bequeathing a large part of his estate in trust for the purpose of maintaining a certain number of British, American, and German students at Oxford University, in the belief that "a good understanding between England, Germany, and the United States will secure the peace of the world, and that educational relations form the strongest tie." The founder suggested the following basis for awarding these scholarships: (1) Proficiency in literary and scholastic attainments, which was to count three-tenths; (2) success in outdoor sports, two-tenths; (3) qualities of manhood, etc., three-tenths; (4) qualities of leadership, two-tenths. Qualifications second and third were to be decided upon by a vote of the fellow students, first and fourth by the masters of the respective schools where candidates prepare. The number of scholarships to be thus distributed are as follows: Rhodesia, 9; Cape Colony, 12; Natal, 3; Australia, 18; New Zealand, 3; Canada, 6; Newfoundland, 3; Bermuda, 3; Jamaica, 3; two to each State and Territory of the United States, and 15 to Germany. The annual value of the Colonial and American scholarships is

£300, tenable for three years. Only one-third of the Colonial and one-half of the American scholarships are to be filled each year. The disposal of the German scholarships is at the pleasure of the Emperor.

In the United States the first qualifying examination, based on the Oxford Responsions, or the first Oxford public examination, was set down for 1904, and was to consist of Latin, Greek, and elementary mathematics. These examinations are to be held under the auspices of the State committees designated by the trustees for selecting suitable candidates for the scholarships. The chairmen of these committees are either the presidents of the State Universities, as is the case in most of the Western and Southern States, or the Presidents of certain prominent universities, as is the case in most of the New England and Eastern States. In California, Maine, Vermont, and Washington, appointments are to be made by the several chartered universities and colleges in rotation. Candidates must be from 20 to 25 years of age and must have attended two years at a recognized institution of higher learning. Scholars must be unmarried and citizens of the United States.

RHODIUM (Neo-Lat., from Gk. *ῥόδιος*, rose-like, from *ῥόδον*, *rhodon*, rose). A metallic chemical element that was discovered by Wollaston in 1804. It occurs with other members of the platinum group and alloyed with gold as 'rhodium gold,' or *rhodite*, a mineral found in Mexico. The element is separated by adding iron to the mother liquors from which platinum has been extracted. The precipitate thus obtained is fused with lead and litharge, after which lead, copper, and palladium are removed by dilute nitric acid, and the residue heated with barium dioxide, then washed and distilled with aqua regia to remove osmium. The remaining solution contains the rhodium, which is then isolated by a somewhat complicated process.

Rhodium (symbol, Rh; atomic weight, 103.01) is a white, hard, malleable metal that fuses at about the same temperature as platinum, and absorbs oxygen like that metal. It combines with oxygen to form a monoxide, a sesquioxide, a dioxide, and probably a trioxide. The metal itself, when added in small quantities to steel, is said to form an alloy that has exceedingly valuable properties.

RHO'DODEN'DRON (Neo-Lat., from Gk. *ῥοδδενδρον*, oleander, from *ῥόδον*, *rhodon*, rose + *δένδρον*, *dendron*, tree). A genus of about 200 trees and shrubs, including *Azalea* (q.v.), of the natural order Ericaceae. The species of *Rhododendron* proper have evergreen leaves, and many of them are of great beauty both in foliage and in flower. They vary in size from a few inches in height to trees 50 to 60 feet high and 18 inches in diameter. A few small species are natives of Continental Europe and of Siberia, but the greater number are found in temperate North America, and in the mountains of India. *Rhododendron maximum*, so designated when the far larger Indian species were unknown, is a common American ornamental shrub or small tree which forms impenetrable thickets in the Alleghany Mountains, and is magnificent when in flower. The flowers are large, in umbellate corymbs, varying in color from pale carmine to lilac. *Rhododendron ponticum*, a very

similar species with narrower and more pointed leaves, of the same color on both sides, is a native of Western Asia, and apparently also of Southern Spain. *Rhododendron cataebense*, a native of the southern Alleghanies, with large purple flowers, and *Rhododendron arboreum*, a native of Nepal, with very dense heads of large scarlet flowers and leaves 12 to 18 inches long, attaining a height of 30 to 40 feet in its native

RHODODENDRON (*Rhododendron ponticum*).

country, are fine and well-known species; *Rhododendron Californicum* and *Rhododendron macrophyllum* are among the most conspicuous species of the Pacific Coast region. Most of the extremely numerous varieties common in gardens and shrubberies have been produced from them. In many if not most of the hybrids, *Rhododendron Cataebense* enters, and in a list published in 1871, 250 named hybrids of this species are mentioned. Since that time the number has undoubtedly greatly increased.

Many splendid species of *Rhododendron* have been discovered in the Himalaya, the Khasia Hills, and other mountainous parts of India, by Hooker and others; and some of them have been introduced into cultivation. *Rhododendron grande* has very beautiful flowers $4\frac{1}{2}$ inches in diameter. *Rhododendron Maddeni*, *Rhododendron Griffithianum*, *Rhododendron Edgeworthii*, and others have white flowers. *Rhododendron Dalhousiae* is remarkable as an epiphyte, growing on magnolias, laurels, and oaks. It is a slender shrub, bearing from 3 to 6 white lemon-scented terminal bells, $4\frac{1}{2}$ inches long. *Rhododendron Nuttallii* has fragrant white flowers, said to be larger than those of any other species. All these belong to the Himalayas. In more southern latitudes, as on the Neilgherry Hills and on the mountains of Ceylon, *Rhododendron barbatum* prevails as a timber tree, a blaze of crimson when in flower. *Rhododendron Keysii* and *Rhododendron cinnabarinum*, natives of Northern India, have flowers with nearly tubular corollas. *Rhododendron ferrugineum* and *Rhododendron hirsutum* are small Alpine shrubs from 1 to 3

feet in height with umbellate clusters of carmine-colored flowers among the finest ornaments of alpine scenery. They are called *alpenrose* (alpine rose) by the Germans, and are not easily cultivated in gardens. The flora of the Himalaya contains a number of similar small species. *Rhododendron setosum*, a dwarf shrub with strongly scented leaves, clothes the mountains in Eastern Nepal at an elevation of 12,000 feet and upward, with a green mantle, brilliant with flowers in summer. *Rhododendron nivale* is the most alpine of woody plants, spreading its small woody branches close to the ground, at an elevation of 17,000 feet in Sikkim. *Rhododendron lapponicum*, a procumbent shrub, with small flowers, grows as far north as human settlements have reached in Europe and Asia. An oil obtained from the buds of *Rhododendron ferrugineum* and *Rhododendron hirsutum* have been used by the inhabitants of the Alps under the name *olio di marmotta*, as a remedy for various ailments. The flowers of *Rhododendron arboreum* are said to be eaten in India, and Europeans make a jelly of them. The wood of some of the larger species is white, hard, and close-grained, and has been recommended as a possible substitute for boxwood. *Rhododendrons* are not of difficult culture, a soil containing plenty of leaf mold and protection from drought and winter scalding being the prime necessities for growing the hardier species in shrubberies and parks. See Colored Plate of AZALEAS AND RHODODENDRONS.

RHODONITE (from Gk. *ῥόδον*, *rhodon*, rose).

A mineral manganese silicate that crystallizes in the triclinic system, has a vitreous lustre, and is usually red, although sometimes green or yellow. It occurs frequently in association with iron and zinc ores, and is found in Sweden, the Harz, the Urals, and in the United States at various localities in Massachusetts, and in Sussex County, N. J., where part of the manganese is replaced by zinc, giving rise to a variety known as *fowlerite*. The massive varieties of this mineral, especially those found in the Ekaterinburg District in the Urals, are used for ornamental purposes, as for table tops, etc., while varieties from other places are used to a limited extent as gems.

RHODOPHYCEÆ (Neo-Lat. nom. pl., from

Gk. *ῥόδον*, *rhodon*, rose, + *φύκος*, *phykos*, seaweed). The red algae. The most beautiful of the four great groups of algae. Some are very complex in structure, but in general they show less vegetative differentiation than do the brown algae (Phaeophyceæ, q.v.). Their peculiarities lie chiefly in a highly developed method of sexual reproduction, resulting in a complex fruit (cystocarp), which contains the carpospores. (Figs. 1, 2.) The male cells (spermatia) are non-motile, and fuse with a thread-like female receptive organ (trichogyne). There is also a form of asexual reproduction generally of four special spores (tetraspores). (Fig. 1.) Most Rhodophyceæ are red or reddish brown, a color due to a peculiar pigment (phycoerythrin) which obscures the green pigment (chlorophyll).

The form of the body ranges from minute filaments of great delicacy to broad membranes and thick cartilaginous fronds. Some of the membranous forms are several feet long (Delesseria), and may be differentiated into a stem and leaf-like out-growths. Others form filamentous branching tufts (*Callithamnion*, *Dasyu*). Some groups bear

protruding fruits resembling urns (Polysiphonia, Fig. 2), others are pinnately branched (Ptilota), others with incurved tips (Cerami-

Pflanzenfamilien (Leipzig, 1887 et seq.); Murray, *Introduction to the Study of Seaweeds* (London, 1895).

RHODO'PIS (Lat., from Gk. Ῥοδῶπις). A famous Greek courtesan, a native of Thrace. At one time she was a fellow slave of the poet Æsop. Later she was carried to Naucratis, in Egypt. While she plied the trade of hetæra there Charaxus, brother of Sappho, fell in love with her and ransomed her at a great price. She was attacked by Sappho in a poem. After her liberation she continued to reside in Naucratis.

RHOMBOID. See PARALLELOGRAM.

RHOMBUS. See PARALLELOGRAM.

RHONDDA, rôn'd'dâ. An important and populous coal-mining district, now a municipality of Glamorganshire, Wales. It is situated amid picturesque valley scenery on the Rhondda River, near Merthyr Tydfil. Population, in 1891, 88,350; in 1901, 113,700.

RHONE, rôn (Fr. *Rhône*; Lat. *Rhodanus*). The principal river of Southeastern France. It rises at an altitude of 7550 feet in the Rhone Glacier on the south slope of the Dammastock, a peak of the Urner Alps in South Central Switzerland (Map: France, L 7). It flows first in a general southwest course through Southern Switzerland and into France as far as Lyons, then due south until it empties into the Gulf of Lyons in the Mediterranean Sea, 25 miles west of Marseilles. Its length is 504 miles. Its upper course is through the great valley lying between the Bernese and the Pennine Alps, which forms the Swiss Canton at Valais. Here it grows rapidly by taking up a number of short but voluminous mountain torrents fed by the great glaciers which cap the mountain ranges on either side. At Martigny the valley is narrowed and the river makes a sharp turn to the northwest, becomes then navigable below Saint-Maurice, and enters the eastern end of Lake Geneva. It leaves the lake at its western end at Geneva, resuming its southwest direction, quits Swiss territory, and soon after passes through the Jura Range in a deep and narrow gorge, where its width is decreased from 350 to 25 yards. Here it formerly disappeared through a subterranean channel known as the Perte du Rhône, but the rocks which covered it were removed in 1828. After leaving the gorge it becomes again navigable, and remains officially so to its mouth.

Its fall from Lyons to the sea, a distance of 208 miles, is over 500 feet, or 2½ feet per mile. Its course below Lyons lies in a broad, fertile, and beautiful valley between the Alps and the Cévennes. It receives here two large tributaries, the Isère and the Durance, the latter joining it at Avignon, below which town the river flows through a sandy and arid tract which was formerly a gulf of the sea. Its delta, whose main arms are the Grand and the Petit Rhône, which form the Ile de la Camargue (see BOUCHES-DU-RHÔNE), is growing at the rate of nearly 200 feet annually, owing to the large quantities of sediment carried by the stream. The navigation of the Rhone, owing to the swift current, the shifting of the bed, and the numerous islands, is very difficult even for steamers, and especially on the upstream route. Extensive regulating works have to some extent improved the waterway above the delta, and the shifting and sand-barred mouths of the latter have been obviated by a short canal

FIG. 1. RED ALGÆ.

1, *Nemallon*, sexual branches, showing antheridia (a) and carpogonium (b) with trichogyne to which two spermatia are attached, beginning of a cystocarp (c), and an almost mature cystocarp (d); 2, *Callithamnion*, showing sporangium (a) and three discharged tetraspores (b).

um). Most of the filamentous and membranous species, especially those which grow in quiet waters, are very delicate. Many forms on surf-beaten coasts develop large and strong cartilaginous fronds. Several of these firmer forms yield a jelly when placed in hot water; for instance, agar-agar is derived from species found in Ceylon, Java, and Madagascar, and *Chondrus crispus* furnishes most of the 'Irish moss' used in cookery. These preparations consist mainly of mucilage of little or no nutritive value, derived from intercellular spaces and swollen cell-walls.

FIG. 2. POLYSIPHONIA.

Showing branching, a cystocarp (a), and escaping spores (b).

Perhaps the most remarkable group of the Rhodophyceæ is the Corallines, with highly specialized fructifications and tetraspores borne in differentiated conceptacles. Some are branched, with jointed segments, others have the form of convoluted nodules. They are so incrustated and pervaded with lime as to resemble coral.

Consult: Engler and Prantl, *Die natürlichen*

running from the Gulf of Foz to the main stream, while other canals connect the latter with several ports on the Gulf of Lyons, one being projected to the port of Marseilles. Canals also connect the Saône with the Loire, the Seine, and the Rhine.

Consult: Barron, *Les fleuves de la France: Le Rhône* (Paris, 1900); Lenthéric, *Le Rhône, histoire d'un fleuve* (ib., 1892); Wood, *In the Valley of the Rhone* (London, 1899); Lombard-Gerin, *Notes sur le tonage du Rhône* (Paris, 1900).

RHÔNE. A southeastern department of France (Map: France, L 6). Area, 1077 square miles. It lies almost wholly in the basin of the Rhone and its great affluent the Saône, its eastern boundary being formed by these rivers. The surface is almost entirely mountainous or hilly, the chief level stretches being the valley of the Saône and the district about Lyons. The principal productions are wine and silk. The wines are famous for their excellent quality. About one-tenth of the surface is in vineyards. Silks are manufactured extensively, and numerous other branches of manufacture are actively carried on. Capital, Lyons (q.v.). Population, in 1896, 839,239; in 1901, 843,179. Consult: Varnet, *Géographie du département du Rhône* (Lyon, n. d.); Lenthéric, *La région du Bas-Rhône* (Paris, 1881); Joanne, *Géographie du département du Rhône* (ib., 1900).

RHÔNE, BOUCHES-DU-. A department of France. See BOUCHES-DU-RHÔNE.

RHUBARB (ML. *rhubarbarum*, *rheubarbarum*, *reubarbarum*, *rheum barbarum*, from Gk. ῥῆον βάραβαρον, *rhubarb*, from ῥῆον, *rheon*, *rhubarb*, and βάραβαρος, *barbaros*, barbarous, foreign), or PIE PLANT (*Rheum*). A large, coarse genus of Asiatic herbs of the natural order Polygonaceæ, closely allied to *Rumex* (dock and sorrel). The rhubarb of commerce, which comes from inland parts of China or Chinese Tartary, is produced by an unknown species.

The leafstalks of rhubarb contain an agreeable mixture of citric and malic acids, and when young and tender are highly esteemed for stewing and preserving, for which purpose the plants are widely cultivated in temperate and cold countries. Several species have been introduced into cultivation for their leafstalks. *Rheum Palmatum*, the first species known, and once believed to yield Turkey rhubarb, has roundish green leafstalks and half-palmate leaves. Its stalks are inferior for the table. *Rheum undulatum*, *Rheum rhaponticum*, and *Rheum hybridum* have broad, heart-shaped, undivided leaves, upon flattened, often reddish leafstalks grooved on the upper side. In some of the finest varieties the flesh is red. In Continental Europe rhubarb is grown more as a foliage plant than as a vegetable. Rhubarb is propagated by seed, or by dividing the roots. It prefers a light rich soil, which should be heavily manured every year. The plants are placed three or four feet apart, according to the size of the variety. Rhubarb is forced in winter and early spring by having pots or barrels inverted over it, and fresh litter or horse manure heaped around. It is also forced under greenhouse benches and in cellars, the roots being frozen before removal to the heat. As a medicine rhubarb roots are considered to be cathartic, astringent, and tonic. See Plate of VEGETABLES.

RHUMB LINE, or **LOXODROMIC LINE.** The course of a ship which is sailing in an oblique direction always to one point of the compass. It is a curve on the surface of the terrestrial sphere which has the property of cutting all meridians at the same angle. The rhumb line appears as a straight line on Mercator's projection. (See MAP.) A ship sailing obliquely to the direction of the North Pole (say, two points off) would wind round it in infinite circuits, always approaching nearer, but never reaching it. In this property, as well as in others, the loxodromic line is analogous to the common logarithmic spiral. See LOXODROME; NAVIGATION; SAILINGS.

RHUS. A genus of shrubs and trees. See SUMACH; POISONOUS PLANTS.

RHYL, ril. A popular tourist and sea-bathing resort in Flintshire, Wales, at the mouth of the Clwyd, 10 miles northwest of Denbigh (Map: Wales, C 3). It has a fine beach, esplanade, promenade pier, aquarium, and winter garden, golf links, etc. Zinc ore is mined in the vicinity. Much municipal activity has been evinced in public improvements to add to the natural attractions. The town owns its water-works, gas, and electric lighting plants, markets, and cemetery; maintains promenades, marine walks, and recreation grounds; and has installed modern sewage disposal works. Population, in 1891, 6500; in 1901, 8500, with a transient summer population of 20,000.

RHYME, or **RIME** (AS., OIG. *rim*, number, Ger. *Reim*, rhyme). In the broader meaning, a poem, or numbered or versified composition, as when we speak of the "Mother Goose Rhymes;" also, by a slight extension, a synonym for poetry in general. In the more technical sense rhyme is the recurrence of the same sound, in a verse or verses, in syllables having corresponding metrical values. Rhymes are of three general types: they may be formed by the correspondence of the initial sounds of the rhyming syllables, in which case they are called head-rhyme or alliteration; they may be formed by the correspondence of the vowel element, in which case, if the succeeding consonant sounds differ in the rhyming syllables, we have assonance, while if the succeeding consonants are the same in sound, or if there are no consonants, we have true rhymes. Alliteration was the characteristic rhyme of the ancient Teutonic poetry, while assonance was first systematically developed in the early Romance literatures. In modern literature both of these types have yielded in large measure to the more perfect music of the true rhyme, but they have not, as is sometimes stated, ceased to be in good form. Most commonly, in modern poetry, they are used in connection with rhyme. Thus, in *The Symphony*, Sidney Lanier combines rhyme and alliteration:

Woe hilt that cunning trades in hearts contrives!
Hase love good women to base joving slaves,
If men loved larger, larger were our lives;
And wooed they nobler, won they nobler wives.

And in the same poem rhyme and assonance are combined in:

Vainly might Plato's brain revolve it;
Plainly the heart of a child could solve it.

The placing of rhyming words in the verse structure varies with the different kinds or with varying types of verse-composition. Alliteration is characteristically complete in a single verse,

and in Anglo-Saxon poetry usually consisted of a three-fold repetition of the alliterated sound, as in the third and fourth lines of the first quotation above given. End-rhymes, on the other hand, may be completed within a single verse, but are ordinarily between two or more verses, the number being determined by the stanzaic structure or the taste of the poet; in the rondeau, for instance, one rhyme is repeated eight times and the other five. Not infrequently poems are constructed having both styles of rhyme, as in Shelley's *Cloud*:

I bring fresh showers for the thirsting flowers,
From the seas and the streams;
I bear light shade for the leaves when laid
In their noonday dreams.

Rhymes, of whatever sort, are in modern poetry always placed upon accented syllables, and end-rhymes are characteristically placed either at the end of the verse or at the end of the colon, as in the first and third verses here given. They may, however, be placed elsewhere, even at the beginning of the verse, as in the second citation from Lanier's *Symphony*. In complicated structures they are often used with less regard to regularity, internal rhymes being carried on in verse endings, or placed within the verse itself without regard to caesural pauses. In general, however, internal rhymes irregularly placed convey an effect of assonance rather than of true rhyme, and many poets make use of assonance in preference to it, when so placed. As to the relation of rhyming verses, this is determined either by the form of the stanza or in non-stanzaic rhymed composition by some set order, as the couplet, which the poet may determine, or again the rhymes may occur irregularly. Stanzas are of indefinite variety, and the poet is at liberty to invent whatever forms may please his ear.

Not all languages agree as to the nature of the adequate rhyme. In English, words which rhyme perfectly must agree in all the sound elements succeeding the initial element of the last accented syllable, and in this element they must differ. In French, on the other hand, such a rhyme is only *suffisante*, the *riche* or perfect rhyme having identical *all* the elements in the rhyming syllables. Thus, *grows* and *rose* form a perfect rhyme in English, *rose* and *arrose* in French. Rarely in English an identical rhyme is used provided the sense be changed, as *reign* with *rein*, *lo* with *low* (change of sense is also always necessary in French), but the change must be more than a mere negation; in no case should *close* and *disclose* be rhymed, nor words having the same root, as *compute*, *dispute*. When a word is repeated to rhyme with itself, as is frequently the case in Poe's poems, for example, it has the value of a refrain rather than of a true rhyme, and in all such cases there should be at least one other word rhymed with it. There are a few words in English the pronunciation of which may be altered to suit the needs of rhyme; thus, *wind* (noun) may be rhymed with *blind*, etc., but this is only a form of poetic archaism, reverting to the original pronunciation of the word. Rhymes are 'masculine' and 'feminine;' masculine when the rhymed syllable is also the chief accent of the word, *aver*, *deter*; *mar*, *tar*; feminine when it is followed by unaccented syllables, *marry*, *tarry*; *tenderly*, *slenderly*. Sometimes a secondary accent is made to carry the rhyme, but in such cases it is generally rhymed

with a word having no great rhetorical stress or having other words rhymed with it. The use of feminine rhymes is the less common in English, and they are never to be found in the complicated form to be met with in some other languages. (Compare the Persian under RUBAIYAT.) They occur most freely in satirical verse, which often takes liberties with rhyme that no serious poetry could tolerate. An example from Lowell is:

Though you brag of your New World, you don't
half believe in it;
And as much of the Old as is possible weave in it.

Rhyme was of relatively slight value in verse which depended upon quantity rather than accent and in languages which abounded in elaborate inflections. It was not until the classical Latin gave way to the vulgar speech that rhyme became the rule, first in the early hymns of the Christian Church. It is possible that an ancient Celtic influence may have aided this development, since the Celts used rhyme in the oldest Celtic poetry preserved to us. Rhyme was elaborately developed among the Persians and Arabs of mediæval times, but it is not known from what influence it was derived. It seems most probable that the simple repetitions, in which most primitive poetry abounds, form the basis from which rhyme naturally arises. Consult: Corson, *Primer of English Verse* (Boston, 1893); Gummere, *Handbook of Poetics* (Boston, 1895); Schipper, *Englische Metrik* (Bonn, 1881-88).

RHYNCHOCEPHALIA, *rîŋ'kò-sě-fā'li-á* (Neo-Lat. nom. pl., from Gk. ῥύγχος, *rhynchos*, snout + κεφαλή, *kephalē*, head). An order of primitive reptiles, represented in modern times by a single survivor, Sphenodon or Hatteria, which lives on islands off the coast of New Zealand, and in ancient times by a large number of creatures whose fossil remains are found in Permian, Mesozoic, and Eocene rocks. This order received its name from the beak-like rostrum on the skulls of some of its typical species. It includes the earliest and most primitive reptiles, and also the birds. The suborder Proterosauria;

RHYNCHOCEPHALIA.

1, Skull of Paleohatteria, superior aspect; 2, the same, lateral aspect; 3, a dorsal vertebra of *Nassaurus claviger*: c, center; j, jugal; m, maxilla; q, quadrate bone.

or Proganosauria, includes the most primitive forms, in which the teeth are of uniform shape and parts of the skeleton are still cartilaginous. Palæohatteria from the Lower Permian of Saxony is the earliest known reptile. It had a lizard-like body about 18 inches long, with a long tail, large head, very large eyes, and numerous large conical teeth that are fused with the jaw bones, and also small teeth on the palate. The

legs were strong and the feet were provided with five clawed toes and adapted to progress on land. A suborder, Pelycosauria, includes several curious though imperfectly known genera in which the anterior teeth are different from the posterior and the dorsal vertebræ are furnished with greatly elongated neural spines. The *Rhyncho-*

THE RHYNCHOCEPHALIC SKULL.

Cranium of *Hyperodapedon Gordoni*: 1, superior aspect; 2, lateral aspect; 3, mandibular symphysis.

cephalia vera includes the most highly specialized forms, which attain their maximum of evolution and widest geographic distribution in late Triassic time. They are characterized by more complete ossification of the skeleton, by reduction of the abdominal ribs, and by having uniform marginal teeth.

BIBLIOGRAPHY. Von Zittel and Eastman, *Text-book of Paleontology*, vol. ii. (London and New York, 1902).

RHYNCHONEL/LA (Neo-Lat. nom. pl., from Gk. ῥύγχος, *rhynchos*, snout). A genus of brachiopods, scarce but widespread in modern seas, but very abundant anciently, and represented in almost every geological formation from the Ordovician upward. About 600 species have been described, mostly from the Mesozoic rocks, of which the Jurassic and Cretaceous groups are especially prolific. Most of the ancient forms are doubly convex shells with prominent though small ventral beaks, and with surfaces marked by strong, usually angular radial plications, and with a more or less elevated median fold and sinus. The structure of the shell in most genera is non-punctuate, a character by which the species may most readily be distinguished from the closely similar species of Terebratulidae. Consult: Hall and Clarke, *Paleontology of New York*, vol. viii., part ii. (Albany, 1894); Davidson, "Monograph of the Recent Brachiopoda," *Transactions of the Linnean Society*, vol. iv. (London, 1886-88).

RHYOLITE (from Gk. ῥυαξ, *ryhax*, stream, especially of lava, from ῥεῖν, *rhein*, to flow + λίθος, *lithos*, stone), LIPARITE, NEVADITE. An igneous rock of porphyritic texture and siliceous composition, generally with a crumpled, banded (rhyolitic) texture, due to the arrangement of its constituent minerals by flowage. Rhyolites are also frequently glassy, vesicular, scoriaceous, or pumiceous. When compact and massive, rhyolites are designated as rhyolite porphyries (formerly called quartz porphyries, and then supposed to be of geological age older than the Tertiary). In chemical composition rhyolites have about the same range as the granites. They average: Silica, 75 per cent.; alumina, 13 per cent.; sesquioxide and protoxide of iron, each 1 per cent.; oxide of lime, 1 per cent.; oxide of sodium, 3 per cent.; oxide of potassium, 6 per cent. Varieties rich in oxide of sodium are designated soda-rhyolites

(pantellerites). Rhyolites are for the most part surface lavas or are intruded in other rocks as dikes or sills. Very extensive areas of rhyolite are found in the Cordilleran mountain system of the Western Hemisphere. Rhyolites when of unusually coarse grain are now designated by the variety name, Nevadite.

RHYS, rës, ERNEST (1859—). An English author, born in London, July 17, 1859. He was educated at schools in Carmarthen, South Wales, at Bishop-Stortford and at Newcastle-on-Tyne, and became a mining engineer (1877). In 1885 he abandoned the profession for general literature. In 1887 he came to the United States on a lecturing tour. His writings on Welsh subjects are popular and are to be distinguished from those of the profound Celtic scholar John Rhys (q.v.). He edited the Camelot series of popular reprints and translations (65 vols., 1886-91); Dekker's *Plays* for the Mermaid Series (1888); *The Lyrio Poets* (12 vols., 1894-99); *Literary Pamphlets* (1897); and other works. His writings include: *The Great Cockney Tragedy* (1881); *A London Rose and Other Rhymes* (1894); *Welsh Ballads and Other Poems* (1898); *Frederick Lord Leighton*, a biography (1898, which had been preceded by an earlier study in 1895); and two romances, *The Fiddler of Carne*, having a Welsh heroine (1896), and *The Whistling Maid* (1900).

RHYS, JOHN (1840—). A Welsh author and professor of Celtic at Oxford since 1877. He was born in Cardiganshire in 1840 and educated at Bangor Normal College, Jesus College, Oxford, the Sorbonne, Heidelberg, and Leipzig. In 1871 he became school inspector for Flintshire and Denbighshire; fellow of Jesus College in 1881; Hibbert lecturer, 1886; Rhind lecturer on archæology in Edinburgh, 1889; and has seen service on numerous commissions on education, reforms and land movements connected with Wales. His works are: *Lectures on Welsh Philology* (1877); *Celtic Britain* (1882); *Celtic Heathendom* (1886); *Studies in the Arthurian Legend* (1891); *Inscriptions and Language of the Northern Picts* (1892); *Rhind Lectures on the Early Ethnology of the British Isles* (1890-91); *Celtic Folk-Lore* (1901); and in conjunction with Mr. D. Brynmor-Jones, *The Welsh People* (1900). Professor Rhys has also coöperated in the production of several important editions of Welsh texts and his contributions to Celtic scholarship have been various and important. To his native and unsurpassed knowledge of Wales and of the Welsh language he has added wide research in the other languages of the Celtic group, and in the history and antiquities of the Celtic peoples. Besides doing valuable linguistic work in early Welsh and Manx, he has made himself the chief living authority on the Ogam inscriptions. His studies on folk-lore, mythology, and religion have been learned and brilliant, but rather bold in conjecture. The editions of Welsh texts which he has brought out in collaboration with Professor Morris Jones and Mr. J. Gwenogvryn Evans are models of accurate editing.

RHYTHM (Lat. *rhythmus*, from Gk. ῥυθμός, *rhythmos*, rhythm, time, measure, from ῥεῖν, *rhein*, Skt. *aru*, to flow). A complex mental process which has been defined, from different points of view, as a temporal perception and as a regulated emotion. Objectively regarded, it is a regularly measured and regularly stressed movement in

time. Regarded as preception, it is a series of auditory or tactual (never of visual) sensations, which recur at regular intervals and show a regular variation of intensity. In other words, our interpretation of rhythm as a perception simply translates the objective definition into subjective terms. There are, however, certain phenomena of the rhythmical consciousness which have led some psychologists to accept the other view, that rhythm is a kind of emotion. (1) If we subject an observer to a series of regularly recurring and similar sounds, we find (within definite time limits) that in the majority of cases the series is apprehended as rhythmical. The most familiar instance is that of listening to the ticking of a clock; the beats of the pendulum are heard, not as tick, tick, tick, but as *tick, tick, tick, tick*, etc. (2) We can produce the effect of rhythm not only by changing the objective intensity of regularly recurring stimuli, but also (a) by changing their duration, (b) by changing the interval between them, and (c) by changing their quality. That is to say, the intensities may remain constant throughout, and yet (if some one of these three variations is introduced into the series) the observer will have the illusion of intensive fluctuation, and will therefore be constrained to hear the series as rhythmical. (3) There is a strong tendency to 'express' rhythm, to accompany a

first beat of every bar has an accent, while in examples 2 and 3, although every bar retains its own accent, there is no special accent or emphasis at the beginning of the rhythmic figure. Accent thus deals with the notes of a single measure; rhythm with groups of notes extending over one or (generally) more measures. Music becomes intelligible only when these larger rhythmic divisions are clearly grasped. A cultivated ear soon tires of constant regularity of rhythm. To avoid monotony, composers resort to various means of breaking the rhythm, such as inserting an odd bar between the regular number of bars composing a rhythmic group, alternating two-bar with three-bar rhythms, or making the weak ending of a phrase coincide with the strong beginning of a new phrase (thus really causing the elision of a bar).

The only simple rhythms are those consisting of a group of notes filling two or three measures (duple and triple rhythm). All rhythms extending over more than three bars are compound. Thus every four-bar rhythm can be resolved into two groups of two bars each. A six-bar rhythm may consist of two groups of three bars each or three groups of two bars each. The Scherzo of Beethoven's *Ninth Symphony* (Ex. 4) begins with a theme in quadruple rhythm (two groups of duple rhythm).

Example 4.

series of rhythmical sounds by movements of head, foot, or hand.

RHYTHM IN MUSIC. The regular recurrence of tone-groups in which the individual notes are symmetrically arranged according to accent and time-value. Rhythm is entirely independent of melody or harmony (q.v.) and can, therefore, be indicated by notes without reference to pitch.

While every bar retains its own accent (marked —), there is a particular emphasis (marked ≡) upon the first and fifth bars (the beginnings of the rhythmic group) and a less emphasis (marked =) upon the third and sixth bars. The effect produced is the same as if the phrase were written in more moderate tempo as follows:

Example 5.

The following examples illustrate this:

After a number of bars Beethoven changes this

Example 1.—POLONAISE. 3/4

Example 2.—FANDANGO. 3/8

Example 3.—BEETHOVEN (Symphony No. 7). 6/8

In the first example the characteristic rhythmic quadruple to triple rhythm:

figure is contained within the limits of a single which produces the following effect:

measure; whereas in the other two examples it fills two measures. It is evident from this that rhythm is not synonymous with accent; for the

A loose use of language has created a great deal of confusion in regard to the meaning of the term rhythm. The word is often carelessly

employed instead of *accent* or *time*, both of which terms are only subdivisions of rhythm. See ACCENT; SYNCOPATION; TIME.

RIAD, rē-ād', or **RIYAD**. The Wahabi capital in the Sultanate of Nedjed, Central Arabia (Map: Turkey in Asia, R 11). It is built on an extensive open plain in a well-cultivated region. In the centre of the city is a large square containing the market-place and the great mosque. The city is a resting-place for pilgrims on the way from Persia to Mecca and Medina. Riad dates from 1824. Population (estimated), 30,000.

RIALL, rī'əl, Sir PHINEAS (1775-1851). A British soldier. He was born in Ireland, entered the British Army as an ensign in 1794, and soon rose to be major. In 1804 he was attached to the Fifteenth Foot, served for several years with distinction in the West Indies, and in 1810 was brevetted colonel. Three years later he was promoted major-general, and was sent to Canada to operate against the forces of the United States. In the following winter he destroyed Black Rock, Buffalo, and other villages on the American border, and during the next summer commanded the troops which opposed the invading army under General Jacob Brown. On July 5th he was defeated in the battle of Street's Creek, or Chippewa. On July 25th at the battle of Lundy's Lane (q.v.), where he held the immediate command of the British forces, he was severely wounded and was taken prisoner. In 1816 he was appointed Governor of Grenada, and administered the affairs of that island for several years. He was promoted lieutenant-general in 1825, was knighted in 1833, and was made a full general in 1841. Consult Morgan, *Sketches of Celebrated Canadians and Persons Connected with Canadian History* (Quebec, 1862).

RIALTO, rē-āl'tō (It., from *rio*, *rivo*, brook + *alto*, deep, high). The chief bridge of Venice, a graceful structure spanning the Grand Canal by a single marble arch 74 feet in length, and 32 feet high. The name is derived from Rivoalto, the island on which Venice was founded. Two rows of shops divide the bridge into a broad road and two narrow side passages. The bridge and adjacent district are referred to in Shakespeare's *Merchant of Venice*.

RIANT, ré-ān', PAUL EDOUARD DIDIER, Count (1836-88). A French scholar and historian, born in Paris. He was known as the foremost scholar of his day on the subject of the Crusades, possessed of a keen historical sense, skill in research, and marked scholarship in the interpretation of documents. In 1875 he founded the Société de l'Orient Latin, whose object was the publication of geographical and historical documents appertaining to the Crusades and Palestine. He collected an excellent library in the history of the Crusades, and in Scandinavian literature, of which Harvard University obtained the former portion, and Yale the latter. Among the numerous volumes written and edited by him are *Expéditions et pèlerinages des Scandinaves en Terre Sainte au temps des croisades* (1865); *Magistri Thadei Neapolitani Historia de Desolatione et Consecratione Civitatis Aconensis 1291* (1874); and *Le changement de direction de la quatrième croisade* (1878). The *Catalogue de la bibliothèque de feu H. le Comte Riant* appeared at Paris in 1896-99 (3 vols.).

RIAZAN, rē-ā-zān'y'. A government and a city of Russia. See RYAZAN.

RIB (AS. *ribb*, OHG. *rippi*, Ger. *Rippe*; connected with OChurch Slav. *rebro*, *rib*, and probably with Ger. *Rebe*, tendril, OHG. *hirmireba*, brain covering, skull). An elastic arch of bone, which, with its fellows, constitutes with the vertebral column behind, and the sternum or breastbone in front, the osseous part of the walls of the chest. In man there are 12 ribs on each side. The first seven are more directly connected through intervening cartilages with the sternum than the remainder, and hence they are termed *vertebro-sternal* or *true ribs*; while the other five are known as *false ribs*, and the last two of these, from being quite free at their anterior extremities, are termed *floating ribs*. A glance at a skeleton, or at a plate representing the articulated bones, will show that the ribs vary very considerably both in their direction and size. The upper ribs are nearly horizontal, but the others lie with the anterior extremity lower than the posterior, this obliquity increasing to the ninth rib, and then slightly decreasing. They in-

FIG. 1. THORAX, FRONT VIEW.

crease in length from the first to the seventh, and then again diminish. The spaces between the ribs are termed the *intercostal spaces*. On examining a rib taken from about the middle of the series, we find that it presents two extremities (a posterior or vertebral, and an anterior or sternal), and an intervening portion, termed the body or shaft. The posterior extremity presents a head, a neck, and a tuberosity. The head is marked by two concave articular surfaces divided by a ridge, the lower facet being the larger. These surfaces fit into the cavity formed by the junction of two contiguous dorsal vertebrae, and the ridge serves for the attachment of a ligament. The neck is a flattened portion proceeding from the head; it is about an inch long, and terminates at an eminence termed the tuberosity or tubercle, whence the shaft commences. On the lower surface of this tubercle is a small oval surface, which articulates with a corresponding surface on the upper part of the transverse process of the lower of the two contiguous vertebrae. The shaft presents an external convex and an internal concave surface. A little in front of the tubercle the rib is bent inward, and at the same time up-

ward, the point where this bending takes place being called the angle. The upper border of the rib is thick and rounded, while the lower border is marked by a deep groove, which lodges the intercostal vessels and nerve.

The ribs of mammals are mostly connected, as in man, with the bodies of two vertebrae, and with the transverse processes of the posterior one. In the Monotremata, however, they articulate with the vertebral bodies only; while in the Cetacea the posterior ribs hang down from the transverse processes alone. Their number, on each side, corresponds with that of the dorsal vertebrae. The greatest number, 23, occurs in the two-toes sloth, while in the Chiroptera 11 is the ordinary number. In birds each rib articulates by means of a small head with the body of a single vertebra near its anterior border, and with the corresponding transverse process by means of the tubercle. Moreover, each rib possesses a

FIG. 2. ARTICULATION OF THE RIBS WITH THE SPINAL COLUMN, FRONT VIEW.

'diverging appendage,' which projects backward over the next rib, so as to increase the consolidation of the thoracic framework, necessary for flying. The dorsal vertebrae here never exceed 11, and are commonly 7 or 8 in number, and the ribs proceeding from them are connected with the sternum, not by cartilage, as in mammals, but by true osseous sternal ribs, which are regularly articulated at one end with the sternum, and at the other with the termination of the spinal ribs. In the chelonian reptiles the ribs (as well as the vertebrae and the sternum) deviate remarkably from the normal type, the lateral parts of the carapace consisting mainly of ankylosed ribs united by dermal plates. In the crocodiles there are only twelve pairs of true or dorsal ribs; while in the other saurians, and in the ophidians, the ribs are usually very numerous. In the frogs there are no true ribs, the reason probably being that any bony element in their thoracic walls would interfere with the enormous thoracic-abdominal enlargement which these animals periodically undergo at the breeding period. See SKELETON; SPINAL COLUMN.

RIB. In architecture, a projecting band or molding on an arched or flat ceiling. It is of universal use in all styles of Gothic architecture and it is the key-note of the Gothic system of construction. (See GOTHIC ARCHITECTURE.) Ribs were first used in certain Romanesque schools during the eleventh and early twelfth centuries, especially those of Lombardy, Normandy, and the Rhine. They simply followed the diagonal lines

of intersection of two barrel vaults on a square plan. But the Gothic system, by using the pointed arch in the ribbing, by making a complete framework of diagonal, transverse, and longitudinal ribs, not only self-sufficient, but capable of sustaining weight and transmitting thrust, and by turning the shell of each vaulting compartment into a concave surface, made of the combination the basic unit of the structure. The ribs were at first heavy and simply molded, becoming in the thirteenth century more slender and elaborately molded. Their intersection at the crown of the vault was commonly decorated with carved ornamentation in the form of floral bosses or pendants. In late Gothic, especially in England and Germany, intermediate ribs of no constructive use were added in the vaulted fields for decorative effect, some of which were called *lierne*. The fan-tracery vaults and paneled vaults are two of the most elaborate of these styles of ribbing. Cusping and tracery were used in late Gothic ribbing, and the ribs often wandered in curved lines across the vaulting.

RIB, FRACTURE OF THE. A very common surgical accident, resulting usually from blows or falls upon the chest. It is not uncommon, however, for ribs to be broken by indirect violence, such as a crushing or squeezing force which springs the convexity of the ribs outward until fracture occurs. Instances are on record where the ribs of very old persons have been actually broken by very violent coughing.

The treatment for fractured ribs consists in the application of broad strips of adhesive plaster which encircle the chest wholly or in part and which by their pressure steady the broken fragments and prevent their moving upon one another in the act of respiration.

Where the sharp extremity of a broken rib penetrates the layers of the pleura and enters the lung and escape of air occurs from the lung substance into the pleura, and thence through the wound in the parietal layer of the pleura into the subcutaneous connective tissue, it is made evident by a puffiness of the skin and a peculiar crackling sensation to the touch. This condition, which is known as *surgical emphysema*, may extend over the entire trunk and occasionally has been known to invade nearly the entire body.

RIBAUT, rē'bô', or RIBAULT, JEAN (c.1520-65). A French navigator and colonizer, born at Dieppe. In 1562 he was given command of an expedition organized by the Huguenot leader, Admiral Coligny, which had for its object the founding of a Huguenot colony in America. With his two vessels he explored the Florida coast, and finally, anchoring at Port Royal, built Fort Charles, near the present Beaufort, S. C. Leaving twenty-six colonists, he went back to France, from which, on account of the civil wars, he was unable to return for some time. Meanwhile the colony had been abandoned. Another settlement of French Protestants, however, had been made in 1564 under Laudonnière at Fort Caroline, on the Saint John's River, and in August of the next year Ribaut came over with seven vessels and assumed command of the colony. The appearance of a Spanish squadron, which had been dispatched with orders to kill all the Protestants in the settlement, drove him to sea. He planned to attack the Spaniards in their new settlement at Saint Augustine, but his fleet was wrecked and

the project was abandoned after a slight initial success. Meanwhile, the Spanish leader Menendez had taken Fort Caroline, on the Saint John's River, by rapid and skillful tactics. Over one hundred of the garrison were murdered by the Spaniards, as well as others of the French forces who later fell into the hands of Menendez. Ribaut traveling toward the settlement was met by Menendez, and with most of his party surrendered unconditionally. All but a few were put to death, Ribaut himself meeting his fate bravely. Consult: Winsor, *Narrative and Critical History of America*, vol. ii. (Boston, 1886); Parkman, *Pioneers of France in the New World* (ib., 1885); Gaffard, *La Floride française* (Paris, 1875).

RIBBECK, OTTO (1827-98). A German classical philologist. He was born in Erfurt, studied in Berlin under Lachmann, Böckh, and Bopp (1845), and in Bonn under Welcker, the 'last Hellene,' and with Ritschl, whose critical method he so closely followed. After receiving his degree in Berlin he went to Italy, where he spent a year. In 1853 he became a member of Böckh's seminar at Berlin, and from 1854 to 1877 taught successively at Elberfeld, Bern, Basel, Kiel, and Heidelberg. He became Ritschl's successor at Leipzig in 1877. Ribbeck's peculiar province was Latin poetry, and his great fame was as a bold textual critic. Besides many contributions to the *Rheinisches Museum*, of which he became an editor in 1876, his more typical works are the valuable collection of Latin comic and tragic fragments (1852-55; enlarged 1871-73; 3d ed. 1897-98); the text of Juvenal (1859), which is very radically reconstructed on the general principles of his essay, *Der echte und unechte Juvencal* (1865), in which Ribbeck held satires 1-9 and 11 as original and all else of the *textus receptus* late additions; the great text of Vergil (1859-62; prolegomena 1866), based on a minute study of the interrelations and history of the manuscripts, but marred by a subjective and fanciful, if brilliant, criticism, which is also to be found in the Horace of 1869; and an edition of Plautus's *Miles Gloriosus* (1881). But his most valuable works were the *Geschichte der römischen Dichtung* (1889-92; 2d ed. 1897-1900) and the masterly *Life of Ritschl* (1879-81). Mention should also be made of his series of classical character sketches, *Alazon* (1882), *Kolax* (1883), and *Agroikos* (1885), patterned somewhat on Theophrastus.

RIBBED VAULTING. A form of arched vaulting in which the masonry of the vault is sustained by ribs, which form a sort of skeleton, upon which the concave surfaces forming the shell of the vault rest. The ribbed vault is a development of the quadripartite groined vault, in which the groins are strengthened by means of ribs of masonry, but differs from it in that the concave surfaces of the vault are independent structures, transmitting the thrust to the ribs. (See GROINED VAULTING.) For the different varieties of Ribbed Vaulting, see VAULT. It is the basal unit of Gothic architecture, under which title its development is fully discussed.

RIBBON. See SILK.

RIBBON (OF. *riban*, *ruban*, *rubant*, Fr. *ruban*; perhaps connected with Ir. *ribin*, ribbon, Welsh *rhibin*, streak, Gael. *rib*, hair, rag). In heraldry (q.v.), a diminutive of the ordinary called the bend.

RIBBON-FISH. (1) Any of a variety of pelagic fishes characterized by a much elongated and compressed body, especially those of the sub-order Taniostomi, including three families, represented by very few species. They are of very delicate structure, with naked and silvery skin, a long dorsal fin often uniting with the tail-fin, a small mouth, and a protractile snout. They are widely distributed from polar to tropical seas, but are nowhere found in abundance, being deep-sea fishes, and mere occasional visitants of the coasts. Owing to the delicacy of their frame, perfect specimens are seldom obtained. Specimens 20 feet long with a depth of 12 inches and a thickness of only an inch or two have been taken. See OARFISH.

(2) One of the roneadors (q.v.) of the Gulf of Mexico and West Indies, *Eques lanceolatus*. Its

GULF RIBBON-FISH (*Eques lanceolatus*).

generic name is due to the long dorsal spines, suggesting a rider; and its common name to blackish-brown bands which curiously ornament its yellowish-gray body.

RIBBON GRASS. See CANARY GRASS.

RIBBONISM. The name given to a movement which originated in Ireland about 1808, and took the form of secret associations of Catholics banded together for the purpose of combating the activity of the Orangemen (q.v.), and known as Ribbon societies. The name was derived from the green ribbon which was the badge of the organization. The societies appeared chiefly in Armagh, Down, Antrim, Tyrone, and Fermanagh, and seem never to have gained a footing in the purely Catholic counties. The members of the Ribbon societies belonged almost exclusively to the poorest classes, and the religious purposes of the organization soon became merged with social and agrarian. The Catholic clergy seem consistently to have opposed the movement.

RIBBON SNAKE. One of the American garter-snakes (*Eutania saurita*) common from Massachusetts to Louisiana, but rare west of the Alleghanies. It is a light chocolate brown above, with three yellow stripes and greenish below. The only peculiarity in its habits is its fondness for water. Two closely similar species are *Eutania Sackenii* of Florida, which is clear olive with straw-colored stripes; and *Eutania proxima*, of the Mississippi Valley and Texas, which is blackish brown, with dull yellow stripes. See GARTER-SNAKE.

RIBEIRO, rā-bā'ro, BERNARDIM (c.1486-c.1550). A Portuguese poet, born at Torrão, in the Province of Alentejo. There is little positive information about this poet. He was a gentleman of the chamber at the Portuguese Court for several years, and there had an unfortunate love affair with a relative of the King, who is said by some to have been Donna Joanna de Vilhena. His best known work is the pastoral

romance *Menina e Moça* (1554), the correct title of which is *Saudedes* or *Tristeszas*. It introduces his own love affair and a number of the personages of the Portuguese Court. Although very obscure and confused as to plot, it contains passages of descriptive beauty. The *Obras de Bernardino Ribeiro* were published in 1645, 1785, and 1852. The best modern edition is that of Dom José Pessanha, the *Menina e Moça* with a *Pre-facio* (1891).

RIBEIRO-FERREIRA, fār-rā'ê-rá, THOMAS ANTONIO (1831-1901). A Portuguese poet and statesman, born at Parada de Gonta, and educated for the bar at Coimbra. In 1870 he became secretary general of the Portuguese colonies. He received the Colonial portfolio in 1878, that of the Interior in 1881, in 1885 and in 1890 was Minister of Public Works, and in 1895 and 1896 served as Minister to Brazil. In prose he wrote for the press and published two volumes of travels, but he was best known as a poet, with a typically Portuguese languor and grace, but much patriotism withal, as in *Dissonancias* (1891). Earlier poems are: *Sons que passam* (1854) and *Vesperas* (1858), both lyric collections; *Don Jaime* (1861; 6th ed. 1880), a national epic; and *Delfina do mal* (1868; revised 1881), a narrative.

RIBERA, rê-bā'râ, JUSEPE DE, called LO SPAGNOLETTO (1588-1656). An historical painter and etcher, Spanish by birth and training, but one of the leading masters of the Neapolitan school and the greatest colorist of Italy in the seventeenth century. He was born at Jativa, Province of Valencia, January 12, 1588. First instructed by Ribalta at Valencia, he received most of his training and spent the greater part of his life in Italy. He studied after the works of the great masters in Rome, then especially after Correggio and the Venetians, from whom he derived his vivacity of color. He formed his style, however, chiefly after Caravaggio, of whom he seems to have been an independent follower, rather than a direct pupil. After years of vicissitude, he settled at Naples, where he secured a patron in the rich picture dealer Cortese, whose daughter he married. Like Caravaggio's pictures Ribera's exhibit a wild, extravagant fancy, but great vigor, and, although imbued with the darkness of shadow masses peculiar to the Neapolitan "Tenebrosi" (Darklings), they show a much finer instinct of the chiaroscuro. He delights in scenes of horror, such as tortures and martyrdoms of all kinds, but occasionally shows also poetic charm and was the first to combine realism with the Roman Catholic spirit. He painted numerous heads and half-figures of hermits, saints, and philosophers with great anatomical exactness. Especially good are his various representations of the "Martyrdom of Saint Bartholomew," examples of which are in the museums of Madrid, Berlin, and Dresden. Among his finest paintings are the "Immaculate Conception" (1635), in the Convent of the Augustine Recollets at Salamanca, excelling in splendor of color and light and in the charm of the Virgin's figure the representations of this subject by Murillo, Guido Reni, and Rubens; the "Descent from the Cross" (1637), admirable for its delineation of pain, and "Communion of the Apostles," both in San Martino, Naples; the "Adoration of

the Shepherds" (1650), in the Louvre; the "Martyrdom of Saint Lawrence," in the Vatican; a "Pietà" in the National Gallery, London; and "Saint Mary of Egypt Praying at Her Grave" (1641), in the Dresden Museum, of exceptional charm in the expression of the head. Of the fifty pictures in the Madrid Museum, the best are: "Jacob's Dream;" "The Immaculate Conception;" "Isaac Blessing Jacob;" "Magdalen;" "Saint Rochus;" "Prometheus;" and "The Blind Sculptor of Gambazo." Of singular interest is a half-figure of "Homer, as Improviser with the Violin," in the Turin Gallery, and his latest work, the "Saint Sebastian" (1651), in the Museum of Naples. Of his twenty-six etchings the best-known are "The Drunken Silenus with Satyrs" (1628), the equestrian portrait of "Don Juan d'Austria" (1648), two of "Saint Jerome," and "Satyr Scourged by Cupid." Consult: Bermudez, *Diccionario histórico . . . de las bellas artes*, iv. (Madrid, 1800) Eisenmann, in Dohme, *Kunst und Künstler Italiens*, iii. (Leipzig, 1879); Woermann, in *Zeitschrift für bildende Kunst* (ib., 1890); and *Diccionario enciclopédico hispano-americano*, xvii. (Barcelona, 1895).

RIBHUS (Skt. *ṛbhū*, dexterous, from *rabh*, Gk. *λαβάνειν*, *lambanein*, to take; ultimately connected with Ger. *Alp*, AS. *ælf*, Eng. *elf*). In Vedic mythology, a group of divine artificers. They are usually three in number, and were originally mortals. They are closely associated with Indra, and also with Savitar, the sun, while in their appearance they are like the sun, and ride in a bright car drawn by fat steeds. They are most frequently mentioned as the artisans of the gods. The physical basis of the divine aspect of the Ribhus is doubtful. Some scholars regard them as the three seasons which are at a standstill during the twelve days of the winter solstice. Consult: Nève, *Essai sur le mythe des Ribhavas* (Paris, 1847); Macdonell, *Vedic Mythology* (Strassburg, 1897); Ryder, *Die Ribhū's im Rgveda* (Gütersloh, 1901).

RIBOT, rê'bô', AUGUSTIN THÉODULE (1823-91). A French genre and portrait painter of the realistic school, born at Saint-Nicolas-d'Attez (Eure). He first painted mirror frames, and then worked for a while under Glaise and studied Chardin and the Dutch and Spanish masters in the Louvre. He began his exhibits at the Salon by a series of still-life pictures and kitchen scenes, painted broadly with strong Rembrandt-like effects of light and shade. These include "Cooks at Dinner Time" (1861), and "Chickens Roasting" (1861). His "Saint Sebastian" (1861) showed his powerful, if somewhat coarse, talent, in another manner. This picture, with "The Good Samaritan," and "Jesus in the Temple," is in the Luxembourg. His later works were mainly portrait heads, chiefly of old people, which are wonderful studies of wrinkled flesh and startling expression. He was decorated with the Legion of Honor. Consult Muther, *The History of Modern Painting* (New York, 1896).

RIBOT, ALEXANDRE FÉLIX JOSEPH (1842-). A French statesman, born in Saint Omer (Pas de Calais), and educated for the law in Paris. He was one of the founders of the Société de Législation Comparée, was for two years (1875-77) at the head of a department in the Ministry of Justice, and in 1878 was elected a Deputy.

He became a member of the Left Centre, defended Dufaure's policy, and in his general conservatism was especially prominent as opposed to the colonial policy of the Ferry Cabinet. In 1890 he became foreign Minister in Freycinet's Cabinet, a portfolio which he also held under Loubet. From December 1892 to March 1893, he was president of the Cabinet, and on Faure's election, in 1895, was again called to form a Cabinet, which did not last the year out. After Fashoda, Ribot again urged his conservative colonial policy of prudent waiting. In the Dreyfus affair, although he had previously urged all possible publicity, he successfully opposed the prosecution of Mercier. Ribot made a special study of English politics, and in 1866 wrote a *Biographie de Lord Erskine*.

RIBOT, THÉODOLE ARMAND (1839—). A French psychologist. He was born at Guingamp, December 18, 1839, and was educated at the Lycée de Saint Briere and at the Ecole Normale, Paris, where he graduated in 1862, and whence he received a doctor's degree in 1875. After teaching for several years as professor of philosophy at various lycées, he came to Paris and turned to the investigation of experimental and physiological psychology in the histological and physiological laboratories and at the clinics of the insane asylums. In 1876 he founded the *Revue philosophique*, of which he became the editor. In 1885 he was given charge of a course in experimental psychology at the Sorbonne, and in 1888 was called to the chair of experimental and comparative psychology in the College of France. Ribot has taken a leading part in the recent development of psychology in France, adopting the best methods of both the German and the English psychologists, while at the same time his work has been characteristically French in breadth of view. Especially valuable have been his psychopathological studies and the analytical and comparative treatment of distinctive types or fields of mental phenomena in his later books. Best known are *La psychologie anglaise contemporaine* (1870; trans., London, 1873); *L'hérédité psychologique* (1873, 5th ed. 1889; trans., London, 1875); *Philosophie de Schopenhauer* (1874; 7th ed. 1896); *Psychologie allemande contemporaine* (1879, 13th ed. 1898; trans., New York, 1886); *Les maladies de la mémoire* (1881, 13th ed. 1898; trans., International Scientific Series, xli, New York, 1882); *Les maladies de la volonté* (1883, 14th ed. 1899; trans., New York, 1884); *Les maladies de la personnalité* (1885, 8th ed. 1899; trans., Chicago, 1895); *La psychologie de l'attention* (1889, 3d ed. 1897; trans., Chicago, 1896); *Psychologie des sentiments* (1896, 3d ed. 1899; trans., London, 1897); *L'évolution des idées générales* (1897; trans., Chicago, 1899); *Essai sur l'imagination créatrice* (1900).

RICARDO, RĀ-KĀR'DŌ, DAVID (1772-1823). An eminent English political economist, born in London. His father, a Jew from Holland, gave him an education in a commercial school in that country. When fourteen years of age Ricardo left school to engage in his father's business on the stock exchange, for which he showed remarkable aptitude. At nineteen he entered the Church of England and was renounced by his father. Thrown upon the world without resources, he set up as a broker, with such success that he was reckoned a man of

wealth by the time he was twenty-five years of age. It was about this time that he was attracted to the works of Adam Smith, and he began to devote himself to economic studies, though he did not wholly withdraw from business life until 1818. His first publication on economic studies was a pamphlet issued in 1809, and entitled *The High Price of Bullion a Proof of the Depreciation of Bank Notes*. This work created considerable stir, and received, as it were, official confirmation in the famous Report of the Bullion Committee in 1811, in the drafting of which Ricardo is reported to have had great influence. A series of pamphlets on financial subjects followed this first venture, and in 1817 appeared his *Principles of Political Economy and Taxation*, on which his fame chiefly rests. In 1819 he entered the House of Commons, and while his diffidence prevented him from becoming a notable speaker, he maintained there a high authority upon all matters pertaining to finance and taxation until his death.

Ricardo exercised a greater influence upon economic thought than any other of the earlier writers except Adam Smith. His writings cover the fields of abstract theory, currency, taxation, and protection, in each of which he contributed much that was of permanent value. In economic theory his name is associated with the law of rent (q.v.), which he did not originate, but expounded so forcibly that it became generally known through his works; the so-called "iron law of wages," that wages in the long run cannot exceed the minimum of subsistence, for which he is, however, no more responsible than Adam Smith; the labor theory of value, according to which commodities tend to exchange in proportion to the quantity of labor that has been expended upon them. None of these theories receives unqualified acceptance at the present day, although existing theories have been profoundly influenced by them. His writings on taxation are abstract, and throw considerable light upon the problems of incidence of taxes. The most complete part of his work is his discussion of currency. His is the first adequate and clear statement of the quantity theory of money. (See MONEY.) The doctrine of comparative costs (see INTERNATIONAL TRADE) is one of his most important discoveries in the realm of international trade.

In addition to the works mentioned in the text, he was author of a large number of pamphlets on taxation, currency, and protection, and of numerous controversial letters to Malthus, J. B. Say, McCulloch, and other economists.

RICASOLI, RĀ-KĪ'ZŌ-LĒ, BETTINO, Baron (1809-80). An Italian statesman, born at Florence. He was a descendant of an ancient Lombard family, studied at Pisa and Florence, and passed the early years of his life on his estate devoted to the study of agriculture, on which subject he wrote a number of useful works. In 1847 he appeared in politics as a leader of the Moderate Liberals and an advocate of Italian unity, and was elected Mayor of Florence. In 1849 as a member of the executive commission he was instrumental in recalling the Grand Duke Leopold, trusting to the constitutional promises given by the latter. Leopold returned accompanied by the Austrians, and Ricasoli, indignant at this treachery, retired into private life.

In 1859 he assumed the leadership of the liberal movement in Tuscany, and after the flight of the Grand Duke was made dictator (August 1). In this office he exerted himself for the union of Tuscany with Sardinia. His firmness strengthened the hands of Cavour and Victor Emmanuel, and on the 20th of March, 1860, he was able to announce to the Tuscan assembly that its work was done. In the same month he was made Governor-General of Tuscany. On the death of Cavour (June, 1861) Ricasoli was called to the head of the Ministry. His Cabinet, however, could not withstand the Radical assault, and he resigned in March, 1862. He returned to power in June, 1866, and retired in April of the following year, when he was succeeded by Ratazzi. Consult his *Lettere e documenti* (10 vols., Florence, 1888-95); Ongaro, *Bettino Ricasoli* (Turin, 1861); Passerini, *Genealogia e storia della Famiglia Ricasoli* (Florence, 1861).

RICCI, rit'chè, FEDERIGO (1809-77). An Italian dramatic composer, born in Naples. He was educated in music at the Conservatory of San Sebastiano, after which he followed his older brother to Rome. His first great success was won by the opera *La prizione d'Edimburgo* (1837), which was followed by the scarcely less successful *Un duello sotto Richelieu* (1839); *Michelangelo e Rolla* (1841); and *Corrado d'Altamura*. In 1853 he went to Saint Petersburg as inspector of the vocal classes in the Theatre School, and about 1870 left that city to superintend personally his own musical productions in Paris. One or two of his operas had been translated and adapted for the French stage, and their success led him to bid for French favor with the more ambitious operas *Docteur Rose* (1872), and *Chi dura vince*. He was disappointed, however, and in 1876 returned to Italy. Additional compositions included masses, cantatas, songs, as well as several other operas. He died at Conegliano.

RICCI, LUIGI (1805-59). An Italian dramatic composer. He was born in Naples, and, like his brother Federigo, was educated at the Conservatory of San Sebastiano, Naples. He composed several very successful operas which he presented in rapid succession, and in 1836 became maestro di capella at the Cathedral of Trieste, and vocal director of the city theatre. After this much of his work was done in collaboration with his brother until 1859, when he was stricken with disease of the brain, and after confinement in the Prague asylum died there. He wrote about 30 operas, of which perhaps *La festa di Piedigrotta* (1852) and *Il diavolo a quattro* (1859), written jointly with his brother, are among the best. His masterpiece, however, was *Crispino e la Comare* (1850), one of the best comic operas of Italy and the only one still performed outside of it. Other compositions include masses, sacred and secular songs, and duets.

RICCI, MATTEO (1553-1610). The founder of the Jesuit missions in China, and a celebrated astronomer, born at Macerata, Italy. After studying law at Rome he entered the Society of Jesus in 1571. In 1577, while still a scholastic, he went on the mission to India. There he was ordained, and because of his ability in Eastern languages, especially in Chinese, selected to found the mission in China. Ricci published

several works in Chinese which attracted the attention of Chinese literati by the purity of their style. He resolved to make his way to Peking, and in the dress of a Chinese scholar succeeded in reaching Nanking (1595), but was not allowed to remain long. Later he wrote a series of didactic works in Chinese, one a *Dialogue of Friendship*, in imitation of Cicero, which so pleased the Chinese mandarins that he obtained the permission to go to Peking. He presented to the Emperor a telescope and various astronomical instruments, which were still in the palace when the Allies forced an entrance in 1900. After this he was allowed to reside at Nanking. In 1601 he obtained permission to build a church and found a mission in Peking itself. Before long his mathematical teaching and classical Chinese style obtained for him great prestige. He became a special favorite of the Emperor, and through his influence Christianity was introduced into the principal cities of China. There is an important work by him which contains a number of valuable observations on the geography and history of China. His book *On The Nature of God*, written in Chinese, has been admitted into the number of Chinese classics. Consult biographies by Sainte-Foi (Paris, 1859) and Werfer 2d ed., Regensburg, 1870).

RICCI, SCIPIONE DE (1741-1810). An Italian bishop, born at Florence. He was ordained a priest in 1766. For some time he was auditor to the Papal Nuncio at Florence, and in 1780 was appointed Bishop of Pistoja and Prato. He attempted to introduce certain reforms in the Church, but though he was supported by the Grand Duke Leopold, brother of Emperor Joseph II., and his reform measures were approved by the diocesan synod of Pistoja in 1786, he was opposed at the general Tuscan Synod, held at Florence in 1787. When Leopold left Tuscany, Ricci was forced by the anger of the populace to flee from Pistoja (April, 1790), and he formally renounced his episcopal dignity in June, 1791. Consult his *Life* by Potter (Brussels, 1825), and his autobiography, *Memorie* (Florence, 1865).

RICCI, SEBASTIANO (1659-1734). An Italian painter of the Venetian school, born at Cividale di Belluno. He was a pupil in Venice of Cervelli, with whom he painted in Milan, Bologna, and Venice. Afterwards he visited Austria and England, where he remained ten years. His works in England include the decorations of the chapel at Bulstrode for the Duke of Portland, of the hall at Burlington House, and those in the chapel of Chelsea Hospital. "The Continence of Scipio," and "The Dinner at Simon's House," two of his best productions, are at Hampton Court. He executed a large number of works distinguished for vivacity of conception, grace of form, and fine color.

RICCIARDELLI, rit'châr-dè'l'è, DANIELE. See VOLTERRA, DANIELE DA.

RICCIO, DAVID. See RIZZIO.

RICCIO, rit'chè, DOMENICO, called BRUSA-SORCI (1494-1567). An Italian painter of the Venetian school, born in Verona. He was the pupil of Caroto, but was strongly influenced by Giorgione and Titian. Most of his works, chiefly frescoes, are to be found in his native city. Those which depict mythological subjects are better than his purely religious pieces. He painted the façade of the Casa Murari, now al-

most destroyed, and "The Entry of Clement VII. and Charles V. into Bologna," in the Palazzo Ridolfi. This last, his most celebrated work, is notable for the dramatic expression of the figures and its fine color. Domenico's son FELICE (1540-1605), also called BRUSASORCI, studied under Ligozzi in Florence. A number of his religious paintings are in the Verona churches, and there is a "Holy Family" by him, in the Louvre. His style is refined, and his coloring rich and pleasing.

RICCOBONI, rik'kô-bô'nê, LODOVICO, called LELIO 1677-1753). An Italian dramaturgist, born at Modena. In 1699 he became director of a company of players, by whose aid he did away with the traditional Italian comedy of masks, and presented the *Pastor fido* and other dramas of importance. Opposition to him at Venice and in the Lombard towns caused him to withdraw to Paris, where from 1716 to 1729 he conducted an Italian theatre in the Hôtel de Bourgogne. He returned thence after a brief residence at Parma (1729-31). His publications include the *Histoire du théâtre italien* (1728-31).

RICCOBONI, MARIE JEANNE LABORAS DE MÉZIÈRES (1714-92). A French novelist, daughter-in-law of the preceding. She was born in Paris. She wrote the once popular novels of society, *Histoire du marquis de Crécy*; *Lettres de milady Catesby*; *Ernestine*, etc., but she is best known as the continuator of *Marianna*, by Mari-vaux (q.v.).

RICE (OF. *ris*, Fr. *riz*, from ML. *orysum*, Lat. *oryza*, from Gk. *ορίζα*, *oryza* *ορίζων*, *oryzon*, rice; connected with Afghan *vrizi*, Skt. *vrihi*, rice). A genus of grasses of which the only important species is the common rice (*Oryza sativa*), one of the most useful and extensively cultivated grains, supplying the principal food of one-half of the human race. It seems to have been originally a native of the East Indies, but has spread to all quarters of the globe, wherever the conditions of warmth and moisture are suitable. It is adapted to subtropical climates, rather than tropical or cold temperatures. Rice is an annual, varying from two to five feet in height. The seed or grain grows on little separate stalks, springing from the main stalk; and the whole appearance of the plant, when the grain is ripe, may be said to be intermediate between that of barley and oats. Rice requires a moist soil, artificially flooded at certain seasons. There are, however, varieties called upland rice that do not require flooding. The cultivation is most extensively carried on in India, China, and other southeastern parts of Asia, Japan, Egypt, the southern countries of Europe, South Carolina, Georgia, and the Gulf States of North America. The best of all rice known in the market is that of Carolina, yet the introduction of rice into that country occurred only about the end of the seventeenth or the first part of the eighteenth century. Rice is known in India as Paddy—a term also used to designate rice in the husk. See Plate of CEREALS.

In China, where, as in other warm countries, two crops may be obtained in a year, rice is generally sown thickly on very wet land, and afterwards transplanted to the land which it is finally to occupy. The plants tiller or spread at the root very much, so that each sends up several or many stalks. The rice-grounds are

carefully weeded, although often so wet that the workmen may sink to their knees.

The origin of the regular production of rice in America is referred to the latter part of the seventeenth century, when a vessel from Madagascar is said to have brought a sack of the grain to Charleston, S. C. This yielded well, the culture spread, and eventually rice became the staple product of that State, until the War of the Rebellion checked it. The mode of cultivation best adapted to the plant in South Carolina has been found to be by irrigation, and it is chiefly grown where the land was formerly overflowed by the tides. The cultivation of rice spread rapidly to most of the Southern States, but of late years Louisiana and Texas have been the most successful in its cultivation. The prairies of the southern parts of the States have proved to be well suited to the cultivation of rice. The land is irrigated by pumping water from rivers and wells and so regulated as to permit of the use of machinery as in growing other small grains. The ground is plowed, harrowed, and rolled, and the seed planted with drills. The ground is allowed to dry sufficiently at harvest time to enable the use of binders and the grain is afterwards threshed with steam threshers. It is also grown on lowlands subject to overflow from the river, with due precautions against a possible crevasse. The water is conveyed by ditches and laterals, and is alternately turned on and drained off, as the condition of the plants' progress may demand. When mature the water is drained off, the grain cut and left to dry. After threshing, it is winnowed and placed in sacks, ready for the mill or market. The 'upland' rice is dry-cultivated, and is claimed by some planters to be better than the lowland. It is grown upon high and dry land, and, after the manner of other grain, the yield is not so generous as on the lowland. The milling of rice consists in removing the outer husk or coat. From the thresher the rice is sent to the mills in barrels holding 162 pounds each. From this quantity of rough rice, the mills secure 95 pounds of clean rice, 8 pounds of polish, 30 pounds of bran, and 29 pounds of waste. The rice polish and rice bran are mixed and sold as a feeding stuff under the name of rice feed or rice meal. It is very nutritious and is largely employed as a food for pigs.

The production of rice in the United States in 1899, as given in the Twelfth Census, was as follows:

	Pounds
Georgia.....	11,174,562
Louisiana.....	172,732,430
North Carolina.....	7,892,580
South Carolina.....	47,360,128
Texas.....	7,186,863

The amount did not supply the home market, and in addition 204,177,000 pounds were imported. The world's production of rice in 1899 was:

	Pounds
North America.....	283,722,627
Europe.....	1,507,368,000
Asia.....	72,386,748,000

Canada rice (*Zizania aquatica*), the wild rice of North America, is a species of a different genus of grass quite different from the true rice. It is particularly abundant in the Northwest, growing in miry places or shallow water, often in the margins of lakes. The seeds are about

half an inch long, slender, farinaceous, affording very good meal, and used to some extent by the Indians where the plant abounds. Owing to its tendency to shatter its seed, its production has not reached any economic importance.

WILD RICE (*Zizania aquatica*).

Aside from its use as food (see below), rice is subjected to fermentation in many countries. The beer made from it (*saki*) is in general use among the Japanese. Several kinds of highly esteemed and very intoxicating wines are made from rice by the Chinese. A spirit is distilled from the lees. Rice starch is made in considerable quantity and is used in laundries and muslin factories. Rice straw is used to make bonnets, and also to some extent as a feed for cattle.

FEEDING VALUE. The rice grain is not directly used as a food for farm animals. However, its by-products, chaff-meal, bran, and polish, are fed especially in regions where rice is grown. The straw also has a feeding value.

Rice bran and rice meal contain more or less of the germ, and are fed to dairy cows and pigs.

According to recent experiments rice meal has practically the same value for pigs as corn meal when fed in addition to skim milk. Rice polish is a fine powder of high nutritive value and is very valuable for cows, pigs, etc. As it is rich in both nitrogen and potash, it produces a valuable manure. Rice hulls are too woody to be of much food value. They are largely used for packing around breakable articles. Unlike most cereal grains, rice is seldom made into bread or cakes, but is eaten boiled. In China, Japan, and other countries where the majority of the people cannot obtain animal food, rice, which is rather deficient in protein (see table), is supplemented by special products made from the soy bean (q.v.), which are rich in protein. In Europe and America rice is used as a vegetable, for making soups, puddings, cakes, etc.

Rice flour has the following percentage composition: Water, 8.5; protein, 8.6; fat, 6.1; nitrogen-free extract, 51.9; crude fibre, 16.1; and ash, 8.8. Flaked rice, a breakfast food, has the following average percentage composition: Water, 9.5; protein, 7.7; fat, 0.4; nitrogen-free extract, 81.7; crude fibre, 0.2; and ash, 0.3. Rice is believed to be very thoroughly digested. Judged both by palatability and wholesomeness, it is worthy of the high esteem in which it is held.

RICE, ALLEN THORNDIKE (1853-89). An American editor, born in Boston, Mass. He graduated at Oxford University in 1875, and in 1876 bought the *North American Review*, of which he subsequently became the editor. In 1879 he promoted the Charnay expedition, which, under the patronage of France and the United States, was sent to investigate the remains of primitive civilization in Central America and Mexico. He was the first to recommend the introduction into the United States of the Australian ballot system. He edited *Reminiscences of Abraham Lincoln* (1886) and was a contributor to *Ancient Cities of the New World* (1887).

RICE, JAMES (1843-82). An English novelist, born at Northampton, September 26, 1843. He studied at Queen's College, Cambridge, and was called to the bar at Lincoln's Inn (1871). Never taking very seriously to his profession, he gave most of his time to literature. As editor and proprietor of *Once a Week*, from 1868 to 1872, he made the acquaintance of Walter Besant, with whom he collaborated on several remarkable novels, as *Ready Money Mortiboy* (1872), which was successfully dramatized (1874); *The Golden Butterfly* (1876); *The Monks of Thelema* (1877); and *The Seamy Side* (1881). Besides these and other novels, they wrote in conjunction several Christmas stories for *All the Year Round* and the *World*. There had been no literary partnership as successful as this since that of Erckmann-Chatrian (q.v.). Rice also wrote a gossipy *History of the British Turf* (1879).

RICE-BIRD. The name in the Gulf States of the bobolink (q.v.).
